Exploring Data Mining Research in West Africa: A Bibliometric Analysis  
By Oladosu O. Oladimeja and Olayanju O. Oladimejib

aUniversity of Ibadan, Ibadan, Nigeria  
bBowen University, Iwo, Nigeria

Introduction
This present century is being referred to as the information age, and it is believed that information is key in decision making nowadays. With the advent of technologies such as computers, tremendous amounts of information are being collected and stored.1 Unfortunately, these massive collections of information (data) stored in various storage mechanisms are becoming overwhelming, even after the creation of structured databases and database management systems (DBMS). Now, far more information can be handled, ranging from transactions, text, pictures, and intelligence. Therefore, information retrieval is not enough for making right decisions. With this, there is a need for help to make the right decision, including summarizing data, extraction of relevant information stored, and discovering patterns.

Data mining is the new powerful technology that meets these needs. It is the automated analysis of large or complex data sets to discover significant, interesting patterns or trends that would otherwise go unrecognized.2,3 Data mining nowadays is a crucial subject in either academic research or practical application.4 A number of developed countries are already reaping the benefits of data mining. Developing countries also have the potential to be influenced by data mining, especially the areas of commerce, health-care, and government, to enhance daily activities in which West African countries are not left out. West Africa, according to the United Nations, includes 16 countries: Benin, Burkina Faso, Cape Verde, The Gambia, Ghana, Guinea, Guinea-Bissau, Ivory Coast, Liberia, Mali, Mauritania, Niger, Nigeria, Senegal, Sierra Leone, Togo, as well as Saint Helena, Ascension and Tristan da Cunha (United Kingdom Overseas Territory).5 As information technology is developing in West Africa and a large amount of data generated, there is a need to apply data mining to make better decisions.6 Data mining has been applied virtually in most West African sectors, especially in business and commerce, where there is competition.

Thus, this research paper’s main objective is to quantify and analyze the research output of data mining in West Africa. The second section of this paper discusses the methodology used in this research, while the third section showcases the results, followed by the discussion of the results, and finally, the conclusion is drawn.

Materials and Methods
The data analyzed to pinpoint the bibliometric analysis in this study were downloaded from Scopus database, which is the largest abstract and citation database of peer-reviewed literature, comprising journals, workshops, and conference proceedings.7,8,9 The choice was made based on the number of studies done in retrospective times that analyzed the coverage difference between other databases, including Google Scholar, Web of Science, CSA Illumina, and Scopus database.10,11,12 In addition, Norris analyzed differences in these databases and concluded, "Scopus offers the best coverage from amongst these databases."13

In this research, we have investigated various aspects of research growth in the field of data mining in West Africa. The factors that are being considered include (1) growth in publications as measured by the Relative Growth Rate (RGR) and Doubling Time (Dt), (2) productivity and quantification of research output for different institutions of the region (West Africa).

Data Mining as a field of study has a lot of terms related to it, which includes: Cluster Analysis, ID3, Neural Network, Pattern Extraction, Decision Tree, Neural Network, etc. for this research, the generic term "Data Mining" or "Knowledge Discovery" was adopted. Therefore, the research data were retrieved based on the carefully-crafted string "Data* Mining*" OR "Knowledge* Discovery," with the years 2020 and 2019 excluded. The search country was limited to West African Countries that were indexed in Scopus database at the time of this research: Benin, Burkina Faso, Cape Verde, Ghana, Gambia, Mali, Nigeria, Senegal, Sierra Leone. The initial output data that were retrieved were cleaned by removing irrelevant and duplicate records. Also, journals with zero impact factors were removed. Finally, 146 publications were considered for further analysis.

Results
Based on data retrieved, it is important to note the first document on data mining to be indexed in Scopus from West Africa was from Nigeria in the year 2000.14

Preferred Journals and Areas of Research
This research, as stated above, covers 17 years, which ranges from 2000 – 2018. The total number of West
African data mining publications retrieved from Scopus was 146, of which 81 were research articles, 47 were in conference proceedings, 12 were book series, and 6 were books. A list of the top 13 journals preferred by West African researchers is presented in Table 1.

The number of research publications per subject area of data mining is listed in Table 2. Data mining research in West Africa is dominated by the sectors related to computer science (29.10 %), followed by engineering (15.67 %), social sciences (8.21 %), and medicine (6.34 %). The classification of subjects is based on the one provided by Scopus.

| 20   | Physics and Astronomy                            | 2                   | 0.75       |
| 21   | Psychology                                       | 2                   | 0.75       |
Growth of Publications
The growth in the number of publications is measured by means of two related parameters viz. RGR and Dt. \(^{15}\). RGR in classical growth analysis is defined as:

\[
RGR = \frac{(\ln S_2 - \ln S_1)}{(t_2 - t_1)}
\]

Here \(S_2\) and \(S_1\) are the cumulative publications in two years \(t_2\) and \(t_1\). In the present analysis \(t_2 - t_1\) is taken as one year. RGR can then be expressed as \(RGR = \ln \left(\frac{S_2}{S_1}\right)\). The Dt is the time required for publications to double in number for a given RGR. Dt is expressed as:

\[
Dt = \frac{(t_2 - t_1)}{\ln 2/\ln S_2 - \ln S_1} \quad \text{or} \quad Dt = \ln 2/RGR
\]

A constant value for RGR in each year subsequently is an indication that the growth rate is exponential. The Dt is a characteristic time for this exponential growth. In Table 3, the annual number of publications in the discipline of data mining is represented and their cumulative number, RGR and Dt, for the period 2000–2018. Starting from only one publication in 2000 to 38 in 2018, there has been a significant increase in the number of publications output. The average annual growth rate of publications (Figure 1) during the last 18 years (2000-2018) is an impressive 28 percent.

Quality of Publications
The number of citations that a paper receives is a good measure of its quality and importance. In columns six and seven of Table 3, we give the number of citations that a paper has received for that year and the average citations per paper (ACCP), respectively. The citations already reported in a certain year are not included in the subsequent year. Figure 2 shows the growth trend in the number of citations.

---

**Table 3. West Africa Data Mining Research Output, Relative Growth Rate, Doubling Time, Citation per Paper**

| Years | Number of Publication | Cumulative | RGR | Dt   | Citation | Citation per paper |
|-------|-----------------------|------------|-----|------|----------|---------------------|
| 2000  | 1                     | 0          | 0.00| 0    | 15       | 15.00               |
| 2001  | 1                     | 2          | 0.69| 1    | 15       | 15.00               |

| 2018  | 38                    | 146        | 0.30| 2.30 | 524      | 13.79               |
Table 4. Top 10 West African institutions’ Data Mining Publications and Citations

| Institution                                      | TP | TC  | ACPP |
|--------------------------------------------------|----|-----|------|
| 1 Covenant University                            | 18 | 101 | 5.61 |
| 2 Federal University of Agriculture, Abeokuta    | 11 | 51  | 4.64 |
| 3 Federal University of Technology, Akure        | 10 | 45  | 4.50 |
| 4 University of Ibadan                          | 10 | 57  | 5.70 |
| 5 University of Lagos                           | 8  | 20  | 2.50 |
| 6 Redeemer’s University                          | 6  | 19  | 3.17 |
| 7 University of Ghana                            | 6  | 482 | 80.33|
| 8 international institute of Tropical Agriculture IITA, Ibadan | 5  | 357 | 119.0|
| 9 Ahmadu Bello University                        | 4  | 4   | 1.00 |
| 10 University of Abuja                           | 4  | 35  | 8.75 |
Table 4 presents the total publications (TP), total citations (TC), and ACPP for the top 10 West African institutions with publications in data mining for the period 2000–2018. Covenant University tops the table. Covenant University is the leading private university in Nigeria\textsuperscript{16}. Covenant University is closely followed by the Federal University of Agriculture, Abeokuta, while the Federal University of Technology, Akure, comes after.

**National Contribution to Data Mining**

Figure 3 shows the West African countries indexed Scopus in the research field of Data Mining and their number of publications.

**Discussion and Conclusion**

The trend of data mining research in West Africa is dominated by Nigerian institutions being the first country in the region to key into data mining research, which was followed by Ghana 9 years later,\textsuperscript{17} then followed by other countries. Other West African countries yet to key into this research area are encouraged to do so through knowledge exchange from countries already indexed in this research, especially from Nigeria, in order to boost data mining research in West Africa. Although Covenant University has the highest number of publications, in terms of quality of publication based on citations, the University of Ghana and IITA has the highest number of citations.

In tracing the research in the field of data mining in West Africa from 2000, the number of research publications has shown a rising trend, though some years have zero publications. From just one publication in 2000, the number increased to 146 for 2018, though more work needs to be done. The trend of data mining research in West Africa is dominated by Nigerian institutions.
