Abstract
In this paper, we consider a second-order scalar auxiliary variable Fourier spectral method to solve the nonlinear fractional generalized wave equation. Unconditional energy conservation or dissipation properties of the fully discrete scheme are first established. Next, we utilize the temporal-spatial error splitting argument to obtain unconditional optimal error estimate of the fully discrete scheme, which overcomes time-step restrictions caused by strongly nonlinear system, or the restrictions that the nonlinear term needs to satisfy the assumption of global Lipschitz condition in all previous works for fractional undamped or damped wave equations. Finally, some numerical experiments are presented to confirm our theoretical analysis.

Keywords Fractional generalized wave equation · Fourier spectral method · Scalar auxiliary variable (SAV) · Unconditional error estimate · Energy dissipation

1 Introduction

In this paper, we consider the following two-dimensional nonlinear space-fractional generalized wave equation (FGWE)

This work was supported in part by NSF of China (12001499, 11771163, 11801527, 12011530058), China Postdoctoral Science Foundation (2019M662506, 2018M632791).

where the parameters $\kappa > 0$, $1 < \alpha \leq 2$, $x = (x_1, x_2)$ and $\gamma_1 \geq 0$, $\gamma_2 \geq 0$ are coefficients of damping terms. $F(u)$ is nonlinear and nonnegative, and $F'(u)$ satisfies local Lipschitz condition. The fractional Laplacian $(-\Delta)\alpha$ is defined by

$$(-\Delta)\alpha u = \sum_{s,l\in\mathbb{Z}} (s^2 + l^2)^{\alpha} \hat{u}_{sl} e^{isx_1 + ilx_2}. \quad (1.3)$$

For $u \in L^2_{per} (\Omega)$, $u = \sum_{s,l\in\mathbb{Z}} \hat{u}_{sl} e^{isx_1 + ilx_2}$, where $i^2 = -1$ and the Fourier coefficients $\hat{u}_{sl}$ are given by

$$\hat{u}_{sl} = (u, e^{isx_1 + ilx_2}) = \frac{1}{|\Omega|} \int_{\Omega} u e^{isx_1 + ilx_2} dx. \quad (1.4)$$

In addition, (1.1)–(1.2) possess the following energy function

$$H(t) = \int_{\Omega} \frac{1}{2} |u_t|^2 + \frac{\kappa}{2} |(-\Delta)\alpha u|^2 + F(u) dx, \quad (1.5)$$

and it holds that

$$\frac{dH(t)}{dt} = -\int_{\Omega} (\gamma_1 |(-\Delta)\alpha u_t|^2 + \gamma_2 |u_t|^2) dx, \quad t \in (0, T]. \quad (1.6)$$

The conventional damped ($\gamma_1 = 0$, $\gamma_2 > 0$) or undamped ($\gamma_1 = \gamma_2 = 0$) wave equations are extensively described in anomalous diffusion, hydrology and so on [1–3]. If $F'(u) = \sin u$, (1.1) deduces to the damped sine-Gordon equation, and when $F'(u) = u^3 - 1$, (1.1) becomes the damped Klein–Gordon equation. The FGWEs as the generalization of conventional wave equations are widely applied in science and engineering to well describe the long-range interaction, such as the interaction of solitons in a collisionless plasma and the presence of the phenomenon of nonlinear supratransmission of energy [4]. A increasing number of mathematical and numerical methods have been developed for the FGWE. Along the mathematical front, Shomberg [5] proved the well-posedness of the FGWE and also derived the energy dissipation–preserving structure. In general, the analytical solution of the FGWE is difficult to obtain and we have to construct numerical methods.

Along the numerical front, numerous efficient numerical methods for the fractional damped ($\gamma_1 = 0$, $\gamma_2 > 0$) or undamped ($\gamma_1 = \gamma_2 = 0$) wave equation were proposed in recent years. Liu et al. [6] studied a class of unconditionally stable difference schemes based on the Padé approximation for the Riesz space-fractional telegraph equation. Ran and Zhang [7] derived a compact difference scheme with accuracy of fourth-order in space and second-order in time for fractional damped wave equation. Plenty of numerical works in [8–16] have shown that energy dissipative (or conservative) numerical methods have obvious superiority over common numerical methods in long time simulation and thus developing energy dissipation–preserving methods for the fractional wave equation has attracted more and more researchers’ attention. For the fractional undamped wave equation, Xin et al. [17] proposed a conservative difference scheme for Riesz space-fractional sine-Gordon equation. Fu et al. [18] derived an explicit structure-preserving algorithm by considering Hamiltonian system for fractional wave equation. For the fractional damped wave equation, Macías-Díaz et al. [19–22] proposed a series of efficient structure-preserving finite difference methods to study the fractional sine-Gordon equation with Riesz fractional derivative. Xie et al. [23] proposed a dissipation–preserving fourth-order difference method for fractional damped wave
equation. However, we noticed that all existing numerical methods were devoted to investigate the nonlinear fractional wave equation ($\gamma_1 = 0, \gamma_2 \geq 0$) and there is a little attention for the fractional generalized wave equation ($\gamma_1 > 0, \gamma_2 > 0$). Recently, Xie et al. [24] developed a dissipation–preserving fourth-order difference method for the nonlinear fractional generalized wave equations with Riesz fractional derivative in two dimensions, and this is the first work to prove unconditional stability and convergence of the fully discrete scheme. But unfortunately, the above scheme is fully implicit, which needs to solve the nonlinear system by a iterative algorithm at each time step, and increases the computational cost. At the same time, the unconditional convergence analysis is under the assumption that $F'(u)$ must satisfy global Lipschitz condition, which means that $|F'(x) - F'(y)| \leq L|x - y|, \ x, \ y \in R$, where $L$ is a positive constant independent of $x$ and $y$. However, this assumption limits the range of applicability. In fact, nonlinear terms in a very large of nonlinear wave equations are local Lipschitz continuous, i.e., for any $x, y \in \Omega, |F'(x) - F'(y)| \leq L_{\Omega}|x - y|$, where $L_{\Omega} > 0$ is a Lipschitz constant dependent on $\Omega$. For example, if $F'(u) = u^2$, the nonlinear term satisfies the local Lipschitz condition. These two reasons motivate us to construct a linearly implicit scheme to reduce computational cost and use some other analytical techniques to remove the restriction of the global Lipschitz condition.

There are many energy dissipative schemes in [25–28] for classical nonlinear wave equations. In particular, Jiang et al. [29] extended invariant energy quadratization (IEQ) approach (proposed in [26]), and established a linearly implicit energy-preserving scheme for sine-Gordon equation. Very recently, to overcome introducing an auxiliary function by the IEQ approach, Shen and Xu [30,31] proposed a new efficient linearly implicit scheme which is called the scalar auxiliary variable (SAV) approach to describe energy dissipative physical systems without the Lipschitz assumption. Moreover, the SAV approach results in a linear system at each time step and it is easy to implement the scheme. Next, Li and Shen [32] gave rigorous error estimate for the stabilized SAV Fourier spectral for the phase field crystal equation. The SAV approach is being studied extensively for other partial differential equations, see Refs. [33,34] and references therein. Following the superiority of SAV approach, we develop the fully discrete SAV scheme for the FGWE (1.1)–(1.2). In addition, the convergence analysis plays an important role in numerical methods. Most previous works need the requirement of global Lipschitz condition and thus it is necessary to study the convergence analysis under weaker condition. Similar to the technique in [35], Wang et al. [36] recently provided a rigorous convergence analysis for fractional damped wave equation under the condition $\tau^2 N \leq c$ caused by the inverse inequality as usual, where nonlinear term is under the weaker assumption. The similar time-spatial stepsize restriction often appeared in general nonlinear parabolic equations, and in order to get the unconditional error estimate without the time stepsize restrictions, the temporal-spatial error splitting argument was presented to get unconditional optimal error estimate for parabolic equations [37–39]. Inspired by the technique, Zeng et al. [40] proposed Fourier spectral method for nonlinear fractional reaction-diffusion equation and used the temporal-spatial error splitting argument to overcome the time stepsize restriction in [35]. However, using the temporal-spatial error splitting argument to obtain the unconditional error estimate for the FGWE, has not been studied. In this work, we extend SAV Fourier spectral method for the FGWE, which the resulting system can be used FFT solver. Furthermore, the temporal-spatial error splitting argument is adopted to study the unconditional convergence analysis of the fully discrete scheme.

The main contribution of this paper is to develop the SAV Fourier-spectral method for the FGWE in two dimensions, which can maintain energy dissipation and reach high error accuracy. The unconditional energy dissipation is proved in detail. We use temporal-spatial error splitting argument to obtain the unconditional optimal error estimate without the global
Lipschitz assumption. We obtain that our scheme is convergent with second order accuracy in time and spectral accuracy in space. Numerical experiments are provided to confirm the theoretical results and validate the efficiency of our algorithms.

The rest of paper is organized as follows. In Sect. 2, we recall some technical lemmas and notations. In Sect. 3, we present the SAV spectral method for FGWE and main results. Unconditional energy dissipation and optimal error estimate results of the fully discrete scheme are shown. We get time-discrete system based on SAV approach and give error estimate as well as unconditional energy dissipation for time-discrete system in Sect. 4. The boundedness of numerical solutions in $L^\infty$ norm are proved unconditionally in Sect. 5. In Sect. 6, the optimal convergence analysis of the SAV spectral scheme based on the temporal error estimate and the spatial error estimate is completed. The numerical experiments are performed to confirm the correctness of theoretical analysis in Sect. 7. Some conclusions are drawn in Sect. 8.

2 Preliminaries

In this section, we first recall some essential notations and lemmas. Denote $\Omega$ be a finite domain with $\Omega = I_x \times I_y = (a, b) \times (c, d)$. Let $C^\infty_{\text{per}}(\Omega)$ be the set of all restrictions onto $\Omega$ of all complex-values, $2\pi$-periodic, $C^\infty$ function on $\mathbb{R}^2$. For a nonnegative real number $r$, let $H^r_{\text{per}}(\Omega)$ be the closure of $C^\infty_{\text{per}}(\Omega)$ with the semi-norm $|\cdot|_r$ and norm $\|\cdot\|_r$ defined by

$$
|u|^2_r = \sum_{s,l \in \mathbb{Z}} \hat{u}_{s,l}(s^2 + l^2)^r, \quad \|u\|^2_r = \sum_{s,l \in \mathbb{Z}} \hat{u}_{s,l}(1 + s^2 + l^2)^r.
$$

(2.1)

Lemma 2.1 [41]. Let $\xi, r \geq 0$, then for any $u, v \in H^\xi_{\text{per}}(\Omega)$, it hold that

$$
((-\Delta)^\xi + r u, v) = ( (-\Delta)^\xi u, (-\Delta)^r v).
$$

Lemma 2.2 [40,41]. If $\xi < r$ and $u, v \in H^{2\xi}_{\text{per}}(\Omega)$ for all $\xi > 0$, then

$$
\|(-\Delta)^\xi (u v)\|^2 \leq C_\xi \|v\|^2_{\infty} \|(-\Delta)^\xi u\|^2 + \|(-\Delta)^\xi v\|^2 \|u\|^2_{\infty}.
$$

where $C_\xi = \max \{1, 2^{2\xi - 1}\}$.

Lemma 2.3 [40,42]. Let $\Omega$ be a domain in $\mathbb{R}^n$ satisfying the cone condition. If $mp > n$, let $p \leq q \leq \infty$; if $mp < n$, let $p \leq q \leq q^* = np/(n - mp)$. Then there exists a positive constant $C_1$ depending on $m, n, p, q$, and the dimensions of $\Omega$ such that for all $u \in W^{m,p}(\Omega)$,

$$
\|u\|_q \leq C_1 \|u\|_{m,p} \|u\|_{p}^{1 - \varepsilon},
$$

where $\varepsilon = (n/mp) - (n/mq)$.

Lemma 2.4 [41,43]. For any $u \in X_N$, there existing a positive constant $C_2$ independent of $N$ and the following inverse inequality holds,

$$
\|u\|_{\infty} \leq C_2 N \|u\|.
$$

Lemma 2.5 [41]. Suppose that $u \in H^r_{\text{per}}(\Omega)$. Then the following estimate holds for all $0 \leq \xi \leq r$,

$$
\|u - P_N u\|_{\xi} \leq C_3 N^{\xi - r} \|u\|_r,
$$

where $C_3$ is a positive constant not depending on $N$.
3 The SAV Fourier Spectral Method for Two-Dimensional FGWE and Main Results

In this section, a linealy implicit fully discrete scheme is constructed, which is based on the SAV approach in time and Fourier spectral method in space. Moreover, we give theoretical analysis of the linear system, including the unconditional energy dissipation and the corresponding error estimate.

3.1 The Stabilized SAV Approach

The Eqs. (1.1)–(1.2), by introducing a scalar variable \( r(t) = \sqrt{E(u)} \), can be transformed into the following system

\[
\begin{align*}
 u_t &= v, \quad (3.1) \\
 v_t + \kappa (-\Delta)^{\frac{\alpha}{2}} u + \gamma_1 (-\Delta)^{\frac{\alpha}{2}} v + \gamma_2 v + r(t) \frac{F'(u)}{\sqrt{E(u)}} &= 0, \quad (3.2) \\
 r_t &= \frac{1}{2\sqrt{E(u)}} \int_{\Omega} F'(u) u_t dx. \quad (3.3) \\
 u(x, 0) &= \phi(x, y), \quad v(x, 0) = \varphi(x), \quad x \in \Omega, \quad (3.4)
\end{align*}
\]

where \( E(u) = \int_{\Omega} F(u) dx + C_0 \), and \( C_0 \) is chosen such that \( E(u) > 0 \). In addition, we assume \( F \in C^3(\mathbb{R}) \).

**Theorem 3.1** (Energy dissipation) Under the periodic boundary conditions, (3.1)–(3.4) possess the following energy function

\[
 H(t) = \int_{\Omega} \frac{1}{2} |u_t|^2 + \frac{\kappa}{2} |(-\Delta)^{\frac{\alpha}{2}} u|^2 dx + r^2, \quad (3.5)
\]

and it holds that

\[
 \frac{dH(t)}{dt} = -\int_{\Omega} (\gamma_1 |(-\Delta)^{\frac{\alpha}{2}} u_t|^2 + \gamma_2 |u_t|^2) dx \leq 0, \quad (3.6)
\]

and thus

\[
 H(t_2) \leq H(t_1), \quad t_1 > t_2. \quad (3.7)
\]

**Proof** Taking the inner product of (3.2) with \( v \) and using (3.1), we can directly obtain

\[
 (v_t, v) + \kappa ((-\Delta)^{\frac{\alpha}{2}} u, u_t) + \gamma_1 ((-\Delta)^{\frac{\alpha}{2}} v, v) + \gamma_2 (v, v) + r(t) \frac{F'(u), u_t}{\sqrt{E(u)}} = 0.
\]

Combining with (3.1) and Leibiniz rule, we have

\[
 \int_{\Omega} \frac{1}{2} |u_t|^2 + \frac{\kappa}{2} |(-\Delta)^{\frac{\alpha}{2}} u|^2 dx + r(t)^2 + \int_{\Omega} (\gamma_1 |(-\Delta)^{\frac{\alpha}{2}} u_t|^2 + \gamma_2 |u_t|^2) dx = 0,
\]

and one can get (3.5) and (3.6)–(3.7).

**Remark 3.1** When \( \gamma_1 = \gamma_2 = 0 \), the system (1.1)–(1.2) deduces to the fractional wave equation. From (3.6), we have

\[
 \frac{dH(t)}{dt} = 0,
\]

which implies that the energy is conservative.
For a positive integer $N$, the function space is denoted by
\[ X_N = \text{span}\{e^{i\pi s + i\pi l} : -N/2 \leq s, l \leq N/2 - 1\}. \]
Define the orthogonal projection operator $P_N$ as follows
\[ (u - P_N u, v) = 0, \forall v \in X_N, u \in L^2_{\text{per}}(\Omega). \]
For the temporal discretization, we divide the interval $[0, T]$ by a time step size $\tau = T/K$.
Let $t_n = n\tau$, $u^n = u(x, t_n)$, $0 \leq n \leq K$, and denote
\[ \delta_t u^{n+\frac{1}{2}} = \frac{u^{n+1} - u^n}{\tau}, \quad \tilde{u}^{n+\frac{1}{2}} = \frac{3u^n - u^{n-1}}{2}, \quad \tilde{u}^{n+\frac{1}{2}} = \frac{u^{n+1} + u^n}{2}. \]
### 3.2 The Full Discrete SAV Fourier Spectral Method

The full discrete Fourier spectral method for (1.1)–(1.2) is given by: Find $(u_N^n, v_N^n) \in X_N \times X_N$, such that for all $(\psi, \varphi) \in X_N \times X_N$,
\[
\begin{align*}
\delta_t u_N^{n+\frac{1}{2}} &\quad \psi = \left(\tilde{v}_N^{n+\frac{1}{2}}, \psi\right), \\
\delta_t v_N^{n+\frac{1}{2}} \quad \varphi &\quad + \kappa \left(-\Delta \right)^{\frac{1}{2}} u_N^{n+\frac{1}{2}}, \varphi + \gamma_1 \left(-\Delta \right)^{\frac{1}{2}} v_N^{n+\frac{1}{2}}, \varphi + \gamma_2 \left(E\left(u_N^{n+\frac{1}{2}}\right), \delta_t u_N^{n+\frac{1}{2}}\right) = 0, \\
\delta_t R_N^{n+\frac{1}{2}} &\quad = \frac{1}{2 \sqrt{E\left(u_N^{n+\frac{1}{2}}\right)}} \left(F\left(u_N^{n+\frac{1}{2}}\right), \delta_t u_N^{n+\frac{1}{2}}\right).
\end{align*}
\]
(3.9)
(3.10)
(3.11)
(3.12)
Since the fully discrete system (3.9)–(3.11) is not self-starting, the following scheme is used in the first step:
\[
\begin{align*}
\delta_t u_N^{\frac{1}{2}} - u_N^{0} &\quad \psi = \left(\tilde{v}_N^{\frac{1}{2}}, \psi\right), \\
\delta_t v_N^{\frac{1}{2}} - v_N^{0} \quad \varphi &\quad + \kappa \left(-\Delta \right)^{\frac{1}{2}} u_N^{\frac{1}{2}}, \varphi + \gamma_1 \left(-\Delta \right)^{\frac{1}{2}} v_N^{\frac{1}{2}}, \varphi + \gamma_2 \left(E\left(u_N^{0}\right), \delta_t u_N^{\frac{1}{2}}\right) = 0, \\
\frac{\tilde{R}_N^{\frac{1}{2}} - R_N^{0}}{\tau/2} &\quad = \frac{1}{2 \sqrt{E\left(u_N^{0}\right)}} \left(F\left(u_N^{0}\right), \frac{\tilde{u}_N^{\frac{1}{2}} - u_N^{0}}{\tau/2}\right).
\end{align*}
\]
(3.13)
(3.14)
(3.15)
\textbf{Theorem 3.2} (Unconditional full discrete energy dissipation) Under the periodic boundary conditions, (3.9)–(3.11) is dissipative in the sense that
\[ H^n \leq H^{n-1}, \quad 1 \leq n \leq K + 1, \] (3.16)

where
\[ H^n = \frac{1}{2} \| v_N^n \|^2 + \frac{\kappa}{2} \| (-\Delta)^{\frac{\alpha}{2}} u_N^n \|^2 + (R^n)^2. \] (3.17)

\textbf{Proof} Similar to the proof for Theorem 3.1, letting \( \varphi = \tilde{v}_{N}^{n+\frac{1}{2}} \) in (3.10), we have
\[ \left( \delta_t v_N^{n+\frac{1}{2}}, \tilde{v}_{N}^{n+\frac{1}{2}} \right) + \kappa \left( (-\Delta)^{\frac{\alpha}{2}} \tilde{u}_{N}^{n+\frac{1}{2}}, \tilde{v}_{N}^{n+\frac{1}{2}} \right) + \gamma_1 \left( (-\Delta)^{\frac{\alpha}{2}} \tilde{v}_{N}^{n+\frac{1}{2}} \right)^2 \]
\[ + \gamma_2 \| \tilde{v}_{N}^{n+\frac{1}{2}} \|^2 + \tilde{R}^{n+\frac{1}{2}} \sqrt{E \left( \tilde{u}_{N}^{n+\frac{1}{2}} \right)} = 0. \]

Taking \( \psi = (-\Delta)^{\frac{\alpha}{2}} \tilde{u}_{N}^{n+\frac{1}{2}} \) in (3.9), it yields
\[ \left( \delta_t u_N^{n+\frac{1}{2}}, (-\Delta)^{\frac{\alpha}{2}} \tilde{u}_{N}^{n+\frac{1}{2}} \right) = \left( \tilde{v}_{N}^{n+\frac{1}{2}}, (-\Delta)^{\frac{\alpha}{2}} \tilde{v}_{N}^{n+\frac{1}{2}} \right). \]

Using
\[ \left( \delta_t v_N^{n+\frac{1}{2}}, v_N^{n+\frac{1}{2}} \right) = \frac{1}{2\tau} \left( \| v_N^{n+1} \|^2 - \| v_N^n \|^2 \right), \quad \left( \delta_t u_N^{n+\frac{1}{2}}, (-\Delta)^{\frac{\alpha}{2}} u_N^{n+\frac{1}{2}} \right) \]
\[ = \frac{1}{2\tau} \left( |u_N^{n+1}|^2 - |u_N^n|^2 \right), \] (3.18)

and (3.11), it directly achieves
\[ \left( \frac{1}{2} \| v_N^{n+1} \|^2 + \frac{\kappa}{2} \| (-\Delta)^{\frac{\alpha}{2}} u_N^{n+1} \|^2 + (R^{n+1})^2 \right) - \left( \frac{1}{2} \| v_N^n \|^2 + \frac{\kappa}{2} \| (-\Delta)^{\frac{\alpha}{2}} u_N^n \|^2 + (R^n)^2 \right) \]
\[ + \tau \gamma_1 \| (-\Delta)^{\frac{\alpha}{2}} \tilde{v}_{N}^{n+\frac{1}{2}} \|^2 + \tau \gamma_2 \| \tilde{v}_{N}^{n+\frac{1}{2}} \|^2 = 0. \]

\( \square \)

Throughout the paper, denote C a generic positive constant independent of K and N that may has different values in different cases. We assume that
\[ \| u_0 \|_{H^m} + \| u \|_{H^m} + |r|_{L^{\infty}(0, T)} + |r_t|_{L^{\infty}(0, T)} + |r_{tt}|_{L^{\infty}(0, T)} + |r_{ttt}|_{L^{\infty}(0, T)} \]
\[ + \| u_t \|_{H^m} + \| u \|_{\alpha} + \| u_t \|_{\alpha} + \| u_{tt} \|_{\alpha} + \| u_{ttt} \|_{\alpha/2} \leq L, \] (3.19)

where \( L \) is a positive constant independent of \( N \) and \( \tau \).

With the assumption, we present unconditional optimal error estimates for the FGWE in the following theorem. For simplicity, we assume \( u^n := u(x, t_n) \).

\textbf{Theorem 3.3} Let \( u \) and \( u_N^{K, \nu} \) be the solutions of (1.1)–(1.2) and (3.9)–(3.15), respectively. Assume \( u \) satisfies (3.19). Then it holds that
\[ \| u^n - u_N^n \|^2 + \| v^n - v_N^n \|^2 + |r^n - R^n|^2 \leq C(\tau^4 + N^{-2m}), \quad \kappa |u^n - u_N^n|^2 \leq C(\tau^4 + N^{\alpha-2m}), \]
\[ \text{(3.20)} \]

where \( C \) are positive constants independent of \( N \) and \( \tau \).
Taking technique similar as [40], we prove the Theorem 3.3 in the next two sections. We splitting error into two parts, i.e., temporal error and spatial error.

4 Error Analysis for the Time-Discrete System

In this section, we present and analyze the time-discrete system for the nonlinear FGWE. We get the following time-discrete scheme based on SAV approach, which define $U^n$, $V^n$ and $R^n$ such that

$$
\delta_t U^{n+\frac{1}{2}} = \tilde{V}^{n+\frac{1}{2}},
$$

$$
\delta_t V^{n+\frac{1}{2}} + \kappa (-\Delta)^\frac{a}{2} \tilde{U}^{n+\frac{1}{2}} + \gamma_1 (-\Delta)^\frac{a}{2} \tilde{V}^{n+\frac{1}{2}} + \gamma_2 \tilde{V}^{n+\frac{1}{2}} + \tilde{R}^{n+\frac{1}{2}} \frac{F'(\tilde{U}^{n+\frac{1}{2}})}{\sqrt{E(\tilde{U}^{n+\frac{1}{2}})}} = 0,
$$

$$
\delta_t R^{n+\frac{1}{2}} = \frac{1}{2\sqrt{E(\tilde{U}^{n+\frac{1}{2}})}} (F'(\tilde{U}^{n+\frac{1}{2}}), \delta_t U^{n+\frac{1}{2}}).
$$

$$
U^0(x) = u^0(x), V^0(x) = v^0(x), R^0 = r^0, x \in \Omega.
$$

While the first step is obtained by

$$
\tilde{U}^{\frac{1}{2}} - U^0 \tau = \tilde{V}^{\frac{1}{2}},
$$

$$
\tilde{V}^{\frac{1}{2}} - V^0 \tau = \kappa (-\Delta)^\frac{a}{2} \tilde{U}^{\frac{1}{2}} + \gamma_1 (-\Delta)^\frac{a}{2} \tilde{V}^{\frac{1}{2}} + \gamma_2 \tilde{V}^{\frac{1}{2}} + \tilde{R}^{\frac{1}{2}} \frac{F'(U^0)}{\sqrt{E(U^0)}} = 0,
$$

$$
\tilde{R}^{\frac{1}{2}} - R^0 \tau = \frac{1}{2\sqrt{E(U^0)}} (F'(U^0), \tilde{U}^{\frac{1}{2}} - U^0 \tau/2).
$$

By using the (3.8) and denote $\tilde{b}^n := \frac{F'(\tilde{U}^{n+\frac{1}{2}})}{\sqrt{E(\tilde{U}^{n+\frac{1}{2}})}}$, we can get a linear equation from the SAV scheme (4.1)–(4.3),

$$
AU^{n+1} + \frac{\tau^2}{4} (\tilde{b}^n, U^{n+1}) \tilde{b}^n = g^n,
$$

where $A = (2 + \tau \gamma_2)I + (\frac{\tau^2}{2} \kappa + \tau \gamma_1) (-\Delta)^{a/2}$, $g^n = (A - \tau^2 \kappa (-\Delta)^{a/2}) U^n + 2 \tau V^n + \frac{\tau^2}{4} (\tilde{b}^n, U^n) \tilde{b}^n - \tau^2 R^n \tilde{b}^n$. We can solve above linear equation by first computing $A^{-1} \tilde{b}^n$ and $A^{-1} g^n$. Thus, it leads to

$$
U^{n+1} + \frac{\tau^2}{4} (\tilde{b}^n, U^{n+1}) A^{-1} \tilde{b}^n = A^{-1} g^n.
$$

Taking the inner product with $\tilde{b}^n$ on the both sides of the above resulting equation to solve $(\tilde{b}^n, U^{n+1})$, then, we can get $U^{n+1}$. Similar to the same solving procedure, we can get $\tilde{U}^{\frac{1}{2}}$ from the Eqs. (4.5)–(4.7) (see [31] for more details). In summary, we solve the schemes (4.1)–(4.3) by the following main procedure at each time step and the solving procedure of schemes (4.5)–(4.7) is similar.
1. Assume $U^n, R^n, U^{n-1}$, and $V^n$ are known;
2. Compute $A^{-1}\tilde{b}^n$ and $A^{-1}\tilde{g}^n$;
3. Compute $(\tilde{b}^n, U^{n+1})$ by solving the resulting equation, which is derived from taking the inner product with $\tilde{b}^n$ on the both sides of (4.9);
4. Solve (4.8) to obtain $U^{n+1}$;
5. Compute $V^{n+1}$ by solving (4.1);
6. Solve (4.3) to get $R^{n+1}$.

**Theorem 4.1** (Unconditional energy dissipation) Under the periodic boundary conditions, (4.1)–(4.3) is dissipative in the sense that

$$H^{n+1} \leq H^n, \quad 0 \leq n \leq K,$$

(4.10)

where

$$H^n = \int_{\Omega} \frac{1}{2} |V^n|^2 + \frac{\kappa}{2} |(-\Delta)^{\frac{q}{2}} U^n|^2 dx + (R^n)^2.$$

(4.11)

**Proof** Taking the inner product of (4.2) with $\tilde{V}^{n+\frac{1}{2}}$, combining with (4.1), we get

$$\left(\delta_t V^{n+\frac{1}{2}}, \tilde{V}^{n+\frac{1}{2}}\right) + \kappa \left(-\Delta\right)^{\frac{q}{2}} \left(-\Delta\right)^{\frac{q}{2}} \tilde{V}^{n+\frac{1}{2}} + \gamma_1 \left(-\Delta\right)^{\frac{q}{2}} \bar{V}^{n+\frac{1}{2}} \bar{U}^{n+\frac{1}{2}} + \gamma_2 \left(-\Delta\right)^{\frac{q}{2}} \bar{V}^{n+\frac{1}{2}} \bar{V}^{n+\frac{1}{2}} + \kappa \left(-\Delta\right)^{\frac{q}{2}} \tilde{V}^{n+\frac{1}{2}} \tilde{V}^{n+\frac{1}{2}} = 0.$$

By using (4.3) and

$$\left(\delta_t V^{n+\frac{1}{2}}, \tilde{V}^{n+\frac{1}{2}}\right) = \frac{1}{2\tau} \left(\|V^{n+1}\|^2 - \|V^n\|^2, \left(-\Delta\right)^{\frac{q}{2}} \tilde{U}^{n+\frac{1}{2}} + \delta_t U^{n+\frac{1}{2}}\right)$$

$$= \frac{1}{2\tau} \left(\left(-\Delta\right)^{\frac{q}{2}} U^{n+\frac{1}{2}} \|U^{n+\frac{1}{2}}\|^2 - \left(-\Delta\right)^{\frac{q}{2}} U^n \|U^n\|^2\right),$$

we easily obtain (4.10).

**4.1 Error Estimate for Time Discrete Scheme**

Denote $e_u^n = u^n - U^n$, $e_v^n = v^n - V^n$ and $e_r^n = r^n - R^n$.

**Theorem 4.2** Suppose that (1.1)–(1.2) has the unique solution $(u, v, r) \in H^\alpha_{\text{per}}(\Omega) \times H^\alpha_{\text{per}}(\Omega) \times C^3(0, T)$. The assumption (3.19) and $U^0 \in H^\alpha$ hold. Then for $0 \leq n \leq K$, there exists a positive constant $\tau^*_1$, such that (4.1)–(4.7) admits unique solution $(U^n, V^n) \in H^\alpha_{\text{per}}(\Omega) \times H^\alpha_{\text{per}}(\Omega)$ and for $\tau < \tau^*_1$, 

$$\|e_u^n\|^2 + \kappa \|e_u^n\|^2 + \kappa \|e_v^n\|^2 + \|e_r^n\|^2 + (e_r^n)^2 \leq C \tau^3, \quad n = 0, \ldots, K,$$

(4.12)

$$\|U^n\|_{\infty} \leq M, \quad n = 0, \ldots, K,$$

(4.13)

where $M > 0$ is a bounded constant independent of $K$. 

 Springer
**Proof** The (4.1)–(4.7) can be rewritten as the following elliptic systems

\[
\begin{align*}
\frac{2\delta_t U^{n+\frac{1}{2}} - 2V^n}{\tau} + \kappa(-\Delta)^\frac{\alpha}{2} U^{n+\frac{1}{2}} + \gamma_1(-\Delta)^\frac{\alpha}{2} \delta_t U^{n+\frac{1}{2}} + \gamma_2 \delta_t U^{n+\frac{1}{2}} + \bar{R}^{n+\frac{1}{2}} \frac{F'(\bar{U}^{n+\frac{1}{2}})}{E(\bar{U}^{n+\frac{1}{2}})} &= 0, \\
\frac{\delta_t R^{n+\frac{1}{2}}}{\tau} &= \frac{1}{2\sqrt{E(U^{n+\frac{1}{2}})}} \left( F'(\bar{U}^{n+\frac{1}{2}}), \delta_t U^{n+\frac{1}{2}} \right), \forall \ n = 1, 2, \cdots, K, \\
\frac{\bar{U}^{\frac{1}{2} - U^0 - \tau \frac{\alpha}{2} V^0}{\tau^2}}{\tau} + \kappa(-\Delta)^\frac{\alpha}{2} \bar{U}^{\frac{1}{2} - U^0 - \tau \frac{\alpha}{2}} + \gamma_1(-\Delta)^\frac{\alpha}{2} \bar{U}^{\frac{1}{2} - U^0 - \tau \frac{\alpha}{2}} + \gamma_2 \frac{\bar{R}^{n+\frac{1}{2}}}{E(U^0)} &= 0, \\
\frac{\bar{R}^{\frac{1}{2} - R^0}{\tau^2}}{\tau} &= \frac{1}{2\sqrt{E(U^0)}} \left( F'(U^0), \bar{U}^{\frac{1}{2} - U^0} \right).
\end{align*}
\]

The existence and uniqueness of the solution to the linear elliptic equations are straightforward. The (3.1)–(3.3) for time discretization at \( t_{n+\frac{1}{2}} \) follow that

\[
\begin{align*}
\frac{\delta_t u^{n+\frac{1}{2}}}{\tau} &= \bar{u}^{n+\frac{1}{2}} + Q_1^{n+\frac{1}{2}}, \quad (4.14) \\
\frac{\delta_t v^{n+\frac{1}{2}}}{\tau} &= \bar{v}^{n+\frac{1}{2}} + Q_2^{n+\frac{1}{2}}, \quad (4.15) \\
\frac{\delta_t r^{n+\frac{1}{2}}}{\tau} &= \frac{1}{2\sqrt{E(u^{n+\frac{1}{2}})}} \left( F'(u^{n+\frac{1}{2}}), \delta_t u^{n+\frac{1}{2}} \right) + Q_3^{n+\frac{1}{2}}, \quad (4.16)
\end{align*}
\]

where

\[
Q_1^{n+\frac{1}{2}} = \left( \delta_t u^{n+\frac{1}{2}} - u^{n+\frac{1}{2}} \right) - \left( \bar{u}^{n+\frac{1}{2}} - v^{n+\frac{1}{2}} \right), \\
Q_2^{n+\frac{1}{2}} = \left( \delta_t v^{n+\frac{1}{2}} - v^{n+\frac{1}{2}} \right) + \kappa \left( (-\Delta)^\frac{\alpha}{2} \bar{u}^{n+\frac{1}{2}} - (-\Delta)^\frac{\alpha}{2} u^{n+\frac{1}{2}} \right) + \gamma_1 \left( (-\Delta)^\frac{\alpha}{2} \bar{v}^{n+\frac{1}{2}} - (-\Delta)^\frac{\alpha}{2} v^{n+\frac{1}{2}} \right) \\
+ \gamma_2 \left( \gamma_2 (\bar{v}^{n+\frac{1}{2}} - v^{n+\frac{1}{2}}) + \frac{F'(\bar{u}^{n+\frac{1}{2}})}{\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} - \frac{F'(u^{n+\frac{1}{2}})}{\sqrt{E(u^{n+\frac{1}{2}})}} \right), \\
Q_3^{n+\frac{1}{2}} = \left( \delta_t r^{n+\frac{1}{2}} - r^{n+\frac{1}{2}} \right)
- \left( \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} \left( F'(\bar{u}^{n+\frac{1}{2}}), \delta_t u^{n+\frac{1}{2}} \right) \right)
- \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} \int_{\Omega} F'(u^{n+\frac{1}{2}}) u_{n+\frac{1}{2}} d\mathbf{x}.
\]

By (3.1)–(3.3) for time discretization at \( t_{\frac{1}{2}} \), it follows that

\[
\begin{align*}
\frac{\bar{u}^{\frac{1}{2}} - u^0}{\tau^2} &= \bar{a}^{\frac{1}{2}} + \bar{Q}_1^{\frac{1}{2}}, \\
\frac{\bar{v}^{\frac{1}{2}} - v^0}{\tau^2} &= \bar{a}^{\frac{1}{2}} + \kappa(-\Delta)^\frac{\alpha}{2} \bar{u}^{\frac{1}{2}} + \gamma_1(-\Delta)^\frac{\alpha}{2} \bar{v}^{\frac{1}{2}} + \gamma_2 \bar{v}^{\frac{1}{2}} + \bar{r}^{\frac{1}{2}} \frac{F'(u^0)}{\sqrt{E(u^0)}} &= \bar{Q}_2^{\frac{1}{2}}.
\end{align*}
\]
\[
\frac{\tilde{r}^{1/2} - r^0}{\tau/2} = \frac{1}{2\sqrt{E(u^0)}} \left( F'(u^0), \frac{\tilde{u}^{1/2} - u^0}{\tau/2} \right) + \tilde{Q}_3^{1/2},
\]

(4.19)

where

\[
\tilde{Q}_1^{1/2} = \left( \frac{\tilde{u}^{1/2} - u^0}{\tau/2} - u^0_i \right) - (v^{1/2} - v^0_i),
\]

\[
\tilde{Q}_2^{1/2} = \left( \frac{\tilde{v}^{1/2} - v^0}{\tau/2} - v^0_i \right) + \kappa \left( -(\Delta)^{\frac{q}{2}} \tilde{u}^{1/2} - (\Delta)^{\frac{q}{2}} u^0 \right) + \gamma_1 \left( -(\Delta)^{\frac{q}{2}} \tilde{v}^{1/2} - (\Delta)^{\frac{q}{2}} v^0 \right)
\]

\[
+ \gamma_2 (\tilde{v}^{1/2} - v^0) + \left( \frac{\tilde{r}^{1/2}}{\sqrt{E(u^0)}} - \frac{r^{1/2}}{\sqrt{E(u^0)}} \right),
\]

\[
\tilde{Q}_3^{1/2} = \left( \frac{\tilde{r}^{1/2} - r^0}{\tau/2} - r^0_i \right)
\]

\[
- \left( \frac{1}{2\sqrt{E(u^0)}} \left( F'(u^0), \frac{\tilde{u}^{1/2} - u^0}{\tau/2} \right) - \frac{1}{2\sqrt{E(u^0)}} \int_{\Omega} F'(u^0) u_i^{1/2} d\mathbf{x} \right).
\]

Using Taylor formula, we get

\[
\tau \sum_{n=0}^{K} \left( \| Q_1^{n+1/2} \| + \| Q_2^{n+1/2} \| + \| Q_3^{n+1/2} \| \right) + \tau \left( \| \tilde{Q}_1^{1/2} \| + \| \tilde{Q}_2^{1/2} \| + \| \tilde{Q}_3^{1/2} \| \right) \leq C \tau^2.
\]

(4.20)

We will give the proof sketch for (4.12)–(4.13).

1. The first step: error estimate for \( \tilde{e}_u^{1/2} = \tilde{u}^{1/2} - \tilde{U}^{1/2} \), \( \tilde{e}_v^{1/2} = \tilde{v}^{1/2} - \tilde{V}^{1/2} \), \( \tilde{e}_r^{1/2} = \tilde{r}^{1/2} - \tilde{R}^{1/2} \).

Combining (4.17)–(4.19) and (4.5)–(4.7), we arrive at

\[
\frac{\tilde{e}_u^{1/2}}{\tau/2} = \tilde{e}_v^{1/2} + \tilde{Q}_1^{1/2}, \tag{4.21}
\]

\[
\frac{\tilde{e}_v^{1/2}}{\tau/2} + \kappa (-(\Delta)^{\frac{q}{2}} \tilde{e}_u^{1/2} + \gamma_1 (-(\Delta)^{\frac{q}{2}} \tilde{e}_v^{1/2} + \gamma_2 \tilde{e}_r^{1/2} + G^{1/2} = \tilde{Q}_2^{1/2}, \tag{4.22}
\]

\[
\frac{\tilde{e}_r^{1/2}}{\tau/2} = \tilde{F}^{1/2} + \tilde{Q}_3^{1/2}, \tag{4.23}
\]

where

\[
\tilde{G}^{1/2} = \tilde{r}^{1/2} \frac{F'(u^0)}{\sqrt{E(u^0)}} - \tilde{R}^{1/2} \frac{F'(U^0)}{\sqrt{E(U^0)}},
\]

and

\[
\tilde{F}^{1/2} = \frac{1}{2\sqrt{E(u^0)}} \left( F'(u^0), \frac{\tilde{u}^{1/2} - U^0}{\tau/2} \right) - \frac{1}{2\sqrt{E(U^0)}} \left( F'(U^0), \frac{\tilde{U}^{1/2} - U^0}{\tau/2} \right).
\]
Taking the inner product of $\tilde{e}_u^\frac{1}{2}$, $\tilde{e}_v^\frac{1}{2}$ in (4.21) and (4.22) respectively, as well as multiplying $\tilde{e}_v^\frac{1}{2}$ on the both sides of (4.23).

\[
\|\tilde{e}_u^\frac{1}{2}\|^2 = \frac{\tau}{2} \left( \tilde{e}_u^\frac{1}{2}, \tilde{e}_u^\frac{1}{2} \right) + \frac{\tau}{2} \left( \tilde{Q}_1^\frac{1}{2}, \tilde{e}_u^\frac{1}{2} \right), \tag{4.24}
\]

\[
\|\tilde{e}_v^\frac{1}{2}\|^2 + \frac{\tau}{2} \kappa \left( -\Delta \right)^\frac{1}{2} \left( \tilde{e}_u^\frac{1}{2}, \tilde{e}_v^\frac{1}{2} \right) + \frac{\tau}{2} \gamma_1 \|\tilde{e}_v^\frac{1}{2}\|_{\tilde{Q}_1}^2 + \frac{\tau}{2} \gamma_2 \|\tilde{e}_v^\frac{1}{2}\|^2
\]

\[
= -\frac{\tau}{2} \left( \tilde{G}_2^\frac{1}{2}, \tilde{e}_v^\frac{1}{2} \right) + \frac{\tau}{2} \left( \tilde{Q}_3^\frac{1}{2}, \tilde{e}_v^\frac{1}{2} \right), \tag{4.25}
\]

\[
\left( \tilde{e}_r^\frac{1}{2} \right)^2 = \frac{\tau}{2} \left( \tilde{F}_2^\frac{1}{2}, \tilde{e}_r^\frac{1}{2} \right) + \frac{\tau}{2} \left( \tilde{Q}_3^\frac{1}{2}, \tilde{e}_r^\frac{1}{2} \right). \tag{4.26}
\]

Using (4.21), the (4.25) can be rewritten as

\[
\|\tilde{e}_v^\frac{1}{2}\|^2 + \kappa \|\tilde{e}_u^\frac{1}{2}\|_{\tilde{Q}_1}^2 + \frac{\tau}{2} \gamma_1 \|\tilde{e}_v^\frac{1}{2}\|_{\tilde{Q}_1}^2 + \frac{\tau}{2} \gamma_2 \|\tilde{e}_v^\frac{1}{2}\|^2
\]

\[
= -\frac{\tau}{2} \left( \tilde{G}_2^\frac{1}{2}, \tilde{e}_v^\frac{1}{2} \right) + \frac{\tau}{2} \left( \tilde{Q}_3^\frac{1}{2}, \tilde{e}_v^\frac{1}{2} \right) + \frac{\tau}{2} \kappa \left( -\Delta \right)^\frac{1}{2} \left( \tilde{e}_u^\frac{1}{2}, \tilde{Q}_1^\frac{1}{2} \right). \tag{4.27}
\]

In addition, $\tilde{G}_2^\frac{1}{2}$ and $\tilde{F}_2^\frac{1}{2}$ could be represented as

\[
\tilde{G}_2^\frac{1}{2} = \tilde{r}_2^\frac{1}{2} \left( \frac{F'(u^0)}{\sqrt{E(u^0)}} - \frac{F'(U^0)}{\sqrt{E(U^0)}} \right) + \tilde{e}_r^\frac{1}{2} \frac{F'(U^0)}{\sqrt{E(U^0)}}, \tag{4.28}
\]

\[
\tilde{F}_2^\frac{1}{2} = \left( \frac{1}{2\sqrt{E(u^0)}} F'(u^0) - \frac{1}{2\sqrt{E(U^0)}} F'(U^0), \frac{\tilde{U}_2 - U^0}{\tau/2} \right) + \left( \frac{1}{2\sqrt{E(u^0)}} F'(u^0), \frac{\tilde{e}_u^\frac{1}{2}}{\tau/2} \right). \tag{4.29}
\]

From (4.24)–(4.26) and Lemma 2.1, using (4.27)–(4.29) and using the Cauchy-Schwarz inequality and Young’s inequality, we obtain

\[
\|\tilde{e}_u^\frac{1}{2}\|^2 \leq C \tau \|\tilde{e}_u^\frac{1}{2}\|^2 + C \tau \|\tilde{Q}_1^\frac{1}{2}\|^2 + C \tau \|\tilde{Q}_3^\frac{1}{2}\|^2, \tag{4.30}
\]

\[
\|\tilde{e}_v^\frac{1}{2}\|^2 + \kappa \|\tilde{e}_u^\frac{1}{2}\|_{\tilde{Q}_1}^2 + \frac{\tau}{2} \gamma_1 \|\tilde{e}_v^\frac{1}{2}\|_{\tilde{Q}_1}^2 + \frac{\tau}{2} \gamma_2 \|\tilde{e}_v^\frac{1}{2}\|^2 \leq C \tau \left( \tilde{e}_r^\frac{1}{2} \right)^2 + C \tau \|\tilde{e}_u^\frac{1}{2}\|^2 + C \tau \|\tilde{Q}_2^\frac{1}{2}\|^2
\]

\[
+ C \tau \|\tilde{e}_u^\frac{1}{2}\|_{\tilde{Q}_1}^2 + C \tau \|\tilde{Q}_1^\frac{1}{2}\|_{\tilde{Q}_1}^2, \tag{4.31}
\]

\[
\left( \tilde{e}_r^\frac{1}{2} \right)^2 \leq C \tau \|\tilde{e}_u^\frac{1}{2}\|^2 + C \tau \|\tilde{e}_u^\frac{1}{2}\|^2 + C \tau \|\tilde{Q}_3^\frac{1}{2}\|^2 + C \tau \|\tilde{Q}_1^\frac{1}{2}\|^2. \tag{4.32}
\]

By combining the above equations, we can obtain

\[
\|\tilde{e}_u^\frac{1}{2}\|^2 + \kappa \|\tilde{e}_u^\frac{1}{2}\|_{\tilde{Q}_1}^2 + \|\tilde{e}_v^\frac{1}{2}\|^2 + \left( \tilde{e}_r^\frac{1}{2} \right)^2 \leq C \tau \left( \|\tilde{Q}_1^\frac{1}{2}\|_{\tilde{Q}_1}^2 + \|\tilde{Q}_2^\frac{1}{2}\|^2 + \|\tilde{Q}_3^\frac{1}{2}\|^2 \right) \leq C \tau^3. \tag{4.33}
\]

Moreover, take the inner product of (4.22) by $(-\Delta)^\frac{\alpha}{2} \tilde{e}_v^\frac{1}{2}$ to get

\[
\|\tilde{e}_u^\frac{1}{2}\|_{\tilde{Q}_1}^2 + \frac{\tau}{2} \kappa \left( -\Delta \right)^\frac{\alpha}{2} \left( \tilde{e}_u^\frac{1}{2}, (\tilde{e}_u^\frac{1}{2}) \right) + \frac{\tau}{2} \gamma_1 \|\tilde{e}_v^\frac{1}{2}\|_{\tilde{Q}_1}^2 + \frac{\tau}{2} \gamma_2 \|\tilde{e}_v^\frac{1}{2}\|_{\tilde{Q}_1}^2
\]

\[
= -\frac{\tau}{2} \left( \tilde{G}_2^\frac{1}{2} - \tilde{Q}_2^\frac{1}{2}, (\tilde{e}_u^\frac{1}{2}, (\tilde{e}_u^\frac{1}{2}) \right). \tag{4.34}
\]
Using \((-\Delta)^\frac{\alpha}{2} \hat{e}_v^1 = (-\Delta)^\frac{\alpha}{2} \hat{e}_v^1 + (-\Delta)^\frac{\alpha}{2} \hat{Q}_1\), (4.34) can be rewritten as
\[
\left| \hat{e}_v^1 \right|^2 + \kappa \left| \hat{e}_v^1 \right|^2 + \frac{T}{2} \gamma_1 \left| \hat{e}_v^1 \right|^2 + \frac{T}{2} \gamma_2 \left| \hat{e}_v^1 \right|^2 \leq \frac{T}{2} \left( \hat{G}_1^\frac{\alpha}{2}, (-\Delta)^\frac{\alpha}{2} \hat{e}_v^1 \right) + \left( \hat{Q}_2^\frac{\alpha}{2}, (-\Delta)^\frac{\alpha}{2} \hat{e}_v^1 \right) + \kappa \left( (-\Delta)^\frac{\alpha}{2} \hat{Q}_1^\frac{\alpha}{2}, (-\Delta)^\frac{\alpha}{2} \hat{e}_u^1 \right).
\]

From Lemma 2.1, the three terms on the right side of the above equation can be controlled by
\[
\left| \left( \hat{G}_1^\frac{\alpha}{2}, (-\Delta)^\frac{\alpha}{2} \hat{e}_v^1 \right) \right| \leq \left| \hat{e}_v^1 \right| \left( \frac{1}{E(U^0)} F'(U^0), (-\Delta)^\frac{\alpha}{2} \hat{e}_v^1 \right) \leq C(L) \left( \hat{e}_v^1 \right)^2 + \frac{C_1}{2} \left| \hat{e}_v^1 \right|^2,
\]
(4.35)
\[
\left| \left( \hat{Q}_2^\frac{\alpha}{2}, (-\Delta)^\frac{\alpha}{2} \hat{e}_v^1 \right) \right| \leq \frac{C_2}{2} \left| \hat{e}_v^1 \right|^2 + \frac{C_3}{2} \left| \hat{Q}_2^\frac{\alpha}{2} \right|^2,
\]
(4.36)
\[
\left| \left( (-\Delta)^\frac{\alpha}{2} \hat{Q}_1^\frac{\alpha}{2}, (-\Delta)^\frac{\alpha}{2} \hat{e}_u^1 \right) \right| \leq \frac{C_4}{2} \left| \hat{e}_u^1 \right|^2 + \frac{C_5}{2} \left| \hat{Q}_1^\frac{\alpha}{2} \right|^2.
\]
(4.37)

From (4.33) and (4.35)–(4.37), then we can get
\[
\left| \hat{e}_u^1 \right|^2 + \kappa \left| \hat{e}_u^1 \right|^2 + \left\| \hat{e}_v^1 \right\|^2 + \left( \hat{e}_v^1 \right)^2 + \left| \hat{e}_v^1 \right|^2 + \kappa \left| \hat{e}_v^1 \right|^2 \leq C \tau^3.
\]
(4.38)

By virtue of Lemma 2.3, (4.33) and (4.38), we have
\[
\left\| \hat{U}^\frac{\alpha}{2} \right\| _\infty \leq \left\| \hat{u}^\frac{\alpha}{2} \right\| _\infty + \left\| \hat{e}_v^1 \right\| _\infty \leq \left\| \hat{u}^\frac{\alpha}{2} \right\| _\infty + C \left| \hat{e}_u^1 \right| _\alpha \leq 1 + L \leq M,
\]
(4.39)

where \(\tau \leq C^{-\frac{\alpha}{2}}\).

2. The second step: estimate \(e_u^1\), \(e_v^1\) and \(e_r^1\).

Subtract (4.1)–(4.3) from (4.14)–(4.16) to obtain for \(n = 0\).
\[
\delta_r e_r^1 = \hat{e}_r^1 + Q_1^\frac{\alpha}{2},
\]
(4.40)
\[
\delta_r e_v^1 + \kappa (-\Delta)^\frac{\alpha}{2} \hat{e}_u^1 + \gamma_1 (-\Delta)^\frac{\alpha}{2} \hat{e}_v^1 + \gamma_2 \hat{e}_v^1 + G^\frac{\alpha}{2} = Q_2^\frac{\alpha}{2},
\]
(4.41)
\[
\delta_r e_r^1 = F^\frac{\alpha}{2} + Q_3^\frac{\alpha}{2},
\]
(4.42)

where
\[
G_1^\frac{\alpha}{2} = \frac{1}{2 \sqrt{E(U^\frac{\alpha}{2})}} (F'(U^\frac{\alpha}{2}), \delta_r u^1) - \frac{1}{2 \sqrt{E(U^\frac{\alpha}{2})}} (F'(U^\frac{\alpha}{2}), \delta_r U^\frac{\alpha}{2}).
\]

It is obvious that
\[
G_1^\frac{\alpha}{2} = r^{\frac{\alpha}{2}} \left( \frac{F'(U^\frac{\alpha}{2})}{\sqrt{E(U^\frac{\alpha}{2})}} + \frac{F'(U^\frac{\alpha}{2})}{\sqrt{E(U^\frac{\alpha}{2})}} \right) + \frac{\hat{e}_r^1}{\sqrt{E(U^\frac{\alpha}{2})}},
\]
\[
(4.43)
\]
\[
F^\frac{1}{2} = \left( \frac{1}{2\sqrt{E(\tilde{u}^\frac{1}{2})}} F'(\tilde{u}^\frac{1}{2}) \right) - \left( \frac{1}{2\sqrt{E(\tilde{U}^\frac{1}{2})}} F'(\tilde{U}^\frac{1}{2}) \right) + \left( \frac{1}{2\sqrt{E(\tilde{U}^\frac{1}{2})}} F'(\tilde{U}^\frac{1}{2}) \right),
\]
\[
\frac{1}{\sqrt{E(\tilde{u}^\frac{1}{2})}} F'(\tilde{u}^\frac{1}{2}) - \frac{1}{\sqrt{E(\tilde{U}^\frac{1}{2})}} F'(\tilde{U}^\frac{1}{2}) = \frac{F'(\tilde{u}^\frac{1}{2}) - F'(\tilde{U}^\frac{1}{2})}{\sqrt{E(\tilde{u}^\frac{1}{2})}} - \frac{F'(\tilde{U}^\frac{1}{2})(E(\tilde{u}^\frac{1}{2}) - E(\tilde{U}^\frac{1}{2}))}{\sqrt{E(\tilde{U}^\frac{1}{2})}\sqrt{E(\tilde{u}^\frac{1}{2})}(\sqrt{E(\tilde{u}^\frac{1}{2})} + \sqrt{E(\tilde{U}^\frac{1}{2})})}.\]

Since \(e_u^0 = 0\), \(e_v^0 = 0\), and \(e_r^0 = 0\), then taking inner product of \(2\tau e_u^1\) and \(2\tau e_v^1\) in (4.40)–(4.41), and multiplying \(2\tau e_r^1\) on the both sides of (4.42), we have
\[
2\|e_u^1\|^2 = \tau(e_r^1, e_u^1) + 2\tau(Q_1^\frac{1}{2}, e_u^1), \tag{4.43}
\]
\[
2\|e_v^1\|^2 + \kappa \tau \left((-\Delta)^\frac{\alpha}{2} e_u^1, e_v^1\right) + \gamma_1 \left((-\Delta)^\frac{\alpha}{2} e_v^1, e_v^1\right) + \gamma_2 \tau (e_v^1, e_v^1)
+ 2\tau \left(G_1^\frac{1}{2}, e_v^1\right) = 2\tau \left(Q_1^\frac{1}{2}, e_v^1\right), \tag{4.44}
\]
\[
(e_r^1)^2 = \tau(F_1^\frac{1}{2}, e_r^1) + \tau(Q_3^\frac{1}{2}, e_r^1). \tag{4.45}
\]

By using the Cauchy–Schwarz inequality and Young’s inequality, we obtain
\[
\|e_u^1\|^2 \leq C\tau\|e_v^1\|^2 + C\tau\|e_u^1\|^2 + C\tau\|Q_1^\frac{1}{2}\|^2, \tag{4.46}
\]
\[
2\|e_v^1\|^2 + 2\kappa |e_u^1|^2_2 + \gamma_1 |e_v^1|^2_2 + \gamma_2 \tau |e_v^1|^2 \leq C\tau \left(|(G_1^\frac{1}{2}, e_v^1)| + \|e_v^1\|^2 + \|Q_2^\frac{1}{2}\|^2 + \left|\left((-\Delta)^\frac{\alpha}{2} e_u^1, (-\Delta)^\frac{\alpha}{2} Q_1^\frac{1}{2}\right)\right|\right)
\leq C\tau |(G_1^\frac{1}{2}, e_v^1)| + C\tau \|e_v^1\|^2 + C\tau \|Q_2^\frac{1}{2}\|^2 + C\tau |e_u^1|^2_2 + C\tau |Q_1^\frac{1}{2}|^2_2, \tag{4.47}
\]
\[
(e_r^1)^2 \leq C\tau \|(F_1^\frac{1}{2}, e_r^1)\| + C\tau \|e_r^1\|^2 + C\tau \|Q_3^\frac{1}{2}\|^2. \tag{4.48}
\]

Since \(|\tilde{U}^\frac{1}{2}|_\infty\) is bounded,
\[
|(G_1^\frac{1}{2}, e_v^1)| \leq \left(\left|F(\tilde{u}^\frac{1}{2})\right|_\infty |e_u^1|_\frac{1}{2} + \left|e_r^1\right| \left|\frac{F'(\tilde{U}^\frac{1}{2})}{\sqrt{E(\tilde{U}^\frac{1}{2})}}\right|_\infty \right) \leq \frac{C\tau}{2} |e_r^1|_\frac{1}{2} + C\tau |e_u^1|_\frac{1}{2} + C\tau |e_v^1|_\frac{1}{2},
\]
\[
|(F_1^\frac{1}{2}, e_r^1)| \leq C\tau \left(\left|\frac{1}{2\sqrt{E(\tilde{u}^\frac{1}{2})}} F'(\tilde{u}^\frac{1}{2}) - \frac{1}{2\sqrt{E(\tilde{U}^\frac{1}{2})}} F'(\tilde{U}^\frac{1}{2})\right| \left(u^1 - u^0\right)\right)
+ |e_r^1| \left|\left(\frac{1}{2\sqrt{E(\tilde{U}^\frac{1}{2})}} F'(\tilde{U}^\frac{1}{2}), \delta_t e_u^\frac{1}{2}\right)\right|. \tag{4.49}
\]

where
\[
u^1 - u^0 = \tau u_t(t_1) - \frac{1}{2} \left(\int_{t_0}^{t_2} (t_0 - s)^2 \frac{\partial^3 u}{\partial t^3}(s)ds + \int_{t_1}^{t_2} (t_1 - s)^2 \frac{\partial^3 u}{\partial t^3}(s)ds\right).
\]
From the above equations and (4.40), using Cauchy-Schwarz inequality and Young’s inequality, Thus,

$$\tau |(F^1, e^1)| \leq C \tau |u, t_2| \infty \left((e^1)^2 + \|e^1_u\|^2\right)$$

$$+ C \tau^4 \int_{t_0}^{t_1} \|\frac{\partial^3 u}{\partial t^3}(s)\|^2 ds + C \tau (e^1)^2 + C \tau \|e^1_v\|^2 + C \tau \|Q_2^1\|^2. \quad (4.50)$$

Combining (4.38) and (4.46)–(4.50), we get

$$\|e^1_u\|^2 + \|e^1_v\|^2 + \kappa \|e^1_u\|^2_\alpha + (e^1)^2 \leq C \tau^4 \int_{t_0}^{t_1} \|\frac{\partial^3 u}{\partial t^3}(s)\|^2 ds$$

$$+ C \tau \left(\|Q_2^1\|^2 + \|Q_1^1\|^2_\alpha\right) + C \tau \|e^1_u\|^2 \leq C \tau^4. \quad (4.51)$$

Applying \((-\Delta)^{\frac{q}{2}}\) on the both sides of (4.40), taking the inner product of the resulting equation with $2\tau(-\Delta)^{\frac{q}{2}} e^1_a$, one arrives at

$$2|e^1_a|_\alpha^2 = \tau((-\Delta)^{\frac{q}{2}} e^1\), (-\Delta)^{\frac{q}{2}} e^1_a) + 2\tau((-\Delta)^{\frac{q}{2}} Q_1^1, (-\Delta)^{\frac{q}{2}} e^1_a). \quad (4.52)$$

Taking the inner product of (4.41) with $2\tau(-\Delta)^{\frac{q}{2}} e^1_v$ and using (4.52), we obtain

$$2|e^1_v\|_\alpha^2 + 2\kappa \|e^1_u\|_\alpha^2 - 2\kappa \tau((-\Delta)^{\frac{q}{2}} Q_1^1, (-\Delta)^{\frac{q}{2}} e^1_a) + \gamma_1 \|e^1_v\|_\alpha^2 +$$

$$\gamma_2 \tau \|e^1_v\|_\alpha^2 + 2\tau(G^\frac{1}{2}, (-\Delta)^{\frac{q}{2}} e^1_v) = 2\tau(Q_2^1, (-\Delta)^{\frac{q}{2}} e^1_v). \quad (4.53)$$

By the Cauchy–Schwarz inequality and Young’s inequality, it leads to

$$2|e^1_v\|_\alpha^2 + 2\kappa \|e^1_u\|_\alpha^2 \leq C \tau \|\Delta^{\frac{q}{2}} G^\frac{1}{2}\|^2 + C \tau \|e^1_v\|_\alpha^2$$

$$+ C \tau \|\Delta^{\frac{q}{2}} Q_2^1\|^2 + C \tau \|\Delta^{\frac{q}{2}} Q_1^1\|^2 + C \tau \|e^1_u\|_\alpha^2. \quad (4.54)$$

Meanwhile, we have

$$\|(-\Delta)^{\frac{q}{2}} G^\frac{1}{2}\|^2 = \left((-\Delta)^{\frac{q}{2}} \left(\frac{r^\frac{1}{2}}{\sqrt{E(u^\frac{1}{2})}} - \frac{F'(U^\frac{1}{2})}{\sqrt{E(U^\frac{1}{2})}}\right)\right)^2$$

$$\leq |r^\frac{1}{2}|^2 \left((-\Delta)^{\frac{q}{2}} \left(\frac{F'(U^\frac{1}{2})}{\sqrt{E(U^\frac{1}{2})}}\right)\right|^2$$

$$+ (e^1_v)^2 \left((-\Delta)^{\frac{q}{2}} \frac{F'(U^\frac{1}{2})}{\sqrt{E(U^\frac{1}{2})}}\right|^2, \quad (4.55)$$

and by using Lemma 2.2, we obtain

$$\|(-\Delta)^{\frac{q}{2}} \left(\frac{F'(U^\frac{1}{2})}{\sqrt{E(U^\frac{1}{2})}} - \frac{F'(\tilde{U}^\frac{1}{2})}{\sqrt{E(\tilde{U}^\frac{1}{2})}}\right)\|^2$$
Taking the inner product of 2 multiplying 2 holds for 1
Combining (4.51), (4.54) and (4.57), we arrive at

\[ \leq C|e^k|^2. \]  (4.56)

Then substituting (4.56) into (4.55) and using Lemma 2.2, it follows from (4.54) that

\[ \|(-\Delta)^{\frac{\alpha}{2}} G \|^2 \leq C|e^k|^2 + C(e^j)^2. \]  (4.57)

Combining (4.51), (4.54) and (4.57), we arrive at

\[ |e^1_{\nu}|^2 + \kappa|e^1_{\mu}|^2 + \|e^1_{\nu}\|^2 + \|e^1_{\mu}\|^2 + \kappa|e^1_{\mu}|^2 + (e^j)^2 \leq C\tau^4. \]  (4.58)

By virtue of Lemma 2.3 and (4.58), we have

\[ \|U^1\|_{\infty} \leq \|u^1\|_{\infty} + \|e^1_{\mu}\|_{\infty} \leq \|u^1\|_{\infty} + C|e^1_{\mu}|_{\mu} \leq 1 + L \leq M, \]  (4.59)

where \( \tau \leq C^{-\frac{1}{\gamma}}. \)

3. The third step: we intend to use the mathematical induction method to estimate (4.12) holds for \( 1 \leq n \leq K. \)

First, we assume that (4.12) holds for \( n \leq k \) and we intend to prove that it also holds for \( n = k + 1. \) Similar to (4.59), we obtain

\[ \|U^n\|_{\infty} \leq M, \ 1 \leq n \leq k. \]  (4.60)

Subtract (4.1)–(4.3) from (4.14)–(4.16) to obtain the following error equations.

\[ \delta_t e^k_{\nu} + Q_1^{k+\frac{1}{2}} = e^k_{\nu} + Q_1^{k+\frac{1}{2}}, \]  (4.61)

\[ \delta_t e^k_{\mu} + \kappa(-\Delta)^{\frac{\alpha}{2}} e^k_{\mu} + \gamma_1(-\Delta)^{\frac{\alpha}{2}} e^k_{\mu} + \gamma_2 e^k_{\mu} + G^{k+\frac{1}{2}} = Q_2^{k+\frac{1}{2}}, \]  (4.62)

\[ \delta_t e^r_{\nu} = F^{k+\frac{1}{2}} + Q_3^{k+\frac{1}{2}}. \]  (4.63)

Taking the inner product of \( 2\tau e^k_{\nu} \) and \( 2\tau e^k_{\nu} \) in (4.61)–(4.62) respectively, as well as multiplying \( 2\tau e^k_{\nu} \) on the both sides of (4.63), we have

\[ \|e^{k+1}_{\nu}\|^2 - \|e^k_{\nu}\|^2 = 2\tau \left( e^{k+\frac{1}{2}}_{\nu}, e^{k+\frac{1}{2}}_{\nu} \right) + 2\tau \left( Q_1^{k+\frac{1}{2}}, e^{k+\frac{1}{2}}_{\nu} \right), \]  (4.64)

\[ \|e^{k+1}_{\nu}\|^2 - \|e^k_{\nu}\|^2 + \kappa \left( |e^{k+1}_{\nu}|^2 - |e^k_{\nu}|^2 \right) + 2\tau \gamma_1 |e^{k+\frac{1}{2}}_{\nu}|^2 + 2\gamma_2 \tau \|e^{k+\frac{1}{2}}_{\nu}\|^2 \]

\[ = 2\tau \left( Q_2^{k+\frac{1}{2}}, e^{k+\frac{1}{2}}_{\nu} \right) - 2\tau \left( G^{k+\frac{1}{2}}, e^{k+\frac{1}{2}}_{\nu} \right) + 2\tau \kappa \left( Q_1^{k+\frac{1}{2}}, (-\Delta)^{\alpha/2} e^{k+\frac{1}{2}}_{\nu} \right). \]  (4.65)

\[ \left( e^{k+1}_{r} \right)^2 - \left( e^k_{r} \right)^2 = 2\tau \left( F^{k+\frac{1}{2}}, e^{k+\frac{1}{2}}_{r} \right) + 2\tau \left( Q_3^{k+\frac{1}{2}}, e^{k+\frac{1}{2}}_{r} \right). \]  (4.66)
Combining (4.69)–(4.70), using Cauchy–Schwarz inequality and Young’s inequality, we get

\[
\left\| \frac{\partial}{\partial t} \left( \frac{F(x)}{\sqrt{E(x)}} - \frac{F'(x)}{\sqrt{E(x)}} \right) \right\|_{\infty} \leq \left( \frac{1}{2} \right) \left( \frac{1}{\sqrt{E(x)}} \right) \left( \frac{1}{\sqrt{E(x)}} \right)
\]

where

\[
G^{k+\frac{1}{2}} = G^{k+\frac{1}{2}} \left( \frac{F'(\bar{u}^{k+\frac{1}{2}})}{\sqrt{E(\bar{u}^{k+\frac{1}{2}})}} - \frac{F'(\bar{\bar{u}}^{k+\frac{1}{2}})}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} + e_r^{k+\frac{1}{2}} \frac{F'(\bar{\bar{u}}^{k+\frac{1}{2}})}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} \right),
\]

and

\[
F^{k+\frac{1}{2}} = \left( \frac{1}{2\sqrt{E(\bar{u}^{k+\frac{1}{2}})}} - \frac{1}{2\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} \right) F'(\bar{\bar{u}}^{k+\frac{1}{2}}),
\]

where

\[
\frac{1}{\sqrt{E(\bar{u}^{k+\frac{1}{2}})}} \frac{F'(\bar{u}^{k+\frac{1}{2}})}{\sqrt{E(\bar{u}^{k+\frac{1}{2}})}} - \frac{1}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} F'(\bar{\bar{u}}^{k+\frac{1}{2}})
\]

\[
= \frac{F'(\bar{u}^{k+\frac{1}{2}}) - F'(\bar{\bar{u}}^{k+\frac{1}{2}})}{\sqrt{E(\bar{u}^{k+\frac{1}{2}})}} \frac{F'(\bar{\bar{u}}^{k+\frac{1}{2}})}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} \left( \sqrt{E(\bar{u}^{k+\frac{1}{2}})} - \sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})} \right),
\]

\[
(4.67)
\]

\[
u^{k+1} - u^k = \tau u_{t} (t_{k+\frac{1}{2}})
\]

\[
- \frac{1}{2} \left( \int_{t_k}^{t_{k+\frac{1}{2}}} (t_k - s)^2 \frac{\partial^3 u}{\partial t^3} (s) ds + \int_{t_{k+\frac{1}{2}}}^{t_{k+1}} (t_{k+1} - s)^2 \frac{\partial^3 u}{\partial t^3} (s) ds \right).
\]

(4.68)

Similar to the proof for (4.49) and (4.50), we have the following estimates

\[
\left( G^{k+\frac{1}{2}}, e_v^{k+\frac{1}{2}} \right) \leq C \left( \frac{1}{\sqrt{E(\bar{u}^{k+\frac{1}{2}})}} \right) \left( \frac{1}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} \right) \left( \frac{1}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} \right) \left( \frac{1}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} \right)
\]

\[
\leq C \left( \frac{1}{\sqrt{E(\bar{u}^{k+\frac{1}{2}})}} \right) \left( \frac{1}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} \right) \left( \frac{1}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} \right) \left( \frac{1}{\sqrt{E(\bar{\bar{u}}^{k+\frac{1}{2}})}} \right),
\]

(4.69)

\[
\tau \left( F^{k+\frac{1}{2}}, e_v^{k+\frac{1}{2}} \right) \leq C \tau \left| u_{t} (t_{k+\frac{1}{2}}) \right| \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} \right) \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} \right) \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} \right) \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} \right) \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} \right).
\]

(4.70)

Combining (4.69)–(4.70), using Cauchy–Schwarz inequality and Young’s inequality, we get

\[
\| e_{u}^{k+1} \|^2 - \| e_{u}^{k} \|^2 + \| e_{v}^{k+1} \|^2 - \| e_{v}^{k} \|^2 + \kappa (\| e_{u}^{k+1} \|^2 - \| e_{u}^{k+1} \|^2) + (\| e_{u}^{k+1} \|^2 - \| e_{u}^{k+1} \|^2)
\leq C \tau \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} + \| e_{u}^{k+1} \|^2 \right) \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} + \| e_{u}^{k+1} \|^2 \right) \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} + \| e_{u}^{k+1} \|^2 \right) \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} + \| e_{u}^{k+1} \|^2 \right) \left( \frac{1}{E(\bar{\bar{u}}^{k+\frac{1}{2}})} + \| e_{u}^{k+1} \|^2 \right).
\]

(4.70)
Applying \((-\Delta)^{\frac{\alpha}{2}}\) on the both sides of (4.61), and then taking the inner product of the resulting equation with \(\tau (-\Delta)^{\frac{\alpha}{2}} e^{k+\frac{1}{2}}\), one arrives at
\[
|e^{k+1}|_\alpha^2 - |e^{k}|_\alpha^2 = 2\tau \left(-\frac{\alpha}{2} e^{k+\frac{1}{2}} + (-\Delta)^{\frac{\alpha}{2}} e^{k+\frac{1}{2}}\right) + 2\tau \left(-\frac{\alpha}{2} Q_1^{k+\frac{1}{2}}, (-\Delta)^{\frac{\alpha}{2}} e^{k+\frac{1}{2}}\right),
\]
and taking the inner product of (4.62) with \(2\tau (-\Delta)^{\frac{\alpha}{2}} e^{k+\frac{1}{2}}\), we get
\[
|e^{k+1}|_2^2 - |e^{k}|_2^2 + \kappa |e^{k+1}|_\alpha^2 - \kappa |e^{k}|_\alpha^2 = 2\tau |e^{k+1}|_\alpha^2 + 2\tau |e^{k+1}|_2^2 + 2\tau \left(-\Delta)^{\frac{\alpha}{2}} e^{k+\frac{1}{2}}\right),
\]
and using Lemmas 2.1 and 2.2, one obtains
\[
\left\|(-\Delta)^{\frac{\alpha}{2}} G^{k+\frac{1}{2}}\right\|^2 \leq C\tau \left(|e^{k+1}|_\alpha^2 + |e^{k}|_\alpha^2 + \left(-\Delta)^{\frac{\alpha}{2}} e^{k+\frac{1}{2}}\right) + \left(-\Delta)^{\frac{\alpha}{2}} e^{k+\frac{1}{2}}\right),
\]
then from (4.73)–(4.74), we get
\[
|e^{k+1}|_2^2 - |e^{k}|_2^2 + \kappa |e^{k+1}|_\alpha^2 - \kappa |e^{k}|_\alpha^2 \leq C\tau \left(|e^{k+1}|_\alpha^2 + |e^{k}|_\alpha^2 + |e^{k+1}|_\alpha^2 + |e^{k}|_\alpha^2\right)
\]
\[
+ \left|\bar{e}^{k+1}\right|_\alpha^2 + \left|\bar{e}^{k}\right|_\alpha^2 + \left(\bar{e}^{k+1}\right)^2 + \left(\bar{e}^{k}\right)^2\right) + \left\|(-\Delta)^{\frac{\alpha}{2}} Q_1^{k+\frac{1}{2}}\right\|^2 + \left\|(-\Delta)^{\frac{\alpha}{2}} Q_2^{k+\frac{1}{2}}\right\|^2.
\]
Combining (4.71) and (4.75), summing from \(n = 1\) to \(n = k\), and then using Gronwall inequality, we get
\[
|e^{k+1}|_\alpha^2 \leq C\tau^2.
\]
which implies \(|e^{k+1}|_\alpha \leq C\tau^2\). Moreover, we arrive at
\[
\left\|U^{k+1}\right\|_\infty^2 \leq \left\|U^{k+1}\right\|_\infty^2 + \left\|e^{k+1}\right\|_\infty^2 \leq L + \left|e^{k+1}|_\alpha \right|_\alpha \leq M.
\]
(4.76) shows that (4.12) holds for \(n = k + 1\). We have completed the mathematical induction and thus the proof is completed. \(\square\)

### 5 Spatial Error Analysis

In this section, we give the \(\tau\)-independent convergence results for the discrete full scheme. It implies that we do not need to assume the global Lipschitz condition. Similar to the technique in [40], from Lemmas 2.3 and 2.5, we have \(\|P_N w\|_\infty \leq C\|w\|_\alpha\). Then we have the boundedness of \(P_N U^n\) in \(L_\infty\) norm, and denote \(M_2 = \max_{0 \leq n \leq K} \{P_N U^n\} + 1\). For convenience, we denote
\[
\tilde{e}^n_{N,u} = U^n - u^n = U^n - P_N U^n + P_N U^n - u^n = \rho^n_u + \theta^n_u,
\]
\[
\tilde{e}^n_{N,v} = V^n - v^n = V^n - P_N V^n + P_N V^n - v^n = \rho^n_v + \theta^n_v.
\]
Combining the time-discrete system (4.1)–(4.3) and (3.9)–(3.15), we directly get the following error equations

$$
\begin{align*}
\left(\delta_t \theta_u^{n+\frac{1}{2}}, \psi\right) &= \left(\tilde{\theta}_u^{n+\frac{1}{2}}, \psi\right), \\
\left(\delta_t \theta_v^{n+\frac{1}{2}}, \varphi\right) &= \kappa \left(\left(-\Delta\right)^{\frac{1}{2}} \tilde{\theta}_u^{n+\frac{1}{2}}, \varphi\right) + \gamma_1 \left(\left(-\Delta\right)^{\frac{1}{2}} \tilde{\theta}_v^{n+\frac{1}{2}}, \varphi\right) \\
&+ \gamma_2 \left(\tilde{\theta}_v^{n+\frac{1}{2}}, \varphi\right) + \left(R_1^{n+\frac{1}{2}}, \varphi\right) = 0,
\end{align*}
$$

(5.2)

where $R_1^{n+\frac{1}{2}} = \tilde{R}^{n+\frac{1}{2}} \left(\frac{F'(u_N^n)}{\sqrt{E(u_N^n)}} - \frac{F'(\tilde{u}_N^{n+\frac{1}{2}})}{\sqrt{E(\tilde{u}_N^{n+\frac{1}{2}})}}\right)$.

From (3.12), we have $\theta_u^0 = 0$ and $\theta_v^0 = 0$. Moreover, for the first step, we have

$$
\begin{align*}
\left(\tilde{\theta}_u^{\frac{1}{2}} / \tau^{\frac{1}{2}}, \psi\right) &= \left(\tilde{\theta}_v^{\frac{1}{2}}, \psi\right), \\
\left(\tilde{\theta}_v^{\frac{1}{2}} / \tau^{\frac{1}{2}}, \varphi\right) &= \kappa \left(\left(-\Delta\right)^{\frac{1}{2}} \tilde{\theta}_u^{\frac{1}{2}}, \varphi\right) + \gamma_1 \left(\left(-\Delta\right)^{\frac{1}{2}} \tilde{\theta}_v^{\frac{1}{2}}, \varphi\right) + \gamma_2 \left(\tilde{\theta}_v^{\frac{1}{2}}, \varphi\right) + \left(\tilde{R}_1^{\frac{1}{2}}, \varphi\right) = 0.
\end{align*}
$$

(5.4)

(5.5)

Theorem 5.1 Suppose that (3.1)–(3.4) have unique solutions satisfying (3.19) and $u_N^n$, $v_N^n$ are the solutions of (3.9)–(3.11), $0 \leq n \leq K$. Then there exist two positive constants $\tau^*$ and $N^*$, such that when $\tau \leq \tau^*$ and $N \geq N^*$, we have

$$
\begin{align*}
\|\theta_u^n\|^2 + \|\theta_v^n\|^2 + \kappa |\theta_u^n|_2^2 &\leq CN^{-2\alpha} , 0 \leq n \leq K, \\
\|u_N^n\|_\infty &\leq M_2.
\end{align*}
$$

(5.6)

(5.7)

Proof 1. The first step: estimate $\tilde{\theta}_u^{\frac{1}{2}}$ and $\tilde{\theta}_v^{\frac{1}{2}}$.

Letting $\psi = \tilde{\theta}_u^{\frac{1}{2}}$ and $\varphi = \tilde{\theta}_v^{\frac{1}{2}}$ in (5.4)–(5.5), we can get

$$
\begin{align*}
\|\tilde{\theta}_u^{\frac{1}{2}}\|^2 &= \frac{\tau}{2} \left(\tilde{\theta}_u^{\frac{1}{2}}, \tilde{\theta}_u^{\frac{1}{2}}\right), \\
\|\tilde{\theta}_v^{\frac{1}{2}}\|^2 + \frac{\tau}{2} \kappa \left(\left(-\Delta\right)^{\frac{1}{2}} \tilde{\theta}_u^{\frac{1}{2}}, \tilde{\theta}_v^{\frac{1}{2}}\right) + \frac{\tau}{2} \gamma_1 |\tilde{\theta}_u^{\frac{1}{2}}|_2^2 + \frac{\tau}{2} \gamma_2 |\tilde{\theta}_v^{\frac{1}{2}}|_2^2 &= -\frac{\tau}{2} \left(\tilde{R}_1^{\frac{1}{2}}, \tilde{\theta}_v^{\frac{1}{2}}\right).
\end{align*}
$$

(5.8)

(5.9)

Setting $\psi = \left(-\Delta\right)^{\frac{1}{2}} \tilde{\theta}_u^{\frac{1}{2}}$ in (5.4), the (5.9) can be rewritten as

$$
\begin{align*}
\|\tilde{\theta}_v^{\frac{1}{2}}\|^2 + \kappa |\tilde{\theta}_u^{\frac{1}{2}}|_2^2 + \frac{\tau}{2} \gamma_1 |\tilde{\theta}_u^{\frac{1}{2}}|_2^2 + \frac{\tau}{2} \gamma_2 |\tilde{\theta}_v^{\frac{1}{2}}|_2^2 &= -\frac{\tau}{2} \left(\tilde{R}_1^{\frac{1}{2}}, \tilde{\theta}_v^{\frac{1}{2}}\right).
\end{align*}
$$

(5.10)
By virtue of Theorem 4.2 and $\tau$ where 

$$
\tau \leq C \tau^3,
$$

we have

$$
\| \tilde{R}_1^{\frac{1}{2}} \| + 1.
$$

(5.12)

Combining (5.8)–(5.12), we get

$$
\| \tilde{\theta}_n^{\frac{1}{2}} \|^2 + \| \tilde{\theta}_n^{\frac{1}{2}} \|^2 + \kappa | \tilde{\theta}_n^{\frac{1}{2}} |^2 \leq C \tau^2 \| \tilde{\theta}_n^{\frac{1}{2}} \|^2 + C \| \rho_u^0 \|^2 + C \tau \| \tilde{\theta}_n^{\frac{1}{2}} \|^2 + C \| \tilde{\theta}_n^{\frac{1}{2}} \|^2.
$$

(5.13)

Thus, by Lemma 2.5, we have

$$
\| \tilde{\theta}_n^{\frac{1}{2}} \|^2 + \| \tilde{\theta}_n^{\frac{1}{2}} \|^2 + \kappa | \tilde{\theta}_n^{\frac{1}{2}} |^2 \leq N^{-2\alpha}.
$$

(5.14)

From Lemma 2.4, we obtain

$$
\| \tilde{u}_n^{\frac{1}{2}} \| \leq \| \tilde{P}_N \tilde{U}^{\frac{1}{2}} \| \leq \| \tilde{\theta}_n^{\frac{1}{2}} \| + \| \tilde{P}_N \tilde{U}^{\frac{1}{2}} \| \leq \| \tilde{P}_N \tilde{U}^{\frac{1}{2}} \| \leq C N^{-\alpha}.
$$

(5.15)

where $\tau \leq \tau^*$ and $N \geq C^0 = 1$.

2. The second step: estimate $\theta_n^{\frac{1}{2}}$ and $\theta_n^{\frac{1}{2}}$. Letting $\Psi = \theta_n^{\frac{1}{2}}$ and $\varphi = \theta_n^{\frac{1}{2}}$ in (5.2)–(5.3), then it leads to

$$
\| \theta_n^{\frac{1}{2}} \| = \frac{1}{2} \theta_n^{\frac{1}{2}}(\theta_n^{\frac{1}{2}}, \theta_n^{\frac{1}{2}}),
$$

(5.16)

$$
\| \theta_n^{\frac{1}{2}} \| + \kappa | \theta_n^{\frac{1}{2}} |^2 + \gamma_1 | \theta_n^{\frac{1}{2}} |^2 + \gamma_2 | \theta_n^{\frac{1}{2}} |^2 = \frac{1}{2} \tilde{R}_1^{\frac{1}{2}}(\theta_n^{\frac{1}{2}}),
$$

(5.17)

Using

$$
\tilde{R}_1^{\frac{1}{2}} = \tilde{R}_2^{\frac{1}{2}} \left( \frac{F'(u_n^0) - F'(U_n^0)}{\sqrt{E(u_n^0)}} + \frac{F'(U_n^0)(E(u_n^0) - E(U_n^0))}{\sqrt{E(U_n^0)}} \right),
$$

and from Theorem 4.2, we get the boundedness of $| \tilde{R}_1^{\frac{1}{2}} |$. We denote $\tilde{K}_1 = \max \{| \tilde{R}_1^{\frac{1}{2}} |, | \tilde{r}_n^{\frac{1}{2}} | \} + 1$, and by virtue of Lemma 2.5, we have

$$
\| \theta_n^{\frac{1}{2}} \|^2 + \| \theta_n^{\frac{1}{2}} \|^2 + \kappa | \theta_n^{\frac{1}{2}} |^2 \leq C N^{-2\alpha}.
$$

(5.18)

Moreover, when $\tau \leq \tau^*$ and $N \geq C^0 = 1$,

$$
\| u_n^{\frac{1}{2}} \| \leq \| \tilde{P}_N U^{\frac{1}{2}} \| \leq \| \tilde{\theta}_n^{\frac{1}{2}} \| \leq \| P_N U \| \leq C N^{-1} \leq M_2.
$$

(5.19)

3. The third step. Suppose that (5.6) holds for $0 \leq n \leq k$ and discuss that the case for $n = k + 1$ holds.

We use the mathematical induction method and assume

$$
\| u_n^{\frac{1}{2}} \| \leq M_2, \ 0 \leq n \leq k.
$$

(5.20)
and denote $\hat{K}_2 = \max\{|\hat{r}^{a+\frac{1}{2}}|, |\hat{R}^{a+\frac{1}{2}}|(n = 0, \ldots, k)\} + 1$. Next, we intend to prove that (5.6) holds for $n = k + 1$. Letting $\psi = \tau \theta_u^{k+\frac{1}{2}}$ and $\varphi = \tau \theta_v^{k+\frac{1}{2}}$ in (5.2)–(5.3), respectively, we get
\[
\|\theta_u^{k+1}\|^2 - \|\theta_u^k\|^2 = 2\tau \left(\theta_v^{k+\frac{1}{2}}, \hat{\theta}_u^{k+\frac{1}{2}}\right),
\]
\[
\|\theta_v^{k+1}\|^2 - \|\theta_v^k\|^2 = \kappa \left(\|\theta_u^{k+1}\|^2 - \|\theta_u^k\|^2\right) + 2\tau \gamma_1 \|\theta_v^{k+\frac{1}{2}}\|^2 + 2\gamma_2 \tau \|\theta_v^{k+\frac{1}{2}}\|^2
\]
\[
= -2\tau \left(\bar{R}_1^{k+\frac{1}{2}}, \hat{\theta}_v^{k+\frac{1}{2}}\right).
\]

By using Cauchy-Schwarz inequality and Young’s inequality, we have
\[
\left|\left(\bar{R}_1^{k+\frac{1}{2}}, \hat{\theta}_v^{k+\frac{1}{2}}\right)\right| \leq \|\theta_u^k\|^2 + \|\theta_v^k\|^2 + \|\theta_v^{k+1}\|^2 + \|\rho_u^k\|^2 + \|\rho_v^{k-1}\|^2,
\]
\[
\left|\left(\hat{\theta}_v^{k+\frac{1}{2}}, \hat{\theta}_u^{k+\frac{1}{2}}\right)\right| \leq \frac{1}{4} \left(\|\theta_u^k\|^2 + \|\theta_u^{k+1}\|^2 + \|\theta_v^k\|^2 + \|\theta_v^{k+1}\|^2\right).
\]

Therefore, we get
\[
\|\theta_u^{k+1}\|^2 - \|\theta_u^k\|^2 + \|\theta_v^{k+1}\|^2 - \|\theta_v^k\|^2 + \kappa \left(\|\theta_u^{k+1}\|^2 - \|\theta_u^k\|^2\right)
\]
\[
\leq C\tau \left(\|\theta_u^k\|^2 + \|\theta_u^{k+1}\|^2 + \|\theta_v^k\|^2 + \|\theta_v^{k+1}\|^2 + \|\rho_u^k\|^2 + \|\rho_v^{k-1}\|^2\right).
\]

Summing from $n = 1$ to $n = k$ and using the discrete Gronwall’s inequality and Lemma 2.5, (5.25) leads to
\[
\|\theta_u^{k+1}\|^2 + \|\theta_v^{k+1}\|^2 + \kappa \|\theta_u^{k+1}\|^2 \leq C N^{-2\alpha}.
\]

which implies that we have completed the mathematics induction. Therefore (5.6) holds and then (5.7) is obtained similar as (5.20). We have completed the proof.

\section{6 The Proof of the Theorem 3.3}

For convenience, we denote
\[
e_n^u = u^n - u_N^n = u^n - P_N u^n + P_N u^n - u_N^n = \eta_u^n + \xi_u^n,
\]
\[
e_n^v = v^n - v_N^n = v^n - P_N v^n + P_N v^n - v_N^n = \eta_v^n + \xi_v^n.
\]

In the convergence analysis, we use the mathematical induction method. From (1.1)–(1.2), (4.17)–(4.19) and (3.13)–(3.15), the error equations at $t = t_1$ are the following:
\[
\left(\frac{\xi_u^{\frac{1}{2}}}{\tau/2}, \psi\right) = \left(\frac{\xi_v^{\frac{1}{2}}}{\tau/2}, \psi\right) + \left(\tilde{Q}_1^{\frac{1}{2}}, \psi\right),
\]
\[
\left(\frac{\xi_v^{\frac{1}{2}}}{\tau/2}, \varphi\right) + \kappa \left((-\Delta)\frac{\varphi}{\xi_u^{\frac{1}{2}}}, \varphi\right) + \gamma_1 \left((-\Delta)\frac{\varphi}{\xi_v^{\frac{1}{2}}}, \varphi\right) + \gamma_2 \left(\frac{\varphi}{\xi_v^{\frac{1}{2}}}, \varphi\right) + \left(\tilde{R}_2^{\frac{1}{2}}, \varphi\right)
\]
\[
\tilde{Q}_2^\perp, \varphi, (6.2)
\]
\[
\frac{\tilde{e}_r}{\tau/2} = \tilde{F}_1^\perp + \tilde{Q}_3^\perp, (6.3)
\]

where
\[
\tilde{R}_2^\perp = \tilde{r}_2 \frac{F'(u_0)}{\sqrt{E(u_0)}} - \tilde{R}_2^\perp \frac{F'(u_0)}{\sqrt{E(u_0)^N}} = \tilde{e}_r^\perp \frac{F'(u_0)}{\sqrt{E(u_0)}} + \tilde{R}_2^\perp \left( \frac{F'(u_0)}{\sqrt{E(u_0)}} - \frac{F'(u_0)}{\sqrt{E(u_0)^N}} \right), (6.4)
\]
\[
\tilde{F}_1^\perp = \frac{1}{2\sqrt{E(u_0)}} \left( F'(u_0) - \frac{\tilde{u}_r^2 - u_0^2}{\tau/2} \right) - \frac{1}{2\sqrt{E(u_0)^N}} \left( F'(u_0^N), - \frac{\tilde{u}_r^2 - u_0^2}{\tau/2} \right)
= \left( \frac{1}{2\sqrt{E(u_0)}} F'(u_0) - \frac{1}{2\sqrt{E(u_0)^N}} F'(u_0^N), \frac{\tilde{u}_r^2 - u_0^2}{\tau/2} \right) + \frac{1}{2\sqrt{E(u_0)^N}} \left( F'(u_0^N), e_r^2 - e_0^2 \right). (6.5)
\]

Letting \( \psi = 2\tau \tilde{e}_u^\perp \) and \( \varphi = 2\tau \tilde{e}_\nu^\perp \) in (6.1)–(6.2), and multiplying \( 2\tau \tilde{e}_r^\perp \) on the both sides of (6.3), and using
\[
\left( \tilde{e}_u^\perp, (\Delta)^\theta \tilde{e}_u^\perp \right) = 2\tau \left( \tilde{e}_u^\perp, (\Delta)^\theta \tilde{e}_u^\perp \right) + 2\tau \left( \tilde{Q}_1^\perp, (\Delta)^\theta \tilde{e}_u^\perp \right),
\]
we have
\[
\left\| \tilde{e}_u^\perp \right\|^2 = 2\tau \left( \tilde{e}_u^\perp, \tilde{e}_u^\perp \right) + 2\tau \left( \tilde{Q}_1^\perp, \tilde{e}_u^\perp \right), (6.6)
\]
\[
\left\| \tilde{e}_\nu^\perp \right\|^2 = \frac{\kappa}{2} \left\| \tilde{e}_u^\perp \right\|^2 + 2\tau \gamma_1 \left\| \tilde{e}_\nu^\perp \right\|^2 + 2\gamma_2 \tau \left\| \tilde{e}_\nu^\perp \right\|^2
= 2\tau \left( \tilde{Q}_2^\perp, \tilde{e}_\nu^\perp \right) - 2\tau \left( \tilde{R}_2^\perp, \tilde{e}_\nu^\perp \right) + 2\tau \kappa \left( (\Delta)^\theta \tilde{Q}_1^\perp, (\Delta)^\theta \tilde{e}_\nu^\perp \right), (6.7)
\]
\[
\left( \tilde{e}_r^\perp \right)^2 = 2\tau \left( \tilde{F}_1^\perp, \tilde{e}_r^\perp \right) + 2\tau \left( \tilde{Q}_3^\perp, \tilde{e}_r^\perp \right). (6.8)
\]

From (6.4)–(6.8), \( \left| \eta_0^\perp / \tilde{e}_u^\perp \right| \leq N^{-m} \tau^{-1} \int_{t_0} t_1^\perp \left\| u_t \right\| ds \), using the Cauchy-Schwarz inequality and Young’s inequality, we obtain
\[
\left| \tilde{e}_r^\perp \right|^2 + \left\| \tilde{e}_u^\perp \right\|^2 + \left\| \tilde{e}_\nu^\perp \right\|^2 + \kappa \left\| \tilde{e}_u^\perp \right\|^2 \leq C \tau K_s,
\]

where \( K_s = \left\| \eta_0^\perp \right\|^2 + N^{-2m} \tau^{-1} \int_{t_0} t_1^\perp \left\| u_t \right\|^2 ds + \left\| \tilde{Q}_2^\perp \right\|^2 + \left\| Q_1^\perp \right\|^2 + \left\| Q_2^\perp \right\|^2 \right|_{\alpha/2} + \tau^3 \int_{t_0} t_1^\perp \left\| \eta_0^\perp \right\|^2 \left\| \eta_0^\perp \right\| ds \). Then we get \( \left| \tilde{e}_r^\perp \right|^2 + \left\| \tilde{e}_u^\perp \right\|^2 + \left\| \tilde{e}_\nu^\perp \right\|^2 + \kappa \left\| \tilde{e}_u^\perp \right\|^2 \leq C \tau^3 + N^{-2m} \).

Then, we prove the equation (3.20) holds for \( n = 1 \). From (1.1)–(1.2), (4.14)–(4.16) and (3.9)–(3.11), the error equations for \( n = 0 \) follow that
\[
\left( \delta_t \xi_u^\perp, \psi \right) = \left( \xi_u^\perp, \psi \right) + \left( Q_1^\perp, \psi \right), (6.9)
\]
\[
\left( \delta_t \xi_u^\perp, \varphi \right) + \kappa \left( (\Delta)^\theta \xi_u^\perp, \varphi \right) + \gamma_1 \left( (\Delta)^\theta \xi_u^\perp, \varphi \right) + \gamma_2 \left( \xi_u^\perp, \varphi \right) + \left( R_2^\perp, \varphi \right)
\]
\[
\delta_t {e_r}^\chi = \tilde{F}^{\chi} + Q_3^{\chi}, \quad (6.10)
\]

where

\[
R_2^{\chi} = \tilde{R}^{\chi} - \tilde{R}^{\chi} \frac{F'(\bar{u}^{\frac{n+1}{2}})}{\sqrt{E(\bar{u}^{\frac{1}{2}})}}, \quad (6.12)
\]

\[
\tilde{F}^{\chi} = \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} (F'(\bar{u}^{\frac{1}{2}}), \delta_t u^{\frac{1}{2}}) - \frac{1}{2\sqrt{E(\bar{u}^{\frac{1}{2}})}} (F'(\bar{u}^{\frac{1}{2}}_N), \delta_t u^{\frac{1}{2}}_N), \quad (6.13)
\]

Since the proof for \( n = 0 \) is similar to the following proof, we just presents the results for \( k=0 \). It follows that

\[
|e_r^{\chi}|^2 + \|\xi_u^{\chi}\|^2 + \|\xi_v^{\chi}\|^2 + \kappa |\xi_u^{\chi}|^2_\frac{1}{2}
\]

\[
\leq C\tau \left( \|u_{u0}\|^2_0 + \|\xi_u^{\chi}\|^2 + \|Q_1^{\chi}\|^2 + \|Q_3^{\chi}\|^2 + \|\tilde{Q}_1^{\chi}\|^2_{1/2} + \|\tilde{Q}_2^{\chi}\|^2 + \|\tilde{Q}_3^{\chi}\|^2 
\right)
\]

\[
+ \tau^3 \int_{t_0}^{t_1} \frac{\partial^3 u}{\partial t^3} (s)^2 ds + CN^{-2m-1} \int_{t_0}^{t_1} \|u_t\|^2 ds \leq C(\tau^4 + N^{-2m}).
\]

Next, we assume the (3.20) holds for \( n = 2, \ldots, k \) and will prove that the equation (3.20) also holds for \( n = k + 1 \). From (1.1)–(1.2), (4.14)–(4.16) and (3.9)–(3.11), we can get

\[
\left( \delta_t \xi_u^{n+\frac{1}{2}}, \varphi \right) = \left( \xi_v^{n+\frac{1}{2}}, \varphi \right) + \left( Q_1^{n+\frac{1}{2}}, \varphi \right), \quad (6.14)
\]

\[
\left( \delta_t \xi_v^{n+\frac{1}{2}}, \varphi \right) + \kappa \left( -\Delta \right)^\frac{\alpha}{2} \xi_u^{n+\frac{1}{2}} \xi_v^{n+\frac{1}{2}} \varphi + \gamma_1 \left( -\Delta \right)^\frac{\alpha}{2} \xi_v^{n+\frac{1}{2}} \varphi
\]

\[
+ \gamma_2 \left( \xi_v^{n+\frac{1}{2}} \varphi \right) + \left( R_2^{n+\frac{1}{2}}, \varphi \right) = \left( Q_2^{n+\frac{1}{2}}, \varphi \right), \quad (6.15)
\]

\[
\delta_t e_r^{n+\frac{1}{2}} = \tilde{F}^{n+\frac{1}{2}} + Q_3^{n+\frac{1}{2}}, \quad (6.16)
\]

where

\[
R_2^{n+\frac{1}{2}} = \tilde{R}^{n+\frac{1}{2}} - \tilde{R}^{n+\frac{1}{2}} \frac{F'(\bar{u}^{\frac{n+1}{2}})}{\sqrt{E(\bar{u}^{\frac{1}{2}})}}, \quad (6.17)
\]

\[
\tilde{F}^{n+\frac{1}{2}} = \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} (F'(\bar{u}^{\frac{1}{2}})_N, \delta_t u^{n+\frac{1}{2}}_N) - \frac{1}{2\sqrt{E(\bar{u}^{\frac{1}{2}})_N}} (F'(\bar{u}^{\frac{1}{2}}), \delta_t u^{n+\frac{1}{2}}). \quad (6.18)
\]

Letting \( \varphi = 2\tau \xi_u^{n+\frac{1}{2}} \) and \( \varphi = 2\tau \xi_v^{n+\frac{1}{2}} \) in (6.14)–(6.15), and multiplying \( 2\tau e_r^{n+\frac{1}{2}} \) on the both sides of (6.16), and using

\[
\left( \delta_t \xi_u^{n+\frac{1}{2}}, (-\Delta \frac{\alpha}{2}) \xi_u^{n+\frac{1}{2}} \right) = \left( \xi_v^{n+\frac{1}{2}}, (-\Delta \frac{\alpha}{2}) \xi_u^{n+\frac{1}{2}} \right) + \left( Q_1^{n+\frac{1}{2}}, (-\Delta \frac{\alpha}{2}) \xi_u^{n+\frac{1}{2}} \right),
\]

we can get

\[
\|\xi_u^{n+1}\|^2 - \|\xi_u^n\|^2 = 2\tau \left( \xi_v^{n+\frac{1}{2}}, \xi_u^{n+\frac{1}{2}} \right) + 2\tau \left( Q_1^{n+\frac{1}{2}}, \xi_u^{n+\frac{1}{2}} \right), \quad (6.19)
\]
where

\[ R_2^{n+\frac{1}{2}} = \frac{F'((\bar{u}^{n+\frac{1}{2}}) \sqrt{E(\bar{u}^{n+\frac{1}{2}})}}{\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} + e^{n+\frac{1}{2}} = \frac{F'((\bar{u}^{n+\frac{1}{2}}) \sqrt{E(\bar{u}^{n+\frac{1}{2}})}}{\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} \]  (6.22)

\[ \tilde{F}^{n+\frac{1}{2}} = \left( \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} F'(\bar{u}^{n+\frac{1}{2}}) - \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} F'((\bar{u}^{n+\frac{1}{2}}) \sqrt{E(\bar{u}^{n+\frac{1}{2}})}}{\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} \right) + \left( \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} F'(\bar{u}^{n+\frac{1}{2}}), \delta_{\bar{u}} n^{+\frac{1}{2}} \right). \]  (6.23)

\[ \tilde{F}^{n+\frac{1}{2}} = \frac{F'(\bar{u}^{n+\frac{1}{2}})}{\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} - \frac{1}{\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} F'((\bar{u}^{n+\frac{1}{2}}) \sqrt{E(\bar{u}^{n+\frac{1}{2}})}}{\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} \]  (6.24)

\[ \left( \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} F'(\bar{u}^{n+\frac{1}{2}}), \delta_{\bar{u}} n^{+\frac{1}{2}} \right) = \left( \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} F'((\bar{u}^{n+\frac{1}{2}}) \sqrt{E(\bar{u}^{n+\frac{1}{2}})}}{\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} \right) + \left( \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} F'(\bar{u}^{n+\frac{1}{2}}), \xi^{n^{+\frac{1}{2}}} + \xi^{n^{+\frac{1}{2}}} \right). \]  (6.25)

From Theorem 5.1, we get \( u^N \) and \( \bar{u}^{n+\frac{1}{2}} \) are bounded. Following the proof of (4.70) and from (6.23)–(6.25), (4.68), we obtain

\[ \left| \left( \frac{1}{2\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} F'((\bar{u}^{n+\frac{1}{2}}) \sqrt{E(\bar{u}^{n+\frac{1}{2}})}}{\sqrt{E(\bar{u}^{n+\frac{1}{2}})}} \right) \right| \leq C \left( \left\| \bar{u}^{n+\frac{1}{2}} \right\|_{\infty} \right| \delta_{\bar{u}} n^{+\frac{1}{2}} \right| \leq C N^{-m} \tau^{-1} \int_{t_n}^{t_{n+1}} \left\| u^{n+1/2} \right\| ds, \]  (6.26)

\[ \tau \left| R_2^{n+\frac{1}{2}} \xi^{n^{+\frac{1}{2}}} \right| \leq C \tau \left( \left\| \xi^{n+1/2} \right\|^2 + \left\| \xi^{n+1/2} \right\|^2 + (e^{n+1/2})^2 + (e^{n+1/2})^2 + \left\| \xi^{n+1/2} \right\|^2 \right) \]  (6.27)

\[ + C \tau \left( \left\| n^{+} \right\|^2 + \left\| n^{+} \right\|^2 \right). \]
\[ \tau \left| (\tilde{E}^{n+1}, \tilde{e}_r^{n+1/2}) \right| \leq C \tau \left( \|\tilde{\xi}_u^{n+1/2}\|^2 + \|\tilde{\eta}_u^{n+1/2}\|^2 + \|\tilde{\xi}_v^{n+1}\|^2 + \|\tilde{\xi}_n^{n+1}\|^2 + \|e_r^{n+1}\|^2 + \|e_r^n\|^2 \right. \\
+ \left. \|Q_1^{n+1/2}\|_2^2 \right) \\
+ C \tau^4 \int_{t_n}^{t_{n+1}} \left( \frac{\partial^3 u}{\partial t^3}(s) \right)^2 \, ds + CN^{-2m} \int_{t_n}^{t_{n+1}} \|u_t^{n+1/2}\|^2 \, ds. \quad (6.28) \]

For convenience, we let \( E^n := \|e_r^n\|^2 + \|\tilde{\xi}_u^n\|^2 + \|\tilde{\xi}_v^n\|^2 + \kappa \|\tilde{\xi}_n^n\|^2 \). Then, from (6.19)–(6.28), we get

\[ E^{n+1} - E^n \leq C \tau (E^{n+1} + E^n) + C \tau \mathcal{R}, \quad (6.29) \]

where \( \mathcal{R} = + \|\eta_u^n\|^2 + \|\eta_v^n\|^2 \). Then, from (6.19)–(6.28), we have

\[ \|u^n - u_N^n\|^2 + \|v^n - v_N^n\|^2 + \|r^n - R^n\|^2 \leq C (\tau^4 + N^{-2m}), \]

\[ \kappa |u^n - u_N^n|^2 \leq C (\tau^4 + N^{-2m}). \]

The proof of Theorem 3.3 is end when \( \tau \leq \tau^*, \ N \geq N^* \).

For the other three cases, we denote \( S_0 := (\tau^*)^4 + (N^*)^{-2m} \).

1. When \( \tau \geq \tau^* \), \( N \leq N^* \), there holds \( \tau^4 + N^{-2m} \geq S_0 \). By using the continuous and discrete energy dissipation, i.e., \( H(t) \leq H(t_0) \) and \( H^0 \leq H^0 \), we can get

\[ \|u^n - u_N^n\|^2 + \|v^n - v_N^n\|^2 + |r^n - R^n|^2 \leq 2(\|u^n\|^2 + \|u_N^n\|^2 + \|v^n\|^2 + \|v_N^n\|^2 + |r^n|^2 + |R^n|^2 + \kappa |u^n|^2 + \kappa |u_N^n|^2) \leq \left( \frac{4}{\kappa} + 4 \right) (H(t_0) + H^0) \leq C (\tau^4 + N^{-2m}), \]

\[ \kappa |u^n - u_N^n|^2 \leq 2 \left( \kappa |u^n|^2 + \kappa |u_N^n|^2 \right) \leq 4 (H(t_0) + H^0) \leq C (\tau^4 + N^{-2m}), \]

where \( C = \left( \frac{4}{\kappa} + 4 \right) (H(t_0) + H^0) / S_0 \).

2. When \( \tau \leq \tau^* \), \( N \leq N^* \), it obviously follows that

\[ C_1 N^{-2m} \geq S_0 \geq \tau^4 + (N^*)^{-2m}, \]

where \( C_1 = \frac{(N^*)^{-2m} + (\tau^*)^4}{(N^*)^{-2m}} \). In this case, we also have

\[ \|u^n - u_N^n\|^2 + \|v^n - v_N^n\|^2 + |r^n - R^n|^2 \leq \left( \frac{4}{\kappa} + 4 \right) (H(t_0) + H^0) \leq C (\tau^4 + N^{-2m}), \]

\[ \kappa |u^n - u_N^n|^2 \leq C (\tau^4 + N^{-2m}), \]

where \( C = \left( \frac{4}{\kappa} + 4 \right) (H(t_0) + H^0) C_1 / S_0 \).
3. When \( \tau \geq \tau^*, N \geq N^* \), there holds
\[
C_2 \tau^4 \geq S_0 \geq (\tau^*)^4 + N^{-2m},
\]
where \( C_2 = \frac{(N^*)^{-2m} + (\tau^*)^4}{(\tau^*)^4} \). In this case, we also have
\[
\|u^n - u^n_N\|^2 + \|v^n - v^n_N\|^2 + |r^n - R^n|^2 \leq \left( \frac{4}{\kappa} + 4 \right) (H(t_0) + H^0) \leq C(\tau^4 + N^{-2m}),
\]
\[
\kappa |u^n - u^n_N|^2 \leq C(\tau^4 + N^{-2m}).
\]
where \( C = \left( \frac{4}{\kappa} + 4 \right)(H(t_0) + H^0)C_2/S_0 \).

In this work, \( \kappa \) is suitable positive constant and does not effect the error estimate of our scheme. Therefore, we complete the proof of Theorem 3.3.

**Remark 6.1** Since the FGWE reduces to classical generalized wave equation when \( \alpha = 2 \), the unconditional energy dissipation and convergence analysis for the FGWE in this paper can naturally be applied to that of conventional generalized wave equation.

### 7 Numerical Experiments

In this section, we will present some numerical examples to confirm the discrete energy dissipation property and the accuracy of the full discrete SAV Fourier spectral scheme.

**Example 1** In this example, we take \( \Omega = (-16, 16) \times (-16, 16), T = 1, \kappa = 1 \), we consider \( F(u) = 1 - \cos u \), and take the initial value \( u(x, y, 0) = \sin(\pi x/16)\cos(\pi y/16) \) and the corresponding \( u_t(x, y, 0) = 0 \).

- case 1: \( \gamma_1 = 0, \gamma_2 = 0 \).
- case 2: \( \gamma_1 = 1, \gamma_2 = 1 \).

Since we have not the exact solution, and thus we choose sufficiently small time step \( K = 1000 \) and \( N = 256 \) to get ‘exact’ solution. For simplicity, Table 1 for case 1 just presents the errors of \( \|e^n_0\|_\infty, \|e^n_0\|_\infty, \|e^n_0\|_\infty \) in time and show that the fully discrete SAV scheme is second order accuracy in time. Table 2 presents the spatial error of case 1 and we get spectral accuracy. Similar to the computational accuracy for case 1, we also present the temporal accuracy in Table 3 and spatial accuracy for case 2 in Table 4. Next, we will verify the conservation or dissipation property of the SAV Fourier spectral method. Figure 1 shows the time evolution of the discrete energy \( H^n \) with different values \( \gamma_1 \) and \( \gamma_2 \) for \( \alpha = 1.2 \) and \( \alpha = 1.8 \) and associate errors of \( H^n \) for the conservation case is presented in Fig. 2. We observe that the damping parameters \( \gamma_1 \) and \( \gamma_2 \) efficiently effect the dissipation property for SAV scheme for long time simulation (Figs 3 and 4).

**Example 2**
\[
\begin{align*}
\alpha u_{tt} + (\Delta)^{\alpha/2} u + \gamma_1 (\Delta)^{\alpha/2} u_t + \gamma_2 u_t + F'(u) = 0, & \quad (x, y, t) \in \Omega \times (0, T], \\
u(x, y, 0) = \frac{1}{2} \arctan\left( \exp\left( -\sqrt{x^2 + y^2} \right) \right), & \quad u_t(x, y, 0) = 0,
\end{align*}
\]
where \( \Omega = (-10, 10) \times (-10, 10) \). We present the profiles of numerical solution \( u_N \) with different potential energy \( F(u) = u^2 (\frac{\alpha}{2} u^2 - \frac{1}{2}) \) for \( \alpha = 1.2 \) and different values of \( \gamma_1 = \gamma_2 \) at \( T = 8 \), which shows that \( \gamma_1, \gamma_2 \) have impacts on the profiles of wave. In addition, we

need to confirm the fully discrete energy dissipation–preserving or conservation property of numerical solution. Figure 5 presents the discrete energy $H^n$ with different values of $\gamma_1$ and $\gamma_2$ in long time simulation. They also show that the influence of coefficients $\gamma_1$ and $\gamma_2$ of the damping term, i.e., when $\gamma_1, \gamma_2 \rightarrow 0$, the energy discrete energy $H^n$ decays more slowly.

8 Conclusion

In this paper, we proposed a linearly implicit scheme to solve the nonlinear fractional general wave equation, and we used the SAV approach in time and Fourier spectral method in space. The resulting system is a linear system at each time step and FFT solver can be adopted.
in space, so that the scheme could be efficient to implement. The energy conservation or dissipation property of the scheme was strictly proved. In addition, we rigorously proved the unconditional convergence for the scheme by the temporal-spatial error splitting technique and got the second order accuracy in time and spectral accuracy in space. Finally, some numerical results were given to confirm our theoretical analysis.
