1. Introduction

A great number of methods for computing the homotopy or the homology of a topological space begin with a mod $p$ reduction, and this has proved to be very efficient even though one then has to deal with an extension problem when reverting to integer coefficients. However, such methods are not well-suited when one considers spaces which are of an algebraic nature, such as Eilenberg-Mac Lane spaces. That a purely functorial approach is possible in such a case was already apparent in the classical paper of S. Eilenberg and S. Mac Lane [24], in which they calculate directly the integral homology of Eilenberg-Mac Lane spaces in low degrees. Their results are expressed in terms of what they called the “new and quite bizarre functors” $\Omega(\Pi)$ and $R(\Pi)$. These functors became more intelligible with the advent of the Dold-Puppe theory of derived functors of non-additive functors [21], as they could then be interpreted as left-derived functors of the second exterior power functor and the second divided power functor respectively. Higher analogues of these new functors subsequently appeared in related contexts in a number of places, particularly in the Ph.D. theses of Mac Lane’s students R. Hamsher [30] and G. Decker [18]. However, this line of research was not vigorously pursued, though one should mention in this context the work of H. Baues [2] and of the first author [10], as well as the unpublished preprint of A. K. Bousfield [8].

In the present text, we compute in this functorial spirit certain unstable homotopy groups of Moore spaces $M(A, n)$ and in particular of the corresponding spheres $S^n = M(\mathbb{Z}, n)$. This approach to the computation of the homotopy groups of spheres is of particular interest, since much more structure is revealed when these homotopy groups are described as special values at the group $A = \mathbb{Z}$ of a certain functor. Our method is in some sense quite classical, since it relies on D. Kan’s construction of the loop group $GK$ of a connected simplicial set $K$ and on E. Curtis’ spectral sequence determined by the lower central series filtration of $GK$. The initial terms in this spectral sequence were described by Curtis in terms of the derived functors of the Lie functors $L^n$ [16]. In addition, Curtis showed that these Lie functors are endowed with a natural filtration whose associated graded components are built up from more familiar functors.

It follows from this description that a key ingredient in such an approach must be a good understanding of the derived functors of the functor $L^n$. We are able to achieve this in low degrees, where this is made possible by the fact that this Curtis decomposition of the Lie functors reduces this problem to the computation of derived functors of iterates of certain elementary functors (particularly the degree $r$ symmetric functor $SP^r$, and the related $r$th exterior algebra and $r$th divided power functors $\Lambda^r$ and $\Gamma^r$). In order to deal with such iterates, we require a composite functor spectral sequence along the lines of the standard Grothendieck spectral sequence [17], but for a pair of composable non-additive functors such as those mentioned above. Such a non-additive composite functor spectral sequence was defined by D. Blanc and C. Stover [6], but here we give a formulation of its initial terms which is better suited to our computational objectives. In fact this spectral sequence degenerates in our context at $E^2$, and may rather be thought of, for the functors which we consider, as a symmetrization of the Künneth
formula and its higher analogues à la Mac Lane \[36, 37\]. In this way we are able to go beyond the computation of the iterates of \( \Lambda^2 \) already considered in this context by the second author \[40\].

In our quest for the explicit values of the Dold-Puppe derived functors of the Lie algebra functors \( \mathcal{L}^r \) for certain values of \( r \), we deal with a number of questions of independent interest. First of all, starting from the description by F. Jean, a student of the first author, of the derived functors of \( S^P^r \) and \( \Lambda^r \) \[32\], we give a complete description of these derived functors (as well as of the divided power functor \( \Gamma_r \)) for \( r = 2 \), by a method different from that of H. Baues and T. Pirashvili in \[5\]. We then go on to give a similarly complete and functorial description of the corresponding derived functors of \( S^P^3, \Lambda^3 \) and \( \Gamma_3 \), and we deduce from this a functorial description of the derived functors \( L_i \mathcal{L}^3(A, n) \) for all \( i \) and \( n \). We also compute certain derived functors of the quartic composite functors \( \Lambda^2 \Lambda^2 \) and \( \Lambda^2 \Gamma_2 \) and deduce from them certain values of the derived functors \( L_i \mathcal{L}^4(A, n) \).

In order to achieve a sufficiently precise understanding of some of these derived functors of \( \mathcal{L}^4 \), we were led to introduce an analogue for Lie functors of the décalage morphisms. The latter are determined for all \( i \) of the Lie functor \( \mathcal{L}^r \). It turns out that this must not be the naive graded commutative version of the Lie functor, in which certain signs are changed in the relations defining it. Instead, it is necessary to introduce in its definition, following D. Leibowitz in her unpublished thesis \[35\], an additional divided square operation with respect to the Lie super-bracket of odd degree elements. While there no longer exist décalage isomorphisms between the Lie and super-Lie functors, there do exist canonical pension maps between them, which we call the semi-décalage morphisms, and which allows us to give a refined description of their derived functors in certain cases.

We also rely at some point on the knowledge of the homology of the complex \( C^m(A) \) dual to the de Rham complex first introduced in the present context by V. Franjou, J. Lannes and L. Schwartz in \[27\]. We refer to \[41\] for an explicit calculation of the values of the homology groups \( H_0 C^m(A) \) for all \( n \) announced by Jean in \[32\], as well as for a description of all the homology groups \( H_i C^m(A) \) when \( n < 8 \). The occurrence of 8-torsion when \( n = 8 \), as well as that of a Lie functor when \( n = 6 \), suggests that no simple description of these groups can be expected for a general \( n \).

In \[41\] we use these tools in order to achieve our goal of computing algebraically certain homotopy groups of \( n \)-spheres and Moore spaces \( M(A, n) \). The task at hand is twofold. The first part consists, as we have said, in computing the initial terms of the Curtis spectral sequence, and for this we rely on our knowledge of the derived functors of certain Lie functors and their super-analogues. The second part consists in understanding certain differentials in the spectral sequence. We rely here upon various methods, some based on the functoriality of our construction and on the fact that the differentials are now natural transformations rather then simply group homomorphisms, and others more classical in spirit (the suspension of a Moore space, the comparison of a Moore space with the corresponding Eilenberg-Mac Lane space, ...). We have at times in this final section made use of known results concerning the homotopy of Moore spaces for specific groups \( A \), whenever this allowed us to progress with our own investigations. It is quite striking to observe how far one can go in the description of these homotopy groups, with only the knowledge of derived functors of quadratic and cubical functors as the basic input.

In this final section we proceed in logical order, beginning with the homotopy groups of \( S^2 \) and \( M(A, 2) \) and then moving on to \( M(A, n) \) for increasing values of \( n \). For \( A = \mathbb{Z} \), some of our results follow in the stable range from \[19\] where a more efficient spectral sequence, which however depends

\[1\] We prefer to call this the super-analogue, rather than the graded analogue as is more customary, since all our functors are graded.
on the choice of a fixed prime \( p \), is considered (see also [17]). As an illustration of our methods, we begin by explaining how one may obtain in this way the known values of the 3-torsion of \( \pi(S^2) \), for values of \( i \) up to 14. To have gone further, so as to retrieve the classical results of H. Toda [16] up to \( i = 22 \), would have obliged us to delve further into the analysis of the spectral sequence. We also recover, and reinterpret, some results of Baues and his collaborators [2], [23], [3]. In particular, we obtain by our methods the results of Baues and Buth [3] concerning \( \pi_i(M(A, 2)) \) for \( i = 4 \), and give an improved description of the unpublished results of Dreckmann for \( i = 5 \) [23] (see also Baues and Goerss [4]). Specializing to the case \( A = \mathbb{Z}/p \), we obtain further information about the groups \( \pi_i(M(\mathbb{Z}/p, 2)) \) whenever the prime \( p \) is odd. By suspending these calculations, this gives us in particular a fully functorial description of the graded components associated to a natural filtration of the group \( \pi_6(M(A, 3)) \) which appears to be new. As a consequence of these computations, we can recover the value of \( \pi_5(M(\mathbb{Z}/3, 2)) \), a significant case of the extension by Neisendorfer [42] to the prime \( p = 3 \) of Cohen, Moore and Neisendorfer’s study [13] of the homotopy of Moore spaces (this value had in fact previously been obtained by D. Leibowitz in [35]).

As a final example, we examine the low degree homotopy groups of \( M(\mathbb{Z}/3, 5) \) since this allows us to exhibit in a simple context some of the techniques on which we relied throughout this section. In fact, the reader may wish to begin with this case, before going on to the more delicate unstable computations which precede it.

As will be apparent from this description of our paper, a number of our results in homotopy theory have already appeared in one form or another in the literature, where they are proved by very diverse methods. Our aim here is to show that these can all be obtained by a uniform method, based solely on functorial techniques from homological and homotopical algebra with integer coefficients. We expect that such an approach to these questions will not only allow one to compute specific additional homotopy groups, but more importantly will shed some new light upon their global structure.

**Acknowledgements.** We are indebted to P. Goerss for providing us with a copy of the dissertation [23], and to A. K. Bousfield for making available to us the thesis [35] as well as for his comments regarding a first version of the present text.

2. Derived functors

2.1. **Graded functors.** Let \( \text{Ab} \) be the category of abelian groups and \( A \) an object of \( \text{Ab} \). For any chain complex \( C_i \), we will henceforth denote by \( C[n] \) the chain complex defined by

\[
C[n]_i := C_{i-n} \text{ for all } i.
\]

In particular, the chain complex \( A[n] \) is concentrated in degree \( n \). In addition to the graded tensor power functor \( \otimes := \bigoplus_{n \geq 0} \otimes^n \), the symmetric power functor \( SP := \bigoplus_{n \geq 0} SP^n \), and the exterior power functor \( \Lambda := \bigoplus_{n \geq 0} \Lambda^n \) (the quotient of \( \otimes A \) by the ideal generated by elements \( x \otimes x \) for all \( x \in A \)), we will consider over \( \mathbb{Z} \) the following somewhat less well-known functors:
1. The divided power functor: (see [43]) $\Gamma_s = \bigoplus_{n \geq 0} \Gamma_n : \text{Ab} \to \text{Ab}$. The graded abelian group $\Gamma_s(A)$ is generated by symbols $\gamma_i(x)$ of degree $i \geq 0$ satisfying the following relations for all $x, y \in A$:

1) $\gamma_0(x) = 1$
2) $\gamma_1(x) = x$
3) $\gamma_s(x)\gamma_t(x) = \left(\frac{s+t}{s}\right)\gamma_{s+t}(x)$
4) $\gamma_n(x + y) = \sum_{s+t=n} \gamma_s(x)\gamma_t(y)$, $n \geq 1$
5) $\gamma_n(-x) = (-1)^n\gamma_n(x)$, $n \geq 1$.

In particular, the canonical map $A \simeq \Gamma_1(A)$ is an isomorphism. The degree 2 component $\Gamma_2(A)$ of $\Gamma_s(A)$ is the Whitehead functor $\Gamma(A)$. It is universal for homogenous quadratic maps from $A$ into abelian groups. The following additional relations in $\Gamma_s(A)$ are consequences of the previous ones:

$$\gamma_r(nx) = n^r\gamma_r(x), \ n \in \mathbb{Z};$$
$$r\gamma_r(x) = x\gamma_{r-1}(x);$$
$$x^r = r!\gamma_r(x);$$
$$\gamma_r(x)y^r = x^r\gamma_r(y).$$

In addition, a direct computations implies that

$$\Gamma_r(\mathbb{Z}/n) \simeq \mathbb{Z}/n(r,n^{\infty}),$$

where the extended g.c.d $(r,n^{\infty})$ is defined by $(r,n^{\infty}) := \lim_{m \to \infty} (r,n^m)$.

2. The Lie functor $L : \text{Ab} \to \text{Ab}$ (see [15]). The tensor algebra $\otimes A$ is endowed with a $\mathbb{Z}$-Lie algebra structure, for which the bracket operation is defined by

$$[a,b] = a \otimes b - b \otimes a, \ a, b \in \otimes(A).$$

One defines $n$-fold brackets inductively by setting

$$[a_1, \ldots, a_n] := [[a_1, \ldots, a_{n-1}], a_n] \tag{2.1}$$

We will denote $\otimes A$, viewed as a $\mathbb{Z}$-Lie algebra, by $\otimes(A)^{\text{Lie}}$. Let $L(A) = \bigoplus_{n \geq 1} L^n(A)$ be the sub-Lie ring of $\otimes(A)^{\text{Lie}}$ generated by $A$. Its degree 2 and 3 components are generated by the expressions

$$a \otimes b - b \otimes a \quad \text{and} \quad a \otimes b \otimes c - b \otimes a \otimes c + c \otimes a \otimes b - c \otimes b \otimes a \tag{2.2}$$

where $a, b, c \in A$. $L(A)$ is called the free Lie ring generated by the abelian group $A$. It is universal for homomorphisms from $A$ to $\mathbb{Z}$-Lie algebras. The grading of $\otimes A$ determines a grading on $L(A)$, so that we obtain a family of endofunctors on the category of abelian groups:

$$L^i : \text{Ab} \to \text{Ab}, \ i \geq 1.$$

In particular,

$$L^i(\mathbb{Z}) = 0 \tag{2.3}$$

for all $i > 1$. For any free group $F$ and $i \geq 1$, one has the natural Magnus-Witt isomorphism ([38, 49])

$$\gamma_i(F)/\gamma_{i+1}(F) \simeq L^i(F_{ab}) \tag{2.4}$$

where $\gamma_i(F)$ is the $i$th term in the lower central series of $F$.

3. The Schur functors. We will also consider the Schur functors

$$J^n, Y^n, E^n : \text{Ab} \to \text{Ab}, \ n \geq 2$$
In particular,

\begin{align*}
J^n(A) &= \ker\{A \otimes SP^{n-1}(A) \to SP^n(A)\}, \ n \geq 2, \\
Y^n(A) &= \ker\{A \otimes \Lambda^{n-1}(A) \to \Lambda^n(A)\}, \ n \geq 2, \\
E^n(A) &= \ker\{A \otimes \Gamma_{n-1}(A) \to \Gamma_n(A)\}, \ n \geq 2.
\end{align*}

Whenever \( A \) is free. The functors \( Y^n(A) \) are the \( \mathbb{Z} \)-forms of the Schur functors \( S_{\lambda}(V) \) associated to the partition \( \lambda = (2, 1, \ldots, 1) \) of the set \( (n) \) (see [26] exercise 6.11, [25] chapter 8 (19)). The functors \( J^n(A) \) and \( E^n(A) \) are two distinct \( \mathbb{Z} \)-forms of the Schur functors \( S_{\mu} \) associated to the partition \( \mu = (n-1, 1) \) of \( (n) \), which is the conjugate partition of \( \lambda \).

Let us now recall some the natural transformations between these functors:

**Proposition 2.1.** [15] Let \( A \) be a free abelian group and \( n \geq 2 \). The 4-term sequence

\[ 0 \to \mathcal{L}^n(A) \cap \mathcal{L}^2 \mathcal{L}^2(A) \to \mathcal{L}^n(A) \xrightarrow{p_n} A \otimes SP^{n-1}(A) \xrightarrow{r_n} SP^n(A) \to 0, \]

is exact, where \( r_n \) is the multiplication, and the map \( p_n \) is defined by

\[ p_n : [m_1, \ldots, m_n] \mapsto m_1 \otimes m_2 \ldots m_n - m_2 \otimes m_1 m_3 \ldots m_n, \text{ where } m_j \in A \ \forall j. \]

The projection

\[ \mathcal{L}^n(A) \longrightarrow J^n(A) \]

of \( \mathcal{L}^n(A) \) onto its image in \( A \otimes SP^{n-1}A \) will also be denoted \( p_n \), so that if we set

\[ \tilde{J}^n(A) := \mathcal{L}^n(A) \cap \mathcal{L}^2 \mathcal{L}^2(A), \]

the sequence (2.4) splits into a pair of short exact sequences

\[ 0 \longrightarrow \tilde{J}^n(A) \longrightarrow \mathcal{L}^n(A) \xrightarrow{p_n} J^n(A) \longrightarrow 0. \]

\[ 0 \longrightarrow J^n(A) \longrightarrow A \otimes SP^{n-1} \longrightarrow SP^n(A) \longrightarrow 0 \]

In particular,

\[ \mathcal{L}^2(A) \simeq \Lambda^2(A) \quad \text{and} \quad \mathcal{L}^3(A) \simeq J^3(A) \]

since \( \tilde{J}^n(A) \) is trivial for \( n = 2, 3 \).
abelian, the induced morphism from \(\Gamma\)

\[ f_n : SP^n(A) \rightarrow \otimes^n A \]  

\[ a_1 \ldots a_n \mapsto \sum_{\sigma \in \Sigma_n} a_{i_1} \otimes \cdots \otimes a_{i_n} \]  

(2.12)

\[ g_n : A^n(A) \rightarrow \otimes^n A \]  

\[ a_1 \wedge \cdots \wedge a_n \mapsto \sum_{\sigma \in \Sigma_n} \text{sign}(\sigma) a_{i_1} \otimes \cdots \otimes a_{i_n} \]  

(2.13)

\[ h_n : \Gamma_n(A) \rightarrow \otimes^n A \]  

\[ \gamma_{r_1}(a_1) \ldots \gamma_{r_k}(a_k) \mapsto \sum_{(i_1, \ldots, i_n)} a_{i_1} \otimes \cdots \otimes a_{i_n} \]  

(2.14)

In these definitions of \(f_n\) and \(g_n\), we have set \(i_j := \sigma(j)\), whereas the \((i_1, \ldots, i_n)\) in the definition of \(h_n\) range over the set of \(n\)-tuples of integers for which \(j\) occurs \(r_j\) times (\(1 \leq j \leq k\)). When \(A\) is free abelian, the induced morphism

\[ h_n : \Gamma_n(A) \rightarrow (\otimes^n A)^{\Sigma_n}, \]

from \(\Gamma_n(A)\) to the group of tensors invariant under the action of the symmetric group is an isomorphism for all \(n \geq 1\). By the universal property of the algebra \(\Gamma_n(A)\), \(h_n\) may also be characterized as the map determined by the divided power algebra structure on \(\otimes A := \oplus_n (\otimes^n A)\), where the product in this algebra is defined by the shuffle product, and the divided powers are characterized by the rule \(\gamma_n(a) := a \otimes \ldots \otimes a \in \otimes^n A\) for all \(a \in A\).

2.2. Derived functors. Let \(A\) be an abelian group, and \(F\) an endofunctor on the category of abelian groups. Recall that for every \(n \geq 0\) the derived functor of \(F\) in the sense of Dold-Puppe [21] are defined by

\[ L_i F(A, n) = \pi_i(FK P_s[n]), \quad i \geq 0 \]

where \(P_s \rightarrow A\) is a projective resolution of \(A\), and \(K\) is the Dold-Kan transform, inverse to the Moore normalization functor

\[ N : \text{Simpl}(\text{Ab}) \rightarrow C(\text{Ab}) \]

from simplicial abelian groups to chain complexes [17] Def. 8.3.6. We denote by \(LF(A, n)\) the object \(FK(P_s[n])\) in the homotopy category of simplicial abelian groups determined by \(FK(P_s[n])\), so that

\[ L_i F(A, n) = \pi_i(LF(A, n)). \]

We set \(LF(A) := LF(A, 0)\) and \(L_i F(A) := L_i F(A, 0)\) for any \(i \geq 0\). When the functor \(F\) is additive, the \(L_i F(A)\) are isomorphic by iterated suspension to \(L_{i+n} F(A, n)\) for all \(n\), and coincide with the usual derived functors of \(F\). As examples of these constructions, observe that the simplicial models \(LF(L \rightarrow M)\) of \(LFA\) and \(FK((L \rightarrow M)[1])\) of \(LF(A, 1)\) associated to the two-term flat resolution

\[ 0 \rightarrow L \xrightarrow{f} M \rightarrow A \rightarrow 0 \]  

(2.15)

of an abelian group \(A\) are respectively of the following form in low degrees:

\[ F(s_0(L) \oplus s_1(L) \oplus s_1 s_0(M)) \xrightarrow{\partial_0, \partial_1, \partial_2} F(L \oplus s_0(M)) \xrightarrow{\partial_0, \partial_1} F(M) \]  

(2.16)
where the component $F(M)$ is in degree zero, and
\[
F(s_0(L) \oplus s_1(L) \oplus s_2(L) \oplus s_1s_0(M) \oplus s_2s_0(M) \oplus s_2s_1(M)) \xrightarrow{\partial_0, \partial_1, \partial_2} F(L \oplus s_1(M) \oplus s_0(M)) \xrightarrow{\partial_0, \partial_1, \partial_2} F(M)
\] (2.17)
where the component $F(M)$ is in degree 1. It follows from the definition of homology that $L_i \mathbb{Z}(A, n) \simeq H_i(K(A, n); \mathbb{Z})$ for all $n$, where $K(A, n)$ is an Eilenberg-MacLane space associated to the abelian group $A$.

1. Derived functors of $\otimes^n$ \cite{37}. For $n \geq 1$, and abelian groups $A_1, \ldots, A_n$, we define\footnote{In \cite{36}, Mac Lane uses the notation $Trip(A_1, A_2, A_3)$ for the group $\text{Tor}_3(A_1, A_2, A_3)$ and $\text{Tor}(A_1, \ldots, A_n)$ for $\text{Tor}_{n-1}(A_1, \ldots, A_n)$.}
\[
\text{Tor}_i(A_1, \ldots, A_n) := H_i \left( A_1 \otimes \cdots \otimes A_n \right), \quad i \geq 0.
\]
where $A \otimes B$ is the derived tensor product of the abelian groups $A$ and $B$ in the derived category of abelian groups, as in \cite{47} §10.6. In particular,
\[
\text{Tor}_0(A_1, \ldots, A_n) \simeq A_1 \otimes \cdots \otimes A_n \quad \text{and} \quad \text{Tor}_i(A_1, \ldots, A_n) = 0 \quad i \geq n.
\]
One sets
\[
\text{Tor}(A_1, A_2) := \text{Tor}_1(A_1, A_2) \quad \text{and} \quad \text{Tor}^{(n)}(A) := \text{Tor}_{n-1}(A, \ldots, A) \quad (n \text{ copies of } A).
\]
While computations of such iterated Tor functors for specific abelian groups $A$ are elementary, an explicit functorial description of the multi-functors Tor$_i$ is more delicate. The functorial short exact sequence
\[
0 \to \text{Tor}(A_1, A_2) \otimes A_3 \to \text{Tor}_1(A_1, A_2, A_3) \to \text{Tor}(A_1 \otimes A_2, A_3) \to 0,
\]
splits unnaturally \cite{36, 37}. The Eilenberg-Zilber theorem determines natural isomorphisms
\[
L_i \otimes^n A \simeq \text{Tor}_i(A_1, \ldots, A), \quad i \geq 0.
\]
The group $\text{Tor}^{(n)}(A)$. It is generated by the $n$-linear expressions $\tau_h(a_1, \ldots, a_n)$ (where all $a_i$ live in the subgroup $h A$ of elements $a$ of $A$ for which $ha = 0$ ($h > 0$), subject to the so-called slide relations
\[
\tau_{hk}(a_1, \ldots, a_i, \ldots, a_n) = \tau_h(ka_1, \ldots, ka_{i-1}, a_i, k_{i+1}, \ldots, ka_n)
\] (2.18)
for all $i$ whenever $hka_i = 0$ for all $j \neq i$ and $ha_i = 0$. The associativity of the derived tensor product functor implies that there are canonical isomorphisms
\[
\text{Tor}^{(n)}(A) \simeq \text{Tor}(\text{Tor}^{(n-1)}(A), A), \quad n \geq 2.
\]
The description of derived functors $L_i \otimes^n A$ for a general $i$ follows from that of $\text{Tor}^{(n)}(A)$. For every abelian group $A$, $n \geq 1$, $1 \leq i \leq n - 1$, the group $L_i \otimes^n (A)$ is by \cite{37} the quotient:
\[
L_i \otimes^n (A) \simeq \text{Tor}^{[i+1]}(A) \otimes (\otimes^{n-i-1}(A))/\text{Jac}_{\otimes},
\]
where $\text{Jac}_{\otimes}$ is the subgroup of generalized Jacobi-type relations, generated by the elements
\[
\sum_{k=1}^{i+2} (-1)^k \tau_h(x_1, \ldots, x_k, \ldots, x_{i+2}) \otimes x_k \otimes x_{i+3} \otimes \cdots \otimes x_n
\]
for all $x_1, \ldots, x_n \in A$.

2. Derived functors of $SP^n$. The map $\otimes^n \rightarrow SP^n$ induces a natural epimorphism
\[
\text{Tor}^{(n)}(A) \rightarrow L_{n-1}SP^n(A)
\] (2.19)
which sends the generators \( \tau_h(a_1, \ldots, a_n) \) of \( \text{Tor}^{[n]}(A) \) to generators \( \beta_h(a_1, \ldots, a_n) \) of \( S_n(A) := L_{n-1}SP^n(A) \).

The kernel of this map is generated by the elements \( \tau_h(a_1, \ldots, a_n) \) with \( a_i = a_j \) for some \( i \neq j \). It is shown by Jean in [32] that

\[
L_iSP^n(A) \simeq (L_iSP^{n+1}(A) \otimes SP^{n-(i+1)}(A))/\text{Jac}_{SP},
\]

where \( \text{Jac}_{SP} \) is the subgroup generated by elements of the form

\[
\sum_{k=1}^{i+2} (-1)^k \beta_h(x_1, \ldots, \hat{x}_k, \ldots, x_{i+2}) \otimes x_k y_1 \cdots y_{n-i-2}.
\]

with \( x_i \in hA \) and \( y_j \in A \) for all \( i, j \). The filtration of \( \mathbb{Z}(A, n) \) by powers of the augmentation ideal determine a filtration on the homology groups \( H_r(K(A, n)) \), whose associated graded pieces are the \( L_rSP^n(A, n) \) [10].

3. Derived functors of \( \Lambda^n \). For any abelian group \( A \) and \( n \geq 1 \), we set

\[
\Omega_n(A) := L_{n-1}\Lambda^n(A).
\]

Consider the action of the symmetric group \( \Sigma_n \) on \( \text{Tor}^{[n]}(A) \), defined by

\[
\sigma \tau_h(a_1, \ldots, a_n) = \text{sign}(\sigma) \tau_h(a_{\sigma(1)}, \ldots, a_{\sigma(n)}),
\]

where \( ha_1 = \cdots = ha_n = 0 \), \( a_i \in A \), \( \sigma \in \Sigma_n \). We denote this action by \( \Sigma_n \). The natural transformations \( g_n \) induces functorial isomorphisms between \( \Omega_n(A) \) and the \( \Sigma_n \)-invariants in \( \text{Tor}^{[n]}(A) \) [10], [32] th. 2.3.3:

\[
\Omega_n(A) \simeq (\text{Tor}^{[n]}(A))^{\Sigma_n}.
\]

In particular, for all \( n > 0 \),

\[
\Omega_n(\mathbb{Z}/r) \simeq \mathbb{Z}/r.
\]

In addition, the morphisms \( \tau_h \) which describe the Tor functors now symmetrize to homomorphisms

\[
\lambda^n_h : \Gamma_n(hA) \to \Omega_n(A)
\]

for \( h \geq 1 \) and the group \( \Omega_n(A) \) is generated by the elements

\[
\omega^n_{i_1}(x_1) \ast \cdots \ast \omega^n_{i_k}(x_j) := \lambda^n_h(\gamma_{i_1}(x_1) \cdots \gamma_{i_k}(x_j))
\]

with \( i_k \geq 1 \) for all \( k \), and \( \sum_k i_k = n \). These satisfy relations which may be thought of, as in [10], as symmetrized versions of the slide relations (2.18). The following description of the derived functors \( L_i\Lambda^n \) is given in [32] Theorem 2.3.5:

\[
L_i\Lambda^n(A) \simeq (\Omega_{i+1}(A) \otimes \Lambda^{n-i-1}(A))/\text{Jac}_\Lambda.
\]

Here \( \text{Jac}_\Lambda \) is the subgroup generated by the expressions

\[
\sum_{k=1}^j \omega^n_{i_k}(x_1) \ast \cdots \ast \omega^n_{i_{k-1}}(x_k) \ast \cdots \ast \omega^n_{i_j}(x_j) \otimes x_k \wedge y_1 \wedge \ldots y_{n-i-2}
\]

for all \( h \), with \( \sum_{k=1}^j = i + 2 \). In particular, this implies that for any finite cyclic group \( A \),

\[
L_i\Lambda^n(A) = 0 \quad i \neq n - 1.
\]

4. Derived functors of \( \Gamma_n \). Not all is known about derived functors of the divided power functors. For an abelian group \( A \), the double décalage isomorphism (described in (2.41) below) determines a composite isomorphism

\[
L_1\Gamma_2(A) \simeq L_5SP^2(A, 2) \simeq H_5(K(A, 2), \mathbb{Z})
\]
so that $L_1\Gamma_2(A)$ is isomorphic to the functor $R(A)$ of Eilenberg-Mac Lane \[21\] \[21\] §22, defined as $(\text{Tor}(A, A) \oplus \Gamma_2(2A))/S,$ where $S$ is the subgroup generated by elements 
\[
\tau_h(x, x), \ x \in _hA, \ h \in \mathbb{N},
\gamma_2(x + y) - \gamma_2(x) - \gamma_2(y) - \tau_2(x, y), \ x, y \in 2A.
\]

More generally, we set 
\[
R_n(A) := L_{n-1}\Gamma_n(A),
\]
so that $R_2(A) = R(A)$, even though this is inconsistent with the notation in \[18\]. The sequence
\[
0 \rightarrow SP^2(A) \rightarrow \Gamma_2(A) \rightarrow A \otimes \mathbb{Z}/2,
\]
is exact for any abelian group $A$, and derives to the short exact sequence
\[
0 \rightarrow L_1SP^2(A) \rightarrow L_1\Gamma_2(A) \rightarrow \text{Tor}(A, \mathbb{Z}/2) \rightarrow 0.
\]

Analogous short exact sequences were obtained in \[32\] §3.1 for the functor $\Gamma_3$:
\[
0 \rightarrow L_1SP^3(A) \rightarrow L_1\Gamma_3(A) \rightarrow (\text{Tor}(A, \mathbb{Z}/2) \otimes A \otimes \mathbb{Z}/2) \oplus \text{Tor}(A, \mathbb{Z}/3) \rightarrow 0 \quad (2.27)
\]
\[
0 \rightarrow L_2SP^3(A) \rightarrow L_2\Gamma_3(A) \rightarrow (\text{Tor}(A, \mathbb{Z}/2) \otimes \text{Tor}(A, \mathbb{Z}/2)) \rightarrow 0
\]

2.3. Koszul complexes. (\[43\], \[31\] I (4.3.1.3)). Let $f : P \rightarrow Q$ be a homomorphism of abelian groups. For $n \geq 1$ and any $k = 0, \ldots, n - 1$ consider the maps
\[
\kappa_{k+1} : \Lambda^{k+1}(P) \otimes SP^{n-k-1}(Q) \rightarrow \Lambda^k(P) \otimes SP^{n-k}(Q)
\]
defined, for $p_i \in P$ and $q_j \in Q$, by:
\[
\kappa_{k+1} : p_1 \wedge \cdots \wedge p_{k+1} \otimes q_{k+2} \cdots q_n \mapsto \sum_{i=1}^{k+1} (-1)^{k+1-i} p_1 \wedge \cdots \wedge \delta_i \wedge \cdots \wedge p_{k+1} \otimes f(p_i) q_{k+2} \cdots q_n.
\]
The associated Koszul complex is defined by
\[
Kos_n(f) : \ 0 \rightarrow \Lambda^n(P) \xrightarrow{\kappa_1} \Lambda^{n-1}(P) \otimes Q \xrightarrow{\kappa_{n-1}} \cdots \rightarrow P \otimes SP^{n-1}(Q) \xrightarrow{\kappa_{1}} SP^n(Q) \rightarrow 0. \quad (2.28)
\]
Dually, one defines maps
\[
\kappa^{k+1} : \Gamma_{k+1}(P) \otimes \Lambda^{n-k-1}(Q) \rightarrow \Gamma_k(P) \otimes \Lambda^{n-k}(Q), \ k = 0, \ldots, n - 1
\]
by setting
\[
\kappa^{k+1} : \gamma_{r_1}(p_1) \cdots \gamma_{r_k}(p_k) \otimes q_1 \wedge \cdots \wedge q_{n-k-1} \mapsto \sum_{j=1}^{k} \gamma_{r_1}(p_1) \cdots \gamma_{r_{j-1}}(p_j) \cdots \gamma_{r_k}(p_k) \otimes f(p_j) q_1 \wedge \cdots \wedge q_{n-k-1} \quad (2.29)
\]
These maps determine a dual Koszul complex:
\[
Kos^n(f) : \ 0 \rightarrow \Gamma_n(P) \xrightarrow{\kappa^n} \Gamma_{n-1}(P) \otimes Q \xrightarrow{\kappa^{n-1}} \cdots \rightarrow P \otimes \Lambda^{n-1}(Q) \xrightarrow{\kappa_1} \Lambda^n(Q) \rightarrow 0. \quad (2.30)
\]
The complexes $Kos_n(f)$ and $Kos^n(f)$ are the total degree $n$ components of the Koszul complexes $\Lambda(P) \otimes SP(Q)$ and $\Gamma(P) \otimes \Lambda(Q)$ associated to a given homomorphism $f : P \rightarrow Q$. For a two-term flat resolution \[21\] \[15\] of an abelian group $A$, the complexes $Kos_n(f)$ and $Kos^n(f)$ represent the derived category objects $LSP^n(A)$ and $L\Lambda^n(A)$ respectively (see for example \[33\]). In particular, when $P$ is free abelian and $f$ the identity arrow, both complexes are acyclic.
For $n \geq 2$, the derived category object $LSP^{n-1}(A) \otimes A$ may be represented, for some 2-term flat resolution $f : L \to M$ of $A$, by the tensor product of $Kos_n(f)$ and $L \to M$, in other words as a total complex associated to the bicomplex

\[
\begin{array}{c}
\Lambda^{n-1}(L) \otimes L & \cdots & L \otimes SP^{n-2}(M) \otimes L & SP^{n-1}(M) \otimes L \\
\Lambda^{n-1}(L) \otimes M & \cdots & L \otimes SP^{n-2}(M) \otimes M & SP^{n-1}(M) \otimes M
\end{array}
\]

The map in this diagram is a Koszul complex for the functors $\text{com}$, represented by the following diagram of (horizontal) complexes:

\[
\begin{array}{c}
Y^n(L) & \cdots & L \otimes SP^{n-1}(M) \otimes M & J^n(M) \\
\Lambda^{n-1}(L) \otimes L & \cdots & L \otimes SP^{n-2}(M) \otimes M & SP^{n-1}(M) \otimes M \\
\Lambda^n(L) & \cdots & L \otimes SP^{n-1}(M) & SP^n(M)
\end{array}
\]

The upper line

\[
Y^n(L) & \cdots & L \otimes SP^{n-1}(M) \otimes M & J^n(M)
\]

in this diagram is a Koszul complex for the functors $J^n$ and $Y^n$. A similar diagram, whose lower line is the dual Koszul complex \((2.30)\) for $n = 3$ is described in appendix \(A\) below. For Koszul complexes associated to more general Schur functors, see \[34\] lemma 1.9.1, \[1\].

2.4. Pensions and décalage. Consider the homomorphisms \((7) 7.4\)

\[
\begin{align*}
\eta_n : \Lambda^n(A) \otimes \Lambda^n(B) & \to SP^n(A \otimes B), \\
\nu_n : \Gamma_n(A) \otimes SP^n(B) & \to SP^n(A \otimes B).
\end{align*}
\]

These are characterized as the unique homomorphisms for which the corresponding diagrams

\[
\begin{array}{ccc}
\Lambda^n(A) \otimes \Lambda^n(B) & \xrightarrow{\eta_n} & SP^n(A \otimes B) \\
g_0 \otimes g_0 & \downarrow & f_n \\
(\otimes^n(A)) \otimes (\otimes^n(B)) & \xrightarrow{\lambda_n} & \otimes^n(A \otimes B)
\end{array}
\quad
\begin{array}{ccc}
\Gamma_n(A) \otimes SP^n(B) & \xrightarrow{\nu_n} & SP^n(A \otimes B) \\
h_n \otimes f_n & \downarrow & f_n \\
(\otimes^n(A)) \otimes (\otimes^n(B)) & \xrightarrow{\lambda_n} & \otimes^n(A \otimes B)
\end{array}
\]

commutes, with $\lambda_n$ defined by

\[
\lambda_n : (a_1 \otimes \cdots \otimes a_n) \otimes (b_1 \otimes \cdots \otimes b_n) \mapsto (a_1 \otimes b_1) \otimes \cdots \otimes (a_n \otimes b_n), \ a_i \in A, \ b_i \in B.
\]

The map $\eta_n$ is explicitly given by the formula

\[
(a_1 \wedge \cdots \wedge a_n) \otimes (b_1 \wedge \cdots \wedge b_n) \mapsto \sum_{\sigma \in \Sigma_n} \text{sign}(\sigma)(a_1 \otimes b_{\sigma(1)}) \cdots (a_n \otimes b_{\sigma(n)}).
\]

It is shown in \[7\] 7.6 that for any free simplicial abelian group $X$, the maps $\eta_n$ and $\nu_n$ induce the isomorphisms of homotopy groups

\[
\begin{align*}
\pi_i(\Lambda^n(X) \otimes \Lambda^n K(Z, 1)) & \to \pi_i(SP^n(X \otimes K(Z, 1))), \ i \geq 0, \\
\pi_i(\Gamma_n(X) \otimes SP^n K(Z, 2)) & \to \pi_i(SP^n(X \otimes K(Z, 2))), \ i \geq 0.
\end{align*}
\]
so that there are natural isomorphisms

\[ L\Lambda^n(A, m) \otimes L\Lambda^n(\mathbb{Z}, 1) \simeq LSP^n(A, m + 1), \]

\[ L\Gamma_n(A, m) \otimes LSP^n(\mathbb{Z}, 2) \simeq LSP^n(A, m + 2). \]

in the derived category. These derived pairings induce for \( n \geq 1 \), by adjunction with the volume element \( n \)-cycle in \( \Lambda^n(\mathbb{Z}, 1)_n = \Lambda^n(\mathbb{Z}^n) \) and the corresponding element in \( SP^n(\mathbb{Z}, 2) \) respectively, a pair of functorial pension morphisms

\[ L\Lambda^j(A, n)[j] \to LSP^j(A, n + 1) \quad (2.37) \]

\[ L\Gamma^j(A, n)[j] \to L\Lambda^j(A, n + 1) \quad (2.38) \]

in the derived category. The maps induced on homotopy groups are are of the form

\[ L_i\Lambda^j(A, n) \simeq L_{i+j}SP^j(A, n + 1) \quad (2.39) \]

\[ L_i\Gamma_j(A, n) \simeq L_{i+j}\Lambda^j(A, n + 1) \quad (2.40) \]

The inverses of these maps are iterated boundary maps arising from the exactness of the Koszul complexes and are known as décalage isomorphisms [31] I 4.3.2. Composing the last two determines a double décalage isomorphism:

\[ L_i\Gamma_j(A, n) \simeq L_{i+j}SP^j(A, n + 2). \quad (2.41) \]

Similarly, it follows from the existence of Koszul sequences of type (2.32) that there exist décalage isomorphisms

\[ L_iY^j(A, n) \simeq L_{i+j}J^j(A, n + 1) \quad (2.42) \]

between the derived functor of \( J^j \) and \( Y^j \) for all \( j, n \geq 0 \).

3. The de Rham complex and its dual

Let \( A \) be an abelian group. For \( n \geq 1 \), let \( D^n(A) \) and \( C^n(A) \) be the complexes of abelian groups defined by

\[ D^n_i(A) = SP^n(A) \otimes \Lambda^{n-i}(A), \quad 0 \leq i \leq n, \]

\[ C^n_i(A) = \Lambda^i(A) \otimes \Gamma_{n-i}(A), \quad 0 \leq i \leq n, \]

where the differentials \( d^i : D^n_i(A) \to D^n_{i-1}(A) \) and \( d_i : C^n_i(A) \to C^n_{i-1}(A) \) are:

\[ d^i((b_1 \ldots b_i) \otimes b_{i+1} \wedge \cdots \wedge b_n) = \sum_{k=1}^i (b_1 \ldots \hat{b}_k \ldots b_i) \otimes b_k \wedge b_{i+1} \wedge \cdots \wedge b_n \]

\[ d_i(b_1 \wedge \cdots \wedge b_i \otimes X) = \sum_{k=1}^i (-1)^k b_1 \wedge \cdots \hat{b}_k \wedge \cdots \wedge b_i \otimes b_k X \]

for any \( X \in \Gamma_{n-i}(A) \). The complex \( D^n(A) \) is the degree \( n \) component of the classical de Rham complex, first introduced in the present context of polynomial functors in [27] and denoted \( \Omega_n \) in [28]. The dual complexes \( C^n(A) \) were considered in [32]. We will call them the dual de Rham complexes.

We will now give a functorial description of certain homology groups of these complexes \( C^n(A) \).

**Proposition 3.1.** Let \( A \) be a free abelian. Then

(1) [28] For any prime number \( p \), \( H_0C^p(A) = A \otimes \mathbb{Z}/p \), and \( H_iC^p(A) = 0 \), for all \( i > 0 \);
(2) There is a natural isomorphism

\[ H_0C^n(A) \simeq \bigoplus_{p|n, \ p \ \text{prime}} \Gamma_{n/p}(A \otimes \mathbb{Z}/p). \]

A proof of proposition 3.1 (2) is given in [41].

The higher homology groups \( H_iC^n(A) \) are more complicated. The following table, which is a consequence of the main theorem in [41], gives a complete description of \( H_iC^n(A) \) for \( n \leq 7 \) and \( A \) free abelian:

| \( n \) | \( H_0C^n(A) \) | \( H_1C^n(A) \) | \( H_2C^n(A) \) | \( H_3C^n(A) \) |
|---|---|---|---|---|
| 8 | \( \Gamma_4(A \otimes \mathbb{Z}/2) \) | * | * | * |
| 7 | \( A \otimes \mathbb{Z}/7 \) | 0 | 0 | 0 |
| 6 | \( \Gamma_2(A \otimes \mathbb{Z}/3) \oplus \Gamma_3(A \otimes \mathbb{Z}/2) \) | \( \Lambda^2(A \otimes \mathbb{Z}/3) \oplus \mathcal{L}^3(A \otimes \mathbb{Z}/2) \) | \( \Lambda^3(A \otimes \mathbb{Z}/2) \) | 0 |
| 5 | \( A \otimes \mathbb{Z}/5 \) | 0 | 0 | 0 |
| 4 | \( \Gamma_2(A \otimes \mathbb{Z}/2) \) | \( \Lambda^2(A \otimes \mathbb{Z}/2) \) | 0 | 0 |
| 3 | \( A \otimes \mathbb{Z}/3 \) | 0 | 0 | 0 |
| 2 | \( A \otimes \mathbb{Z}/2 \) | 0 | 0 | 0 |

Table 1.

For example, the isomorphism

\[ f : \Lambda^2(A \otimes \mathbb{Z}/2) \to H_1C^4(A) \] (3.1)

is defined, for representatives \( a, b \in A \) of \( \bar{a}, \bar{b} \in A \otimes \mathbb{Z}/2 \), by

\[ f : \bar{a} \otimes \bar{b} \mapsto a \otimes a \gamma_2(b) - b \otimes b \gamma_2(a). \]

3.1. Comparing the de Rham and Koszul complexes. For any free abelian group \( A \), consider the following natural monomorphism of complexes:

\[
\begin{align*}
\text{Kos}_n(A) : & \quad \Lambda^n(A) \hookrightarrow \Lambda^{n-1}(A) \otimes A \quad \cdots \quad A \otimes SP^{n-1}(A) \quad SP^n(A) \\
\text{C}^n(A) : & \quad \Lambda^n(A) \hookrightarrow \Lambda^{n-1}(A) \otimes A \quad \cdots \quad A \otimes \Gamma_{n-1}(A) \quad \Gamma_n(A)
\end{align*}
\] (3.2)

Let us denote the cokernel of this map by \( D^n(A) \). We have

\[ D^n(A) : \quad \Lambda^{n-2}(A) \otimes W_2(A) \to \Lambda^{n-3}(A) \otimes W_3(A) \to \cdots \to A \otimes W_{n-1}(A) \to W_n(A) \]

where

\[ W_n(A) = \text{coker}\{SP^n(A) \to \Gamma_n(A)\} \]

Since Koszul complex is acyclic, it follows that

\[ H_iC^n(A) \simeq H_iD^n(A), \ n \geq 0. \]

Proposition 3.1 implies that the sequence:

\[ 0 \to A \otimes A \otimes \mathbb{Z}/2 \to W_3(A) \to A \otimes \mathbb{Z}/3 \to 0 \] (3.3)

is exact (and splits naturally). For every \( n \geq 2, \ m \geq 0 \), we obtain the natural exact sequence:

\[ 0 \to LSP^n(A, m) \to L\Gamma_n(A, m) \to LW_n(A, m) \to 0 \] (3.4)
Passing to homotopy groups and applying the décalage isomorphisms \((2.39), (2.40)\), this yields the long exact sequence

\[
\cdots \to L_i SP^n(A, m) \to L_{i+2n} SP^n(A, m+2) \to L_i W_n(A, m) \to
L_{i-1} SP^n(A, m) \to L_{i+2n} SP^n(A, m+2) \to L_{i-1} W_n(A, m) \to \cdots
\tag{3.5}
\]

Let \(X\) be a free abelian simplicial group and \(k \geq 1, n \geq 2\) be integers. If \(\pi_i(X) = 0, i < k\), then by \([21]\), Satz 12.1

\[
\pi_i(SP^n(X)) = 0, \begin{cases} 
\text{for } i < n, \text{ when } k = 1, \\
\text{for } i < k + 2n - 2, \text{ provided } k > 1.
\end{cases}
\tag{3.6}
\]

We will make use of exact sequence \((4.3)\) and of the assertion \((3.6)\) in order to compute derived functors of polynomial functors of low degrees.

4. Derived functors of quadratic functors

For every abelian group \(A\), the exactness of the sequence \((2.26)\) implies that \(W_2(A) \simeq A \otimes \mathbb{Z}/2\). Since this functor is additive, it follows immediately that

\[
L_i W_2(A, m) \simeq \begin{cases} 
A \otimes \mathbb{Z}/2, & i = m \\
\text{Tor}(A, \mathbb{Z}/2), & i = m + 1 \\
0, & i \neq m, m + 1
\end{cases}
\]

for all \(m\). Let us define a new functor \(\Lambda^2(A)\) by:

\[
\Lambda^2(A) := \Lambda^2(A) \oplus \text{Tor}(A, \mathbb{Z}/2).
\tag{4.1}
\]

The long exact sequence \((3.5)\), the connectivity result \((3.6)\), and the décalage formulas \((2.39)\) and \((2.40)\) produce the following complete description of the derived functors of the symmetric power functor \(SP^2\).

**Proposition 4.1.**

\[
L_i SP^2(A, n) = \begin{cases} 
SP^2(A), & i = 0, n = 0 \\
S_2(A), & i = 1, n = 0 \\
\Lambda^2(A), & i = 2, n = 1 \\
A \otimes \mathbb{Z}/2, & i = n + 2, n + 4, \ldots, n + 2\left\lfloor \frac{n-1}{2} \right\rfloor \\
\text{Tor}(A, \mathbb{Z}/2), & i = n + 3, n + 5, \ldots, n + 2\left\lfloor \frac{n-1}{2} \right\rfloor + 1, i \neq 2n \\
\Gamma_2(A), & i = 2n, n \neq 0 \text{ even} \\
\lambda^2(A), & i = 2n, n \neq 1 \text{ odd} \\
R_2(A), & i = 2n + 1, n \neq 0 \text{ even} \\
\Omega_2(A), & i = 2n + 1, n \text{ odd} \\
0, & \text{for all other } i.
\end{cases}
\]

We will only sketch the proof of this computation in the present quadratic situation, and will discuss the more elaborate case of cubical functors in the following section. These quadratic results were also obtained in \([2]\) §4 by a different method (see also \([11]\) §A.15).

**Proof:** The first two equations follow from the definitions. By double décalage \((2.41)\), there is an iterated isomorphism

\[
\Gamma_2(A) = L_0 \Gamma_2(A, 0) \simeq L_4 SP^2(A, 2)
\]

which determines the sixth equation above for \(n = 2\). The general case of the sixth equation then follows by induction when we consider the isomorphism \(L_{2n} SP^2(A, n) \simeq L_{2n+2} SP^2(A, n + 2)\) from \((3.5)\) for \(n\) even. Décalage also implies that

\[
\Lambda^2 A \simeq L_2 SP^2(A, 1)
\]
and the sequence (3.4) then determines a short exact sequence

$$0 \to L_2 SP^2(A, 1) \to L_2 \Gamma_2(A, 1) \to \text{Tor}(A, \mathbb{Z}/2) \to 0$$

Consider the following diagram, in which the vertical arrows are the suspension maps:

$\begin{array}{cccc}
0 & \rightarrow & L_1 SP^2 A & \rightarrow & L_1 \Gamma_2(A) & \rightarrow & \text{Tor}(A, \mathbb{Z}/2) & \rightarrow & 0 \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
0 & \rightarrow & L_2 SP^2(A, 1) & \rightarrow & L_2 \Gamma_2(A, 1) & \rightarrow & \text{Tor}(A, \mathbb{Z}/2) & \rightarrow & 0
\end{array}$

The left-hand vertical arrow is trivial by [21] corollary 6.6, since all elements of $L_1 SP^2 A$ are in the image of the arrow (2.19) $(n = 2)$. The lower sequence is therefore split since it is a pushout by the trivial map, and a diagram chase makes it clear that this splitting is functorial. This proves the seventh equation in proposition (4.1) for $n = 3$ by the double décalage isomorphism

$$L_2 \Gamma_2(A, 1) \simeq L_6 SP^2(A, 3)$$

The general case of the sixth equation now follows by induction since (3.4) and décalage imply that

$$L_i SP^2(A, n) \simeq L_i \Gamma_2(A, n) \simeq L_{i+4} SP^2(A, n + 2)$$

for all $n$. A similar discussion, in the next degree, shows that the seventh and eight equations are also satisfied. The remaining fourth and fifth equations are proved by considering once more the sequence (3.5), and observing that the functors $L_i SP^2(A, n)$ vanish by [21] whenever $i$ is sufficiently large. □

As a corollary, one finds that this computation (and even the inductive reasoning that led to it) can be carried over by the décalage isomorphisms (2.39), (2.41) to the derived functors of $\Lambda^2$ and $\Gamma_2$. We simply state the result:

$$L_1 \Lambda^2(A, n) = \begin{cases} 
\Lambda^2(A), & i = 0, \ n = 0, \\
A \otimes \mathbb{Z}/2, & i = n + 1, n + 3, \ldots, n + 2\left[\frac{n-1}{2}\right] + 1, \ i \neq 2n \\
\text{Tor}(A, \mathbb{Z}/2), & i = n + 2, n + 4, \ldots, n + 2\left[\frac{n-1}{2}\right] \\
\Gamma_2(A), & i = 2n, \ n \ odd \\
\lambda^2(A), & i = 2n, \ n \neq 0 \ even \\
R_2(A), & i = 2n + 1, \ n \ odd \\
\Omega_2(A), & i = 2n + 1, \ n \ even \\
0 & \text{for all other } i.
\end{cases}$$

(4.2)

$$L_1 \Gamma_2(A, n) = \begin{cases} 
A \otimes \mathbb{Z}/2, & i = n, n + 2, \ldots, n + 2\left[\frac{n-1}{2}\right], \ n > 0 \\
\text{Tor}(A, \mathbb{Z}/2), & i = n + 1, n + 3, \ldots, n + 2\left[\frac{n-1}{2}\right] + 1, \ n > 0, \ i \neq 2n \\
\Gamma_2(A), & i = 2n, \ n \ even \\
\lambda^2(A), & i = 2n, \ n \ odd \\
R_2(A), & i = 2n + 1, \ n \ even \\
\Omega_2(A), & i = 2n + 1, \ n \ odd \\
0 & \text{for all other } i.
\end{cases}$$

(4.3)

5. THE DERIVED FUNCTORS OF CERTAIN CUBICAL FUNCTORS

It follows from (3.3) that

$$W_3(A) = (A \otimes A \otimes \mathbb{Z}/2) \oplus (A \otimes \mathbb{Z}/3),$$

(5.1)
and this derives to an isomorphism
\[ LW_3(A) \simeq (A \otimes A \otimes \mathbb{Z}/2) \oplus (A \otimes \mathbb{Z}/3) \]  
(5.2)
in the derived category, from which the values of \( L_iW_3(A) \) follow immediately (consistently with the two equations \([2,27]\)). This implies that
\[ L_iW_3(A, 1) = \begin{cases} A \otimes \mathbb{Z}/3, & i = 1 \\ A \otimes A \otimes \mathbb{Z}/2 \oplus \text{Tor}(A, \mathbb{Z}/3), & i = 2 \\ \text{Tor}_1(A, A, \mathbb{Z}/2), & i = 3 \\ \text{Tor}_2(A, A, \mathbb{Z}/2), & i = 4 \\ 0, & \text{for all other } i \end{cases} \]  
(5.3)
and, for \( n > 1 \):
\[ L_iW_3(A, n) = \begin{cases} A \otimes \mathbb{Z}/3, & i = n \\ \text{Tor}(A, \mathbb{Z}/3), & i = n + 1 \\ A \otimes A \otimes \mathbb{Z}/2, & i = 2n, \\ \text{Tor}_1(A, A, \mathbb{Z}/2), & i = 2n + 1, \\ \text{Tor}_2(A, A, \mathbb{Z}/2), & i = 2n + 2, \\ 0, & \text{for all other } i \end{cases} \]  
(5.4)

We will now use this computation in order to determine the derived functors of \( SP^3 \) in all degrees. Let \( X \) be a free abelian simplicial group. The natural map of simplicial groups
\[ E : SP^3(X) \otimes K(\mathbb{Z}, 2) \to SP^3(X \otimes K(\mathbb{Z}, 2)) \]
induces the pairing map \([8]\):
\[ \epsilon_3 : \pi_iSP^3(X) \otimes H_6K(\mathbb{Z}, 2) \to \pi_{i+6}SP^3(X \otimes K(\mathbb{Z}, 2)) \]
Observe that the following diagram is commutative:
\[
\begin{array}{ccc}
\pi_iSP^3(X) & \xrightarrow{\epsilon_3} & \pi_{i+6}SP^3(X \otimes K(\mathbb{Z}, 2)) \\
\downarrow & & \downarrow \\
\pi_i\Gamma_3(X) & \xrightarrow{\simeq} & \pi_{i+6}(\Gamma_3(X) \otimes SP^3K(\mathbb{Z}, 2))
\end{array}
\]
where the right hand vertical arrow is the homomorphism \([2,30]\). It follows from \((5.5), (5.3)\) and \((5.4)\) that the maps
\[ \epsilon_3 : L_iSP^3(A, n) \to L_{i+6}SP^3(A, n + 2) \]
are isomorphisms for \( i \neq n - 1, n, n + 1, n + 2, 2n - 1, 2n, 2n + 1, 2n + 2 \). In addition the sequence
\[
0 \to L_{2n+2}SP^3(A, n) \to L_{2n+8}SP^3(A, n + 2) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \to \\
L_{2n+1}SP^3(A, n) \to L_{2n+7}SP^3(A, n + 2) \to \text{Tor}_1(A, A, \mathbb{Z}/2) \to \\
L_{2n}SP^3(A, n) \to L_{2n+6}SP^3(A, n + 2) \to A \otimes A \otimes \mathbb{Z}/2 \to \\
L_{2n-1}SP^3(A, n) \to L_{2n+5}SP^3(A, n + 2) \quad (5.5)
\]
is exact by \([5,5]\). Furthermore, for \( n > 1 \),
\[ L_{n+7}SP^3(A, n + 2) \simeq \text{Tor}(A, \mathbb{Z}/3) \]
\[ L_{n+6}SP^3(A, n + 2) \simeq A \otimes \mathbb{Z}/3 \]
by (3.6). Finally, according to [8] corollary 4.3, the pension maps

\[ \varepsilon_3 : L_1 SP^3(A, n) \to L_{i+6} SP^3(A, n+2) \]

are split injections, for all \( i \geq 0 \) and all \( n > 1 \). The long exact sequence (5.5) therefore decomposes for \( n > 1 \) into short exact sequences:

\[
0 \to L_{2n+2} SP^3(A, n) \to L_{2n+8} SP^3 K(A, n+2) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \to 0
\]

\[
0 \to L_{2n+1} SP^3(A, n) \to L_{2n+7} SP^3 K(A, n+2) \to \text{Tor}_1(A, A, \mathbb{Z}/2) \to 0
\]

and \( 0 \to L_{2n} SP^3(A, n) \to L_{2n+6} SP^3(A, n+2) \to A \otimes A \otimes \mathbb{Z}/2 \to 0 \)

and an isomorphism

\[ L_{2n+5} SP^3(A, n+2) \simeq L_{2n-1} SP^3(A, n). \]

**Example 5.1.** Since the values taken by the derived functors of \( W_3 \) in (5.3) and (5.4) are distinct, we must consider the implications of (5.3) separately. Observe that exact sequence (5.5) and the equations (5.3) imply that

\[
L_{11} SP^3(A, 3) = \Omega_3(A),
\]

\[
L_{8} SP^3(A, 3) = A \otimes A \otimes \mathbb{Z}/2 \oplus \text{Tor}(A, \mathbb{Z}/3),
\]

\[
L_{7} SP^3(A, 3) = A \otimes \mathbb{Z}/3,
\]

and that the groups \( L_i SP^3(A, 3) \) for \( i = 9, 10 \) live in the long exact sequence

\[
0 \to L_1 \Lambda^3(A) \to L_{10} SP^3(A, 3) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \xrightarrow{\partial} \Lambda^3(A) \xrightarrow{\varepsilon_3} L_9 SP^3(A, 3) \to \text{Tor}_1(A, A, \mathbb{Z}/2) \to 0. \quad (5.6)
\]

The diagram

\[
\begin{array}{ccc}
\Lambda^3(A) & \xrightarrow{g_3} & \otimes^3(A) \\
\downarrow & & \downarrow \\
L_3 SP^3(A, 1) & \xrightarrow{h_3} & L_3 \otimes^3(A, 1)
\end{array}
\]

commutes, where the left-hand vertical arrow is the map (2.39), and the right-hand one the corresponding obvious décalage map for tensor powers. It follows that the composite map

\[ \varepsilon_3 : \Lambda^3 A \to L_3 \Gamma_3(A, 1) \simeq L_9 SP^3(A, 3) \]

is injective so that the boundary map \( \partial \) in (5.6) is trivial. The complete description of the \( L_i SP^3(A, 3) \) is therefore given by

\[
L_i SP^3(A, 3) = \begin{cases} 
\Omega_3(A), & i = 11 \\
A \otimes A \otimes \mathbb{Z}/2 \oplus \text{Tor}(A, \mathbb{Z}/3), & i = 8 \\
A \otimes \mathbb{Z}/3, & i = 7 \\
0, & i \neq 7, 8, 9, 10, 11
\end{cases}
\]

and the exactness of the sequences

\[
0 \to L_1 \Lambda^3(A) \to L_{10} SP^3(A, 3) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \to 0
\]

\[
0 \to \Lambda^3(A) \to L_9 SP^3(A, 3) \to \text{Tor}_1(A, A, \mathbb{Z}/2) \to 0.
\]

The discussion in example 5.1 does not only apply to the derived functors \( L_i SP^3(A, n) \) with \( n = 3 \). The corresponding assertion for a general \( n \) is the following one:
Theorem 5.1. Case I: $n \geq 3$ is odd.

\[ L_i SP^3(A, n) = \begin{cases} 
A \otimes \mathbb{Z}/3, & n + 4 \leq i < 2n + 2, \ i - n \equiv 0 \mod 4 \\
\text{Tor}(A, \mathbb{Z}/3), & n + 4 \leq i < 2n + 2, \ i - n \equiv 1 \mod 4 \\
A \otimes A \otimes \mathbb{Z}/2, & i = 2n + 2, \ n \equiv 1 \mod 4, \\
\text{Tor}(A, \mathbb{Z}/3) \oplus A \otimes A \otimes \mathbb{Z}/2, & i = 2n + 2, \ n \equiv 3 \mod 4, \\
\text{Tor}_1(A, A, \mathbb{Z}/2), & 2n + 3 \leq i \leq 3n - 2, \ i - n \equiv 2 \mod 4, \\
A \otimes \mathbb{Z}/3 \oplus \text{Tor}_1(A, A, \mathbb{Z}/2), & 2n + 3 \leq i \leq 3n - 2, \ i - n \equiv 0 \mod 4, \\
\Omega_3(A), & i = 3n + 2, \\
0, & \text{for all other } i. 
\end{cases} \]

In addition, the following sequences are exact:

\[ 0 \to \text{Tor}(A, \mathbb{Z}/3) \oplus A \otimes A \otimes \mathbb{Z}/2 \to L_i SP^3(A, 3) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \to 0, \]

\[ 0 \to A \otimes A \otimes \mathbb{Z}/2 \to L_i SP^3(A, n) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \to 0, \]

\[ 0 \to L_i \Lambda^3(A) \to L_{3n+1} SP^3(A, n) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \to 0, \]

\[ 0 \to \Lambda^3(A) \to L_{3n} SP^3(A, n) \to \text{Tor}_1(A, A, \mathbb{Z}/2) \to 0. \]

Case II: $n > 3$ is even.

\[ L_i SP^3(A, n) = \begin{cases} 
A \otimes \mathbb{Z}/3, & n + 4 \leq i < 2n + 2, \ i - n \equiv 0 \mod 4 \\
\text{Tor}(A, \mathbb{Z}/3), & n + 4 \leq i < 2n + 2, \ i - n \equiv 1 \mod 4 \\
A \otimes A \otimes \mathbb{Z}/2, & i = 2n + 2, \ n \equiv 0 \mod 4, \\
A \otimes \mathbb{Z}/3 \oplus A \otimes A \otimes \mathbb{Z}/2, & i = 2n + 2, \ n \equiv 2 \mod 4, \\
\text{Tor}(A, \mathbb{Z}/3) \oplus \text{Tor}_1(A, A, \mathbb{Z}/2), & 2n + 3 \leq i \leq 3n - 1, \ i - n \equiv 1 \mod 4, \\
\text{Tor}_1(A, A, \mathbb{Z}/2), & 2n + 3 \leq i \leq 3n - 1, \ i - n \equiv 3 \mod 4, \\
L_1 \Gamma_3(A), & i = 3n + 1, \\
R_3(A), & i = 3n + 2, \\
0, & \text{for all other } i. 
\end{cases} \]

In addition, the following sequences are exact:

\[ 0 \to A \otimes \mathbb{Z}/3 \oplus A \otimes A \otimes \mathbb{Z}/2 \to L_i SP^3(A, n) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \to 0, \]

\[ 2n + 4 \leq i \leq 3n - 2, \ i - n \equiv 0 \mod 4 \]

\[ 0 \to A \otimes A \otimes \mathbb{Z}/2 \to L_i SP^3(A, n) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \to 0, \]

\[ 2n + 4 \leq i \leq 3n - 2, \ i - n \equiv 2 \mod 4 \]

\[ 0 \to \Gamma_3(A) \to L_{3n} SP^3(A, n) \to \text{Tor}_2(A, A, \mathbb{Z}/2) \to 0. \]

The corresponding description of the derived functors of $\Lambda^3$ and $\Gamma_3$ now follow by the décalage isomorphisms (2.59), (2.40).

6. Some derived functors of $SP^4$.

We will now make use of the computation of the homology of the dual de Rham complex $C^4(A)$ in proposition [3,1] in order to investigate some of the derived functors of $SP^4$. For $A$ a free abelian
group, we now consider the following diagram with exact rows and columns, which extends diagram (3.2) when \( n = 4 \):

\[
\begin{array}{cccccccccccc}
\Lambda^4(A) & \longrightarrow & \Lambda^3(A) \otimes A & \longrightarrow & \Lambda^2(A) \otimes SP^2(A) & \longrightarrow & A \otimes SP^3(A) & \longrightarrow & SP^4(A) \\
\Lambda^4(A) & \longrightarrow & \Lambda^3(A) \otimes A & \longrightarrow & \Lambda^2(A) \otimes \Gamma_2(A) & \longrightarrow & A \otimes \Gamma_3(A) & \longrightarrow & \Gamma_4(A) \\
\Lambda^2(A) \otimes A \otimes \mathbb{Z}/2 & \longrightarrow & A \otimes W_3(A) & \longrightarrow & W_4(A)
\end{array}
\]

By proposition 3.1 this determines a functorial diagram of exact sequences

\[
\begin{array}{c}
SP^2(A) \otimes A \otimes \mathbb{Z}/2 \\
H_1D^4(A) \longrightarrow (A \otimes W_3(A)) / \text{im}(\lambda) \longrightarrow W_4(A) \longrightarrow \Gamma_2(A \otimes \mathbb{Z}/2) \\
A \otimes A \otimes \mathbb{Z}/3
\end{array}
\] (6.1)

The map (3.1) defines canonical isomorphisms

\[H_1D^4(A) \simeq H_1C^4(A) \simeq \Lambda^2(A \otimes \mathbb{Z}/2) \simeq L_1SP^2(A \otimes \mathbb{Z}/2).\]

Let us define a map

\[\delta : \Lambda^2(A \otimes \mathbb{Z}/2) \rightarrow SP^2(A) \otimes A \otimes \mathbb{Z}/2 \subset (A \otimes W_3(A)) / \text{im}(\lambda)\]

as follows, where \( a, b \) are representatives in \( A \) of the classes \( \bar{a} \) and \( \bar{b} \):

\[\delta : \bar{a} \wedge \bar{b} \mapsto a a \otimes \bar{b} - b b \otimes \bar{a}, \ a, b \in A, \ \bar{a}, \bar{b} \in A \otimes \mathbb{Z}/2.\]

It follows from this discussion that diagram (6.1) induces a short exact sequence

\[0 \rightarrow \frac{SP^2(A) \otimes A \otimes \mathbb{Z}/2}{A^2(A \otimes \mathbb{Z}/2)} \oplus A \otimes A \otimes \mathbb{Z}/3 \rightarrow W_4(A) \rightarrow \Gamma_2(A \otimes \mathbb{Z}/2) \rightarrow 0.\]

The filtration on \( \Gamma_4(A) \) provided by this description of \( W_4(A) \) is consistent with that in [32] proposition 3.1.2. Together with long exact sequence (3.3), it allows one to compute derived functors of the functor \( SP^4 \) by comparing them to those of \( \Gamma_4 \) and taking into account the double décalage. For example, one finds:

\[L_0SP^4(A, 3) \simeq A \otimes \mathbb{Z}/2,\]
\[L_{10}SP^4(A, 3) \simeq A \otimes A \otimes \mathbb{Z}/3 \oplus \Lambda^2(A \otimes \mathbb{Z}/2) \oplus \text{Tor}(A, \mathbb{Z}/2),\]
\[L_{10}SP^4(A, 4) \simeq A \otimes \mathbb{Z}/2,\]
\[L_{11}SP^4(A, 4) \simeq \text{Tor}(A, \mathbb{Z}/2).\]

### 7. Lie and super-Lie functors

We will now consider the structure theory of Lie and super-Lie functors.

#### 7.1. The third Lie functor

For any free abelian group \( A \), consider the Koszul resolution:

\[0 \rightarrow \Lambda^3(A) \rightarrow \Lambda^2(A) \otimes A \overset{f}{\rightarrow} A \otimes SP^2(A) \rightarrow SP^3(A) \rightarrow 0,\] (7.1)

in which the map \( f \) is defined by

\[f : a \wedge b \otimes c \mapsto a \otimes bc - b \otimes ac, \ a, b, c \in A.\]

It decomposes as

\[\Lambda^2(A) \otimes A \overset{u}{\longrightarrow} A \otimes A \otimes A \overset{v}{\longrightarrow} A \otimes SP^2(A)\] (7.2)
where
\[ u : a \land b \otimes c \mapsto a \otimes b \otimes c - b \otimes a \otimes c - c \otimes a \otimes b + c \otimes b \otimes a, \tag{7.3} \]
\[ v : a \otimes b \otimes c \mapsto a \otimes bc, \quad a, b, c \in A. \]

Since the expressions \( u(a \land b \otimes c) \) generate \( \mathcal{L}^3(A) \), the long exact sequence (7.1) decomposes as a pair of short exact sequences
\[ 0 \to \Lambda^3(A) \to \Lambda^2(A) \otimes A \to \mathcal{L}^3(A) \to 0 \tag{7.4} \]
\[ 0 \to \mathcal{L}^3(A) \overset{p_3}{\to} A \otimes SP^2(A) \to SP^3(A) \to 0, \tag{7.5} \]

In particular the map
\[ \mathcal{L}^3(A) \overset{p_3}{\to} J^3(A) \]
\[ [a, b, c] \overset{(a, b, c)}{\to} \]

induced by \( p_3 \) (2.8) is an isomorphism.

**Remark 7.1.**

i) The sequences (7.4) and (7.5) both remain exact for an arbitrary group \( A \). Indeed, (7.5) derives for any \( A \) to long exact sequences, and the arrow
\[ \pi_1 \left( A \overset{L}{\otimes} LSP^2 A \right) \to L_1 SP^3 A \]
is surjective, as follows from the presentation (2.20) of \( L_1 SP^3 A \).

ii) There is a natural isomorphism
\[ \mathcal{L}^3(A) \simeq E^3(A) := \ker \{ \Gamma_2(A) \otimes A \to \Gamma_3(A) \}, \tag{7.6} \]
as follows from the following prolongation of part of diagram (3.2) for \( n = 3 \):
\[ \pi_1 \left( A \overset{L}{\otimes} A \overset{L}{\otimes} \mathbb{Z}/2 \right) \overset{p_3}{\to} \pi_1 \left( A \overset{L}{\otimes} A \overset{L}{\otimes} \mathbb{Z}/2 \right) \oplus \text{Tor}(A, \mathbb{Z}/3) \]
\[ \mathcal{L}^3(A) \overset{\Gamma_2}{\to} SP^2(A) \otimes A \overset{\Gamma_3}{\to} SP^3(A) \]
\[ E^3(A) \overset{\Gamma_2}{\to} \Gamma_2(A) \otimes A \overset{\Gamma_3}{\to} \Gamma_3(A) \to A \otimes \mathbb{Z}/3 \]
\[ A \otimes A \otimes \mathbb{Z}/2 \overset{(A \otimes \mathbb{Z}/2) \oplus A \otimes \mathbb{Z}/3}{\to} A \otimes \mathbb{Z}/3 \]

7.2. **The Curtis decomposition.** We will now consider higher Lie functors. Curtis gave in [15] (see also [40]) a decomposition of the functors \( \mathcal{L}^n(A) \) into functors \( SP^n \), \( J^n \) and their iterates. For example,
when $A$ is a free abelian group we have the following decompositions in low degrees:

\begin{align}
\mathcal{L}^1(A) &= A \\
\mathcal{L}^2(A) &= J^2(A) \\
\mathcal{L}^3(A) &= J^3(A) \\
\mathcal{L}^4(A) &= J^2(J^2(A)) \oplus J^4(A) \\
\mathcal{L}^5(A) &= (J^3(A) \otimes J^2(A)) \oplus J^5(A) \\
\mathcal{L}^6(A) &= J^3(J^2(A)) \oplus J^2(J^3(A)) \oplus (J^4(A) \otimes J^2(A)) \oplus J^6(A) \\
\mathcal{L}^7(A) &= (J^3(A) \otimes SP^2(J^2(A))) \oplus (J^5(A) \otimes J^2(A)) \oplus (J^2(J^2(A)) \otimes J^3(A)) \\
&\quad \oplus (J^4(A) \otimes J^3(A)) \oplus J^7(A) \\
\mathcal{L}^8(A) &= J^2(J^2(J^2(A))) \oplus J^2J^4 \oplus (J^3(A) \otimes J^2(A) \otimes J^3(A)) \\
&\quad \oplus J^5(A) \otimes J^3(A) \otimes J^2(J^2(A)) \oplus (J^1(A) \otimes SP^2(J^2(A))) \\
&\quad \oplus (J^6(A) \otimes J^2(A)) \oplus J^8(A) \\
&\quad \ldots
\end{align}

We will refer to these descriptions of the Lie functors as their Curtis decompositions. It should be understood that the splittings into direct sums displayed here are not functorial, and that all that exists functorially are filtrations of the $\mathcal{L}^n(A)$, whose associated graded components are the expressions displayed. As a matter of convenience, we will nevertheless refer to these expressions as summands of the Lie functors. We have already come across the cases $n = 2, 3$ of these decompositions (prop. 2.1).

The next two cases are the short exact sequences

\begin{align}
0 \to &\Lambda^2 \Lambda^2(A) \to \mathcal{L}^4(A) \xrightarrow{p_4} J^4(A) \to 0 \quad (7.9) \\
0 \to &\Lambda^2(A) \otimes J^3(A) \to \mathcal{L}^5(A) \xrightarrow{p_5} J^5(A) \to 0, \quad (7.10)
\end{align}

where the left-hand arrows are respectively defined by

\[
(a \wedge b) \wedge (c \wedge d) \mapsto [[a, b], [c, d]] \\
(a \wedge b) \otimes (c, d, e) \mapsto [[a, b], [c, d, e]].
\]

It is a general fact that the final term in the decomposition of $\mathcal{L}^n(A)$ is always $J^n(A)$, the projection of $\mathcal{L}^n(A)$ onto $J^n(A)$ being the map $p_n$ (2.8).

### 7.3. Super-Lie functors

We will now define super-Lie functors

\[
\mathcal{L}_n^\circ : \text{Ab} \to \text{Ab}, \ n \geq 1.
\]

**Definition 7.1.** [35] A graded Lie ring with squares (GLRS for short) is a graded abelian group $B = \bigoplus_{i=0}^\infty B_i$ with homomorphisms

\[
\{ \, , \} : B_i \otimes B_j \to B_{i+j}, \quad (7.12)
\]

\[
[2] : B_n \to B_{2n} \text{ for } n \text{ odd} \quad (7.13)
\]
such that the following conditions are satisfied (for elements $x \in B_i$, $y \in B_j$, $z \in B_k$):

1. $\{x, y\} + (-1)^{ij} \{y, x\} = 0$ 
2. $\{x, x\} = 0$ for even $i$
3. $(-1)^{ik} \{\{x, y\}, z\} + (-1)^{ij} \{\{y, z\}, x\} + (-1)^{kj} \{\{z, x\}, y\} = 0$ 
4. $\{x, x, x\} = 0$
5. $(ax)^{[2]} = a^2 x^{[2]}$ for odd $i$, $a \in \mathbb{Z}$
6. $(x + y)^{[2]} = x^{[2]} + y^{[2]} + \{x, y\}$ for $i = j$ odd
7. $\{y, x^{[2]}\} = \{y, x, x\}$ for odd $i$. 

For an abelian group $A$, define $L_s(A)$ to be the graded Lie ring with squares freely generated by $A$ in degree 1. It may be defined as a GLRS together with a homomorphism of abelian groups $f : L \to A$ such that for every map $f : A \to B$ with $B$ a GLRS, there is a unique morphism of GLRS $d : L \to B$ such that $f = d \circ l$. The abelian group $L_s(A)$ is naturally graded by $L_s(A) = \bigoplus_{n=1}^{\infty} L_n^{s}(A)$ and for any $x \in L_s(A)$, we set $|x| = n$ whenever $x \in L_n^{s}(A)$. The $n$th graded piece $L_n^{s}(A)$ is called the $n$th super-Lie functor applied to $A$. In particular, there is a natural isomorphism

$$\Gamma_2(A) \simeq L_2^{s}(A)$$
$$\gamma_2(a) \mapsto a^{[2]}$$

analogous to (2.11).

For any free abelian group $A$, the natural monomorphism

$$z_n : L_n(A) \to \otimes^n(A),$$

is defined inductively on homogeneous elements by

$$\{x, y\} \mapsto z_{|x|}(x) \otimes z_{|y|}(y) - (-1)^{|x||y|} z_{|y|}(y) \otimes z_{|x|}(x),$$
$$x^{[2]} \mapsto z_{|x|}(x) \otimes z_{|x|}(x).$$

7.4. The third super-Lie functor. We will now adapt the discussion of section 7.1 to the context of the super-Lie functors. The relations (7.13) and (7.14) imply that the group $L_3^{s}(A)$ can be identified with the subgroup of $A \otimes A \otimes A$ generated by the elements

$$a \otimes b \otimes c + b \otimes a \otimes c - c \otimes a \otimes b - c \otimes b \otimes a, \quad a, b, c \in A,$$

which are the super analogues of the generators (2.2) of $L^3(A)$. Let us now show that there is a natural isomorphism

$$L_3^{s}(A) \simeq Y^3(A)$$

$$\{a, b, c\} \mapsto a \otimes b \wedge c + b \otimes a \wedge c, \quad a, b, c \in A.$$

Consider, for any free abelian group $A$, the Koszul resolution $Kos^3(A)$ (2.30)

$$0 \to \Gamma_3(A) \xrightarrow{i} \Gamma_2(A) \otimes A \xrightarrow{\bar{f}} A \otimes \Lambda^2(A) \to \Lambda^3(A) \to 0,$$

where the maps $\bar{f}$ and $i$ are defined by

$$\bar{f} : \gamma_2(a) \otimes b \mapsto a \otimes a \wedge b, \quad a, b \in A$$

$$i : \begin{cases} \gamma_3(a) \mapsto \gamma_2(a) \otimes a, \quad a \in A \\ \gamma_2(a)b \mapsto \gamma_2(a) \otimes ab + ab \otimes a, \quad a, b \in A. \end{cases}$$
The map \( \bar{f} \) factors as
\[
\begin{array}{ccc}
\Gamma_2(A) \otimes A & \xrightarrow{\bar{u}} & \Gamma_2(A) \otimes A \\
\otimes A & \xrightarrow{\bar{v}} & A \otimes \Lambda^2(A)
\end{array}
\] (7.20)
where
\[
\bar{u} : \gamma_2(a) \otimes b \mapsto a \otimes a \otimes b - b \otimes a \otimes a,
\bar{v} : a \otimes b \otimes c \mapsto a \otimes b \wedge c, \quad a, b, c \in A.
\]
It follows that
\[
\bar{u}(ab \otimes c) = \{a, b\}, c, \quad a, b, c \in A
\]
so that (7.19) decomposes as a pair of short exact sequences
\[
0 \to \Gamma_3(A) \to \Gamma_2(A) \otimes A \to \mathcal{L}_3^2(A) \to 0
\]
\[
0 \to \mathcal{L}_3^2(A) \to A \otimes \Lambda^2(A) \to \Lambda^3(A) \to 0.
\] (7.21)
It follows from the presentation (2.24) of \( L \) is exact, with

**Proposition 7.1.** For any free abelian group \( A \), the sequence of abelian groups
\[
0 \to \Lambda^2 \Gamma_2(A) \xrightarrow{j} \mathcal{L}_3^2(A) \xrightarrow{\bar{p}_3} A \otimes \Lambda^3(A) \to \Lambda^4(A) \to 0
\] (7.24)
is exact, with \( j \) and \( \bar{p}_3 \) respectively defined by
\[
j : \gamma_2(a_1) \wedge \gamma_2(a_2) \mapsto \{a_1, a_2, a_1, a_2\}
\]
\[
\bar{p}_3 : \{a_1, a_2, a_3, a_4\} \mapsto a_1 \otimes a_2 \wedge a_3 \wedge a_4 + a_2 \otimes a_1 \wedge a_3 \wedge a_4,
\]
The relations (7.14) and (7.15) imply that the sequence (7.24) must be replaced by:
\[
\{a_1, a_2, a_1, a_2\} = -\{a_2, a_1, a_2, a_1\}, \quad a_1, a_2 \in A.
\]
In addition
\[
j : (\gamma_2(a + b) - \gamma_2(a) - \gamma_2(b)) \wedge \gamma_2(c) \mapsto \{a, c, b, c\} - \{b, c, a, c\}, \quad a, b, c \in A
\]
so that the map \( j \) is well-defined.

**Remark 7.2.** For an arbitrary abelian group \( A \), the sequence (7.24) must be replaced by:
\[
0 \to \Lambda^2 Y^2(A) \to \mathcal{L}_3^4(A) \to A \otimes \Lambda^3(A) \to \Lambda^4(A) \to 0.
\] (7.26)
and the following long exact sequence describes the relation between the functors \( \Gamma_2 \) and \( Y^2 \):
\[
0 \to R_2(A) \to \text{Tor}(A, A) \to \Omega_2(A) \to \Gamma_2(A) \to Y^2(A) \to 0.
\]
Let us define a functor $\tilde{Y}^n$ by the short exact sequence

$$0 \longrightarrow \tilde{Y}^n(A) \xrightarrow{j} \mathcal{L}_s^n(A) \xrightarrow{\bar{p}_n} Y^n(A) \longrightarrow 0. \quad (7.27)$$

Sequence (7.26) asserts in particular that

$$\tilde{Y}^4(A) = \Lambda^2 Y^2(A), \quad (7.28)$$

so that we have the following super-analogue for $n = 4$ of the short exact sequence (7.29):

$$0 \longrightarrow \Lambda^2 Y^2(A) \xrightarrow{j} \mathcal{L}_s^4(A) \xrightarrow{\bar{p}_4} Y^4(A) \longrightarrow 0. \quad (7.29)$$

Similarly, the short exact sequence (7.27) for $n = 5$, which is the super-analogue of the decomposition (7.10) of $\mathcal{L}_s^5(A)$, is described more precisely by the short exact sequence

$$0 \longrightarrow Y^3(A) \otimes \Gamma_2(A) \xrightarrow{h} \mathcal{L}_s^5(A) \xrightarrow{\bar{p}_5} Y^5(A) \longrightarrow 0, \quad (7.30)$$

where the arrow $h$ is defined by

$$h : \{a, b, c\} \otimes \gamma_2(d) \mapsto \{a, b, c, d, d\}.$$

**Remark 7.3.** One can show that there is a natural filtration on the term $\tilde{Y}^6$ has a decomposition with an associated component $\Gamma_2 Y^3(A)$, so that $\mathcal{L}_s^6(A)$ can have some 4-torsion whenever there is some 2-torsion in the group $A$. In fact, this is a general phenomenon: for all $k \geq 1$, there may be some 4-torsion in $\mathcal{L}_s^{4k+2}(A)$ whenever $A$ is a 2-torsion group, whereas there will only be 2-torsion in all other components of the super-Lie algebra $\mathcal{L}_s(A)$.

### 7.6. Relations between Lie and super-Lie functors.

Let $A$ be a free abelian group, and consider, for $n \geq 2$, the natural monomorphisms

$$c_n : \mathcal{L}^n(A) \rightarrow \otimes^n A,$$

$$z_n : \mathcal{L}_s^n(A) \rightarrow \otimes^n A.$$

For $n = 3$, we have by (7.3), (7.17), for $a, b, c \in A$:

$$c_3 : \{a, b, c\} \mapsto a \otimes b \otimes c - b \otimes a \otimes c - c \otimes a \otimes b + c \otimes b \otimes a,$$

$$z_3 : \{a, b, c\} \mapsto a \otimes b \otimes c - b \otimes a \otimes c - c \otimes a \otimes b + c \otimes b \otimes a.$$

For any pair of free abelian groups $A$ and $B$, and $n \geq 2$, we define a pair of morphisms

$$\chi_n : \mathcal{L}_s^n(A) \otimes \Lambda^n(B) \rightarrow \mathcal{L}_s^n(A \otimes B) \quad (7.31)$$

$$\bar{\chi}_n : \mathcal{L}_s^n(A) \otimes \Lambda^n(B) \rightarrow \mathcal{L}_s^n(A \otimes B) \quad (7.32)$$

for $a_1, \ldots, a_n \in A$ and $b_1, \ldots, b_n \in B$, by

$$\chi_n : \{a_1, \ldots, a_n\} \otimes b_1 \wedge \cdots \wedge b_n \mapsto \sum_{\sigma \in \Sigma_n} \text{sign}(\sigma) [a_1 \otimes b_{\sigma_1}, \ldots, a_n \otimes b_{\sigma_n}],$$

$$\bar{\chi}_n : [a_1, \ldots, a_n] \otimes b_1 \wedge \cdots \wedge b_n \mapsto \sum_{\sigma \in \Sigma_n} \text{sign}(\sigma) \{a_1 \otimes b_{\sigma_1}, \ldots, a_n \otimes b_{\sigma_n}\}.$$
**Theorem 7.1.** Let $A$ and $B$ be free abelian groups. The following diagrams with arrows defined by (7.31), (7.32), (7.14) are commutative:

$$
\begin{align*}
\mathcal{L}^n(A) \otimes \Lambda^n(B) & \xrightarrow{\chi_n} \mathcal{L}^n(A \otimes B) & \mathcal{L}^n(A) \otimes \Lambda^n(B) & \xrightarrow{\bar{\chi}_n} \mathcal{L}^n(A \otimes B) \\
\otimes^n A \otimes \otimes^n B & \xrightarrow{\lambda_n} \otimes^n (A \otimes B) & \otimes^n A \otimes \otimes^n B & \xrightarrow{\lambda_n} \otimes^n (A \otimes B)
\end{align*}
(7.33)
$$

> **Proof.** Let us begin by considering the first diagram (7.33) for $n = 2$. The commutativity of diagram

$$
\begin{align*}
\Gamma_2(A) \otimes \Lambda^2(B) & \xrightarrow{\chi_2} \Lambda^2(A \otimes B) \\
\otimes^2 (A \otimes B) & \xrightarrow{\lambda_2} (A \otimes B) \otimes (A \otimes B)
\end{align*}
$$

can be checked directly: for any $a_1, b_1, b_2 \in B$:

$$
\lambda_2 \circ ((\otimes^2 g_2) / (\gamma_2(a_1) \otimes b_1 \wedge b_2)) = c_2 \circ \chi_2(\gamma_2(a_1) \otimes b_1 \wedge b_2) = (a_1 \otimes b_1) \otimes (a_1 \otimes b_2) - (a_1 \otimes b_2) \otimes (a_1 \otimes b_1).
$$

By induction on $n$, we find that

$$
z_n \otimes g_n(a_1, \ldots, a_n) \otimes b_1 \wedge \cdots \wedge b_n = \sum_{\sigma \in \Sigma_n} \text{sign}(\sigma) z_n \{a_1, \ldots, a_n\} \otimes b_{\sigma_1} \otimes \cdots \otimes b_{\sigma_n} =
$$

$$
\sum_{\sigma \in \Sigma_n} \text{sign}(\sigma) z_{n-1} \{a_1, \ldots, a_{n-1}\} \otimes a_n \otimes b_{\sigma_1} \otimes \cdots \otimes b_{\sigma_n} + (-1)^n \sum_{\sigma \in \Sigma_n} \text{sign}(\sigma) a_n \otimes z_{n-1} \{a_1, \ldots, a_{n-1}\} \otimes b_{\sigma_1} \otimes \cdots \otimes b_{\sigma_n}
$$

Hence

$$
\lambda_n \circ (z_n \otimes g_n)(a_1, \ldots, a_n) \otimes b_1 \wedge \cdots \wedge b_n) =
$$

$$
\sum_{j=1}^{n} \lambda_{n-1}^{\chi_n} \left( \sum_{\eta = \{\sigma_1, \ldots, \sigma_{n-1}\} \in \{1, \ldots, j\}^{n-1}} \text{sign}(\eta, j) z_{n-1} \{a_1, \ldots, a_{n-1}\} \otimes b_{\sigma_1} \otimes \cdots \otimes b_{\sigma_{n-1}} \right) \otimes (a_n \otimes b_j)
$$

$$
+ (-1)^n \sum_{j=1}^{n} (a_n \otimes b_j) \otimes \lambda_{n-1}^{\chi_n} \left( \sum_{\eta = \{\sigma_1, \ldots, \sigma_{n-1}\} \in \{1, \ldots, j\}^{n-1}} \text{sign}(\eta, j) z_{n-1} \{a_1, \ldots, a_{n-1}\} \otimes b_{\sigma_1} \otimes \cdots \otimes b_{\sigma_{n-1}} \right)
$$

$$
= \sum_{j=1}^{n} \left( \sum_{\eta = \{\sigma_1, \ldots, \sigma_{n-1}\} \in \{1, \ldots, j\}^{n-1}} \text{sign}(\eta, j) (c_{n-1} \{a_1 \otimes b_{\sigma_1}, \ldots, a_{n-1} \otimes b_{\sigma_{n-1}}\} \otimes (a_n \otimes b_j) - (a_n \otimes b_j) \otimes c_{n-1} \{a_1 \otimes b_{\sigma_1}, \ldots, a_{n-1} \otimes b_{\sigma_{n-1}}\}) \right)
$$

$$
= \sum_{\sigma \in \Sigma_n} \text{sign} \circ \chi_n \{a_1, \ldots, a_n\} \otimes b_1 \wedge \cdots \wedge b_n
$$

One can prove in a similar manner that

$$
c_{2k} \circ \chi_{2k}(a_1, \ldots, a_k) \otimes b_1 \wedge \cdots \wedge b_{2k} = \lambda_{2k} \circ (z_{2k} \otimes g_{2k})(a_1, \ldots, a_k) \otimes b_1 \wedge \cdots \wedge b_{2k} (7.34)
$$

for an odd $k$, so that the commutativity of the first diagram (7.33) is proved. The commutativity of the second diagram is proved in a similar manner: for $n = 2$, it follows from the commutativity of the
diagram (2.33) and one then simply repeats the previous computation for a general \( n \), with appropriate changes in the signs of the various expressions.

For any pair of abelian groups \( A, B \), we define as follows a natural arrow:

\[
\beta_n : Y^n(A) \otimes \Lambda^n(B) \to J^n(A \otimes B)
\]

(7.35)

\[
\beta_n : \bar{p}_n \{a_1, \ldots, a_n \} \otimes b_1 \wedge \cdots \wedge b_n \mapsto \sum_{\sigma \in \Sigma_n} \text{sign}(\sigma) \ p_n[a_1 \otimes b_{\sigma_1}, \ldots, a_n \otimes b_{\sigma_n}],
\]

\[a_1, \ldots, a_n \in A, \ b_1, \ldots, b_n \in B.\]

**Proposition 7.2.** There is a natural commutative diagram with exact columns

\[
\begin{array}{ccc}
Y^n(A) \otimes \Lambda^n(B) & \xrightarrow{\beta_n} & J^n(A \otimes B) \\
\downarrow & & \downarrow \\
A \otimes \Lambda^{n-1}(A) \otimes \Lambda^n(B) & \xrightarrow{\eta'_n} & (A \otimes B) \otimes SP^{n-1}(A \otimes B) \\
\downarrow & & \downarrow \\
\Lambda^n(A) \otimes \Lambda^n(B) & \xrightarrow{\eta_n} & SP^n(A \otimes B),
\end{array}
\]

where the map \( \eta_n \) is defined by (2.34) and \( \eta'_n \) is by

\[
\eta_n : a_1 \otimes a_2 \wedge \cdots \wedge a_n \otimes b_1 \wedge \cdots \wedge b_n \mapsto \sum_{\sigma \in \Sigma_n} \text{sign}(\sigma) (a_1 \otimes b_{\sigma_1}) \otimes (a_2 \otimes b_{\sigma_2}) \cdots (a_n \otimes b_{\sigma_n}).
\]

The proof of this proposition follows directly from the definition of the various maps.

8. Derived functors of Lie functors

It is asserted in [45] that if \( p \) is an odd prime then the groups \( L_{n+k}\mathcal{L}^p(Z,n) \) are \( p \)-torsion for all \( k \), and in particular

\[
L_{n+k}\mathcal{L}^p(Z,n) = \begin{cases} 
\mathbb{Z}/p, & k = 2i(p-1) - 1, \ i = 1, 2, \ldots, [n/2] \\
0, & \text{otherwise}
\end{cases}
\]

(8.1)

In the next three subsections, we will give a direct proof of this fact for \( p = 3 \), in other words show that

\[
L_{n+k}\mathcal{L}^3(Z,n) = \begin{cases} 
\mathbb{Z}/3, & k = 4i - 1, \ i = 1, 2, \ldots, [n/2] \\
0, & \text{otherwise}
\end{cases}
\]

(8.2)

and we will more generally compute in theorem 8.1 the derived functors \( L_{n+k}\mathcal{L}^3(A,n) \) for a general abelian group \( A \). Note that the derived functors of the Lie functors \( \mathcal{L}^q \) are complicated when \( q \) a composite number, and we refer to [40], page 280 for a description of these in low degrees. One finds for example that

\[
L_i\mathcal{L}^8(Z,1) = \begin{cases} 
\mathbb{Z}/2, & i = 4, 5, 7 \\
0, & i \neq 4, 5, 7
\end{cases}
\]

The gap in the homotopy groups which occurs here for \( i = 6 \) is the illustration of a general phenomenon which, as we will see for example in (8.10), also occurs in more elaborate contexts.
Returning to the $p = 3$ case, let us first observe that for any abelian group $A$ the exact sequence (7.3) derives to a long exact sequence

$$\cdots \to L_{i+1} \mathcal{L}^3(A, n) \to \pi_{i+1} \left( A[n] \otimes LSP^2(A, n) \right) \to L_{i+1} \Lambda^3(A, n) \to$$

$$L_i \mathcal{L}^3(A, n) \to \pi_i \left( A[n] \otimes LSP^2(A, n) \right) \to L_i \Lambda^3(A, n) \to \cdots \quad (8.3)$$

In addition, the isomorphism (2.42) implies that

$$L_i Y^3(A, n) \simeq L_{i+3} \mathcal{L}^3(A, n+1), \text{ for all } i \geq 3. \quad (8.4)$$

8.1. **The derived functors** $L_i \mathcal{L}^3(A)$. The Koszul sequence (2.32) associated for $n = 3$ to a flat 2-term resolution $f : L \to M$ of an abelian group $A$ may be written as follows:

$$0 \to \mathcal{L}^3_s(L) \to L \otimes M \otimes L \xrightarrow{\delta} L \otimes M \otimes M \to \mathcal{L}^3(M) \to \mathcal{L}^3(A) \to 0$$

where

$$\delta(l \otimes m \otimes l') = l \otimes m \otimes f(l') + l' \otimes f(l) \otimes m - l \otimes f(l') \otimes m, \quad l, l' \in L, m \in M.$$ 

The three middle terms constitute a complex which represents the object $L \mathcal{L}^3(A)$ of the derived category. In particular, if one considers the resolution $Z \xrightarrow{m} Z$ of $\mathbb{Z}/m$, one finds that

$$L_i \mathcal{L}^3(\mathbb{Z}/m) = \begin{cases} \mathbb{Z}/m, & i = 1, \\ 0, & i \neq 1 \end{cases}$$

By (2.20), the natural transformation $\text{Tor}(S_2(A), A) \to S_3(A)$ is an epimorphism. More generally, the exact sequence (8.3) provides the following description of the derived functors of $\mathcal{L}^3$:

$$L_2 \mathcal{L}^3(A) = \ker \{ \text{Tor}(S_2(A), A) \to S_3(A) \}$$

$$0 \to \ker \{ S_2(A) \otimes A \to L_1 \Lambda^3(A) \} \to L_1 \mathcal{L}^3(A) \to \text{Tor}(\Lambda^3(A), A) \to 0$$

$$L_i \mathcal{L}^3(A) = 0, \quad i > 2.$$ 

8.2. **The derived functors** $L_i \mathcal{L}^3(A, 1)$. Similarly, the short exact sequence (7.21) derives to a long exact sequence

$$\cdots \to L_{i+1} \mathcal{L}^3_s(A, n) \to \pi_{i+1} \left( A[n] \otimes \Lambda^2(A, n) \right) \to L_{i+1} \Lambda^3(A, n) \to$$

$$L_i \mathcal{L}^3_s(A, n) \to \pi_i \left( A[n] \otimes \Lambda^2(A, n) \right) \to L_i \Lambda^3(A, n) \to \cdots \quad (8.5)$$

analogous to (8.3). For $n = 0$ this reduces to the exact sequence

$$0 \to L_2 Y^3(A) \to \text{Tor}(\Omega_2(A), A) \to \Omega_3(A) \to$$

$$L_1 Y^3(A) \to \pi_1 \left( \Lambda^2(A) \otimes A \right) \to L_1 \Lambda^3(A) \to 0 \quad (8.6)$$

This exact sequence is consistent with the results of [10] prop. 6.15, and with the presentation (2.24) of the groups $L_i \Lambda^n(A)$. The latter implies that the composite arrow

$$L_1 \Lambda^2(A) \otimes A \to \pi_1 \left( \Lambda^2(A) \otimes A \right) \to L_1 \Lambda^3(A) \quad (8.7)$$
is an epimorphism. The Künneth formula, together with the exact sequence (8.6), determines a 3-step filtration of $L_1Y^3(A)$. Taking into account the isomorphism (8.4) for $n = 0$, we obtain the following description of the derived functors $L_iL^3(A, 1)$:

$$L_3L^3(A, 1) \simeq Y^3(A)$$  \hspace{1cm} (8.8)

$$gr_1L_4L^3(A, 1) \simeq gr_1L_1Y^3(A) \simeq \ker\{\Tor(\Omega_2(A), A) \to \Omega_3(A)\}$$

$$gr_2L_4L^3(A, 1) \simeq gr_2L_1Y^3(A) \simeq \ker\{\Omega_2(A) \otimes A \to L_1\Lambda^3(A)\}$$

$$gr_3L_4L^3(A, 1) \simeq gr_3L_1Y^3(A) \simeq \Tor(\Lambda^2(A), A)$$

$$L_5L^3(A, 1) \simeq L_2Y^3(A) \simeq \ker\{\Tor(\Omega_2(A), A) \to \Omega_3(A)\}$$

**Remark 8.1.** The natural map

$$\Tor(\Omega_2(A), A) \simeq \pi_2\left(\Lambda^2 A \otimes A\right) \to \Omega_3(A)$$  \hspace{1cm} (8.9)

in the exact sequence (8.6) is in general neither injective nor surjective. This can be seen by considering the generators $\omega_i^h(x)$ of the groups $\Omega_n(A)$. We know by [10] (5.14) that the diagram

$$\begin{array}{ccc}
\Gamma_2(A) \otimes A & \longrightarrow & \Gamma_3(A) \\
\lambda_h \otimes 1 & \downarrow & \lambda_h \\
\Tor(\Omega_2(A), A) & \longrightarrow & \Omega_3(A)
\end{array}$$  \hspace{1cm} (8.10)

is commutative. It follows from the relation $\gamma_2(x)x = 3\gamma_3(x)$ in $\Gamma_3(A)$ that, with the notation introduced in (2.23), the corresponding relation

$$\omega_2^h(x) \ast x = 3\omega_3^h(x)$$

is satisfied in $\Omega_3(A)$ for all $x \in \Lambda A$. In particular, this implies that the arrow (8.9) is trivial for $h = 3$ and $A = \mathbb{Z}/3$. Moreover, it is asserted in [3] that

$$L_1Y^3(\mathbb{Z}/3) = \mathbb{Z}/9.$$  \hspace{1cm} (8.11)

We refer to proposition [A.1] for a proof by our methods of this assertion.

### 8.3. The derived functors $L_iL^3(A, 2)$

The décalage isomorphisms (2.39) and Künneth formula yield the following description of the groups $\pi_r\left(LSP^j(A, 2) \overset{L}{\otimes} A[2]\right)$:

$$\pi_{2j+2}\left(LSP^j(A, 2) \overset{L}{\otimes} A[2]\right) \simeq \Gamma_j(A) \otimes A$$

$$0 \to L_{i-2}\Gamma_j(A) \otimes A \to \pi_{2j+1}\left(LSP^j(A, 2) \overset{L}{\otimes} A[2]\right) \to \Tor(L_{i-3}\Gamma_j(A), A) \to 0, \hspace{1cm} i = 3, \ldots, j + 1$$

$$\pi_{3j+2}\left(LSP^j(A, 2) \overset{L}{\otimes} A[2]\right) \simeq \Tor(L_{j-1}\Gamma_j(A), A)$$
From (2.26) and (5.2) we have the following commutative diagram, a prolongation of (7.7):

\[
\begin{array}{ccc}
S_2(A) \otimes A^c & \xrightarrow{\pi_1} & LSP^2(A) \otimes A \\
& & \xrightarrow{L_1SP^3(A)} \\
\downarrow q & & \downarrow L_1SP^3(A) \\
R_2(A) \otimes A^c & \xrightarrow{\pi_1} & L\Gamma_2(A) \otimes A \\
& & \xrightarrow{t_1} \Gamma_2(A) \\
\downarrow t_2 & & \downarrow \Gamma_3(A) \\
\text{Tor}(A, \mathbb{Z}/2) \otimes A^c & \xrightarrow{\text{coker}(q)} & \text{coker}(q) \\
& & \xrightarrow{(\text{Tor}(A, \mathbb{Z}/2) \otimes A) \oplus \text{Tor}(A, \mathbb{Z}/3)} \text{Tor}(A \otimes \mathbb{Z}/2, A)
\end{array}
\]

A diagram chase yields a canonical isomorphism \( \text{coker}(t_1) \cong \text{Tor}(A, \mathbb{Z}/3) \). We obtain the following description of a portion of the long exact sequence (8.3) for \( n = 2 \):

\[
R_2(A) \otimes A \xrightarrow{t_2} L_1\Gamma_3(A) \longrightarrow L_6\mathcal{L}^3(A, 2) \longrightarrow \Gamma_2(A) \otimes A \longrightarrow \Gamma_3(A) \longrightarrow A \otimes \mathbb{Z}/3
\]  
(8.13)

Here \( t_2 := t_1 \circ q[2] \), up to a double décalage map. There is a functorial direct sum decomposition of the term \( L_6\mathcal{L}^3(A, 2) = L_3Y^3(A, 1) \), as can be seen from the following diagram, in which the vertical arrows are suspension maps:

\[
\begin{array}{ccc}
\text{Tor}(A, \mathbb{Z}/3)^c & \xrightarrow{L_6\mathcal{L}^3(A, 2)} & \mathcal{L}^3(A) \\
\downarrow & & \downarrow \\
\text{Tor}(A, \mathbb{Z}/3) & \xrightarrow{L_7\mathcal{L}^3(A, 3)} & \end{array}
\]

(we refer to theorem 8.11 below for this description of \( L_7\mathcal{L}^3(A, 3) \)). We may prolong diagram (8.13) by the following exact sequence:

\[ 0 \rightarrow L_8\mathcal{L}^3(A, 2) \rightarrow \text{Tor}(R_2(A), A) \rightarrow R_3(A) \rightarrow L_7\mathcal{L}^3(A, 2) \rightarrow \ker(t_2) \rightarrow 0. \]

The diagram

\[
\begin{array}{ccc}
\text{Tor}(S_2(A), A)^c & \xrightarrow{\text{Tor}(R_2(A), A)} & \text{Tor}(R_2(A), A, \mathbb{Z}/2) \\
& & \xrightarrow{\ker(S_2(A) \otimes A \rightarrow R_2(A) \otimes A)} \\
\downarrow S_3(A)^c & \xrightarrow{R_3(A)} & \text{Tor}(R_2(A), A, \mathbb{Z}/2) \\
& & \end{array}
\]

then implies that

\[ \ker\{\text{Tor}(S_2(A), A) \rightarrow S_3(A)\} = \ker\{\text{Tor}(R_2(A), A) \rightarrow R_3(A)\} \]

and

\[ \text{coker}\{\text{Tor}(R_2(A), A) \rightarrow R_3(A)\} = \ker\{S_2(A) \otimes A \rightarrow R_2(A) \otimes A\}. \]
Taking once more into account the décalage isomorphisms (8.4), this provides a complete description of the functors $L_i \mathcal{L}^3(A, 2)$:

\[
\begin{align*}
L_5 \mathcal{L}^3(A, 2) &= L_2 Y^3(A, 1) = A \otimes \mathbb{Z}/3 \\
L_6 \mathcal{L}^3(A, 2) &= L_3 Y^3(A, 1) = \mathcal{L}^3(A) \oplus \text{Tor}(A, \mathbb{Z}/3) \\
gr_1 \mathcal{L}^3(A, 2) &= gr_1 L_4 Y^3(A, 1) = \ker \{S_2(A) \otimes A \to R_2(A) \otimes A\} \\
gr_2 L_7 \mathcal{L}^3(A, 2) &= gr_2 L_4 Y^3(A, 1) = \ker \{R_2(A) \otimes A \to L_1 \Gamma_3(A)\} \\
gr_3 L_7 \mathcal{L}^3(A, 2) &= gr_3 L_4 Y^3(A, 1) = \text{Tor}(\Gamma_2(A), A) \\
L_8 \mathcal{L}^3(A, 2) &= L_5 Y^3(A, 1) = L_2 \mathcal{L}^3(A).
\end{align*}
\]

For all other values of $i$, $L_i \mathcal{L}^3(A, 2) = 0$.

As an illustration of these results, we will now give an explicit description of the isomorphism

\[
A \otimes \mathbb{Z}/3 \to L_2 Y^3(A, 1) = L_2 \mathcal{L}^3(A, 1)
\]

occurring in the first equation of (8.14), even though this will not be used in the sequel. Consider the simplicial model (2.17) of $L \mathcal{L}^3(A, 1)$ associated to a free resolution (2.15) of $A$. The isomorphism (8.15) is induced by the map

\[
A \otimes \mathbb{Z}/3 \to \mathcal{L}^3(A) \oplus s_1(M) \oplus s_0(L))/\partial_0(\cap_{i=1}^3 \partial_i)
\]

defined, for a chosen lifting $a$ to $M$ of $\bar{a} \in A \otimes \mathbb{Z}/3$, by

\[
\bar{a} \mapsto \{s_1(a), s_0(a), s_1(a)\}.
\]

In order for this map to be well-defined, we must verify that

\[
3\{s_1(a), s_0(a), s_1(a)\} \in \partial_0(\ker(\partial_1) \cap \ker(\partial_2) \cap \ker(\partial_3)).
\]

This is true since the element

\[
\eta = 3\{s_2 s_0(a), s_1 s_0(a), s_2 s_0(a)\} - \{s_2 s_1(a), s_1 s_0(a), s_2 s_0(a)\} + \{s_2 s_1(a), s_2 s_0(a), s_1 s_0(a)\} \in \mathcal{L}^3(s_0(A_1) \oplus s_1(A_1) \oplus s_2(A_1) \oplus s_1(A_0) \oplus s_2(A_0) \oplus s_2 s_1(A_0))
\]

satisfies the equations $\partial_i(\eta) = 0$, $i = 1, 2, 3$ and $\partial_0(\eta) = 3\{s_1(a), s_0(a), s_1(a)\}$.

8.4. **The derived functors** $L_i \mathcal{L}^3(A, n)$ for $n \geq 3$. In each of the three following commutative diagrams, the exactness of the upper short exact sequence follows from proposition 3.1 and the exactness of the lower one from theorem 5.1. For $n \geq 3$ odd:

\[
\begin{array}{cccc}
\pi_1 \bigg( \Lambda^2(A) \otimes A \bigg) & \xrightarrow{L} & \pi_{3n+1} \bigg( \text{LSP}^2(A, n) \otimes A[n] \bigg) & \xrightarrow{L} & \text{Tor}_2(A, A, \mathbb{Z}/2) \\
L_1 \Lambda^3(A) & \xrightarrow{L} & L_{3n+1} \text{SP}^3(A, n) & \xrightarrow{L} & \text{Tor}_2(A, A, \mathbb{Z}/2) \\
\Lambda^2(A) \otimes A & \xrightarrow{L} & \pi_{3n} \bigg( \text{LSP}^2(A, n) \otimes A[n] \bigg) & \xrightarrow{L} & \text{Tor}_1(A, A, \mathbb{Z}/2) \\
\Lambda^3(A) & \xrightarrow{L} & L_{3n} \text{SP}^3(A, n) & \xrightarrow{L} & \text{Tor}_1(A, A, \mathbb{Z}/2)
\end{array}
\]
and for $n > 3$ even:

$$
\begin{align*}
\Gamma_2(A) \otimes A &\longrightarrow \pi_{3n} \left( LSP^2(A, n) \otimes A[n] \right) \longrightarrow \text{Tor}_2(A, A, \mathbb{Z}/2) \\
\Gamma_3(A) \otimes A &\longrightarrow L_{3n}SP^3(A, n) \longrightarrow \text{Tor}_2(A, A, \mathbb{Z}/2)
\end{align*}
$$

The sequence (8.3) therefore determines the following exact sequences:

**Case I:** $n$ odd $\geq 3$

$$0 \to L_{3n+2}L^3(A, n) \to \text{Tor}(\Omega_2(A), A) \to \Omega_3(A) \to \text{Tor}(\Omega_2(A), A) \to \Omega_3(A) \to \text{Tor}(\Omega_2(A), A) \to \Omega_3(A) \to L_{3n-1}L^3(A, n)$$

**Case II:** $n$ even

$$0 \to L_{3n+2}L^3(A, n) \to \text{Tor}(R_2(A), A) \to R_3(A) \to \text{Tor}(R_2(A), A) \to R_3(A) \to \text{Tor}(R_2(A), A) \to R_3(A) \to L_{3n-1}L^3(A, n)$$

We may now summarize this discussion as follows:

**Theorem 8.1.** Case I: $n$ odd

$$L_iL^3(A, n) = \begin{cases}
\ker\{\text{Tor}(\Omega_2(A), A) \to \Omega_3(A)\}, & i = 3n + 2, \\
gr_1L_{3n+1}L^3(A, n) = \ker\{\pi_1\left( \Lambda^2(A) \otimes A \right) \to L_1\Lambda^3(A)\} & i = 3n \\
\text{Tor}(A, \mathbb{Z}/3), & n + 3 \leq i < 3n - 1, \ i \equiv n + 3 \mod 4 \\
\end{cases}$$

and $L_iL^3(A, n) = 0$ for all other values of $i$.

**Case II:** $n$ even

$$L_iL^3(A, n) = \begin{cases}
\ker\{\text{Tor}(R_2(A), A) \to R_3(A)\}, & i = 3n + 2 \\
gr_1L_{3n+1}L^3(A, n) = \ker\{\pi_1\left( L\Gamma_2(A) \otimes A \right) \to L_1\Gamma_3(A)\} & i = 3n \\
\text{Tor}(A, \mathbb{Z}/3) \oplus L^3(A), & i = 3n \\
\text{Tor}(A, \mathbb{Z}/3), & n + 3 \leq i < 3n - 1, \ i \equiv n + 3 \mod 4 \\
\end{cases}$$

and $L_iL^3(A, n) = 0$ for all other values of $i$.

Note that in the computation of $L_{3n}L^3(A, n)$ for $n$ odd, we relied on the surjectivity of the map (8.7).
Example. The previous discussion shows in particular that
\[
L_i\mathcal{L}^3(\mathbb{Z}/3, 5) = \begin{cases} 
\mathbb{Z}/9, & i = 16, \\
\mathbb{Z}/3, & i = 8, 9, 12, 13, 17 \\
0, & \text{otherwise}
\end{cases}
\] (8.16)

A functorial description of some of these groups will be given in lemma 11.1.

For a given a free abelian group \( A \) and an integer \( n \geq 2 \) the composite map
\[
\mathcal{L}^n(A) \to \otimes^n(A) \to \mathcal{L}^n(A)
\]
is simply multiplication by \( n \) (13.5 proposition 3.3). It follows that for an odd prime \( p \), the derived functors \( L_i\mathcal{L}^p(\mathbb{Z}, n) \) are \( p \)-groups (see (8.1)). The torsion part of the derived functors can be usually be determined by general arguments. Recall that by Bousfield [7], corollary 9.5, if \( T : \text{Ab} \to \text{Ab} \) is a functor of finite degree which preserves direct limits, then \( L_qT(A, n) \) is a torsion group for every abelian group \( A \), unless \( q \) is divisible by \( n \).

The \( p \)-components of the derived functors of \( \mathcal{L}^p \) and \( J^p \) are connected by the following relation (13.5 proposition 4.7): for every prime \( p \), there are natural isomorphisms
\[
\pi_i\left(\mathbb{Z}/p \otimes L\mathcal{L}^p(\mathbb{Z}, n)\right) \simeq \pi_i\left(\mathbb{Z}/p \otimes LJ^p(\mathbb{Z}, n)\right), \ i \geq 0, \ n \geq 2.
\]
However the formulas for the full derived functors \( L_iJ^p(\mathbb{Z}, n) \) are more complicated than those for the functors \( L_i\mathcal{L}^p(\mathbb{Z}, n) \) (8.1). For example, we know by theorem 8.1 that
\[
L\mathcal{L}^5(\mathbb{Z}, 3) \simeq K(\mathbb{Z}/5, 10)
\]
so that by (13.2)
\[
LJ^2(\mathbb{Z}, 3) \otimes LJ^3(\mathbb{Z}, 3) \simeq K(\mathbb{Z}/3, 12).
\]
On the other hand \( L\mathcal{L}^5(\mathbb{Z}, 3) \simeq K(\mathbb{Z}/3, 6) \) by (8.1), and the values of the derived functors \( L_iJ^5(\mathbb{Z}, 3) \) now follow from those of \( L^5(\mathbb{Z}, 3) \) and the Curtis decomposition of \( \mathcal{L}^5 \). One finds:
\[
L_iJ^5(\mathbb{Z}, 3) \simeq \begin{cases} 
\mathbb{Z}/3, & i = 13 \\
\mathbb{Z}/5, & i = 10 \\
0, & i \neq 10, 13
\end{cases}
\]
One can compute the groups \( L_iJ^5(\mathbb{Z}, n) \) for a general \( n \) by similar methods. One finds that \( L_iJ^5(\mathbb{Z}, n) \) is isomorphic to \( L_i\mathcal{L}^5(\mathbb{Z}, n) \) for \( i \geq 1 \) and even \( n \), and that \( L_iJ^5(\mathbb{Z}, n) \) contains only \( 3 \)-torsion and \( 5 \)-torsion elements whenever \( n \) is odd. A similar computation detects a non-trivial 11-torsion element in \( L_{29}J^{13}(\mathbb{Z}, 3) \), whereas the corresponding groups \( L_i\mathcal{L}^{13}(\mathbb{Z}, 3) \) are 13-torsion for all \( i \).

9. Derived functors of composite functors

Consider a pair of composable functors
\[
\begin{array}{ccc}
\mathcal{A} & \xrightarrow{G} & \mathcal{B} \\
\downarrow{F} & & \downarrow{E} \\
& & \mathcal{C}
\end{array}
\]
between abelian categories, and in which the categories \( \mathcal{A} \) and \( \mathcal{B} \) have enough projectives. In addition, we assume that \( G(A) \) is of finite projective dimension for each object \( A \in \mathcal{A} \). When these functors are additive, the composite functor spectral sequence (17) 5.8 describes the derived functors of the composite functor \( G \circ F \) in terms of those of \( F \) and \( G \), under the condition that the objects \( G(P) \) are \( F \)-acyclic for any projective object \( P \) of \( \mathcal{A} \) (we will refer to this as the \( F \)-acyclicity hypothesis). We will now carry out a similar discussion when \( G \) and \( F \) are no longer additive, in which case chain complexes must be replaced by simplicial abelian groups.
Let $P_*$ be projective resolution of an object $A \in \mathcal{A}$. Following the notations of [47] §5.7, we construct a Cartan-Eilenberg resolution $\mathbb{P}_{*,*}$ of the simplicial object $G(P_*)$, with $\mathbb{P}^R_{*,*}$ (resp. $\mathbb{P}^Z_{*,*}$, resp. $\mathbb{P}^H_{*,*}$) the chosen projective resolution of $B_pG(P_*)$ (resp. $Z_qG(P_*)$, resp. $L_pG(A)$). By the Dold-Kan correspondence this yields in particular a projective bisimplicial resolution of $L_pG(A)$ which we will also denote by $\mathbb{P}_{*,*}$, as well as a corresponding projective simplicial model $\mathbb{P}^H_{*,*}$ for the Eilenberg-Mac Lane spaces $K(L_pG(A), p)$. The two filtrations on the complex associated to the bisimplicial object $FP_{*,*}$ determine a pair of spectral sequences with common abutment $\pi_n(LF \circ LG(A))$. The initial terms of the first of these are given by:

$$E^2_{p,q} = L_{p+q}F(\bigoplus_{q_i=q} K(L_{q_i}G(A), q_i))$$

(9.1)

as in [6]. When the functor $F$ is of finite degree, we may decompose this initial term according to cross-effects of $P$ [21] §4.18, so that the spectral sequence can be expressed as:

$$E^2_{p,q} = \bigoplus_{r \geq 1} \bigoplus_{q_1 + \ldots + q_r = q} L_{p+q}F[r](L_{q_1}G(A), q_1) \ldots |L_{q_r}G(A), q_r) \Rightarrow \pi_{p+q}((LF \circ LG)(A)).$$

(9.2)

The $F$-acyclicity hypothesis, which here asserts that $L_iF(G(P)) = 0$ for any projective abelian group $P$ and all $i \geq 0$, implies that the morphism $(LF \circ G)(P) \rightarrow FG(P)$ is a quasi-isomorphism for any projective object $P$ in $A$, and so is the induced map

$$(LF \circ LG)(A) \rightarrow L(FG)(A).$$

(9.3)

The spectral sequence (9.2) can now be written as:

$$E^2_{p,q} = \bigoplus_{r \geq 1} \bigoplus_{q_1 + \ldots + q_r = q} L_{p+q}F[r](L_{q_1}G(A), q_1) \ldots |L_{q_r}G(A), q_r) \Rightarrow L_{p+q}(FG)(A).$$

(9.4)

Replacing the object $A$ by the shifted derived category object $A[n]$, in other words by the Eilenberg-Mac Lane object $K(A, n)$, we may now compute under the same hypotheses the derived functors $L_r(FG)(A, n)$ for all $n$. The $F$-acyclicity hypothesis implies inductively that the quasi-isomorphism (9.3) determines a quasi-isomorphism

$$(LF \circ LG)(A, n) \rightarrow L(FG)(A, n)$$

(9.5)

for all $n \geq 0$, since we can choose as a simplicial model for $K(A, n)$ the bisimplicial model

$$\ldots \rightarrow K(A^2, n-1) \rightarrow K(A^2, n-1) \rightarrow K(A, n-1) \rightarrow \{e\}$$

and work componentwise. Since no change is necessary in the discussion of the spectral sequence (9.2) when passing from the case $n = 0$ to the general situation, we finally obtain for any positive $n$, when $F$ is of finite degree and the $F$-acyclicity hypothesis is satisfied, a functorial spectral sequence:

$$E^2_{p,q} = \bigoplus_{r \geq 1} \bigoplus_{q_1 + \ldots + q_r = q} L_{p+q}F[r](L_{q_1}G(A, n), q_1) \ldots |L_{q_r}G(A, n), q_r) \Rightarrow L_{p+q}(FG)(A, n).$$

(9.6)

We now restrict ourselves to a special case, that in which $F$ and $G$ are endo-functors on the category of abelian groups (or more generally the category of $R$-modules, with $R$ a principal ideal domain or even a hereditary ring). By construction, the total complex of $\mathbb{P}_{*,*}$ and the complex $\bigoplus_{q} \mathbb{P}^H_{q,*}$ are both projective and have as homology $\bigoplus_{q} L_{q}G(A)[q]$, viewed as a complex with trivial differentials. It follows as in [22] §II.4 that this identification of their homology may be realized by a chain homotopy equivalence between the complexes, which in turn induces a simplicial homotopy equivalence between the corresponding simplicial groups $\mathbb{P}$ and $\bigoplus_{q} \mathbb{P}^H_{q,*}$. The induced homotopy equivalence between $F(\mathbb{P})$ and $F(\bigoplus_{q} \mathbb{P}^H_{q,*})$ makes it clear that in this case the $E^2$ term of the spectral sequence (9.6) is (non-canonically) isomorphic to its abutment. It follows that the spectral sequence degenerates at the $E^2$ level, so that this proves the following proposition:
Proposition 9.1. Let $F$ and $G$ be a pair of endofunctors on the category of abelian groups, with $F$ of finite degree. Suppose that for any projective abelian group $P$, $L_q F(G(P)) = 0$ whenever $q > 0$. Then the derived functors of the functor $L$ is a (non-naturally split) short exact sequence

\[
\text{abutment } L \to \text{...} \to L_n G(A, n) \to L_{n+1} G(A, n) \to \text{...} \to L_{n+m} G(A, n) \to 0
\]

and the graded components associated to the filtration on the abutment $L_m(A)$ of the spectral sequence are described by the formula:

\[
gr_p L_{p+q}(FG)(A, n) \simeq \bigoplus_{r \geq 1} \bigoplus_{q_1 + \ldots + q_r = q} L_{p+r}(A, n) \cdot \ldots \cdot L_{q_r}(A, n) 
\]

(9.7)

When $F$ is one of the functors $SP^\iota, \Lambda^\iota$ or $\Gamma^\iota$, such an assertion may also be deduced, under the $F$-acyclicity hypothesis, from the formula \cite{III} V (4.2.7) of Illusie.

9.1. The derived functors of $\Lambda^2 \Lambda^2$. As an illustration of proposition 9.1, we will now compute the derived functors of the functor $L_i(\Lambda^2 \Lambda^2)(A, n)$ for all for $n = 0, 1, 2$. Such results are of interest to us, since $\Lambda^2 \Lambda^2$ is the first composite functor arising in the decomposition (4.8) of the Lie functors $L^n A$.

We know by (4.2) that

\[
L_i \Lambda^2(1) = \begin{cases} 
\Omega_2(A), & i = 1 \\
\Lambda^2(A), & i = 0 \\
0, & i \neq 0, 1
\end{cases}
\]

\[
L_i \Lambda^2(2) = \begin{cases} 
\Omega_2(A), & i = 5 \\
\Lambda^2(A), & i = 4 \\
A \otimes \mathbb{Z}/2, & i = 3 \\
0, & i \neq 3, 4, 5
\end{cases}
\]

\[
L_i \Lambda^2(3) = \begin{cases} 
R_2(A), & i = 7 \\
\Gamma_2(A), & i = 6 \\
\text{Tor}(A, \mathbb{Z}/2), & i = 5 \\
0, & i \neq 4, 5, 6, 7.
\end{cases}
\]

\[
L_i \Lambda^2(4) = \begin{cases} 
\Omega_2(A), & i = 9 \\
\Lambda^2(A), & i = 8 \\
\text{Tor}(A, \mathbb{Z}/2), & i = 6 \\
A \otimes \mathbb{Z}/2, & i = 5, 7 \\
0, & \text{otherwise}
\end{cases}
\]

(9.8)

\[
L_i \Lambda^2(5) = \begin{cases} 
R_2(A), & i = 11 \\
\Gamma_2(A), & i = 10 \\
\text{Tor}(A, \mathbb{Z}/2), & i = 9 \\
A \otimes \mathbb{Z}/2, & i = 6, 8 \\
0, & \text{otherwise}
\end{cases}
\]

with $\Lambda^2(A)$ defined in (4.11). Proposition 9.1 yields the following table for the functors $L_i \Lambda^2 \Lambda^2(A)$:

\[
\begin{array}{c|c|c}
2 & 0 & R_2 \Omega_2(A) \\
1 & \Omega_2 \Lambda^2(A) & \Gamma_2 \Omega_2(A) \oplus \text{Tor}(\Lambda^2(A), \Omega_2(A)) \\
p=0 & \Lambda^2 \Lambda^2(A) & \Lambda^2 A \oplus \Omega^2(A) \\
\hline
q=0 & & \\
q=1 & & \\
\end{array}
\]

Table 2. $gr_p(L_{p+q}(\Lambda^2 \Lambda^2)(A))$

The functors $L_n(\Lambda^2 \Lambda^2)(A)$ can be read off from the $p + q = n$ line of this table. In particular, there is a (non-naturally split) short exact sequence

\[
0 \to \Lambda^2(A) \otimes \Omega_2(A) \to L_1(\Lambda^2 \Lambda^2)(A) \to \Omega_2 \Lambda^2(A) \to 0
\]
which may be viewed as a symmetrized version of a K"unneth formula for \( \pi_1 \left( \Lambda^2(A) \right)^L \).

We now pass to the derived functors \( L_n(\Lambda^2 \Lambda^2(A, 1)) \). The corresponding table of values of these derived functors may be read off from the values \([9,8]\) and \([11,1]\) of the derived functors of \( \Lambda^2 \):  

\[
\begin{array}{c|ccccc}
 p=0 & 4 & 3 & 2 & 1 & 0 \\
\hline
q=0 & 0 & R_2 R_2(A) & 0 & 0 & 0 \\
q=1 & \Omega_2 \Gamma_2(A) & \Gamma_2 R_2(A) & 0 & 0 & 0 \\
q=2 & \lambda^2 \Gamma_2(A) & \text{Tor}(R_2(A), \mathbb{Z}/2) & 0 & 0 & 0 \\
q=3 & \Gamma_2(A) \otimes \mathbb{Z}/2 & R_2(A) \otimes \mathbb{Z}/2 & \text{Tor}(\Gamma_2(A), R_2(A)) & 0 & 0 \\
q=4 & 0 & 0 & 0 & \Gamma_2(A) \otimes R_2(A) & 0 \\
\end{array}
\]

\textbf{Table 3.} \( gr_p(L_{p+q}(\Lambda^2 \Lambda^2)(A, 1)) \)

When one also takes into account the values of \( L_n \Lambda(A, n) \) for \( n = 4, 5 \), one finds the following values for the derived functors of \( \Lambda^2 \Lambda^2(A, 2) \):  

\[
\begin{array}{c|cccccccccc}
p=0 & 6 & 5 & 4 & 3 & 2 & 1 & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 \\
\hline
q=0 & 0 & 0 & R_2 \Omega_2(A) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
q=1 & 0 & \Omega_2 \lambda^2(A) & \Gamma_2 \Omega_2(A) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
q=2 & R_2(A \otimes \mathbb{Z}/2) & \lambda^2 \lambda^2(A) & \text{Tor}(\Omega_2(A), \mathbb{Z}/2) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
q=3 & \Gamma_2(A \otimes \mathbb{Z}/2) & \lambda^2(A) \otimes \mathbb{Z}/2 & \Omega_2(A) \otimes \mathbb{Z}/2 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
q=4 & \lambda^2 \Omega_2(A) \otimes \mathbb{Z}/2 & \Gamma_2(A \otimes \mathbb{Z}/2, \lambda^2(A)) & \text{Tor}(\lambda^2(A), \Omega_2(A)) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
\end{array}
\]

\textbf{Table 4.} \( gr_p(L_{p+q}(\Lambda^2 \Lambda^2)(A, 2)) \)

9.2. The derived functors of \( \Lambda^2 \Gamma_2 \). We will now carry out a similar discussion for the derived functors of \( \Lambda^2 \Gamma_2 \). By \([4,9]\),

\[
L_1 \Gamma_2(A) = \begin{cases} R_2(A), & i = 1 \\ \Gamma_2(A), & i = 0 \\ 0, & i \neq 0, 1 \end{cases} \quad L_1 \Gamma_2(A, 1) = \begin{cases} \Omega_2(A), & i = 3 \\ \lambda^2(A), & i = 2, \\ A \otimes \mathbb{Z}/2, & i = 1 \\ 0, & i \neq 1, 2, 3 \end{cases}
\]

(9.9)
Since $\Gamma_2(P)$ is torsion-free for any torsion-free group $P$, the derived functors of $\Lambda^2 \Gamma_2$ may be computed by formula (9.7). The following tables may now be deduced from (9.8) and (9.9):

\[
\begin{array}{c|cc}
 p=0 & R_2 R_2(A) & \Omega_2 \Gamma_2(A) \\
1 & \Gamma_2 R_2(A) & \Omega_2 \Gamma_2(A) \\
q=0 & \Lambda^2 \Gamma_2(A) & \Gamma_2(A) \otimes R_2(A) \\
\end{array}
\]

Table 5. \( gr_p(\Lambda^2 \Gamma_2)(A) \)

\[
\begin{array}{c|cccc}
p=0 & 4 & 3 & 2 & 1 \\
q=0 & 0 & 0 & R_2 \Omega_2(A) & 0 \\
q=1 & 0 & \Omega_2 \lambda^2(A) & \Gamma_2 \Omega_2(A) & 0 \\
q=2 & R_2(A \otimes \mathbb{Z}/2) & \Lambda^2 \lambda^2(A) & \text{Tor}(\Omega_2(A), \mathbb{Z}/2) & 0 \\
q=3 & \Gamma_2(A \otimes \mathbb{Z}/2) & \lambda^2(A) \otimes \mathbb{Z}/2 & \Omega_2(A) \otimes \mathbb{Z}/2 \text{Tor}(A \otimes \mathbb{Z}/2, \lambda^2(A)) & \text{Tor}(A \otimes \mathbb{Z}/2, \Omega_2(A)) \\
q=4 & 0 & 0 & \Lambda \otimes \mathbb{Z}/2 \otimes \lambda^2(A) & \Lambda \otimes \mathbb{Z}/2 \otimes \Omega_2(A) & \lambda^2(A) \otimes \Omega_2(A) \\
\end{array}
\]

Table 6. \( gr_p(\Lambda^2 \Gamma_2)(A, 1) \)

The coincidence, up to changes in degree, between certain terms in table 5 and those in table 3 and (more strikingly) between certain terms in table 6 and those in table 4 is explained by the décalage isomorphisms (2.40) between the derived functors of $\Gamma_2$ and those of $\Lambda^2$.

10. Derived functors of super-Lie functors

In view of (10.18), the décalage isomorphisms (2.42) and formulas (8.2) imply that for \( n \geq 1 \):

\[
L_{n+k} \mathcal{L}_s^n(\mathbb{Z}, n) = \begin{cases} 
\mathbb{Z}/3, & k = 4i + 1, \ i = 0, 1, \ldots, \left\lfloor \frac{n-1}{2} \right\rfloor \\
0, & \text{otherwise}
\end{cases} \quad (10.1)
\]

We will now examine the relations between the derived functors of $\mathcal{L}^n$ and $\mathcal{L}_s^n$. For any free simplicial abelian group $A_\ast$, the maps $\chi_n$ and $\bar{\chi}_n$ (17.31) induce arrows:

\[
\chi_n^* : \pi_m \left( L \mathcal{L}_s^n(A_\ast) \otimes L \Lambda^n(\mathbb{Z}, 1) \right) \to \pi_m(L \mathcal{L}^n(A) \otimes \mathbb{Z}[1]), \ m \geq 0
\]

\[
\bar{\chi}_n^* : \pi_m \left( L \mathcal{L}^n(A_\ast) \otimes L \Lambda^n(\mathbb{Z}, 1) \right) \to \pi_m(L \mathcal{L}_s^n(A) \otimes \mathbb{Z}[1]), \ m \geq 0
\]
For \( A_s = K(A, m) \), these determine by adjunction pension maps
\[
\chi_n^s : L_m \mathcal{L}_s^n(A, k) \rightarrow L_{m+n} \mathcal{L}_s^n(A, k + 1)
\]
(10.2)
\[
\tilde{\chi}_n^s : L_m \mathcal{L}_s^n(A, k) \rightarrow L_{m+n} \mathcal{L}_s^n(A, k + 1).
\]
which may be viewed as generalized décalage transformations, even though the maps \( \chi_n^s \) are no longer isomorphisms. We will for this reason refer to such maps as semi-décalage morphisms. Similarly, the pairing \( \beta_n \) (7.35) determines a family of pension isomorphisms (2.42) which we now denote \( \zeta_n \):
\[
L_m Y^n(A, k) \xrightarrow{\zeta_n} L_{m+n} J^n(A, k + 1).
\]
(10.3)

Proposition (7.2) now implies the following assertion:

**Theorem 10.1.** The following diagram is commutative:
\[
\begin{array}{ccc}
L_m \mathcal{L}_s^n(A, k) & \xrightarrow{\chi_n} & L_m Y^n(A, k) \\
\downarrow{\zeta_n} & & \downarrow{\zeta_n} \\
L_{m+n} \mathcal{L}_s^n(A, k + 1) & \xrightarrow{\tilde{\chi}_n} & L_{m+n} J^n(A, k + 1)
\end{array}
\]

We will now consider the boundary maps:
\[
\theta_m : L_m J^n(A, k) \rightarrow L_{m-1} \tilde{J}^n(A, k),
\]
(10.4)
\[
\tilde{\theta}_m : L_m Y^n(A, k) \rightarrow L_{m-1} \tilde{Y}^n(A, k).
\]
(10.5)

induced by the short exact sequences (2.9) and (7.27). The following proposition is a corollary of theorem 10.1

**Proposition 10.1.** For \( m, n \geq 1 \), and an abelian group \( A \), the following diagram, in which the vertical arrows are décalage and semi-décalage morphisms, commutes:
\[
\begin{array}{ccc}
L_{m+1} Y^n(A, k) & \xrightarrow{\tilde{\theta}_{m+1}} & L_m Y^n(A, k) \\
\downarrow{\zeta_n} & & \downarrow{\zeta_n} \\
L_{m+n+1} J^n(A, k + 1) & \xrightarrow{\theta_{m+n+1}} & L_{m+n} \tilde{J}^n(A, k + 1)
\end{array}
\]

(10.6)

Let \( A \) be an abelian group and \( n \geq 2 \). The following diagram, in which the vertical arrows are décalage maps, is commutative:
\[
\begin{array}{ccc}
\pi_{2n} \left( LSP^{n-1}(A, 2) \otimes A[2] \right) & \xrightarrow{L} & L_{2n} S^n(A, 2) \\
\downarrow & & \downarrow \\
\pi_n \left( L\Lambda^{n-1}(A, 1) \otimes A[1] \right) & \xrightarrow{L} & L_n \Lambda^n(A, 1)
\end{array}
\]

(10.7)
\[
\begin{array}{ccc}
\Gamma_{n-1}(A) \otimes A & \xrightarrow{\Gamma_n} & \Gamma_n(A) \\
\downarrow & & \downarrow \\
& \rightarrow & H_0 C^n(A)
\end{array}
\]

It follows in particular, by proposition 3.1 that there exists a natural isomorphism
\[
L_{2n-1} J^n(A, 2) \simeq \bigoplus_{p|n} \Gamma_{n/p}(A \otimes \mathbb{Z}/p),
\]
(10.8)

which describes explicitly the right-hand terms in diagram (10.7).
10.1. The fourth Lie and super-Lie functors. We will now discuss certain derived functors of the functors \( L^4 \) and \( L^4_s \). Recall that by (7.9) and (7.28),

\[
\hat{J}^4(A) \cong \Lambda^2 \Lambda^2(A), \quad \hat{Y}^4(A) \cong \Lambda^2 \Gamma_2(A).
\]

for any free abelian \( A \). By (10.8), the right-hand vertical arrows in diagram (10.7) for \( n = 4 \) are:

\[
L_7 J^4(A, 2) \cong L_3 Y^4(A, 1) \cong \Gamma_2(A \otimes \mathbb{Z}/2).
\]  

(10.9)

**Proposition 10.2.** For every abelian group \( A \), the arrow

\[
L_3 Y^4(A, 1) \xrightarrow{\bar{\theta}_3} L_2 \Lambda^2 \Gamma_2(A, 1)
\]

is a natural isomorphism between a pair of functors, both naturally isomorphic to \( \Gamma_2(A \otimes \mathbb{Z}/2) \).

**Proof.** Let us first verify that the map \( \bar{\theta}_3 \) is surjective. Consider the simplicial model (2.17) of \( L^2 \Gamma_2(A, 1) \) determined by a flat resolution (2.15) of \( A \). We define a map

\[
\Gamma_2(A \otimes \mathbb{Z}/2) \xrightarrow{v} L_2 \Lambda^2 \Gamma_2(A, 1)
\]

explicitly as follows:

\[
\gamma_2(\bar{a}) \quad \mapsto \quad \gamma_2(s_0(a)) \wedge \gamma_2(s_1(a))
\]

for some lift \( a \) to \( M \) of \( \bar{a} \in A \otimes \mathbb{Z}/2 \). Under the natural transformation \( \Lambda^2 \Gamma_2 \rightarrow L^4_s \) (2.26), the image of \( \gamma_2(\bar{a}) \) goes to the element

\[
\{s_0(a), s_1(a), s_0(a), s_1(a)\}
\]

in the term \( L^4_s(L \oplus s_0(M) \oplus s_1(M)) \) of the corresponding simplicial model for \( L^4_s(A, 1) \). The element

\[
\tau := \{s_1s_0(a), s_2s_0(a), s_1s_0(a), s_2s_0(a)\} - \{s_1s_0(a), s_2s_0(a), s_1s_0(a), s_2s_1(a)\} \in L^4_s(s_0(A_1) \oplus s_1(A_1) \oplus s_2(A_1) \oplus s_1s_0(A_0) \oplus s_2s_0(A_0) \oplus s_2s_1(A_0))
\]

satisfies the equations \( \partial_i(\tau) = 0, \ i = 1, 2, 3 \) and

\[
\partial_0(\tau) = \{s_0(a), s_1(a), s_0(a), s_1(a)\} \in L^4_s(A_1 \oplus s_0(A_0) \oplus s_1(A_0)).
\]

It follows that the map \( L_2 \Lambda^2 \Gamma_2(A, 1) \rightarrow L_2 L^4_s(A, 1) \) is trivial so that, by exactness of the upper line of diagram (10.6), the arrow \( \bar{\theta}_3 \) is surjective.

We will now give a more explicit description of the target of \( \bar{\theta}_3 \). We have a natural isomorphism

\[
v : L_2 \Lambda^2 \Gamma_2(A, 1) \xrightarrow{\sim} \Gamma_2(A \otimes \mathbb{Z}/2)
\]

since the only non-trivial total degree 2 term in table 4 is the expression \( \Gamma_2(A \otimes \mathbb{Z}/2) \) in bidegree \((1,1)\). We now have a pair of arrows \( u \) (10.9) and \( v \), which provide natural isomorphisms between both the source and target of \( \bar{\theta}_3 \) and the group \( \Gamma_2(A \otimes \mathbb{Z}/2) \). We may now assume that \( A \) is finitely generated. In that case both source and target of the surjective map \( \bar{\theta}_3 \) are finite groups of the same order, so that \( \bar{\theta}_3 \) is an isomorphism. \( \square \)

We know by the description of homotopy groups of \( L^2 \Lambda^2(A, 2) \) in table 4 that there is a natural projection \( L_2 \Lambda^2 \Lambda^2(A, 2) \rightarrow \Gamma_2(A \otimes \mathbb{Z}/2) \). The following proposition is a consequence of propositions 10.1 and 10.2.
Proposition 10.3. The group $G := L_6\Lambda^2\Lambda^2(A, 2)$ is endowed with a 3-step descending filtration $F^iG$ (1 ≤ i ≤ 3) for which the associated graded components are described by

$$gr_iG = \begin{cases} 
\Gamma_2(A \otimes \mathbb{Z}/2) & i = 1 \\
\text{Tor}(\lambda^2(A), \mathbb{Z}/2) & i = 2 \\
\Omega_2(A) \otimes \mathbb{Z}/2 & i = 3 
\end{cases}$$

In addition, the projection $w$ of $G$ on the highest graded component $gr_3G$ is the map arising from the edge-homomorphism in the spectral sequence (9.6) described in table 4. This surjection $w$ is split, up to isomorphism, by the boundary map $L_7J^4(A, 2) \xrightarrow{\partial_7} L_6\Lambda^2\Lambda^2(A, 2)$ provided by the decomposition (7.3) of $J^4(A)$.

Proof. The associated graded terms $\Omega_2(A) \otimes \mathbb{Z}/2$ and $\text{Tor}(\lambda^2(A), \mathbb{Z}/2)$ in the line $p + q = 6$ of table 4 give us the required description of $F^2G = \text{ker}(w)$. The previous discussion provides us with a commutative diagram

$$\begin{array}{ccc}
\Gamma_2(A \otimes \mathbb{Z}/2) & \xrightarrow{\sim} & L_3Y^4(A, 1) \\
& \downarrow \cong & \downarrow \psi_4 \\
L_7J^4(A, 2) & \xrightarrow{\partial_7} & L_6\Lambda^2\Lambda^2(A, 2) \xrightarrow{w} \Gamma_2(A \otimes \mathbb{Z}/2)
\end{array}$$

where the injectivity of the map $\psi_4$ (10.6) is obtained by examining the behavior of the decompositions (9.7) of its source and target under décalage. It remains to show that the composite map $w \circ \theta_7 : L_7J^4(A, 2) \rightarrow \Gamma_2(A \otimes \mathbb{Z}/2)$ is an isomorphism. When $A$ is free abelian of finite rank, $L_6\Lambda^2\Lambda^2(A, 2) \simeq \Gamma_2(A \otimes \mathbb{Z}/2)$, so that the injective map $\psi_4 : \Gamma_2(A \otimes \mathbb{Z}/2) \hookrightarrow L_6\Lambda^2\Lambda^2(A, 2)$ is a monomorphism between two finite groups of the same order. It follows that the map $w \circ \theta_7$ is an isomorphism whenever $A$ is free abelian, and therefore an epimorphism for an arbitrary abelian group $A$. Returning to the case of an abelian group $A$ of finite rank, we conclude that the epimorphism $w \circ \theta_7$ is an isomorphism, since source and target are finite groups of the same order. This implies that the corresponding assertion is true for an arbitrary abelian group. \hfill $\square$

In the sequel, we will also need the following result, which follows since the only non-trivial terms contributed by the Curtis decomposition to $L_i\mathcal{L}^4(A, 2)$ for $i < 7$ are those provided by the derived functors of $\Lambda^2\Lambda^2$:

Corollary 10.1. There group $L_6\mathcal{L}^4(A, 2)$ is canonically isomorphic to the direct sum of the two following expressions:

$$\text{gr}_1L_6\mathcal{L}^4(A, 2) = \text{Tor}(\lambda^2(A), \mathbb{Z}/2) = \text{Tor}(\Lambda^2(A), \mathbb{Z}/2) \oplus \text{Tor}_2(A, \mathbb{Z}/2, \mathbb{Z}/2)$$

$$\text{gr}_2L_6\mathcal{L}^4(A, 2) = \Omega_2(A) \otimes \mathbb{Z}/2.$$
spaces. When $A$ is free abelian with a chosen basis, a Moore space $M(A,n)$ can be constructed as a wedge of $n$-spheres, labelled by basis elements of $A$. For an arbitrary abelian group $A$ and $n \geq 2$, an $n$-dimensional Moore space is constructed as follows: choose a 2-step free resolution $\{A,n\}$ of $A$ with chosen bases. $M(A,n)$ can then be defined as the mapping cone $\{29\}$ VI 2 of the induced map between the wedges of spheres $M(L,n) \to M(M,n)$. For any homomorphism of abelian groups $f : A \to B$, it is possible to construct a map $\phi : M(A,n) \to M(B,n)$ such that $H_n(\phi) = f$. However, the construction of the map $\phi$ is not canonical and the construction of Moore spaces is non-functorial. The canonical class in $H^n(M(A,n), A)$ induces a map

$$M(A,n) \to K(A,n)$$

which is well-defined up to homotopy.

We will now recall the construction of the Curtis spectral sequence. Let $G$ be a simplicial group. The lower central series filtration on $G$ gives rise to the long exact sequence

$$\cdots \to \pi_{i+1}(G/\gamma_r(G)) \to \pi_i(\gamma_r(G)/\gamma_{r+1}(G)) \to \pi_i(G/\gamma_{r+1}(G)) \to \pi_i(\gamma_r(G)) \to \cdots$$

This exact sequence defines a graded exact couple, which gives rise to a natural spectral sequence $E(G)$ with the initial terms

$$E^1_{r,q}(G) = \pi_q(\gamma_r(G)/\gamma_{r+1}(G))$$

and differentials

$$d^r_{r,q} : E^r_{r,q}(G) \to E^r_{r+i,q-1}(G).$$

According to $[10]$, for $K$ a connected simplicial set and $G = GK$ the associated Kan construction $[32]$ §26, this spectral sequence $E^r(G)$ converges to $E^\infty(G)$ and $\oplus_r E^r_{r,q}$ is the graded group associated to the filtration on $\pi_q(GK)$ induced by the lower central series filtration on $K$. Since $GK$ is a loop group of $K$, this spectral sequence may be written as

$$E^1_{r,q}(K) := \pi_q(\gamma_r(GK)/\gamma_{r+1}(GK)) \implies \pi_{q+1}(|K|).$$

The groups $E^1(G)$ are homology invariants of $K$. By the Magnus-Witt isomorphism $[2.4]$, the spectral sequence can be rewritten as

$$E^1_{r,q}(K) = \pi_q(C^r(\tilde{Z}K, -1)) \implies \pi_{q+1}(|K|).$$

since the abelianization $GK_{ab} := GK/\gamma_2GK$ of $GK$ corresponds to the reduced chains $\tilde{Z}K$ on $K$, with degree shifted by 1. When $K = M(A,n)$, $\tilde{Z}K$ corresponds to an Eilenberg-Mac Lane space $K(A,n)$ so that the spectral sequence is simply of the form

$$E^1_{r,q} = L_qC^r(A, n-1) \implies \pi_{q+1}(M(A,n)).$$

In particular,

$$E^1_{1,q} = \pi_q(K(A, n-1)) = \begin{cases} A, & q = n - 1 \\ 0, & q \neq n - 1 \end{cases}$$

For a additional information regarding this spectral sequence, see $[16]$, $[40]$ ch. 5.

11.2. The 3-torsion of $\pi_n(S^2)$. As a first illustration of our techniques, we will now discuss the 3-torsion components of the homotopy groups of the sphere $S^2$. For this, consider the 3-torsion parts of the various terms in the spectral sequence $([11],[25])$, with $A = \mathbb{Z}$ and $n = 2$:

$$E^1_{r,q} = L_qC^r(\mathbb{Z}, 1) \Rightarrow \pi_{q+1}(S^2).$$

From now on, we will denote by $pA$ the $p$-torsion subgroup of an abelian group $A$ and by $(p)A$ the quotient of $A$ by the $q$-torsion elements, for all primes $q \neq p$. We will refer to this quotient group as the $(p)$-torsion group of $A$.  

DERRIVED FUNCTORS OF NON-ADDITIVE FUNCTORS AND HOMOTOPY THEORY
It is shown in [16] (see also [40] props. 5.33 and 5.35) that

\[ L_i \Lambda^n(Z, 1) = \begin{cases} 
\mathbb{Z}, & i = 2, n = 2 \\
0, & \text{otherwise}
\end{cases} \quad (11.7) \]

This, together with the Curtis decomposition (7.8) of the Lie functors and the computation of the torsion in the groups \( J_r \) by either of the factors \( F_r \), implies that there is no 3-torsion in any of the expressions \( L_i \mathcal{L}^p(Z, 1) \) for \( p < 6 \). Let us show that the first non-trivial 3-torsion term in the spectral sequence \( (11.5) \) occurs in the group \( L_5 \mathcal{L}^6(Z, 1) \). It follows from (11.7) and the Künneth formula that no 3-torsion is produced by either of the factors \( J^6(Z, 1) \) and \( J^4(Z, 1) \otimes J^2(Z, 1) \) of \( \mathcal{L}^6(Z, 1) \), nor is any contribution made by \( J^2 J^3(Z, 1) \) since \( J^3(Z, 1) \) is contractible. It thus follows from (11.7) and (8.2) (or (8.14)) that

\[ L_4 \mathcal{L}^6(Z, 1) \simeq L_4 J^3 J^2(Z, 1) \simeq L_4 \mathcal{L}^3(Z, 2) \simeq \begin{cases} 
\mathbb{Z}/3, & i = 5 \\
0, & i \neq 5.
\end{cases} \quad (11.8) \]

We restate this result as:

\[ L J^3 J^2(Z, 1) \simeq K(Z/3, 5). \quad (11.9) \]

More generally, the Curtis decomposition (7.8), together with (11.7) and (11.8), implies that 3-torsion in the groups \( L_q \mathcal{L}^r(Z, 1) \) can only arise from components of the decomposition of the form \( F J^k J^2 \) and their tensor products (for functors \( F = S P^k \), \( F = J^k \)), so that there is no 3-torsion in the initial terms of (11.6) unless \( 6 | r \). The analysis of the \( r = 18 \) case is similar to that of \( r = 6 \). The only contribution to the 3-torsion in the derived functors \( L_q \mathcal{L}^r(Z, 1) \), for \( q \leq 14 \), comes from the derived functors of \( J^3 J^3 J^2(Z, 1) \), and by (11.9):

\[ L_i J^3 J^3 J^2(Z, 1) \simeq L_i \mathcal{L}^3(Z/3, 5). \]

These groups were computed in (8.10), so it now follows from the connectivity result (6.6) that

\[ 3 L_q \mathcal{L}^r(Z, 1) = \mathbb{Z}/3, \quad r = 18, \quad q = 8, 9 \quad (11.10) \]

and

\[ 3 L_q \mathcal{L}^r(Z, 1) = 0, \quad 5 < q < 10, \quad r \neq 18. \]

We refer to [40] ch. 5 for a similar analysis of the 2-torsion components in the spectral sequence (11.6).

For \( r \neq 12 \), the 3-torsion components of \( L_q \mathcal{L}^r(Z, 1) \) may all be computed by the previous method so long as \( q \leq 14 \), and indeed all of these components are trivial except for those provided by (11.8) and (11.10). We will now consider in detail the case of the 12th Lie functor. We will need to introduce additional techniques in order to achieve a complete understanding of the derived functors of \( \mathcal{L}^{12} \) and of the differentials in the spectral sequence (11.6) within the range \( q \leq 14 \).

First observe that only the functors \( J^6 J^2 \), \( J^3 J^2 J^2 \), \( J^2 J^3 J^2 \), \( J^4 J^2 \otimes J^2 J^2 \), \( J^4 J^3 \otimes J^2 J^2 \) may give any contribution to the 3-torsion in \( L_q \mathcal{L}^{12}(A, 1) \) in degrees \( q \leq 14 \). By (11.2) and (8.14), the derived functors of \( J^3 J^2 J^2 \) and \( J^4 J^2 \otimes J^2 J^2 \) are all 2-torsion groups for \( A = \mathbb{Z} \). It follows that that 3-torsion in \( L_q \mathcal{L}^{12}(Z, 1) \) within our range can only occur in degrees \( q = 10, 11 \). In fact we will now show that while \( J^6 J^2(Z, 1) = K(\mathbb{Z}_6, 11) \) by (10.8), and so could in principle contribute to the 3-torsion of \( L_{11} \mathcal{L}^{12}(Z, 1) \), this is not in fact the case:

**Proposition 11.1.** The groups \( (3) L_q \mathcal{L}^{12}(Z, 1) = 0 \) are trivial for all \( q \geq 2 \).

**Proof:** By (11.7), we may think of the Curtis decomposition of \( \mathcal{L}^{12}(Z, 1) \) as reducing to a short exact sequence

\[ 0 \to J^2 J^3 J^2(Z, 1) \to \mathcal{L}^{12}(Z, 1) \to J^6 J^2(Z, 1) \to 0 \]
when only 3-torsion is considered. This induces following commutative diagram of finite groups with exact horizontal lines, and boundary maps $\eta_{11}$:

$$
\begin{array}{cccc}
3L_{11}L^3(Z, 1) & \xrightarrow{\eta_{11}} & 3L_{11}J^2J^2(Z, 1) & \xrightarrow{\eta_{11}} & 3L_{10}L^1J^2(Z, 1) \\
3L_{11}L^5(Z, 2) & \xrightarrow{} & 3L_{11}J^3(Z, 2) & \xrightarrow{\eta_{11}} & 3L_{10}L^1J^2(Z, 2) \\
\Gamma_2(Z_3) & \xrightarrow{} & \Gamma_2(Z_3)
\end{array}
$$

(11.11)

In this diagram, the value of $3L_{11}J^2(Z, 2)$ was determined by (10.8) and that of $3L_{10}J^2J^2(Z, 1)$ follows from (11.9) and (4.2).

We will now look at this in more detailed, for $A$ well-known [12], [18], in fact the only nontrivial generators for such groups are the fundamental class $\pi_q(A, n)$, since within the range of values of $q \leq 11$ we may replace the expression $\tilde{Z}K(Z, n)$ in the initial term of (11.13) by $\oplus_i K(\tilde{H}_{i+1}(Z, n), i)$ so that the spectral sequence becomes

$$E_{r,q}^1 = \pi_q L^r(\oplus_i K(\tilde{H}_{i+1}(Z, n), i)) \implies \mathbb{Z}[n - 1]$$

(11.14)

In particular,

$$E_{1,q}^1 = \tilde{H}_{q+1}(K(Z, n)).$$

(11.15)

Let us now consider the Curtis spectral sequence (11.4) for the space $K := K(A, n)$ for some abelian group $A$:

$$E_{r,q}^1 = L_{q+1}L^r(\tilde{Z}K(A, n), -1) \implies \pi_q(K(A, n - 1))$$

(11.12)

We will now look at this in more detailed, for $A = \mathbb{Z}$:

$$E_{r,q}^1 = L_{q+1}L^r(\tilde{Z}K(Z, n), -1) \implies \pi_q(K(Z, n - 1))$$

(11.13)

By Dold’s theorem [20] th. 5.1, we may replace the expression $\tilde{Z}K(Z, n)$ in the initial term of (11.13) by $\oplus_i K(\tilde{H}_{i+1}(Z, n), i)$ so that the spectral sequence becomes

$$E_{r,q}^1 = \pi_q L^r(\oplus_i K(\tilde{H}_{i+1}(Z, n), i)) \implies \mathbb{Z}[n - 1]$$

(11.14)

In particular,

$$E_{1,q}^1 = \tilde{H}_{q+1}(K(Z, n)).$$

(11.15)

We now consider the case $n = 3$. The low-degree (3)-torsion integral homology groups of $K(Z, 3)$ are well-known [12], [13], in fact the only nontrivial generators for such groups are the fundamental class $i_3$ in degree 3, the degree 7 suspension of element $\gamma_3(i_2) \in H_6(K(Z, 2))$, and their product in degree 10 (under the multiplication induced by the $H$-space structure of $K(Z, 3)$):

| $n$ | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
|-----|---|---|---|---|---|---|---|----|----|----|
| $(3)H_nK(Z, 3)$ | $\mathbb{Z}$ | 0 | 0 | 0 | $\mathbb{Z}/3$ | 0 | 0 | $\mathbb{Z}/3$ | 0 | 0 |

When $n = 3$, Dold’s theorem also allows us to (non-functorially) compute the other initial terms in (11.14), since within the range of values of $q \leq 11$ we may replace the expression $\tilde{Z}K(Z, 3)$ by the product of Eilenberg-Mac Lane spaces $K(Z, 2) \oplus K(Z/3, 6) \oplus K(Z/3, 9)$. For $r = 2$ we must therefore compute the homotopy of the induced $LJ^2(K(Z, 2) \oplus K(Z/3, 6) \oplus K(Z/3, 9))$. No 3-torsion in the homotopy is provided by the functor $J^2$ applied to any of the three summands, so the only non-trivial terms are those coming from the cross-effect terms $\mathbb{Z}[2] \otimes \mathbb{Z}/3[6]$ and $\mathbb{Z}[2] \otimes \mathbb{Z}/3[9]$, in other words copies of $\mathbb{Z}/3$ in degrees 8 and 11 respectively.

Similarly, in looking for the 3-torsion of the $r = 3$ initial terms of (11.13) within our range of values $q \leq 11$, we need only consider the homotopy of $LJ^3(K(Z, 2) \oplus K(Z/3, 6))$. Let us record here the functorial form of (8.16), for all $n$ and a more restricted range of values of $k$:

**Lemma 11.1.** For any abelian group $A$, and integer $n > 4$

$$3L_{n+k}J^3(A, n) = \begin{cases} 
A \otimes \mathbb{Z}_3 & k = 3, 7 \\
\text{Tor}(A, \mathbb{Z}/3) & k = 4, 8 \\
0 & k = 2, 5, 6 
\end{cases}$$
It follows that the summand \( IJ^3(Z, 2) \) contributes a term \( Z/3 \) in degree 5 to the 3-torsion of \( E_3^{1,q} \), while the summand \( IJ^3(Z/3, 6) \) contributes a pair of terms \( Z/3 \) in degrees 9 and 10. In addition, since the second third cross-effect of the functor \( J^3 \) is the functor

\[ J^3_{[2]}(A|B) \simeq (A \otimes B \otimes A) \oplus (A \otimes B \otimes B), \]

it contributes an additional term \( Z[2] \otimes Z/3[6] \otimes Z[2] \) to the homotopy of \( IJ^3(K(Z, 2) \oplus K(Z/3, 6)) \) 9 in degree 10, in other words a second factor \( Z/3 \) to the initial term \( E_3^{1,10} \) of \( (11.11) \).

There is no contribution to the 3-torsion component of the initial terms of the spectral sequence \( (11.13) \) for \( r = 4, 5, 7, 8 \) since none of these numbers is a multiple of 3. If we leave aside the case \( p = 6 \) for the time being, the only initial terms which we still need to consider are those for which \( r = 9 \).

In our range \( q \leq 11 \), the only the summand of \( \mathcal{L}^q \) which comes into play is \( J^3J^3 \) and by \( (8.10) \) the homotopy groups of \( IJ^3K(Z/3, 5) \) contribute a pair of groups \( Z/3 \) to the 3-torsion of \( L\mathcal{L}^q(Z, 2) \) in degrees 8 and 9.

We now collect in the following table the outcome of this discussion of the \( (3) \)-torsion components of the initial terms of the spectral sequence \( (11.13) \) for \( n = 3 \):

| \( r \) | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|-------|---|---|---|---|---|---|---|---|---|
| \( (3)E_{r,11}^1 \) | 0 | \( Z/3 \) | 0 | 0 | 0 | * | 0 | 0 | * |
| \( (3)E_{r,10}^1 \) | 0 | 0 | \( (Z/3)^2 \) | 0 | 0 | 3L_{10}L^6(Z, 2) | 0 | 0 | 0 |
| \( (3)E_{r,9}^1 \) | \( Z/3 \) | 0 | \( Z/3 \) | 0 | 0 | 0 | 0 | \( Z/3 \) |
| \( (3)E_{r,8}^1 \) | 0 | \( Z/3 \) | 0 | 0 | 0 | 0 | \( Z/3 \) |
| \( (3)E_{r,7}^1 \) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| \( (3)E_{r,6}^1 \) | \( Z/3 \) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| \( (3)E_{r,5}^1 \) | 0 | 0 | \( Z/3 \) | 0 | 0 | 0 | 0 | 0 | 0 |
| \( (3)E_{r,4}^1 \) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| \( (3)E_{r,3}^1 \) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| \( (3)E_{r,2}^1 \) | \( Z \) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 7. The 3-torsion in the initial terms for the spectral sequence \( (11.13) \) when \( n = 3 \)

Since all the terms in the abutment of this spectral sequence vanish (except for a copy of \( Z \) in degree 2), it follows by examining the possible differentials in the spectral sequence that the term \( (3)\mathcal{L}^6(Z, 2) \) survives all the way to \( E_{6,10}^\infty \) and must therefore be trivial. Diagram \( (11.11) \) now makes it clear that \( (3)\mathcal{L}^{12}(Z, 1) = (3)\mathcal{L}^6(Z, 2) \) also vanishes. These were the only possibly non-vanishing terms within our range of degrees, so that finally:

\[
(3)L_r\mathcal{L}^{12}(Z, 1) = 0, \quad r \leq 14.
\]

(11.16)

\[ \square \]

**Remark 11.1.** A direct computation shows that the triviality of \( L_{10}\mathcal{L}^6(Z, 2) \) is equivalent to the assertion the class in \( \mathcal{L}_6^0(Z, 1)_4 \), of the element

\[
\zeta = \{ \{ s_2 s_1 s_0(a), s_2 s_1 s_0(a), s_3 s_1 s_0(a), s_3 s_1 s_0(a), s_3 s_1 s_1(a) \} - \\
\{ \{ s_2 s_1 s_0(a), s_2 s_1 s_0(a), s_3 s_2 s_0(a), s_3 s_1 s_1(a) \} + \\
\{ \{ s_3 s_1 s_0(a), s_3 s_1 s_0(a), s_3 s_0 s_0(a) \}; \{ s_2 s_1 s_0(a), s_2 s_1 s_0(a), s_3 s_2 s_1(a) \} \}
\]

is trivial, where \( a \) is a generator of \( Z = \pi_1 K(Z, 1) \). It would be of some interest to find a specific element in \( \mathcal{L}_6^0(Z, 1)_5 \) with boundary \( \zeta \).
We now return to the spectral sequence (11.6), where we now know that \( E^1_{12,q} = 0 \) for all \( q \leq 14 \). We will now display the entire table of initial terms in the range \( q \leq 14 \):

\[
\begin{array}{c|cccccccccc}
 r & 6 & 12 & 18 & 24 & 30 & 36 & 42 & 48 & 54 & 162 \\
\hline
3L_{14}L^r(Z, 1) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \mathbb{Z}/3 \\
3L_{13}L^r(Z, 1) & 0 & 0 & \mathbb{Z}/3 & 0 & 0 & 0 & 0 & \mathbb{Z}/3 & 0 & 0 \\
3L_{12}L^r(Z, 1) & 0 & 0 & \mathbb{Z}/3 & 0 & 0 & 0 & 0 & \mathbb{Z}/3 \oplus \mathbb{Z}/3 & 0 & 0 \\
3L_{11}L^r(Z, 1) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & \mathbb{Z}/3 & 0 & 0 \\
3L_{10}L^r(Z, 1) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
3L_9L^r(Z, 1) & 0 & 0 & \mathbb{Z}/3 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
3L_8L^r(Z, 1) & 0 & 0 & \mathbb{Z}/3 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
3L_7L^r(Z, 1) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
3L_6L^r(Z, 1) & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
3L_5L^r(Z, 1) & \mathbb{Z}/3 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
\end{array}
\]

Table 8. The 3-torsion in the initial terms of the spectral sequence (11.6)

The values of the various terms in this table are justified as follows. Observe first of all that the vanishing of all terms \( E^1_{12,q} \) terms implies that there are no non-zero terms \( E^1_{r,q} \) whenever \( r \) is a multiple of 12. Non-trivial terms with \( r = 18 \) arise by applying the functor \( J^3 \) according to the rule of lemma (11.1) to the cyclic group \( 3E^8_{1,5} = \mathbb{Z}/3 \), so that they are contributed by derived functors of the summands \( J^3J^3J^2 \) of \( \mathcal{L}^{18} \). Applying one more functor \( J^3 \) to each of the two cyclic groups \( E^8_{18,8} \) and \( E^8_{18,9} \) provides us, according to the same rule, with two additional copies of \( \mathbb{Z}/3 \) in the columns \( r = 54 \). Finally, a last composition with a \( J^3 \) yields the only non-trivial term in column \( r = 162 \) within our range \( r \leq 14 \). Our discussion makes it clear that this cyclic group has been contributed by the appropriate derived functor of the summands \( J^3J^3J^3J^2 \) of \( \mathcal{L}^{162} \).

It now follows from this discussion, by taking into account the possible differentials in the spectral sequence, that we have obtained the following description of the 3-torsion in \( \pi_i(S^2) \) in the range \( i \leq 11 \):

\[
3\pi_i(S^2) = \begin{cases} 
\mathbb{Z}/3 & i = 6, 9, 10 \\
0 & \text{otherwise}
\end{cases}
\]  

(11.17)

In addition,

\[
\pi_i(S^2) \supseteq \mathbb{Z}/3, \ i = 13, 14.
\]

We recover in this way by purely algebraic methods certain of Toda’s results (10). In fact, it can be shown by comparing once more once more the differentials in a spectral sequence for the Moore space (11.18) with those in the corresponding spectral sequence for an Eilenberg-Mac Lane space, and by suspension arguments, that the additional differentials \( d^3_{18,12} : \mathbb{Z}/3 \to \mathbb{Z}/3 \) and \( d^3_{18,13} : \mathbb{Z}/3 \to \mathbb{Z}/3 \oplus \mathbb{Z}/3 \) in (11.6) are both monomorphisms. In this way, we recover algebraically the entire description of the 3-torsion in \( \pi_n(S^2) \) up to degree 14.

11.3. Some homotopy groups of \( M(A, 2) \). We now consider the spectral sequence (11.3) for \( n = 2 \):

\[
E^1_{r,q} = L_qL^r(A, 1) \Rightarrow \pi_{q+1}M(A, 2).
\]

(11.18)

For \( r = 3 \), some initial terms in this spectral sequence were computed in (8.2). We will now study the terms \( E^1_{4,q} = L_qL^4(A, 1) \). The short exact sequences (2.9) and (7.9) derive to the horizontal lines of the two following diagrams, while the vertical ones arise from semi-décalage and the computations of the groups \( L_iA^2A^2(A, 1) \) in table (3):
The computation of the $L_1\Lambda^2\Lambda^2(A)$ also implies that there are genuine décalage isomorphisms

$$L_1\mathcal{L}_n^\alpha(A) \simeq L_{i+n}\mathcal{L}_n^\alpha(A, 1)$$

for $n = 4$ whenever $i > 2$. The same is true for $n = 5$ and all $i$ by comparison of the derived long exact sequences associated to the sequences (11.10) and (11.30).

This discussion provides the justification for the description of the columns $q = 1, 2, 3, 5$ of the following table of initial terms of the spectral sequence (11.18):

| $q$ | $E^1_{1, 0}$ | $E^1_{2, 0}$ | $E^1_{3, 0}$ | $E^1_{4, 0}$ |
|-----|---------------|---------------|---------------|---------------|
| $7$ | $0$           | $0$           | $0$           | $0$           |
| $6$ | $0$           | $0$           | $0$           | $0$           |
| $5$ | $0$           | $0$           | $L_2Y^3(A)$   | $\pi_1\left(L\Gamma_2(A) \otimes \mathbb{Z}/2\right) \oplus \mathcal{L}_3^\delta(A)$ |
| $4$ | $0$           | $0$           | $L_1Y^3(A)$   | $\pi_1\left(L\Gamma_2(A) \otimes \mathbb{Z}/2\right) \oplus \mathcal{L}_3^\delta(A)$ |
| $3$ | $0$           | $\Gamma_2(A)$ | $Y^3(A)$      | $\Gamma_2(A) \otimes \mathbb{Z}/2$ |
| $2$ | $0$           | $\Gamma_2(A)$ | $0$           | $0$           |
| $1$ | $A$           | $0$           | $0$           | $0$           |

| $q$ | $E^1_{5, 0}$ |
|-----|--------------|
| $7$ | $\text{Tor}(R_2(A), \mathbb{Z}/3) \oplus \text{Tor}(L_2Y^3(A), \mathbb{Z}/2) \oplus L_1\mathcal{L}_n^\alpha(A)$ |
| $6$ | $\pi_1\left(L\Gamma_2(A) \otimes \mathbb{Z}/3\right) \oplus \pi_2\left(Y^3(A) \otimes \mathbb{Z}/2\right) \oplus \mathcal{L}_5^\delta(A)$ |
| $5$ | $\Gamma_2(A) \otimes \mathbb{Z}/3 \oplus \pi_1\left(Y^3(A) \otimes \mathbb{Z}/2\right)$ |
| $4$ | $Y^3(A) \otimes \mathbb{Z}/2$ |
| $3$ | $0$           |
| $2$ | $0$           |
| $1$ | $0$           |

| $q$ | $E^1_{9, 0}$ | $E^1_{10, 0}$ |
|-----|---------------|---------------|
| $6$ | $\pi_2\left(L\Gamma_2(A) \otimes \mathbb{Z}/2 \otimes \mathbb{Z}/2\right) \oplus \pi_1\left(L\mathcal{L}_2^\delta(A) \otimes \mathbb{Z}/2\right)$ | $Y^3(A) \otimes \mathbb{Z}/3$ |
| $5$ | $\pi_1\left(L\Gamma_2(A) \otimes \mathbb{Z}/2 \otimes \mathbb{Z}/2\right) \oplus \mathcal{L}_5^\delta(A) \otimes \mathbb{Z}/2$ |
| $4$ | $\Gamma_2(A) \otimes \mathbb{Z}/2$ |
| $3$ | $0$           |
| $2$ | $0$           |
| $1$ | $0$           |

**Table 9.** The $E^1$-terms of the spectral sequence (11.18)
The second column in table 9 follows from (2.11) and from the computation (4.2) for \( n = 1 \), and the third one from (8.4). The first summand in the term \( E_{1,3}^4 \) in the fourth column is provided by the subgroup \( \Lambda^2 \Lambda^2(A) \) of \( \mathcal{L}^4(A) \) exhibited in (7.3), when the expression in position \((2,1)\) in table 2 is taken into account, and its derived versions then occur above it. The second summand in \( E_{1,3}^4 \) arises from the décalage isomorphism (11.20) and a diagram chase in diagram (11.19). Once more, its derived versions are then to be found above it.

We will now show how to find the terms of interest to us in columns 6 and 8, by the methods of (8). Those in the sixth column in degrees \( q = 4, 5 \) only depend on the first two summands \( J^3 J^2(A) \) and \( J^2 J^3(A) \) of \( \mathcal{L}^6(A) \). The term \( J^2 J^3(A) \) in \( \mathcal{L}^6(A) \) contributes an expression

\[
L_4(J^2 J^3(A, 1)) \simeq L_4 \Lambda^2(Y^3(A), 3) \simeq Y^3 A \otimes \mathbb{Z}/2,
\]
to \( E_{6,4}^4 \), since \( L_2 \Lambda^2(A, 1) \simeq \Gamma_2 A \) and \( L_5 J^3(A, 2) \simeq A \otimes \mathbb{Z}/3 \) (8.14). The same computation provides the corresponding factor in \( E_{6,5}^4 \). Similarly, the term \( J^3 J^2(A) \) provides the expression \( \Gamma_2(A) \otimes \mathbb{Z}/3 \) in \( E_{6,5}^4 \), since \( L_2 \Lambda^2(A, 1) \simeq \Gamma_2 A \) and \( L_5 J^3(A, 2) \simeq A \otimes \mathbb{Z}/3 \) (8.14). Finally, the term \( E_{8,4}^4 \) comes from the term \( L_4 J^2 J^2 J^2(A, 1) \) in \( L_4 \mathcal{L}^8(A, 1) \) by the same sort of reasoning: we already know that

\[
L_3 \Lambda^2 \Lambda^2(A, 1) \simeq \Gamma_2(A) \otimes \mathbb{Z}/2.
\]

This implies that

\[
L_4 \Lambda^2(\Lambda^2 \Lambda^2(A, 1)) \simeq L_4 \Lambda^2(\Gamma_2 A \otimes \mathbb{Z}/2, 3)
\]

and the result follows, since

\[
L_4 \Lambda^2(\Gamma_2 A \otimes \mathbb{Z}/2, 3) \simeq L_6 SP^2(\Gamma_2 A \otimes \mathbb{Z}/2, 4) \simeq H_6(K(\Gamma_2 A \otimes \mathbb{Z}/2, 4)) \simeq \Gamma_2 A \otimes \mathbb{Z}/2,
\]

with the last isomorphism following by a direct calculation, or by reference to the well-known Eilenberg-MacLane functorial stable isomorphism

\[
H_6(K(B, 4)) \simeq B \otimes \mathbb{Z}/2.
\]

It is immediate from the line \( q = 2 \) of table 9 that

\[
\pi_3(M(A, 2)) \simeq \Gamma_2(A),
\]

a result which essentially goes back to J.H.C. Whitehead’s “certain exact sequence” (18), and that in particular a generator of \( \Gamma_2(\mathbb{Z}) \) corresponds to the class of the Hopf map \( \eta : S^3 \to S^2 \). By comparing the spectral sequence (11.18) with the corresponding spectral sequence (11.12) for \( n = 3 \), one verifies that the differential \( d_{3,4} : E_{3,4}^1 \to E_{4,3}^1 \) in (11.18) is trivial. The line \( q = 3 \) of table 9 then implies that there is a short exact sequence

\[
0 \to \mathcal{L}^4_3(A) \oplus (\Gamma_2(A) \otimes \mathbb{Z}/2) \to \pi_4 M(A, 2) \to R_2(A) \to 0,
\]

a result already proved in (2), (3), where the expression \( \mathcal{L}^4_3(A) \oplus (\Gamma_2(A) \otimes \mathbb{Z}/2) \) is denoted \( \Gamma_2^3(A) \).

Similarly, the last two terms in the line \( q = 4 \) of our table, together with the factor \( \mathcal{L}^4_3(A) \) from \( E_{4,4}^1 \), regroup to the expression denoted \( \Gamma_2^3(A) \) in (3), while the direct sum of the two remaining terms on the line \( q = 4 \) correspond to the derived functor \( L_1 \Gamma_2^3(A) \) of the functor \( \Gamma_2^3(A) \) mentioned above. By considering the restriction of the differential \( d_{4,5} : E_{4,5}^1 \to E_{5,4}^1 \) in our table to the factor \( \text{Tor}(R_2(A), \mathbb{Z}/2) \) of \( E_{4,5}^1 \) we therefore recover the description of \( \pi_5 M(A, 2) \) in (3) as a middle term in an exact sequence:

\[
L_2 \Gamma_2^2(A) \xrightarrow{d_2} \Gamma_2^3(A) \to \pi_5 M(A, 2) \to L_1 \Gamma_2^3(A) \to 0,
\]

where \( d_2 \) is a differential in the spectral sequence from (23) (for a generalized version of this sequence, see (4) theorem 5.1). We will verify later on in this section (see diagram (11.31)) that this restriction of
$d_{1,5}^1$ is not zero. This implies that the corresponding differential $d_2$ in \((11.23)\) is also non-trivial. This discussion is consistent with the low-dimensional homotopy groups of the Moore space $M(\mathbb{Z}/2, 2) = \Sigma \mathbb{R}P^2$ as known from \([50]\):

$$
\begin{array}{cccccccc}
 i & 2 & 3 & 4 & 5 & 6 & 7 \\
 \pi_i M(\mathbb{Z}/2, 2) & \mathbb{Z}/2 & \mathbb{Z}/4 & (\mathbb{Z}/2)^{\oplus 3} & (\mathbb{Z}/2)^{\oplus 5} & (\mathbb{Z}/2)^{\oplus 2} \oplus (\mathbb{Z}/4)^{\oplus 2} \oplus \mathbb{Z}/8 \\
\end{array}
$$

Table 10.

Finally, returning to the case $A = \mathbb{Z}$, we also observe in table 9, in positions $E_{2p, 2p-1}$ with $p$ prime, the early occurrences in $p\pi_{2p}(S^2)$ of Serre’s first non-trivial $p$-torsion in the homotopy of $S^2$ (see also for this \([40]\) corollary 5.40 and the discussion pp. 280–281).

**Remark 11.2.** In the spectral sequence from [23] there are terms $E_{p,q}^2 = L_p \Gamma_q^q(A)$, where $\Gamma_q^q(A)$ is the $q$-th term arising from the homotopy operation algebra. In particular, there is a natural homomorphism $L_{q+1}^q(A) \rightarrow \Gamma_q^q(A)$, where the occurrence of the $(q+1)$-st super-Lie functor is due to Whitehead products, viewed as homotopy operations. It is natural to conjecture that the semi-décalage described in theorem 10.1 connects the homotopy operation spectral sequence from [23] with the Curtis spectral sequence, with for example the existence of a commutative diagram

$$
\begin{array}{ccc}
 L_i L_{\mathcal{L}^q(A)} & \overset{\chi^1_i}{\longrightarrow} & L_{i+q} \mathcal{L}^q(A,1) \\
 \downarrow d^2 & & \downarrow d^1 \\
 L_{i-2} L_{\mathcal{L}^{q+1}(A)} & \overset{\chi^1_{i-1}}{\longrightarrow} & L_{i+q-1} \mathcal{L}^{q+1}(A,1) \\
\end{array}
$$

where $d^2$ is a natural map induced by the second differential in the homotopy operation spectral sequence. The low-dimensional computation given above support this conjectural connection between the two spectral sequences.

11.4. **Some homotopy groups of** $M(\mathbb{Z}/p, 2)$, $p \neq 2$. The next proposition provides us with some information regarding the derived functors of $\mathcal{L}^q(A)$. We begin with the following lemma:

**Lemma 11.2.** Let $A = \mathbb{Z}/p$ for some prime $p \neq 2$. The natural map $\text{Tor}(\Omega_3(A), A) \rightarrow \Omega_4(A)$ is an isomorphism.

**Proof.** By \([10]\) (5.14), there exists, for any abelian group $A$ and integer $h$, a commutative diagram of abelian groups

$$
\begin{array}{ccc}
 \Gamma_3(\ hA) \otimes \ hA & \longrightarrow & \Gamma_4(\ hA) \\
 \downarrow \chi^3_h \otimes 1 & & \downarrow \chi^4_h \\
 \text{Tor}(\Omega_3(A), A) & \longrightarrow & \Omega_4(A) \\
\end{array}
$$

(11.24)

where the upper horizontal arrow is induced by the multiplication in the divided power algebra. The arrows $\chi^q_h$ provide, where $h$ varies, and the slide relations are taken into account, presentations for the groups $\text{Tor}(\Omega_3(A), A)$ and $\Omega_4(A)$ respectively. Let us now suppose that $A$ is cyclic of order $p$, with a chosen generator $a \in A$. In that case the only relevant integer is $h = p$. We know that
\[ \Omega_3(\mathbb{Z}/p) = \Omega_4(\mathbb{Z}/p) = \mathbb{Z}/p \] so that the lower horizontal map in (11.24) is a homomorphism \( \mathbb{Z}/p \to \mathbb{Z}/p \). Let us show that this morphism is non-trivial: the image of \( \gamma_3(a) \otimes a \) in \( \Omega_4(\mathbb{Z}/p) \):

\[ \gamma_3(a) \otimes a \mapsto 4\gamma_4(a) \mapsto 4\omega_p^4(a) \]

and \( 4\omega_p^4(a) \neq 0 \) since \( p \neq 2 \).

\[ \square \]

**Proposition 11.2.** For any integer \( i \geq 0 \) and any odd prime \( p \), one then has

\[ L_i \mathcal{L}_4^4(\mathbb{Z}/p) = \begin{cases} \mathbb{Z}/p, & i = 1, 2 \\ 0, & i \neq 1, 2 \end{cases} \]

**Proof.** It follows from definition that \( \mathcal{L}_4^4(A) = 0 \) for every cyclic group \( A \). By (7.29), the sequence

\[ 0 \to L_3\Lambda^2\Gamma_2(A) \to L_3\mathcal{L}_4^4(A) \to L_3\mathcal{Y}^4(A) \to L_2\Lambda^2\Gamma_2(A) \to L_2\mathcal{L}_4^4(A) \to L_1\mathcal{L}_4^4(A) \to L_1\mathcal{Y}^4(A) \]

is exact. By (11.26), \( L_i\Lambda^2\Gamma_2(\mathbb{Z}/p) = K(\mathbb{Z}/p, 0) \) for \( p \) odd, so that

\[ L_i\Lambda^2\Gamma_2(\mathbb{Z}/p) = \begin{cases} \mathbb{Z}/p, & i = 1, 2 \\ 0, & i \neq 1 \end{cases} \]

In particular, the right-hand arrow in (11.25) is surjective. The definition of \( \mathcal{Y}^4 \) implies that there is a long exact sequence

\[ L_2\mathcal{Y}^4(A) \to \pi_2\left( \Lambda^3(A) \otimes L \right) \to L_2\Lambda^4(A) \to L_1\mathcal{Y}^4(A) \to \pi_1\left( \Lambda^3(A) \otimes L \right) \to L_1\Lambda^4(A) \]

and an isomorphism

\[ L_3\mathcal{Y}^4(A) \simeq \ker\{\text{Tor}(\Omega_3(A), A) \to \Omega_4(A)\} \]

Lemma 11.2 asserts that the group \( L_3\mathcal{Y}^4(\mathbb{Z}/p) \) is trivial, and we know by (2.21) and (2.25) that

\[ L_i\Lambda^4(\mathbb{Z}/p) = \begin{cases} \mathbb{Z}/p, & i = 3 \\ 0, & i \neq 3 \end{cases} \]

The exactness of the sequence (11.25) then implies that

\[ L_i\mathcal{Y}^4(\mathbb{Z}/p) = \begin{cases} \mathbb{Z}/p, & i = 2 \\ 0, & i \neq 2 \end{cases} \]

We will now show that the boundary map (11.25):

\[ L_2\mathcal{Y}^4(\mathbb{Z}/p) \xrightarrow{\partial} L_1\Lambda^2\Gamma_2(\mathbb{Z}/p) \]

is trivial. Consider first the case \( p \neq 2, 3 \). One then has the following values for the homology groups \( H_iK(\mathbb{Z}/p, 2) \):

| \( n \) | \( 2 \) | \( 3 \) | \( 4 \) | \( 5 \) | \( 6 \) | \( 7 \) | \( 8 \) | \( 9 \) |
|---|---|---|---|---|---|---|---|---|
| \( H_nK(\mathbb{Z}/p, 2) \) | \( \mathbb{Z}/p \) | \( 0 \) | \( \mathbb{Z}/p \) | \( 0 \) | \( \mathbb{Z}/p \) | \( 0 \) | \( \mathbb{Z}/p \) | \( 0 \) |

**Table 11.**
The analogue of the spectral sequence (11.13) for $K = K(\mathbb{Z}/p, 2)$ is

$$E_{r,q}^1 = L_{q+1}^{q+r}(\tilde{Z}K(\mathbb{Z}/p, 2), -1) \implies \pi_q(Kinz/\mathbb{Z}, 1)) \quad (11.29)$$

Reasoning as in the proof of proposition (11.1), we find that the initial terms in this spectral sequence are the following:

| $q$ | $E_{1,0}^1$ | $E_{2,0}^1$ | $E_{3,0}^1$ | $E_{4,0}^1$ | $E_{5,0}^1$ | $E_{6,0}^1$ | $E_{7,0}^1$ | $E_{8,0}^1$ | $E_{9,0}^1$ | $E_{10,0}^1$ |
|-----|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| 8   | 0           | *           | *           | *           | *           | *           | *           | *           | *           | *           |
| 7   | $\mathbb{Z}/p$ | $\mathbb{Z}/p$ | *           | *           | *           | *           | *           | *           | *           | *           |
| 6   | 0           | $\mathbb{Z}/p^2$ | $\mathbb{Z}/p^2$ | *           | *           | *           | *           | *           | *           | *           |
| 5   | $\mathbb{Z}/p$ | $\mathbb{Z}/p$ | $\mathbb{Z}/p$ | $L_1\mathcal{L}_4^3(\mathbb{Z}/p)$ | 0           | 0           | 0           | 0           | 0           | 0           |
| 4   | 0           | $\mathbb{Z}/p$ | $\mathbb{Z}/p$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 3   | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 2   | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 1   | $\mathbb{Z}/p$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |

Table 12. The $E^1$-term of the spectral sequence (11.29) for $p \neq 2, 3$

This spectral sequence converges to the graded group $\mathbb{Z}/p[1]$. Suppose that $L_1\mathcal{L}_4^3(\mathbb{Z}/p) = 0$. In that case $E_{2,0}^2 \oplus E_{3,0}^2 \neq 0$ and this contradicts the fact that homotopy groups $\pi_i K(\mathbb{Z}/p, 1)$ are trivial for $i \geq 2$. It follows by (11.26) and (11.27) that $L_1\mathcal{L}_4^3(\mathbb{Z}/p) = \mathbb{Z}/p$ and the map (11.28) is the zero map. The description of all the derived functors of $\mathcal{L}_4^3(\mathbb{Z}/p)$ for $p \neq 2, 3$ now follows from the exact sequence (11.25).

We now consider the $p = 3$ case. We have the following description of the low degree homology of $K(\mathbb{Z}/3, 2)$:

| $n$ | $H_n K(\mathbb{Z}/3, 2)$ |
|-----|-------------------------|
| 2   | $\mathbb{Z}/3$ |
| 3   | $\mathbb{Z}/3$ |
| 4   | $\mathbb{Z}/9$ |
| 5   | $\mathbb{Z}/3$ |
| 6   | $\mathbb{Z}/3$ |
| 7   | $\mathbb{Z}/3$ |
| 8   | $\mathbb{Z}/3$ |
| 9   | $\mathbb{Z}/3$ |

Table 13.

The initial terms for the spectral sequence (11.29) for $p = 3$ are the following:

| $q$ | $E_{1,0}^1$ | $E_{2,0}^1$ | $E_{3,0}^1$ | $E_{4,0}^1$ | $E_{5,0}^1$ | $E_{6,0}^1$ | $E_{7,0}^1$ | $E_{8,0}^1$ | $E_{9,0}^1$ | $E_{10,0}^1$ |
|-----|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| 8   | $\mathbb{Z}/3$ | *           | *           | *           | *           | *           | *           | *           | *           | *           |
| 7   | $\mathbb{Z}/3$ | $\mathbb{Z}/3^2$ | *           | *           | *           | *           | *           | *           | *           | *           |
| 6   | $\mathbb{Z}/3$ | $\mathbb{Z}/3^2$ | $\mathbb{Z}/3^3$ | *           | *           | *           | *           | *           | *           | *           |
| 5   | $\mathbb{Z}/9$ | $\mathbb{Z}/3$ | $\mathbb{Z}/3^2$ | $L_1\mathcal{L}_4^3(\mathbb{Z}/3)$ | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           |
| 4   | 0           | $\mathbb{Z}/3$ | $\mathbb{Z}/9$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 3   | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 2   | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 1   | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |

Table 14. The $E^1$-term of the spectral sequence (11.29) for $p = 3$
We will now prove that $L_1\mathcal{L}^4_s(\mathbb{Z}/3) = \mathbb{Z}/3$. For any abelian group $A$, the differentials $d^1_{1,7}$ and $d^1_{1,8}$ in the corresponding spectral sequence (11.12) for $n = 2$ have the property that the following natural diagrams are commutative:

$$
\begin{array}{ccc}
\Gamma_4(A) & \xrightarrow{\kappa^4} & \Gamma_3(A) \otimes A \\
\downarrow & & \downarrow \\
E^1_{1,7} & \xrightarrow{d^1_{1,7}} & E^1_{2,6}
\end{array}
\quad \quad
\begin{array}{ccc}
L_1\Gamma_4(A) & \xrightarrow{\kappa^4} & \pi_1 \left( (\Gamma_3(A) \otimes A) \right) \\
\downarrow & & \downarrow \\
E^1_{1,8} & \xrightarrow{d^1_{1,8}} & E^1_{2,7}
\end{array}
$$

where $\kappa^4$ is the homomorphism in the Koszul complex $Kos^4(A \xrightarrow{\xi} A)$ (2.30) and $\kappa^4$ its first derived analog. This implies, in the case $A = \mathbb{Z}/3$, that the differentials $d^1_{1,7}$ and $d^1_{1,8}$ are monomorphisms. The assumption $L_1\mathcal{L}^4_s(\mathbb{Z}/3) = 0$, implies that $E^\infty_{3,6} \neq 0$ and this contradicts the triviality of the sixth homotopy group of $K(\mathbb{Z}/3, 1)$.

Remark 11.3. For $p = 2$ the description of $L_i\mathcal{L}^4_s(\mathbb{Z}/p)$ is also more complicated. For example, the group $L_2\mathcal{L}^4_s(\mathbb{Z}/2)$ contains non-trivial 4-torsion elements. In the simplicial language, a generator of the 4-torsion subgroup is provided by the following element:

$$\{s_0a_1, s_1a_1, s_0a_1, s_1a_1\} - \{s_1a_1, s_1s_0a_0, s_0a_1, s_0a_1\} + \{s_0a_1, s_1s_0a_0, s_1a_0, s_1a_0\} + \{\{s_1a_1, s_1s_0a_0\}, \{s_0a_1, s_1s_0a_0\}\}$$

This 4-torsion element corresponds to twice the 8-torsion element of Cohen-Wu [14, 50] App. A, which lives in the last summand of $\pi_7\Sigma R^2 = \pi_7M(\mathbb{Z}/2, 2)$ (see table 11). We will not discuss this computation, since it involves more elaborate techniques than those described here.

After these preliminaries regarding the derived functors of $\mathcal{L}^4_s$, let us begin our computations of the homotopy of the spaces $M(\mathbb{Z}/p, 2)$ with the case $p = 3$. By remark 8.1 we know that

$$L_i\mathcal{L}^3_s(\mathbb{Z}/3, 1) = \begin{cases} 
\mathbb{Z}/9, & i = 4 \\
\mathbb{Z}/3, & i = 5 \\
0, & i \neq 4, 5
\end{cases}$$

The computation of the derived functors $L_q\mathcal{L}^r(\mathbb{Z}/3, 1)$ for $q < 7$ follows easily from the Curtis decomposition of $\mathcal{L}^r$ and the known values of the derived functors of $\mathcal{L}^3(\mathbb{Z}/3, 1)$. We display the result in the following table:

| $q$ | $E^1_{1,q}$ | $E^1_{2,q}$ | $E^1_{3,q}$ | $E^1_{4,q}$ | $E^1_{5,q}$ | $E^1_{6,q}$ | $E^1_{7,q}$ | $E^1_{8,q}$ | $E^1_{9,q}$ | $E^1_{10,q}$ |
|-----|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| 6   | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 5   | 0           | 0           | $\mathbb{Z}/3$ | $\mathbb{Z}/3$ | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           |
| 4   | 0           | 0           | $\mathbb{Z}/9$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 3   | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 2   | 0           | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 1   | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |

Table 15. The $E^1$-term of the spectral sequence (11.5) for $A = \mathbb{Z}/3$ and $n = 2$.

The differentials $d^5_{5,6} : \mathbb{Z}/3 \rightarrow \mathbb{Z}/3$ and $d^5_{6,6} : \mathbb{Z}/3 \rightarrow \mathbb{Z}/3$ are trivial, as follows from the comparison between the Curtis spectral sequences for $K = M(\mathbb{Z}/3, 2)$ and $K = K(\mathbb{Z}/3, 2)$ and from the structure of table 15. The assumption that either $d^5_{5,6}$ or $d^5_{6,6}$ is an isomorphism would produce a non-trivial...
term $E_5^{3,6}$ in the spectral sequence whose initial terms were given in table 14. Looking at the horizontal lines in table 15, we now see that

$$
\begin{align*}
\pi_2 M(\mathbb{Z}/3, 2) &= \mathbb{Z}/3 \\
\pi_3 M(\mathbb{Z}/3, 2) &= \mathbb{Z}/3 \\
\pi_4 M(\mathbb{Z}/3, 2) &= 0 \\
\pi_5 M(\mathbb{Z}/3, 2) &= \mathbb{Z}/9 \\
|\pi_6 M(\mathbb{Z}/3, 2)| &= 27.
\end{align*}
$$

Observe that we have in particular exhibited here the cyclic group of order 9 of [42], [35] mentioned in the introduction.

The homotopy groups of the spaces $M(\mathbb{Z}/p, 2)$ for a prime $p \neq 2, 3$, are simpler to describe. In that case, the initial terms of the spectral sequence (11.5) are:

| $q$ | $E_{1,q}^1$ | $E_{2,q}^1$ | $E_{3,q}^1$ | $E_{4,q}^1$ | $E_{5,q}^1$ | $E_{6,q}^1$ | $E_{7,q}^1$ | $E_{8,q}^1$ | $E_{9,q}^1$ | $E_{10,q}^1$ |
|-----|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| 6   | 0          | 0          | $\mathbb{Z}/p$ | 0          | 0          | 0          | 0          | 0          | 0          | 0          |
| 5   | 0          | 0          | $\mathbb{Z}/p$ | 0          | 0          | 0          | 0          | 0          | 0          | 0          |
| 4   | 0          | 0          | $\mathbb{Z}/p$ | 0          | 0          | 0          | 0          | 0          | 0          | 0          |
| 3   | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          |
| 2   | 0          | $\mathbb{Z}/p$ | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          |
| 1   | $\mathbb{Z}/p$ | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          | 0          |

Table 16. The $E^1$-term of the spectral sequence (11.5) for $A = \mathbb{Z}/p$ when $p \neq 2, 3$ and $n = 2$.

In particular, the derived functors $L_i \mathcal{L}^3(\mathbb{Z}/p, 1)$ are simpler for these values of $p$, which explains the difference between the third columns in tables 15 and 16. Note also that the $p$-torsion in $L_4 \mathcal{L}^3(\mathbb{Z}/p, 1)$ comes from the term $\ker \{\Omega_2(\mathbb{Z}/p) \otimes \mathbb{Z}/p \rightarrow L_1 \Lambda^3(\mathbb{Z}/p)\}$ in (8.8). We obtain in particular

$$
\begin{align*}
\pi_6 M(\mathbb{Z}/p, 2) &= \mathbb{Z}/p \\
|\pi_7 M(\mathbb{Z}/p, 2)| &= p^2.
\end{align*}
$$

11.5. Some homotopy groups of $M(A, 3)$. Consider the spectral sequence (11.5) for $n = 3$:

$$
E_{r,q}^1 = L_q \mathcal{L}^r(A, 2) \Rightarrow \pi_{q+1} M(A, 3).
$$

(11.30)

The initial terms of this spectral sequence are obtained as in the spectral sequence (11.18) from the Curtis decomposition of Lie functors and the computation of the derived functors of its graded components. In addition, the occurrence of a summand $\mathcal{L}^3(A)$ in $E_{5,6}^1$ follows from the composition of the maps (10.2). These initial terms are given in the following table (recall that $\Lambda^2$ is the functor (4.1)):
As a result we have a natural isomorphism
\[ \pi_4 M(A, 3) \simeq A \otimes \mathbb{Z}/2, \]
which is simply the suspended version of the isomorphism (11.21), as well as the following natural short exact sequence:
\[ 0 \to A \otimes \mathbb{Z}/2 \to \pi_5 M(A, 3) \to \lambda^2(A) \to 0. \]
However, the latter is not split, since it is known for example that \( \pi_5 M(\mathbb{Z}/2, 3) = \mathbb{Z}/4 \).

The differential \( d_{3,6}^1 : E_{3,6}^1 \to E_{4,5}^1 \) is trivial, as can be seen by reduction to the case of \( A \) free abelian of finite rank, and a comparison of the rank of \( E_{3,6}^1 \) with that of the homotopy group of the corresponding wedge of spheres \( S^3 \), as computed by the Hilton-Milnor theorem (see [17] theorem 4.21). On the other hand, the differential \( d_{4,6}^4 : E_{4,6}^4 \to E_{5,5}^4 \) can be non-trivial. It is an isomorphism for \( A = \mathbb{Z}/2 \), as follows from the known description of the groups \( \pi_i(M(\mathbb{Z}/2, 3)) = \pi_i(\Sigma^2 \mathbb{R}P^2) \) for small values of \( i \):

| \( i \) | \( 3 \) | \( 4 \) | \( 5 \) | \( 6 \) | \( 7 \) | \( 8 \) | \( 9 \) |
|---|---|---|---|---|---|---|---|
| \( \pi_i M(\mathbb{Z}/2, 3) \) | \( \mathbb{Z}/2 \) | \( \mathbb{Z}/2 \) | \( \mathbb{Z}/4 \) | \( \mathbb{Z}/4 \oplus \mathbb{Z}/2 \) | \( \mathbb{Z}/2 \oplus \mathbb{Z}/2 \) | \( \mathbb{Z}/2 \oplus \mathbb{Z}/2 \) | \( \mathbb{Z}/4 \oplus \mathbb{Z}/2 \) |

Table 18.

In addition, one can express the differential \( d_{4,6}^4 \) in (11.30) as a suspension by comparing the spectral sequences (11.18) and (11.30). For this, consider the following commutative diagram, in which the vertical arrows are suspension morphisms:

\[ \text{Tor}(R_2(A), \mathbb{Z}/2) \xrightarrow{d_{4,5}^4(A,2)} \text{Tor}(A, \mathbb{Z}/2) \xrightarrow{\Gamma_2(A) \otimes \mathbb{Z}/2} \]

\[ \text{Tor}(\lambda^2(A), \mathbb{Z}/2) \xrightarrow{d_{4,6}^4(A,3)} A \otimes \mathbb{Z}/2 \quad (11.31) \]
The upper arrow in this diagram is the restriction to the first summand of the differential $d_{4,5}^1$ from (11.18), whereas the lower one is the differential $d_{4,6}^1$ from (11.30). The suspension maps are isomorphisms for $A = \mathbb{Z}/2$. Since we know that $d_{4,6}^1$ is an isomorphism in that case, so is the differential $d_{4,5}^1$ in (11.18).

The spectral sequence (11.30) determines in particular a filtration on the group $\pi_6 M(A,3)$, with the following non-trivial associated graded components:

- $gr_2 \pi_6 M(A,3) = \Omega_2(A)$
- $gr_3 \pi_6 M(A,3) = A \otimes \mathbb{Z}/3$
- $gr_4 \pi_6 M(A,3) = (A^2(A) \otimes \mathbb{Z}/2) \oplus \mathrm{Tor}_1(A, \mathbb{Z}/2, \mathbb{Z}/2)$
- $gr_5 \pi_6 M(A,3) = A \otimes \mathbb{Z}/2/ \mathrm{im}(d_{4,6}^1)$

For $A = \mathbb{Z}$, this determines precisely 12 elements in $\pi_6(S^3)$, which are the non-trivial elements in the associated graded components $gr_2, gr_4, gr_5$ listed above. Table 17 also implies that there is a natural epimorphism

$$\pi_7 M(A,3) \to \mathcal{L}^3(A) \oplus \mathrm{Tor}(A, \mathbb{Z}_3).$$

As an example of this computation, consider the case $A = \mathbb{Z}/3$. A simple analysis, with the help of (8.14), gives the following description of the initial terms of the corresponding spectral sequence (11.30):

| $q$ | $E_{1,q}^1$ | $E_{2,q}^1$ | $E_{3,q}^1$ | $E_{4,q}^1$ | $E_{5,q}^1$ | $E_{6,q}^1$ | $E_{7,q}^1$ | $E_{8,q}^1$ | $E_{9,q}^1$ | $E_{10,q}^1$ |
|-----|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| 8   | 0           | 0           | 0           | 0           | 0           | $\mathbb{Z}/3$ | 0           | 0           | $\mathbb{Z}/3$ | 0           |
| 7   | 0           | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 6   | 0           | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 5   | 0           | $\mathbb{Z}/3$ | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 4   | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 3   | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 2   | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |

Table 19. The initial terms of the spectral sequence (11.30) for $A = \mathbb{Z}/3$

We conclude that

$$\pi_7 M(\mathbb{Z}/3, 3) = \pi_8 M(\mathbb{Z}/3, 3) = \mathbb{Z}/3.$$  

11.6. Some homotopy groups of $M(A,4)$. The spectral sequence (11.5) for $n = 4$:

$$E_{p,q}^1 = L_q \mathcal{L}^p(A,3) \Rightarrow \pi_{q+1} M(A,4).$$

has the following initial terms in low dimensions:
Observe in particular that the torsion-free expression \( \Gamma_2(Z) \) which appears in column 2 of table 20 for \( A = Z \) survives to \( E_2^{2,0} \) since a non-trivial morphism \( d_2^{2,0} : \Gamma_2(Z) \to Z \otimes Z/2 \) would contradict the known non-trivial value of \( \pi_6(S^4) \). We can therefore recognize in a generator of this group \( \Gamma_2(Z) \) the class of the generalized Hopf fibration \( \nu : S^7 \to S^4 \).

The suspension homomorphisms \( \pi_4(M(A,2)) \to \pi_5(M(A,3)) \to \pi_6(M(A,4)) \) can be described in terms of the suspension homomorphisms between the corresponding derived functors of Lie functors. The result is expressed by the following commutative diagram (see also [2] VIII §3, IX §2, XI §1):

\[
\begin{array}{ccc}
L^3_s(A) \oplus \Gamma_2(A) \otimes Z/2 & \longrightarrow & \pi_4(M(A,2)) \longrightarrow R_2(A) \\
\downarrow & & \downarrow \\
A \otimes Z/2 & \longrightarrow & \pi_5(M(A,3)) \longrightarrow \chi^3(A) \\
\downarrow & & \downarrow \\
A \otimes Z/2 & \longrightarrow & \pi_6(M(A,4)) \longrightarrow \text{Tor}(A, Z/2)
\end{array}
\]

Table 20. The initial terms in the spectral sequence (11.5) for \( n = 4 \)

| \( q \) | \( E_1^{1,q} \) | \( E_2^{1,q} \) | \( E_3^{1,q} \) | \( E_4^{1,q} \) |
|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 |
| 3 | 0 | 0 | 0 | 0 |
| 4 | 0 | 0 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 | 0 |
| 7 | 0 | 0 | 0 | 0 |
| 8 | 0 | 0 | 0 | 0 |
| 9 | 0 | 0 | 0 | 0 |

11.7. **Solving the extension problem.** In simple cases one can solve the extension problems with the help of functoriality. For example we have just seen that there is a natural exact sequence

\[
0 \to A \otimes Z/2 \to \pi_6(M(A,4)) \to \text{Tor}(A, Z/2) \to 0.
\]

In particular, for \( A = Z/4 \), this reduces to the sequence

\[
0 \to Z/2 \to \pi_6(M(Z/4, 4)) \to Z/2 \to 0.
\]

In order to compute the group \( \pi_6(M(Z/4, 4)) \), we must still determine whether this sequence is split. The following simple argument will show that this indeed is the case.

Let \( F \) be any endofunctor on the category of abelian groups which is endowed with a natural extension of functors

\[
0 \to A \otimes Z/2 \to F(A) \to \text{Tor}(A, Z/2) \to 0.
\]  \hspace{1cm} (11.33)

We will now prove that for any such functor \( F \) the extension (11.33) is split. Suppose on the contrary that \( F(Z/4) = Z/4 \). In that case the group \( F(Z/2) \) is isomorphic either to \( Z/4 \) or to \( Z/2 \oplus Z/2 \). Let
us first suppose that $F(\mathbb{Z}/2) = \mathbb{Z}/4$ and consider the following diagram, induced by the injection of \( \mathbb{Z}/2 \) into \( \mathbb{Z}/4 \):

\[
\begin{array}{c}
\mathbb{Z}/2 \hookrightarrow \mathbb{Z}/4 \rightarrow \mathbb{Z}/2 \\
\downarrow \quad \downarrow \\
\mathbb{Z}/2 \rightleftharpoons \mathbb{Z}/4 \rightarrow \mathbb{Z}/2
\end{array}
\]

Such a commutative diagram cannot exist since the pushout of any extension by the trivial homomorphism is a trivial extension. If on the other hand we suppose that $F(\mathbb{Z}/2) = \mathbb{Z}/2 \oplus \mathbb{Z}/2$, then the natural projection $\mathbb{Z}/4 \rightarrow \mathbb{Z}/2$ induces a commutative diagram

\[
\begin{array}{c}
\mathbb{Z}/2 \hookrightarrow \mathbb{Z}/4 \rightarrow \mathbb{Z}/2 \\
\downarrow \downarrow \downarrow \\
\mathbb{Z}/2 \rightleftharpoons \mathbb{Z}/2 \oplus \mathbb{Z}/2 \rightarrow \mathbb{Z}/2
\end{array}
\]

which also cannot exist, since the pullback of any extension by the trivial homomorphism is a trivial extension. This proves that the extension (11.33) is split, and in particular that $\pi_6 M(\mathbb{Z}/4, 4) = \mathbb{Z}/2 \oplus \mathbb{Z}/2$.

11.8. **Some homotopy groups of** $M(\mathbb{Z}/3, 5)$. In this simple example, we will illustrate some lines of reasoning by which we computed certain differentials in Curtis spectral sequences. Consider such a spectral sequence (11.3) for $n = 5$, with abutment $M(\mathbb{Z}/3, 5)$ and initial terms $E^1_{p,q} = L_q L^p(\mathbb{Z}/3, 4)$

One finds in low degree:

| $q$ | $E^1_{1,q}$ | $E^1_{2,q}$ | $E^1_{3,q}$ | $E^1_{4,q}$ | $E^1_{5,q}$ | $E^1_{6,q}$ | $E^1_{7,q}$ | $E^1_{8,q}$ | $E^1_{9,q}$ |
|-----|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| 10  | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           | $\mathbb{Z}/3$ |
| 9   | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           |
| 8   | 0           | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           |
| 7   | 0           | 0           | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           |
| 6   | 0           | 0           | 0           | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           |
| 5   | 0           | 0           | 0           | 0           | 0           | $\mathbb{Z}/3$ | 0           | 0           | 0           |
| 4   | $\mathbb{Z}/3$ | 0           | 0           | 0           | 0           | 0           | 0           | 0           | 0           |

Table 21. The initial terms in the spectral sequence (11.3) for $n = 5$ and $A = \mathbb{Z}/3$

We will now provide two separate justifications for the triviality of the differential $d^1_{2,9} : \mathbb{Z}/3 \rightarrow \mathbb{Z}/3$, both of which were used in more complex situations in the previous paragraphs. The first argument goes as follows. The differential $d^1_{2,9}$ for $n = 5$ and $A = \mathbb{Z}/3$ lives in the following commutative diagram, in which the notation is the same as in diagram (11.31) (and the vertical arrows are suspension maps):

\[
\begin{array}{ccc}
L_9 L^2(\mathbb{Z}/3, 4) & \xrightarrow{d^1_{2,9}(\mathbb{Z}/3, 5)} & L_8 L^3(\mathbb{Z}/3, 4) \\
\downarrow \Sigma & & \downarrow \Sigma \\
L_{10} L^2(\mathbb{Z}/3, 5) & \xrightarrow{d^1_{2,10}(\mathbb{Z}/3, 6)} & L_9 L^3(\mathbb{Z}/3, 5)
\end{array}
\]
This commutative square is actually of the form:

\[
\begin{array}{ccc}
\mathbb{Z}/3 & \overset{d_{2,9}(\mathbb{Z}/3,5)}{\rightarrow} & \mathbb{Z}/3 \\
\downarrow & & \downarrow \\
0 & \overset{d_{2,10}(\mathbb{Z}/3,6)}{\rightarrow} & \mathbb{Z}/3
\end{array}
\]

so that the map \(d_{2,9}(\mathbb{Z}/3,5)\) is trivial. As a consequence, \(\pi_9 M(\mathbb{Z}/3,5) = \pi_{10} M(\mathbb{Z}/3,5) = \mathbb{Z}/3\).

Here is the second proof of this assertion. Consider the natural map \(M(\mathbb{Z}/3,5) \rightarrow K(\mathbb{Z}/3,5)\) \((11.1)\) and the corresponding map between the spectral sequences \((11.5)\) and \((11.14)\) for \(n = 5\) and \(A = \mathbb{Z}/3\). The homology groups of \(K(\mathbb{Z}/3,5)\) are given by:

| \(n\) | 5 | 6 | 7 | 8 | 9 | 10 | 11 |
|---|---|---|---|---|---|---|---|
| \(H_n K(\mathbb{Z}/3,5)\) | \(\mathbb{Z}/3\) | 0 | 0 | 0 | \(\mathbb{Z}/3\) | \(\mathbb{Z}/3\) | \(\mathbb{Z}/3\) |

Table 22.

The initial terms of the spectral sequence \((11.14)\) for \(n = 5\) and \(A = \mathbb{Z}/3\) are the following:

| \(q\) | \(E^1_{1,q}\) | \(E^1_{2,q}\) | \(E^1_{3,q}\) | \(E^1_{4,q}\) | \(E^1_{5,q}\) | \(E^1_{6,q}\) | \(E^1_{7,q}\) | \(E^1_{8,q}\) | \(E^1_{9,q}\) |
|---|---|---|---|---|---|---|---|---|---|
| 10 | \(\mathbb{Z}/3\) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | (\(\mathbb{Z}/3\)) |
| 9  | \(\mathbb{Z}/3\) | (\(\mathbb{Z}/3\)) | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 8  | \(\mathbb{Z}/3\) | 0 | (\(\mathbb{Z}/3\)) | 0 | 0 | 0 | 0 | 0 | 0 |
| 7  | 0 | 0 | (\(\mathbb{Z}/3\)) | 0 | 0 | 0 | 0 | 0 | 0 |
| 6  | 0 | 0 | 0 | (\(\mathbb{Z}/3\)) | 0 | 0 | 0 | 0 | 0 |
| 5  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 4  | (\(\mathbb{Z}/3\)) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 23. The initial terms in the spectral sequence \((11.12)\) for \(A = \mathbb{Z}/3\) and \(n = 5\)

We displayed within brackets those terms which are in the image of elements from the corresponding spectral sequence \((11.5)\), as given in table 21. Since the spectral sequence \((11.12)\) converges here to the graded group \(\mathbb{Z}/3[4]\), it follows that the map \(d_{2,9}^3\) is necessarily zero: otherwise, the element \(E_{1,10}^1 = \mathbb{Z}/3\) would contribute non-trivially to \(\pi_{10}(K(\mathbb{Z}/3,4))\). It follows that the corresponding map \(d_{2,9}^3\) in the spectral sequence whose initial terms are displayed in table 21 is also trivial. We deduce from this that \(\pi_9 M(\mathbb{Z}/3,5) = \pi_{10} M(\mathbb{Z}/3,5) = \mathbb{Z}/3\).

**Appendix A. Derived Koszul complex**

In this appendix, we illustrate our derived functor methods, by giving an explicit description of certain objects and morphisms obtained by deriving the Koszul sequence \((2.30)\).

Let

\[0 \rightarrow L \overset{\delta}{\rightarrow} M \rightarrow A \rightarrow 0\]

be a flat resolution of the abelian group \(A\). A convenient model for the derived category object \(L \Lambda^n(A)\) is provided by the dual Koszul complex of the morphism \(L \overset{\delta}{\rightarrow} M\). Recall that for \(n = 2\) this is the complex

\[\Gamma_2(L) \overset{\delta_2}{\rightarrow} L \otimes M \overset{\delta_1}{\rightarrow} \Lambda^2(M)\]  

(A.1)
with the differentials
\[
\begin{align*}
\delta_2(\gamma_2(l)) &= l \otimes \delta(l) \\
\delta_1(l \otimes m) &= \delta(l) \land m
\end{align*}
\]
and for \( n = 3 \) the complex
\[
\Gamma_3(L) \xrightarrow{\delta_3} \Gamma_2(L) \otimes M \xrightarrow{\delta_2} L \otimes \Lambda^2(M) \xrightarrow{\delta_1} \Lambda^3(M)
\]
with the differentials
\[
\begin{align*}
\delta_3(\gamma_3(l)) &= \gamma_2(l) \otimes \delta(l) \\
\delta_3(\gamma_2(l)l') &= l'l' \otimes \delta(l) + \gamma_2(l) \otimes \delta(l') \\
\delta_2(\gamma_2(l) \otimes m) &= l \otimes m \land \delta(l) \\
\delta_1(l \otimes m \land m') &= \delta(l) \land m \land m'
\end{align*}
\]

The derived category object \( L\Lambda^2(A) \otimes L A \) may be represented by the tensor product of the complex \((A.1)\) with the complex \( L \xrightarrow{\delta} M \), in other words by the total complex associated to the bicomplex
\[
\begin{array}{ccc}
\Gamma_2(L) \otimes L & \xrightarrow{\delta} & L \otimes M \otimes L \\
\downarrow & & \downarrow \\
\Gamma_2(L) \otimes M & \xrightarrow{\delta} & L \otimes M \otimes M
\end{array}
\]
and the complex
\[
\begin{array}{ccc}
\Gamma_2(L) \otimes L & \xrightarrow{\delta} & \Gamma_2(L) \otimes M \oplus (L \otimes M \otimes L) \\
\downarrow & & \downarrow \\
\Gamma_2(L) \otimes M & \xrightarrow{\delta} & L \otimes M \otimes M \oplus \Lambda^2(M) \otimes L \\
\downarrow & & \downarrow \\
& \xrightarrow{\delta} & \Lambda^2(M) \otimes M
\end{array}
\] (A.2)
with differentials
\[
\begin{align*}
\delta'_2(\gamma_2(l) \otimes l') &= (\gamma_2(l) \otimes \delta(l') \otimes l') \\
\delta'_2(\gamma_2(l) \otimes m) &= (l \otimes \delta(l) \otimes m, 0) \\
\delta'_2(l \otimes m \otimes l') &= (l \otimes m \otimes \delta(l') \otimes l'), m \otimes \delta(l) \otimes l') \\
\delta'_1(l \otimes m \otimes m') &= \delta(l) \land m \otimes m' \\
\delta'_1(m \otimes m' \otimes l) &= m \otimes m' \otimes \delta(l)
\end{align*}
\]

Recall that
\[
L_1\Lambda^2(A) = \Omega_2(A) \quad \text{(A.3)}
\]
\[
\pi_2\left(\Lambda^2(A) \otimes L A\right) = \text{Tor}(\Omega_2(A), A). \quad \text{(A.4)}
\]

Given elements \( a, a' \in \Lambda^2(A) \), let us choose its representatives \( m, m' \in M \) and cross-cap elements \( l, l' \in L \) such that \( \delta(l) = nm, \delta(l') = nm' \). The maps
\[
\begin{align*}
\Omega_2(A) & \to (L \otimes M) / \text{im}(\delta_2) \\
\text{Tor}(\Omega_2(A), A) & \to (\Gamma_2(L) \otimes M \oplus (L \otimes M \otimes L)) / \text{im}(\delta'_3)
\end{align*}
\]
which define the isomorphisms \((A.3)\) and \((A.4)\) are given by
\[
\begin{align*}
w_2(a) & \mapsto l \otimes m + \text{im}(\delta_2) \\
w_2(a) \ast b & \mapsto (-\gamma_2(l) \otimes m', l \otimes m \otimes l') + \text{im}(\delta_3)
\end{align*}
\]
Next we consider the following diagram with exact rows and columns:

\[
\begin{array}{ccccccccc}
\mathcal{L}^3(L)^{\cdot} & \xrightarrow{\delta_3} & L \otimes M \otimes L & \xrightarrow{\delta_2} & L \otimes M \otimes M & \xrightarrow{\delta_1} & Y^3(M) \\
\Gamma_2(L) \otimes L & \xrightarrow{\delta_3} & \Gamma_2(L) \otimes M \oplus (L \otimes M \otimes L) & \xrightarrow{\delta_2} & (L \otimes M \otimes M) \oplus \Lambda^2(M) \otimes L & \xrightarrow{\delta_1} & \Lambda^2(M) \otimes M \\
\phi_3 & & \phi_2 & & \phi_1 & & \phi_0 \\
\Gamma_3(L)^{\cdot} & \xrightarrow{\delta_3} & \Gamma_2(L) \otimes M & \xrightarrow{\delta_2} & L \otimes \Lambda^2(M) & \xrightarrow{\delta_1} & \Lambda^3(M) \\
L \otimes \mathbb{Z}/3 & & & & & & \\
\end{array}
\]

with

\[
\begin{align*}
\phi_0(m \wedge m' \otimes m'') &= m \wedge m' \wedge m'' \\
\phi_1(l \otimes m \otimes m') &= l \otimes m \wedge m' \\
\phi_1(m \wedge m' \otimes l) &= l \otimes m \wedge m' \\
\phi_2(\gamma_2(l) \otimes m) &= -\gamma_2(l) \otimes m \\
\phi_2(l \otimes m \otimes l') &= l l' \otimes m \\
\phi_3(\gamma_2(l) \otimes l') &= -\gamma_2(l) l'.
\end{align*}
\]

and

\[
\begin{align*}
\delta_3'(l \otimes l' \wedge l'') &= l \otimes \delta(l') \otimes l' + l'' \otimes \delta(l) \otimes l' - l \otimes \delta(l') \otimes l'' - l' \otimes \delta(l) \otimes l'' \\
\delta_2'(l \otimes m \otimes l') &= l \otimes \delta(l') \otimes m + l' \otimes \delta(l) \otimes m + l \otimes m \otimes \delta(l') \\
\delta_1'(l \otimes m \otimes m') &= \{\delta(l), m', m\}
\end{align*}
\]

Here \(l \otimes l' \wedge l''\) denotes the image of the element \(l \otimes l' \wedge l''\) under the natural epimorphism \(L \otimes \Lambda^2(L) \to \mathcal{L}^3(L)\). We will now make use of the fact that the dual de Rham complex

\[0 \to \Lambda^3(L) \to L \otimes \Lambda^2(L) \to \Gamma_2(L) \otimes L \to \Gamma_3(L)\]

has trivial homology in positive dimensions and hence

\[\mathcal{L}^3(L) = \ker\{\Gamma_2(L) \otimes L \to \Gamma_3(L)\} = \operatorname{coker}\{\Lambda^3(L) \to L \otimes \Lambda^2(L)\}\]

Consider the functor \(\bar{E}^3(A) := \operatorname{im}\{\Gamma_2(A) \otimes A \to \Gamma_3(A)\}\). We have a natural short exact sequence

\[0 \to \bar{E}^3(A) \to \Gamma_3(A) \to A \otimes \mathbb{Z}/3 \to 0\]

which induces the following commutative diagram

\[
\begin{array}{ccccccccc}
\bar{E}^3(L) & \xrightarrow{\delta_3} & \Gamma_2(L) \otimes M & \xrightarrow{\delta_2} & L \otimes \Lambda^2(M) & \xrightarrow{\delta_1} & \Lambda^3(M) \\
\Gamma_3(L) & \xrightarrow{\delta_3} & \Gamma_2(L) \otimes M & \xrightarrow{\delta_2} & L \otimes \Lambda^2(M) & \xrightarrow{\delta_1} & \Lambda^3(M) \\
L \otimes \mathbb{Z}/3 & & & & & & \\
\end{array}
\]

(A.6)
From diagrams (A.5) and (A.6) we deduce the following diagram with exact arrows and columns:

\[
\begin{array}{ccc}
H_2 W & \longrightarrow & L_2 Y^3(A) \\
\pi_2 (L \Lambda^2(A) \otimes A) & \longrightarrow & \pi_2 (L \Lambda^2(A) \otimes A) \\
L \otimes \mathbb{Z}/3 & \longrightarrow & H_2 Q \\
H_1 W & \longrightarrow & L_1 Y^3(A) \\
\pi_1 (L \Lambda^2(A) \otimes A) & \longrightarrow & \pi_1 (L \Lambda^2(A) \otimes A) \\
L_1 \Lambda^3(A) & \longrightarrow & L_1 \Lambda^3(A)
\end{array}
\]

where \( W \) and \( Q \) are the upper rows in diagrams (A.5) and (A.6) respectively. We give the following simple example, which illustrates the inner life of the previous diagrams.

**Proposition A.1.**

\[ L_i Y^3(\mathbb{Z}/3) = \begin{cases} 
\mathbb{Z}/3, & i = 2 \\
\mathbb{Z}/9, & i = 1, \\
0, & i \neq 1, 2
\end{cases} \]

**Proof.** It follows from the description \( Y^3(A) = \ker \{ \Lambda^2(A) \otimes A \to \Lambda^3(A) \} \) that

\[ L_2 Y^3(A) = \ker \{ \text{Tor}(\Omega_2(A), A) \to L_2 \Lambda^3(A) \} \]

Let \( A = \mathbb{Z}/3 \) and \( L \overset{\partial}{\to} M \) is \( \mathbb{Z} \overset{3}{\to} \mathbb{Z} \). Let \( l, m \) be generators of \( L \) and \( M \) respectively with \( \delta(l) = 3m \). The group \( \text{Tor}(\Omega_2(A), A) \) is generated by the homology class of the element \( (\gamma_2(l) \otimes m, l \otimes m \otimes l) \) in the complex (A.2). We have

\[ \phi_2(\gamma_2(l) \otimes m, l \otimes m \otimes l) = \gamma_2(l) \otimes m + ll \otimes m = 3\gamma_2(l) \otimes m = \gamma_2(l) \otimes \delta(l) = \delta_3(\gamma_3(l)) \]

Hence the map

\[ \text{Tor}(\Omega_2(A), A) \to L_2 \Lambda^3(A) \]

induced by the map \( \phi_2 \) is the zero map. This proves that

\[ L_2 Y^3(\mathbb{Z}/3) = \mathbb{Z}/3. \]
It is easy to see that for our choice of $L$ and $M$, the complex $W$ has the form $\mathbb{Z}/9 \rightarrow \mathbb{Z} \rightarrow 0$ so that $H_1W = \mathbb{Z}/9$, $H_2W = 0$. In this case, the diagram (A.7) has the form

\[
\begin{array}{ccc}
0 & \rightarrow & \mathbb{Z}/3 \\
\downarrow & & \downarrow \cong \\
\mathbb{Z}/3 & \rightarrow & \mathbb{Z}/3 \\
\downarrow & & \downarrow 0 \\
\mathbb{Z}/3 & \rightarrow & H_2Q \\
\downarrow & & \downarrow \\
\mathbb{Z}/9 & \rightarrow & L_1Y^3(A) \\
\downarrow & & \downarrow \\
\mathbb{Z}/3 & \rightarrow & \mathbb{Z}/3 \\
\downarrow & & \downarrow \\
0 & & 0 \\
\end{array}
\]

and we see that the map $H_1W \rightarrow L_1Y^3(A)$ is an isomorphism and hence

$$L_1Y^3(\mathbb{Z}/3) = \mathbb{Z}/9.$$ 

\[\square\]

The object $L\Gamma_2(A)$ of the derived category may be represented as the following complex:

$$L \otimes L \rightarrow \Gamma_2(L) \otimes (M \otimes L) \rightarrow \Gamma_2(M)$$

Consider the following diagram:

\[
\begin{array}{ccc}
\Lambda^2(L) & \rightarrow & M \otimes L \\
\downarrow & & \downarrow (0, id) \\
L \otimes L & \rightarrow & \Gamma_2(L) \oplus (M \otimes L) \\
\downarrow & & \downarrow \\
SP^2(L) & \rightarrow & \Gamma_2(L) \\
\end{array}
\]

Denote by $C = C(L \xrightarrow{\delta} M)$ the upper complex in (A.8). Diagram (A.8) implies the following exact sequence of homology groups:

$$0 \rightarrow H_1C \rightarrow R_2(A) \rightarrow L \otimes \mathbb{Z}/2 \rightarrow H_0C \rightarrow \Gamma_2(A) \rightarrow 0$$

In particular, the $p$-torsion components of $H_1C$ and $L_4\Gamma_2$ are naturally isomorphic for $p \neq 2$.

The objects $L\Gamma_3(A)$ and $A \xrightarrow{L} L\Gamma_2(A)$ of the derived category may be represented by the following complexes:

$$L \otimes L \otimes L \rightarrow (\Gamma_2(L) \otimes L) \oplus (L \otimes \Gamma_2(L)) \oplus (L \otimes L \otimes M) \rightarrow$$

$$\Gamma_3(L) \oplus (\Gamma_2(L) \otimes M) \oplus (L \otimes \Gamma_2(M)) \rightarrow \Gamma_3(M) \quad (A.9)$$

$$L \otimes L \otimes L \rightarrow (M \otimes L \otimes L) \oplus (L \otimes \Gamma_2(L)) \oplus (L \otimes L \otimes M) \rightarrow$$

$$(L \otimes \Gamma_2(M)) \oplus (M \otimes \Gamma_2(L)) \oplus (M \otimes L \otimes M) \rightarrow M \otimes \Gamma_2(M) \quad (A.10)$$
Consider the following diagram:

\[
\begin{array}{ccccccc}
\Lambda^3(L) & \longrightarrow & M \otimes \Lambda^2(L) & \longrightarrow & SP^2(M) \otimes L & \longrightarrow & SP^3(M) \\
\downarrow & & \downarrow & & \downarrow & & \\
\Lambda^3(L) & \longrightarrow & M \otimes \Lambda^2(L) & \longrightarrow & \Gamma_2(M) \otimes L & \longrightarrow & \Gamma_3(M) \\
\downarrow & & \downarrow & & \downarrow & & \\
M \otimes L \otimes \mathbb{Z}/2 & \longrightarrow & M \otimes \mathbb{Z}/3 \oplus (M \otimes M \otimes \mathbb{Z}/2)
\end{array}
\]

(A.11)

The upper complex in (A.11) is a model for the element \(LSP^3(A)\) in the derived category. Denote the middle horizontal complex by \(D = D(L, \delta \rightarrow M)\). We have the natural isomorphism

\[H_2D \cong LSP^3(A)\]

and the following exact sequence:

\[0 \rightarrow L_1SP^3(A) \rightarrow H_1D \rightarrow \text{Tor}(M \otimes A, \mathbb{Z}/2) \rightarrow SP^3(A) \rightarrow H_0D \rightarrow M \otimes \mathbb{Z}/3 \oplus (M \otimes A \otimes \mathbb{Z}/2) \rightarrow 0 \quad (A.12)\]

Now consider the following diagram which extends the diagram (A.5):

\[
\begin{array}{ccccccc}
\Lambda^3(L) & \longrightarrow & M \otimes \Lambda^2(L) & \longrightarrow & \Gamma_2(M) \otimes L & \longrightarrow & \Gamma_3(M) \\
\downarrow & & \downarrow & & \downarrow & & \\
L \otimes \Lambda^2(L) & \longrightarrow & M \otimes \Lambda^2(L) \oplus (L \otimes M \otimes L) & \longrightarrow & (M \otimes M \otimes L) \oplus L \otimes \Gamma_2(M) & \longrightarrow & M \otimes \Gamma_2(M) \\
\downarrow & & \downarrow & & \downarrow & & \\
\Gamma_2(L) \otimes L & \longrightarrow & \Gamma_2(L) \otimes M \oplus (L \otimes M \otimes L) & \longrightarrow & (L \otimes M \otimes M) \oplus \Lambda^2(M) \otimes L & \longrightarrow & \Lambda^2(M) \otimes M \\
\downarrow & & \downarrow & & \downarrow & & \\
\Gamma_3(L) & \longrightarrow & \Gamma_2(L) \otimes M & \longrightarrow & L \otimes \Lambda^2(M) & \longrightarrow & \Lambda^3(M) \\
\downarrow & & & & & & \\
L \otimes \mathbb{Z}/3
\end{array}
\]

(A.13)

Here

\[
\tilde{\delta}_1(m \otimes m' \otimes l) = m \otimes m' \delta(l) \\
\tilde{\delta}_1(l \otimes \gamma_2(m)) = \delta(l) \otimes \gamma_2(m) \\
\delta_2(m \otimes l \wedge l') = (m \otimes \delta(l) \otimes l' - m \otimes \delta(l') \otimes l, 0) \\
\delta_2(l \otimes m \otimes l') = (\delta(l) \otimes m \otimes l', -l \otimes m \delta(l)) \\
\delta_3(l \otimes l' \wedge l'') = (\delta(l) \otimes l' \wedge l'', -l \otimes \delta(l') \otimes l'' + l \otimes \delta(l'') \otimes l')
\]

and

\[
\phi_0'(m \otimes \gamma_2(m')) = m \wedge m' \otimes m' \\
\phi_1'(m \otimes m' \otimes l) = (-l \otimes m \otimes m', m \wedge m' \otimes l) \\
\phi_1'(l \otimes \gamma_2(m)) = (l \otimes m \otimes m, 0) \\
\phi_2'(l \otimes m \otimes l') = (-ll' \otimes m, -l \otimes m \otimes l') \\
\phi_2'(m \otimes l \wedge l') = (0, l \otimes m \otimes l' - l' \otimes m \otimes l) \\
\phi_2'(l \otimes l' \wedge l'') = -ll' \otimes l'' + ll'' \otimes l'
\]
We obtain the natural isomorphism of complexes:

\[
\begin{array}{cccc}
H_2 D & \rightarrow & H_2 (A \otimes C) & \rightarrow \ Tor(\Omega_2(A), A) & \rightarrow \ \Omega_3(A) \\
L_2 SP^3(A) & \rightarrow & Tor(A, L_1 SP^2(A)) & \rightarrow \ Tor(\Omega_2(A), A) & \rightarrow \ \Omega_3(A)
\end{array}
\]

The map

\[
Tor(A, L_1 SP^2(A)) \rightarrow (M \otimes \Lambda^2(L) \oplus (L \otimes M \otimes L)) / im(\bar{\delta}_3)
\]

is given as follows: let \(a, a', a'' \in A\) with \(na = na' = na'' = 0\) are represented by elements \(m, m', m''\) is \(M\) and \(\delta(l) = nm, \delta(l') = nm', \delta(l'') = nm''\), then

\[
a * a' * a'' \mapsto (-m \otimes l' \wedge l'', l \otimes m' \otimes l'' - l \otimes m'' \otimes l') + im(\bar{\delta}_3)
\]

The map \(\phi''_2\) induces the Koszul-type map

\[
Tor(A, L_1 SP^2(A)) \rightarrow Tor(\Omega_2(A), A)
\]

defined by

\[
a * a' * a'' \mapsto (w(a + a'') - w(a) - w(a'')) * a' - (w(a + a') - w(a) - w(a')) * a''.
\]

**Example.** In the case \((L \rightarrow M) = (\mathbb{Z} \rightarrow \mathbb{Z})\), the diagram (A.13) has the following form:

\[
\begin{array}{cccc}
\mathbb{Z} & \rightarrow & \mathbb{Z} & \rightarrow \mathbb{Z} \\
\mathbb{Z} & \rightarrow & \mathbb{Z} \oplus \mathbb{Z} & \rightarrow \mathbb{Z} \\
\mathbb{Z} & \rightarrow & \mathbb{Z} \oplus \mathbb{Z} & \rightarrow \mathbb{Z}
\end{array}
\]

This diagram implies that the map

\[
H_1 \left( \mathbb{Z}/n \otimes C(\mathbb{Z} \rightarrow \mathbb{Z}) \right) \rightarrow \pi_1 \left( L\Lambda^2(\mathbb{Z}/n) \otimes \mathbb{Z}/n \right)
\]

is multiplication by 3 in the group \(\mathbb{Z}/n\).

When \(A = \mathbb{Z}/2\) and \(C = C(\mathbb{Z} \rightarrow \mathbb{Z})\), we have the following commutative diagram

\[
\begin{array}{cccc}
A \otimes H_1 C & \rightarrow & A \otimes R_2(A) & \rightarrow \pi_1 \left( A \otimes L\Gamma_2(A) \right) \\
H_1 \left( A \otimes C \right) & \rightarrow \pi_1 \left( A \otimes L\Gamma_2(A) \right) & \rightarrow \pi_1 \left( L\Lambda^2(A) \otimes A \right) \\
Tor(A, H_0 C) & \rightarrow \rightarrow \ Tor(A, \Gamma_2(A))
\end{array}
\]

As a corollary, we find that:
Proposition A.2. The derived Koszul map
\[ \pi_1 \left( A \otimes L \pi_1(A) \right) \to \pi_1 \left( LA^2(A) \otimes A \right) \]
is the zero map for \( A = \mathbb{Z}/3 \) and an epimorphism for \( A = \mathbb{Z}/p \), where \( p \) is a prime \( \neq 3 \).
