We introduce and investigate a new subclass $M_{1}(\theta, \lambda, \eta)$ of meromorphic spirallike functions. Such results as integral representations, convolution properties, and coefficient estimates are proved. The results presented here would provide extensions of those given in earlier works. Several other results are also obtained.

1. Introduction

Let $\mathcal{M}$ denote the class of functions $f$ of the form

$$f(z) = \frac{1}{z} + \sum_{n=1}^{\infty} a_n z^n,$$  \hspace{1cm} (1)

which are analytic in the punctured open unit disk:

$$\mathbb{U}^* := \{z : z \in \mathbb{C}, 0 < |z| < 1\} =: \mathbb{U} \setminus \{0\}.$$  \hspace{1cm} (2)

Let $f, g \in \mathcal{M}$, where $f$ is given by (1) and $g$ is defined by

$$g(z) = \frac{1}{z} + \sum_{n=1}^{\infty} b_n z^n.$$  \hspace{1cm} (3)

Then the Hadamard product (or convolution) $f \ast g$ of $f$ and $g$ is defined by

$$(f \ast g)(z) = \frac{1}{z} + \sum_{n=1}^{\infty} a_n b_n z^n := (g \ast f)(z).$$  \hspace{1cm} (4)

Let $\mathcal{P}$ denote the class of functions $p$ given by

$$p(z) = 1 + \sum_{n=1}^{\infty} b_n z^n \quad (z \in \mathbb{U}),$$  \hspace{1cm} (5)

which are analytic in $\mathbb{U}$ and satisfy the condition

$$\mathbb{R}(p(z)) > 0 \quad (z \in \mathbb{U}).$$  \hspace{1cm} (6)

For $\theta$ which is real with $|\theta| < \pi/2$, $0 \leq \gamma < 1$, we denote by $\mathcal{M} S^\gamma(\theta, \gamma)$ and $\mathcal{M} K^\gamma(\theta, \gamma)$ the subclasses of $f \in \mathcal{M}$ which are defined, respectively, by

$$\mathbb{R}\left(e^{\theta} \frac{zf'(z)}{f(z)}\right) < -\gamma \cos \theta \quad (z \in \mathbb{U}^*),$$  \hspace{1cm} (7)

$$\mathbb{R}\left(e^{\theta} \frac{zf'(z)}{f'(z)}\right) < -\gamma \cos \theta \quad (z \in \mathbb{U}^*).$$

By setting $\theta = 0$ in (7), we get the well-known subclasses of $f \in \mathcal{M}$ consisting of meromorphic functions which are starlike and convex of order $\gamma$ ($0 \leq \gamma < 1$), respectively. For some recent investigations on meromorphic spirallike functions and related topics, see, for example, the earlier works [1–4] and the references cited therein.

For $\eta > 1$, Wang et al. [5] and Nehari and Netanyahu [6] introduced and studied the subclass $\mathcal{M}(\eta)$ of $\mathcal{M}$ consisting of functions $f$ satisfying

$$\mathbb{R}\left(zf'(z)\frac{f(z)}{f'(z)}\right) > -\eta \quad (z \in \mathbb{U}^*).$$  \hspace{1cm} (8)

Let $\mathcal{A}$ be the class of functions of the form

$$f(z) = z + \sum_{n=1}^{\infty} a_n z^n,$$  \hspace{1cm} (9)
which are analytic in $U$. A function $f \in \mathcal{A}$ is said to be in the class $\mathcal{D}^*(\theta, \delta, \gamma)$ if it satisfies the condition
\[
\Re \left( \frac{e^{\delta_0} z f'(z)}{(1 - \delta) f(z) + \delta z f'(z)} \right) > \gamma \cos \theta
\]
\[
\left( z \in U; \quad |\theta| < \frac{\pi}{2}; \quad 0 \leq \delta < 1; \quad 0 \leq \gamma < 1 \right).
\] (10)

The function class $\mathcal{D}^*(\theta, \delta, \gamma)$ is introduced and studied recently by Orhan et al. [7]. An analogous of the class $\mathcal{D}^*(\theta, \delta, \gamma)$ has been studied by Liu and Srivastava [15]. It should also be remarked that the linear operator $\mathcal{H}_l^l[\alpha, \beta]$ is a generalization of other linear operators considered in many earlier investigations (see, e.g., [16–18]).

Using the operator $\mathcal{H}_l^l[\alpha, \beta]$, we introduce the following class of meromorphic functions.

**Definition 1.** For $|\theta| < \pi/2, 0 \leq \lambda < 1/2, \text{ and } \eta > 1$, let $\mathcal{M}_l^l(\theta, \lambda, \eta)$ denote a subclass of $\mathcal{M}$ consisting of functions satisfying the condition that
\[
\Re \left( \frac{e^{\delta_0} (1 - 2\lambda) z (\mathcal{H}_l^l[\alpha, \beta] f(z))' (1 - \lambda) \mathcal{H}_l^l[\alpha, \beta] f(z) + \lambda z (\mathcal{H}_l^l[\alpha, \beta] f(z))'}{\cos \theta} \right)
\]
\[
> -\eta \cos \theta, \quad (z \in U^*),
\] (18)

where $\mathcal{H}_l^l[\alpha, \beta] f$ is given by (13).

We note that, for $l = 2, m = 1, \alpha_1 = \alpha_2 = 1, \beta_1 = 1$, and $\theta = \lambda = 0$, the class $\mathcal{M}_l^l(0, 0, \eta)$ becomes the class $\mathcal{M}(\eta)$.

In the present paper, we aim at proving some interesting properties such as integral representations, convolution properties, and coefficient estimates for the class $\mathcal{M}_l^l(\theta, \lambda, \eta)$.

The following lemma will be required in our investigation.

**Lemma 2.** Suppose that the sequence $\{A_n\}_{n=1}^{\infty}$ is defined by
\[
A_1 = \frac{(1 - 2\lambda) (\eta - 1) \cos \theta}{(1 - \lambda) \phi_1(\alpha, \beta; l; m)},
\]
\[
A_{n+1} = \frac{2 (\eta - 1) \cos \theta}{(n + 2) (1 - \lambda) \phi_{n+1}(\alpha, \beta; l; m)} \times \left[ 1 - 2\lambda + \sum_{k=1}^{n} \phi_k(\alpha, \beta; l; m) (1 - \lambda + k\lambda) A_k \right].
\] (19)

Then
\[
A_n = \frac{(1 - 2\lambda) (\eta - 1) \cos \theta}{(1 - \lambda) \phi_n(\alpha, \beta; l; m)} \times \prod_{k=1}^{n-1} \left[ (k + 1) (1 - \lambda) + 2 (1 - \lambda + k\lambda) (\eta - 1) \cos \theta \right],
\]
\[
(n \geq 2).
\] (20)
Proof. From (19), we have
\[(n+2) (1-\lambda) \phi_{n+1}(\alpha,\beta; l; m) A_{n+1} = 2(\eta-1) \cos \theta \left[ 1 - 2\lambda \right. \]
\[\left. + \sum_{k=1}^{n} \phi_k(\alpha,\beta; l; m) (1 - \lambda + k\lambda) A_k \right],\]
\[(n+1) (1-\lambda) \phi_n(\alpha,\beta; l; m) A_n = 2(\eta-1) \cos \theta \left[ 1 - 2\lambda \right. \]
\[\left. + \sum_{k=1}^{n-1} \phi_k(\alpha,\beta; l; m) (1 - \lambda + k\lambda) A_k \right].\]
(21)
Combining (21), we find that
\[A_{n+1} A_n = \frac{(n+1) (1-\lambda) + 2 (1 - n\lambda) (\eta - 1) \cos \theta}{(n+2) (1-\lambda)} \]
\[\cdot \frac{n (1-\lambda) + 2 (1 - n\lambda) (\eta - 1) \cos \theta}{(n+1) (1-\lambda)} \]
\[\times \frac{3 (1-\lambda) + 2 (1 + \lambda) (\eta - 1) \cos \theta}{4 (1-\lambda)} \]
\[\cdot \frac{2 (1-\lambda) + 2 (\eta - 1) \cos \theta}{3 (1-\lambda)} \]
\[\cdot \frac{\phi_n(\alpha,\beta; l; m)}{\phi_{n+1}(\alpha,\beta; l; m)} \cdot \phi_1(\alpha,\beta; l; m) \cdot (1 - 2\lambda) (\eta - 1) \cos \theta \]
\[\cdot \frac{\phi_2(\alpha,\beta; l; m)}{\phi_3(\alpha,\beta; l; m)} \cdot (1 - 3\lambda) \phi_1(\alpha,\beta; l; m) \]
\[= \frac{(1 - 2\lambda) (\eta - 1) \cos \theta}{(1-\lambda)^n} \phi_n(\alpha,\beta; l; m) \]
\[\times \prod_{k=1}^{n-1} (k+1) (1 - \lambda) + 2 (1 - \lambda + k\lambda) (\eta - 1) \cos \theta].\]
(22)

This completes the proof of Lemma 2. \(\square\)

2. Main Results

We begin by proving the following integral representation for the class \(\mathcal{M}_m^l(\theta, \lambda, \eta)\).

**Theorem 3.** Let \(f \in \mathcal{M}_m^l(\theta, \lambda, \eta)\). Then
\[f(z) = \left( z^{-1} + \sum_{n=1}^{\infty} \phi_n^{-1}(\alpha, \beta; l; m) z^n \right) \]
\[\ast \left( z^{-1} \cdot \exp \left( \int_0^z \left( (1 - 2\lambda) (\eta - 1) \right. \right. \]
\[\left. \times \left( 1 + e^{-2i\theta} \right)^2 \omega(t) \right) \right. \]
\[\left. \times \left( \left( (1 - \lambda) (1 - \omega(t)) \right) \right. \right. \]
\[\left. \left. \times \omega(t) \left( r^{-1} \right)^\theta \right) \right) \right) \right) \right), \]
(24)
where \(\omega\) is analytic in \(U\) with \(\omega(0) = 0\) and \(|\omega(z)| < 1\).

Proof. Suppose that \(f \in \mathcal{M}_m^l(\theta, \lambda, \eta)\) and
\[\tau(z) := \left( e^{i\theta} (1 - 2\lambda) z \left( \mathcal{H}_m^l[\alpha, \beta] f(z) \right) \right) \]
\[\times \left( (1 - \lambda) \mathcal{H}_m^l[\alpha, \beta] f(z) \right) \]
\[+ (1 + \omega(z)) \times ((\eta - 1) \cos \theta)^{-1}, \]
(25)
(\(z \in U\)).

We know that \(\tau \in \mathcal{P}\), which implies
\[\left( e^{i\theta} (1 - 2\lambda) z \left( \mathcal{H}_m^l[\alpha, \beta] f(z) \right) \right) \]
\[\times \left( (1 - \lambda) \mathcal{H}_m^l[\alpha, \beta] f(z) + \lambda z \mathcal{H}_m^l[\alpha, \beta] f(z) \right)^{-1} \]
\[+ \eta \cos \theta + i \sin \theta \times ((\eta - 1) \cos \theta)^{-1}, \]
(26)
where \(\omega\) is analytic in \(U\) with \(\omega(0) = 0\) and \(|\omega(z)| < 1\). We find from (26) that
\[\frac{(1 - 2\lambda) z \left( \mathcal{H}_m^l[\alpha, \beta] f(z) \right)'}{(1 - \lambda) \mathcal{H}_m^l[\alpha, \beta] f(z) + \lambda z \left( \mathcal{H}_m^l[\alpha, \beta] f(z) \right)'} \]
\[= \frac{-1 + \left( \eta - 1 \right) \left( 1 + e^{-2i\theta} \right) \omega(z)}{1 - \omega(z)}, \]
(27)
which follows
\[
\left(\mathcal{H}_m^I[\alpha, \beta] f(z)\right)' + \frac{1}{z} (1 - 2\lambda) (\eta - 1) (1 + e^{-2i\theta}) \omega(z)
\]
\[
= z \left[ (1 - \lambda) (1 - \omega(z)) - \lambda (\eta - 1) (1 + e^{-2i\theta}) \omega(z) \right]^{-1}.
\]
(28)

Integrating both sides of (28) yields
\[
\log(z \mathcal{H}_m^I[\alpha, \beta] f(z)) = \int_0^z \frac{(1 - 2\lambda) (\eta - 1) (1 + e^{-2i\theta}) \omega(t)}{(1 - \lambda) (1 - \omega(t)) - \lambda (\eta - 1) (1 + e^{-2i\theta}) \omega(t)} dt.
\]
(29)

From (29), we obtain
\[
\mathcal{H}_m^I[\alpha, \beta] f(z) = z^{-1} \exp\left(\int_0^z \frac{(1 - 2\lambda) (\eta - 1) (1 + e^{-2i\theta}) (\eta - 1) \omega(t)}{(1 - \lambda) (1 - \omega(t)) - \lambda (\eta - 1) (1 + e^{-2i\theta}) \omega(t)} t^{-1} dt\right).
\]
(30)

Thus, the assertion (24) of Theorem 3 follows directly from (30).

Next, we derive a convolution property for the class \(\mathcal{M}_m^I(\theta, \lambda, \eta)\).

**Theorem 4.** Let \(\xi \in \mathbb{C}\) and \(|\xi| = 1\). Then \(f \in \mathcal{M}_m^I(\theta, \lambda, \eta)\) if and only if
\[
f * \left( (1 - \xi) \left[ \frac{1}{z} - \sum_{n=1}^{\infty} n\phi_n(\alpha, \beta; l; m) z^n \right] + \left[ \xi \eta + \xi (\eta - 1) e^{-2i\theta} - 1 \right] \right.
\]
\[
\left. \cdot \left[ \frac{1}{z} + \sum_{n=1}^{\infty} \frac{1 - \lambda + n\lambda}{1 - 2\lambda} \phi_n(\alpha, \beta; l; m) z^n \right] \right) \neq 0,
\]
(31)

\(z \in \mathbb{U}^\ast\).

**Proof.** From the definition (18), we know that \(f \in \mathcal{M}_m^I(\theta, \lambda, \eta)\) if and only if
\[
\left( e^{i\theta} (1 - 2\lambda) z \mathcal{H}_m^I[\alpha, \beta] f(z) \right)'
\]
\[
\times \left( (1 - \lambda) \mathcal{H}_m^I[\alpha, \beta] f(z) + \lambda z \mathcal{H}_m^I[\alpha, \beta] f(z) \right)^{-1}
\]
\[
+ \eta \cos \theta + i \sin \theta \times ((\eta - 1) \cos \theta)^{-1} \neq \frac{1 + \xi}{1 - \xi},
\]
(z \in \mathbb{U}^\ast; |\xi| = 1),
(32)

which is equivalent to
\[
- (1 - \xi) z \mathcal{H}_m^I[\alpha, \beta] f(z) + \left[ \xi \eta + \xi (\eta - 1) e^{-2i\theta} - 1 \right]
\]
\[
\times (1 - \lambda) \mathcal{H}_m^I[\alpha, \beta] f(z) + \lambda z \mathcal{H}_m^I[\alpha, \beta] f(z) \neq 0.
\]
(33)

On the other hand, we find from (14) that
\[
- z \mathcal{H}_m^I[\alpha, \beta] f(z)'
\]
\[
= \frac{1}{z} - \sum_{n=1}^{\infty} n\phi_n(\alpha, \beta; l; m) a_n z^n
\]
\[
= f(z) * \left[ \frac{1}{z} - \sum_{n=1}^{\infty} n\phi_n(\alpha, \beta; l; m) z^n \right],
\]
(34)

\[
\frac{(1 - \lambda) \mathcal{H}_m^I[\alpha, \beta] f(z) + \lambda z \mathcal{H}_m^I[\alpha, \beta] f(z)'}{1 - 2\lambda}
\]
\[
= \frac{1}{z} + \sum_{n=1}^{\infty} \frac{1 - \lambda + n\lambda}{1 - 2\lambda} \phi_n(\alpha, \beta; l; m) a_n z^n
\]
\[
= f(z) * \left[ \frac{1}{z} + \sum_{n=1}^{\infty} \frac{1 - \lambda + n\lambda}{1 - 2\lambda} \phi_n(\alpha, \beta; l; m) z^n \right].
\]

Combining (33) and (34), we get assertion (31) of Theorem 4.

Now, we discuss the coefficient estimates for functions in the class \(\mathcal{M}_m^I(\theta, \lambda, \eta)\).

**Theorem 5.** Suppose that \(f \in \mathcal{M}_m^I(\theta, \lambda, \eta)\). Then
\[
|a_1| \leq (1 - 2\lambda) (\eta - 1) \cos \theta
\]
\[
\frac{1}{(1 - \lambda) \phi_1(\alpha, \beta; l; m)},
\]
\[
|a_n| \leq \frac{(1 - 2\lambda) (\eta - 1) \cos \theta}{(1 - \lambda)^n \phi_n(\alpha, \beta; l; m)}
\]
\[
\times \prod_{k=1}^{n-1} (k + 1) (1 - \lambda) + 2 (1 - \lambda + k\lambda) (\eta - 1) \cos \theta,
\]
\((n \in \mathbb{N} \setminus \{1\})
(35)
Proof. Let \( f \in M^l_m(\theta, \lambda, \eta) \). Then there exists \( \tau \in \mathcal{P} \) such that

\[
\begin{align*}
&\quad \frac{e^{\theta}(1-2\lambda) z(\mathcal{H}_m^l [\alpha, \beta] f(z))'}{(1-\lambda) \mathcal{H}_m^l [\alpha, \beta] f(z) + \lambda z(\mathcal{H}_m^l [\alpha, \beta] f(z))'} \\
&= (\eta - 1) \cos \theta \tau (z) - \eta \cos \theta - i \sin \theta, \\
&\quad (z \in \mathbb{U}^*).
\end{align*}
\]

(36)

It follows from (36) that

\[
\begin{align*}
&e^{\theta}(1-2\lambda) z(\mathcal{H}_m^l [\alpha, \beta] f(z))' \\
&= \left[(1-\lambda) \frac{1}{z} + \sum_{n=1}^{\infty} \frac{(1-\lambda+n\lambda) \phi_n(\alpha, \beta; l; m)}{(1-\lambda+n\lambda) \phi_n(\alpha, \beta; l; m)} a_n z^n \right] \\
&\quad \times \left[ \eta - 1 \cos \theta \tau_1 z + (\eta - 1) \cos \theta \tau_2 z^2 + \ldots \right].
\end{align*}
\]

(37)

Combining (1) and (37), we have

\[
\begin{align*}
&\quad e^{\theta}(1-2\lambda) \left[ \frac{1}{z} + \sum_{n=1}^{\infty} \phi_n(\alpha, \beta; l; m) a_n z^n \right] \\
&= \left[ (1-\lambda) \frac{1}{z} + \sum_{n=1}^{\infty} \frac{(1-\lambda+n\lambda) \phi_n(\alpha, \beta; l; m)}{(1-\lambda+n\lambda) \phi_n(\alpha, \beta; l; m)} a_n z^n \right] \\
&\quad \times \left[ -e^{\theta} + (\eta - 1) \cos \theta \tau_1 z + (\eta - 1) \cos \theta \tau_2 z^2 + \ldots \right].
\end{align*}
\]

(38)

Evaluating the coefficient of \( z^n \) in both sides of (38) yields

\[
\begin{align*}
&\quad 2e^{\theta}(1-\lambda) \phi_1(\alpha, \beta; l; m) a_1 = (1-2\lambda)(\eta - 1) \cos \theta \tau_2, \\
&\quad e^{\theta}(n+1)(1-\lambda) \phi_n(\alpha, \beta; l; m) a_n \\
&= (\eta - 1) \cos \theta \left[ (1-2\lambda) \tau_{n+1} \\
&\quad + \sum_{k=1}^{n-1} \phi_k(\alpha, \beta; l; m) (1-\lambda+k\lambda) a_k \tau_{n-k} \right],
\end{align*}
\]

(39)

By observing the fact that \( |\tau_n| \leq 2 \) for \( n \in \mathbb{N} \), we find from (39) that

\[
|a_1| \leq \frac{(1-2\lambda)(\eta - 1) \cos \theta}{(1-\lambda) \phi_1(\alpha, \beta; l; m)},
\]

(40)

\[
|a_n| \leq \frac{2(\eta - 1) \cos \theta}{(n+1)(1-\lambda) \phi_n(\alpha, \beta; l; m)} \\
\times \left[ 1 - 2\lambda + \sum_{k=1}^{n-1} \phi_k(\alpha, \beta; l; m) (1-\lambda+k\lambda) |a_k| \right],
\]

(41)

Now we define the sequence \( \{A_n\}_{n=1}^{\infty} \) as follows:

\[
\begin{align*}
A_1 &= \frac{(1-2\lambda)(\eta - 1) \cos \theta}{(1-\lambda) \phi_1(\alpha, \beta; l; m)}, \\
A_{n+1} &= \frac{2(\eta - 1) \cos \theta}{(n+2)(1-\lambda) \phi_{n+1}(\alpha, \beta; l; m)} \\
&\quad \times \left[ 1 - 2\lambda + \sum_{k=1}^{n} \phi_k(\alpha, \beta; l; m) (1-\lambda+k\lambda) A_k \right].
\end{align*}
\]

(42)

In order to prove that

\[
|a_n| \leq A_n \quad (n \in \mathbb{N}),
\]

(43)

we use the principle of mathematical induction. Note that

\[
|a_1| \leq A_1 = \frac{(1-2\lambda)(\eta - 1) \cos \theta}{(1-\lambda) \phi_1(\alpha, \beta; l; m)}.\]

(44)

Therefore, assume that

\[
|a_k| \leq A_k \quad (k = 1, 2, \ldots, n; \ n \in \mathbb{N}).
\]

(45)

Combining (41) and (42), we get

\[
|a_{n+1}| \leq \frac{2(\eta - 1) \cos \theta}{(n+2)(1-\lambda) \phi_{n+1}(\alpha, \beta; l; m)} \\
\times \left[ 1 - 2\lambda + \sum_{k=1}^{n} \phi_k(\alpha, \beta; l; m) (1-\lambda+k\lambda) A_k \right] \\
\leq \frac{2(\eta - 1) \cos \theta}{(n+2)(1-\lambda) \phi_{n+1}(\alpha, \beta; l; m)} \\
\times \left[ 1 - 2\lambda + \sum_{k=1}^{n} \phi_k(\alpha, \beta; l; m) (1-\lambda+k\lambda) A_k \right] \\
= A_{n+1}.
\]

(46)

Hence, by the principle of mathematical induction, we have

\[
|a_n| \leq A_n \quad (n \in \mathbb{N}),
\]

(47)

as desired. By means of Lemma 2 and (42), we know that (20) holds. Combining (47) and (20), we readily get the coefficient estimates asserted by Theorem 5.

Remark 6. By setting \( \theta = 0, l = 2, m = 1, \alpha_1 = \alpha_2 = \beta_1 = 1, \) and \( \lambda = 0 \) in Theorem 5, we get the corresponding result due to Wang et al. [5].

In what follows, we present some sufficient conditions for functions belonging to the class \( M^l_m(\theta, \lambda, \eta) \).
Theorem 7. Let $\zeta$ be a real number with $0 \leq \zeta < 1$. If $f \in \mathcal{M}$ satisfies the condition
\[
\| (1-2\lambda) z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l - (1-\lambda) \mathcal{H}_m^l [\alpha, \beta] f (z) + \lambda z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l \|_{1} + 1 \leq 1 - \zeta,
\]
then $f \in \mathcal{M}_m^l (\theta, \lambda, \eta)$ provided that $\cos \theta \geq \frac{1 - \zeta}{\eta - 1}$.

Proof. From (48), it follows that
\[
(1-2\lambda) z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l - (1-\lambda) \mathcal{H}_m^l [\alpha, \beta] f (z) + \lambda z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l = -1 + (1-\zeta) \omega (z),
\]
where $\omega$ is analytic in $\mathbb{U}$ with $\omega(0) = 0$ and $|\omega(z)| < 1$. Thus, we have
\[
\Re \left( e^{i\theta} \left( (1-2\lambda) z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l - (1-\lambda) \mathcal{H}_m^l [\alpha, \beta] f (z) + \lambda z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l \right) \right) = \Re \left( e^{i\theta} (-1 + (1-\zeta) \omega (z)) \right) = -\cos \theta + (1-\zeta) \Re \left( e^{i\theta} \omega (z) \right) \geq -\cos \theta - (1-\zeta) |\omega (z)| \geq -\eta \cos \theta,
\]
provided that $\cos \theta \geq (1-\zeta)/(\eta - 1)$. This completes the proof of Theorem 7.

If we take $\zeta = 1 - (\eta - 1) \cos \theta$ in Theorem 7, we obtain the following result.

Corollary 8. If $f \in \mathcal{M}$ satisfies the inequality
\[
\| (1-2\lambda) z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l - (1-\lambda) \mathcal{H}_m^l [\alpha, \beta] f (z) + \lambda z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l \|_{1} + 1 \leq (\eta - 1) \cos \theta,
\]
then $f \in \mathcal{M}_m^l (\theta, \lambda, \eta)$.

Theorem 9. If a function $f \in \mathcal{M}$ given by (1) satisfies the inequality
\[
\sum_{n=1}^{\infty} \left| (1-\lambda) (1+n) \sec \theta + (\eta - 1)(1-\lambda + n\lambda) \right| \phi_n (\alpha, \beta; l, m) |a_n| \leq (1-2\lambda)(\eta - 1),
\]
then it belongs to the class $\mathcal{M}_m^l (\theta, \lambda, \eta)$.

Proof. In virtue of Corollary 8, it suffices to show that condition (52) holds. We observe that
\[
\| (1-2\lambda) z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l - (1-\lambda) \mathcal{H}_m^l [\alpha, \beta] f (z) + \lambda z (\mathcal{H}_m^l [\alpha, \beta] f (z))^l \|_{1} + 1 \\
= (1-\lambda) \left| \sum_{n=1}^{\infty} \phi_n (\alpha, \beta; l, m) a_n \phi_n (\alpha, \beta; l, m) |a_n| \right|
\]
which is equivalent to
\[
\sum_{n=1}^{\infty} \left| (1-\lambda) (1+n) \sec \theta + (\eta - 1)(1-\lambda + n\lambda) \right| \phi_n (\alpha, \beta; l, m) |a_n| \leq (1-2\lambda)(\eta - 1).
\]
This completes the proof of Theorem 9.

Conflict of Interests
The authors declare that there is no conflict of interests regarding the publication of this paper.

Acknowledgments
The present investigation was supported by the National Natural Science Foundation under Grant nos. 11301008 and 11226088, the Foundation for Excellent Youth Teachers of Colleges and Universities of Henan Province under Grant no. 2013GGJS-146, and the Natural Science Foundation of Educational Committee of Henan Province under Grant no. 14B110012 of China.
