XRD data:

Table S1. X-ray data from the 2D patterns: \(2\theta_{\text{obs}}\) ... experimental scattering angle; \(d_{\text{obs}}\) ... experimental \(d\) value; \(n\) ... order of reflection and \(d\) ... layer spacing: for the SmC\(_c\) phase.
a) Position of the maxima of the diffuse scattering and the layer reflections in the small angle region (because of the shape of the diffuse scattering curves the values are of limited accuracy, especially those for the very weak innermost maxima or shoulders):

* Data from wide angle patterns (sample – detector distance = 9.3 cm)

* The discrepancies between these values and those cited in [10] result from the very limited accuracy of the determination of the maxima for the inner diffuse scattering in the WAXD patterns used in [10].
b) Position of the maxima of the outer diffuse scattering:

Figure S2: Azimuthal distribution of the outer and inner scattering (χ scans) in the 2D XRD patterns for a sample of BN_9-6 at 160 and 125 °C aligned in the magnetic field obtained on cooling from the isotropic liquid. The outer scattering at 125 °C shows maxima at χ = 74, 253, 110, and 291° from which a tilt of the molecules with respect to the layer normal of about 18° can be calculated. The azimuthal distribution of the inner scattering at 160 °C at the upper meridian may be fitted by two Gauss curves showing maxima at χ = 156 and 188° yielding a tilt angle of about 16° of the molecules in the smectic clusters.

Spectroscopic and analytical data for the new dimeric compounds

Spectroscopic data are given for one imine homologue of each series, since the only significant difference in the NMR spectra relates to the number of carbons in the alkoxy chains and alkyene spacer.
