ABSTRACT
This study will analyze principal leadership, organizational culture, and teacher competence on teacher performance. This study used a quantitative approach to causality. The data were collected through documentation and questionnaires. This study used a sample of 98 respondents to determine the sample size using the saturated sample formula. A partial least square was applied to examine the relationship of teacher performance, principal leadership, organizational culture, and teacher competence. The results of this study showed that of the three hypotheses formulated, two hypotheses were rejected, including the effect of the principal leadership variable on the teacher performance variable, in which the results did not have a significant effect, and the effect of the teacher competence variable on the teacher performance variable that obtained the same results, in which it did not have a significant effect. Meanwhile, the organizational culture variable had a significant effect on teacher performance. Through the findings of this study, it is expected to provide additional information for various parties, especially the Sultan Agung Education Foundation and the Education Authority of Pematangsiantar City in determining policies related to improving teacher performance.

Keywords: Principal Leadership, Organizational Culture, Teacher Competence, Teacher Performance

1. INTRODUCTION

The urgency of school attendance as a forum for conducting education and performing its functions properly is to produce quality human resources to face the dynamics of environmental change and the times [1], [2], and [3]. The success parameters applied in the teaching and learning process of a teacher include matters relating to the number of achievements obtained by the teacher and optimizing their performance [4] [5].

To produce the best human resources, a teacher needs his role in carrying out his duties effectively. In general, many constituents affect the level of performance, one of which is the principal's leadership [6]. Over the last few decades, many studies have stated and attempted to validate the relationship between principal leadership, teacher performance and the learning process of student [7] & [8]. The role of a leader is very important because the main element for the effectiveness of a school is the principal's leadership style [9]. As explained by [10] the success or progress of a school is strongly influenced by the pattern of leadership. This is reinforced by the opinion [11], which states that school principals must have a good spirit of professionalism to maximize the implementation of school management. Furthermore, the right leadership style of the principal will motivate teachers to improve their work morale [12]. The above opinion is supported by the findings [13] and [14], stating a significant influence between the principal's leadership and teacher performance.

A complex effort is needed to achieve optimal teacher performance through the development of various interrelated factors [15]; [16]; [17]; [18]. One of the representative competitive advantages of an organization can be seen from implementing a good organizational culture [19]. The optimal representation of the quality of education will be seen when there is an increase in the work culture and organizational culture in schools [20]. Research [21] and [22], stated that an increase in one's performance could occur because one
of them is significantly influenced by organizational culture.

In achieving performance optimization, a teacher must be able to develop all of his abilities related to competence and create a learning atmosphere that is more comfortable and conducive for his students [23]. Quality improvement in education will only be realized if teachers are motivated, creative, innovative, dynamic, and active in every job they do [24]; [25], and [26]. Based on government regulations as outlined in Article 10 of Law no. 14 of 2005 concerning teachers and lecturers [27], it is explained that a teacher in carrying out an educational learning process is required to have competence integrated and skilled. The professionalism of a teacher in teaching will be seen from the mastery of the sub competencies of the structure and scientific methods of a particular field, so the implications of this mastery are believed to be able to improve performance [28]. The above statement is supported by the findings [29] and [30], whose research results conclude that improving a teacher's performance can be significantly boosted by the competence he has.

Factors supporting performance improvement as stated above are not all acceptable. Several studies have stated that principal's leadership, organizational culture, and competence have no significant effect on teacher performance. Research result[9] said an increase in a teacher's performance was not driven significantly by the leadership applied by the principal. Research submitted by [31]; [32] stated that a teacher's competence did not significantly influence teacher performance. This can happen because there are fewer teachers who play an active role in helping actualize prospective students.

2. METHOD

The quantitative causality approach used in this study is oriented to the theoretical model assessed by PLS-SEM analysis in a two-stage process. First, the research data analyzed for validity and reliability using Cronbach's alpha testing, composite reliability, outer loading, and average variance extracted. Then, perform a Confirmatory Factor Analysis analysis to check the model's fit and the reliability of the model and discuss the hypothesis through the variance-based Structural Equation Model (SEM) [33]. The instrument used for this study used a questionnaire using a Likert scale, namely (1) which stated "very dissatisfied to" (5) "very satisfied". The measurement of the dependent and independent variables uses previous references relevant to the research topic and research variables. The measurement of the dependent variable, namely the teacher's performance is measured using Law of the Republic of Indonesia number 14 of 2005 about Teachers and Lecturers [27], which consists of 3 indicators. Furthermore, for the first independent variable, namely the principal's leadership, it is measured using Permendiknan number 13 of 2007 concerning Standards for Principals/Madrasah [34], consisting of 5 indicators. The second independent variable, namely organizational culture is measured using previous research [35] which consists of 4 indicators. Then for the third independent variable, namely teacher competence, it is measured using the law of the Republic of Indonesia number 14 of 2005 article 8 [27] which consists of 4 indicators. Therefore, the conceptual framework of this research can be described in Figure 1 below:

![Picture 1. Research Framework Model](image)

3. RESULT

The number of respondents who have filled out the questionnaire is 98 teachers. The general characteristics of respondents in this study will clearly be described in Table 1 below:

| Category               | Details         | amount | Percentage |
|------------------------|-----------------|--------|------------|
| Gender                 | Men             | 23     | 23.47%     |
|                        | Woman           | 75     | 76.53%     |
| Age                    | < 20 years      | 1      | 1.02%      |
|                        | 21-30 years old | 13     | 13.27%     |
|                        | 31-40 years old | 34     | 34.69%     |
|                        | 41-50 years old | 23     | 23.47%     |
|                        | > 50 years      | 27     | 27.55%     |
| Level of education     | high school     | 2      | 2.04%      |
|                        | Bachelor degree | 81     | 82.65%     |
|                        | Level 2         | 15     | 15.31%     |
| Work unit              | kindergarten    | 15     | 15.31%     |
|                        | SD              | 33     | 33.67%     |
|                        | middle school   | 22     | 23.47%     |
|                        | high school     | 28     | 27.55%     |
3.1. Outlier Model Measurement

The data obtained from the research questionnaire were processed using the SmartPLS version 3.2.9 application with management guidelines from [36]. In the measurement of the outer model, the tests carried out are validity tests and reliability tests. The loading factor and AVE determine convergent validity testing with the condition that the loading factor is above 0.7 and the AVE value is 0.5 [33]. Testing the reliability of the model according to [33] seen from the value of cronbach's alpha and composite reliability (CR) which has a value greater than 0.7. In the following, an explanation of the measurement of the model's outlet is presented using table 2 below:

Table 2. Outlier Model Measurement Results

| Construct/item                  | Outlier Loadings | Cronbach alpha | CR     | AVE  |
|---------------------------------|------------------|----------------|--------|------|
| Principal Leadership            |                  |                |        |      |
| KS1                             | 0.928            | 0.946          | 0.777  |      |
| KS2                             | 0.842            |                |        |      |
| KS3                             | 0.868            |                |        |      |
| KS4                             | 0.860            |                |        |      |
| KS5                             | 0.909            |                |        |      |
| Organizational culture          |                  | 0.943          | 0.959  | 0.854|
| BO1                             | 0.919            |                |        |      |
| BO2                             | 0.922            |                |        |      |
| BO3                             | 0.965            |                |        |      |
| BO4                             | 0.889            |                |        |      |
| Teacher Competence              |                  | 0.955          | 0.968  | 0.882|
| KT1                             | 0.964            |                |        |      |
| KT2                             | 0.929            |                |        |      |
| KT3                             | 0.904            |                |        |      |
| KT4                             | 0.958            |                |        |      |
| Teacher Performance             |                  | 0.928          | 0.954  | 0.873|
| KG1                             | 0.934            |                |        |      |
| KG2                             | 0.949            |                |        |      |
| KG3                             | 0.920            |                |        |      |

In testing the validity test presented in table 2 above, it is known that the value of each loading factor on the indicators of the principal's leadership variable, organizational culture, teacher competence and teacher performance is above 0.7 and above 0.5 for the average variance value extracted (AVE). Furthermore, the value for each of the above reliability values obtained for each research variable is above 0.7 which can be explained: principal leadership gets 0.946, organizational culture gets 0.959, teacher competence gets 0.968 and teacher performance gets 0.954. Furthermore, Cronbach's alpha values obtained for each variable above 0.7 indicate that all research variables have good reliability values.

3.2. Inner Model Measurement

The value of R-square is a value that shows the ability of exogenous variables to build endogenous variables. According to [37] there are three categories of R-square values, if the R-square value is 0.19 the relationship between exogenous variables forming endogenous variables is weak, if it is 0.33 it means the relationship is moderate and if the value is 0.67 it means that the relationship is strong. While [38] states that if the R-square value is more than 0.67, the relationship between endogenous and exogenous is very strong. The explanation of the results of the calculation of the R-square value can be seen in table 3 below:

Table 3. Calculation results of the R-Square nilai value

| Information     | R Square | R Square Adjusted |
|-----------------|----------|-------------------|
| Teacher Performance | 0.509    | 0.494             |

Source: data processing results (2020)

The significant criterion is seen from the p-value. With a significance level of 5%, if the p-value between exogenous and endogenous variables is less than 0.05, it means that the exogenous variable has a significant effect on the endogenous variable, on the other hand, if the value is greater than 0.05, it means that the exogenous variable has no significant effect on building endogenous variables. The following presents the results of the hypothesis test which are explained in Figure 2 and Table 4 below:

Figure 2. Inner Model Display
Table 4. Path Coefficients . Test Results

| Path Between Variables | Coefficient | tcount | P-Value | Conclusion |
|------------------------|-------------|--------|---------|------------|
| Principal Leadership >> Teacher Performance | 0.108 | 1.362 | 0.174 | Rejected |
| Organizational Culture >> Teacher Performance | 0.669 | 8.203 | 0.000 | Be accepted |
| Teacher Competence >> Teacher Performance | 0.052 | 0.080 | 0.512 | Rejected |

Source: data processing results (2020)

Meanwhile, the organizational culture variable has a significant effect on teacher performance.

4. DISCUSSION

4.1. The Effect of Principal’s Leadership on Teacher Performance

This can be influenced by the leadership of the principal who has not been optimal in carrying out his responsibilities at school, as a result, weakening the ability of teachers in upgrading [39]. The findings of this research are in line with the research results [40] and [41], whose research results report the leadership of the principal does not directly influence an escalation or decline in teacher performance, but there are more vital things that can encourage an increase in teacher performance, such as encouragement or the activity environment. On the other hand, the results obtained in this study contradict the results of the submitted study [42]; [13]; [43], who reported that there was a significant effect of principal's leadership on teacher ability.

4.2. The Influence of Organizational Culture on Teacher Performance

Representatives of strengthening organizational culture in schools can suppress the increase in a teacher's performance [9]. On the other hand, maintaining a transparent organizational culture can support teachers in carrying out their profession following the values and norms of society[44]. The findings of this research are in agreement with the research results[45]; [46]; [47], whose findings report that there is a significant effect of organizational culture on teacher performance. The practice of a pleasant organizational culture encourages teachers to carry out their duties competently and the impact will be seen from the results of the activities they have undertaken [48]. The results of this study contradict the results of research submitted by [49], who reported that there was no significant effect of organizational culture on teacher performance. Research findings [50], also detects similar results regarding the increase in teacher performance not influenced by organizational culture.

4.3. The Influence of Teacher Competence on Teacher Performance

The description of the third hypothesis test above, informed that there is no significant effect between teacher competence on teacher performance. When someone has good social competence and reliable competence with the help of optimistic thinking, in fact it is not enough to encourage him to improve his professional results [51]. The findings of this research are in line with the research results [52], whose findings report that there is no significant effect between teacher competence on teacher performance. Although a teacher has sufficient competence, but the incentives provided are not following the level of competence he has, then the teacher does not have great enthusiasm for activities as a result can limit his performance [32]. However, some studies carry out similar research and get results that contradict the results of this research. Research attempted by [53]; [54]; [55], reported that teacher competence had a significant impact on teacher performance. A teacher who has good competencies, including academic competence, character competence, social competence, and professional competence, is believed to help the person improve his performance. The manifestation of the continuous increase in teachers' ability will be seen from the competencies they have [56].

5. CONCLUSION

The results of the test of the influence between the principal’s leadership and teacher performance obtained positive but not significant results. The test of the influence of school organizational culture with teacher performance obtained positive and significant results. The results of the test of the influence between the
principal’s leadership and teacher performance obtained positive but not significant results.

AUTHORS’ CONTRIBUTIONS

Kevin indajang as the first writers who carried out the research activity, Sherly and Fitria Halim as the second and third authors who had compiled the article from the beginning to the end, Acai Sudirman as the corresponding writer had edited the manuscript and carried out the review process.

ACKNOWLEDGMENTS

The author would like to thank the Sultan Agung College Foundation which has permitted this research and all school principals and teachers from kindergarten to high school units who have contributed to this research.
