Abstract

In this paper, we define three types of 2-Ruled hypersurfaces in the Minkowski 4-space \(\mathbb{E}^4_1\). We obtain Gaussian and mean curvatures of the 2-ruled hypersurfaces of type-1 and type-2, and some characterizations about its minimality. We also deal with the first Laplace-Beltrami operators of these types of 2-Ruled hypersurfaces in \(\mathbb{E}^4_1\). Moreover, the importance of this paper is that the definition of these surfaces by using the octonions in \(\mathbb{E}^4_1\). Thus, this is a new idea and make the paper original. We give an example of 2-ruled hypersurface constructed by octonion and we visualize the projections of the images with MAPLE program. Furthermore, the optical fiber can be defined as a one-dimensional object embedded in the 4-dimensional Minkowski space \(\mathbb{E}^4_1\). Thus, as a discussion, we investigate the geometric evolution of a linearly polarized light wave along an optical fiber by means of the 2-ruled hypersurfaces in a four-dimensional Minkowski space.
