1 Introduction

Let $K$ be a field and an element $q \in K^* := K \setminus \{0\}$ which is not a root of unity. The algebra $K_q[X, Y] := K\langle X, Y \mid XY = qYX \rangle$ is called the quantum plane. A classification of simple modules over the quantum plane is given in [8]. The quantized enveloping algebra $U_q(sl_2)$ of $sl_2$ is generated over $K$ by elements $E, F, K$ and $K^{-1}$ subject to the defining relations:

$$KEK^{-1} = q^2E, \quad KFK^{-1} = q^{-2}F, \quad EF - FE = \frac{K - K^{-1}}{q - q^{-1}}, \quad KK^{-1} = K^{-1}K = 1.$$ 

For basic properties and representation theory of the algebra $U_q(sl_2)$ the reader is referred to [28, 33]. The simple $U_q(sl_2)$-modules were classified in [4], see also [7, 8] and [9].

The quantum plane and the quantized enveloping algebra $U_q(\mathfrak{sl}_2)$ are important examples of generalized Weyl algebras and ambiskew polynomial rings, see e.g., [6] and [31]. Let $U_q^{\geq 0}(\mathfrak{sl}_2)$ be the ‘positive part’ of $U_q(\mathfrak{sl}_2)$. It is the subalgebra of $U_q(\mathfrak{sl}_2)$ generated by $K^{\pm 1}$ and $E$. There is a Hopf algebra structure on $U_q^{\geq 0}(\mathfrak{sl}_2)$ defined by

$$\Delta(K) = K \otimes K, \quad \varepsilon(K) = 1, \quad S(K) = K^{-1},$$

$$\Delta(E) = E \otimes 1 + K \otimes E, \quad \varepsilon(E) = 0, \quad S(E) = -K^{-1}E.$$  

The notion of smash product has proved to be very useful in studying Hopf algebra actions [40]. For example, the enveloping algebra of a semi-direct product of Lie algebras can naturally be seen as a smash product algebra. The smash product is constructed from a module algebra, see [40, 4.1] for details and examples. We can make the quantum plane a $U_q^{\geq 0}(\mathfrak{sl}_2)$-module algebra by defining

$$K \cdot X = qX, \quad E \cdot X = 0, \quad K \cdot Y = q^{-1}Y, \quad E \cdot Y = X,$$

and introduce the smash product algebra $\mathcal{A} := \mathbb{K}_q[X, Y] \rtimes U_q^{\geq 0}(\mathfrak{sl}_2)$. We call this algebra the quantum spatial ageing algebra. The defining relations for the algebra $\mathcal{A}$ are given explicitly in the following definition.

**Definition** The quantum spatial ageing algebra $\mathcal{A} = \mathbb{K}_q[X, Y] \rtimes U_q^{\geq 0}(\mathfrak{sl}_2)$ is an algebra generated over $\mathbb{K}$ by the elements $E, K, K^{-1}, X$ and $Y$ (where $K^{-1}$ is the inverse of $K$) subject to the defining relations:

$$EK = q^{-2}KE, \quad XK = q^{-1}KX, \quad YK = qKY,$$

$$EX = qXE, \quad EY = X + q^{-1}YE, \quad qYX = XY.$$  

The algebra $\mathcal{A}$ can be seen as the quantum analogue of the enveloping algebra $U(a)$ of the 4-dimensional (non-semisimple) Lie algebra $a$ with basis $\{h, e, x, y\}$ and Lie brackets:

$$[h, e] = 2e, \quad [h, x] = x, \quad [h, y] = -y, \quad [e, x] = 0, \quad [e, y] = x, \quad [x, y] = 0.$$

The, so-called, $l$-spatial ageing algebra, which is studied in [38] where all the simple weight modules are classified, is a central extension of the Lie algebra $a$. Our aim is to study the structure of the algebra $\mathcal{A}$ and its representation theory. For an infinite dimensional non-commutative algebra, to classify its simple modules is a very difficult problem, in general. The known examples of algebras for which the simple modules were classified are mainly generalized Weyl algebras, see e.g. [4, 6–9, 11, 12, 14] and Ore extensions with Dedekind ring as coefficient ring, [11]. In the paper, we classify all simple unfaithful $\mathcal{A}$-modules and the simple weight modules. Weight modules for certain (quantum) algebras of small Gelfand-Kirillov dimension are treated in [17–20, 45, 46].

The paper is organized as follows. In Section 2, we describe the partially ordered sets of the prime, maximal and primitive ideals of the algebra $\mathcal{A}$. Using this description the prime factor algebras of $\mathcal{A}$ are given explicitly via generators and relations (Theorem 2.9). There are nine types of prime factor algebras of $\mathcal{A}$. For two of them, ‘additional’ non-obvious units appear under factorization at prime ideals. It is proved that every prime ideal of $\mathcal{A}$ is completely prime (Corollary 2.13). In Section 3, the automorphism group of $\mathcal{A}$ is determined, which turns out to be a ‘small’ non-commutative group that contains an infinite discrete subgroup (Theorem 3.1). The orbits of the prime spectrum under the action of the automorphism group are described. In Section 4, we classify all simple unfaithful $\mathcal{A}$-modules. This is the first instance where such a large class of simple modules is classified for a quantum algebra of Gelfand-Kirillov dimension larger than 2. In Section 5, we find the
centralizer $C_A(K)$ of the element $K$ in the algebra $A$ and give a classification of all simple weight $A$-modules.

The prime or/and primitive ideals of various quantum algebras (and their classification) are considered in [15, 16, 21, 24–27, 34, 37, 39, 43]. The automorphism group of some (quantum) algebras are considered in [1, 2, 13, 22, 32, 35, 36, 44].

2 Prime Spectrum of the Algebra $A$

The aim of this section is to describe the prime, maximal and primitive spectrum of the algebra $A$ (Theorem 2.9, Corollary 2.10 and Proposition 2.12). Every prime ideal of $A$ is completely prime (Corollary 2.13). For all prime ideals $P$ of $A$, the factor algebras $A/P$ are given by generators and defining relations (Theorem 2.9).

**Generalized Weyl Algebra** *Definition, [3, 4, 6].* Let $D$ be a ring, $\sigma$ be an automorphism of $D$ and $a$ is an element of the centre of $D$. The generalized Weyl algebra $A := D(\sigma, a) := D[X, Y; \sigma, a]$ is a ring generated by $D$, $X$ and $Y$ subject to the defining relations:

$$X\alpha = \sigma(a)X \text{ and } Y\alpha = \sigma^{-1}(\alpha)Y \text{ for all } \alpha \in D, \ YX = a \text{ and } XY = \sigma(a).$$

The algebra $A = \oplus_{n \in \mathbb{Z}} A_n$ is $\mathbb{Z}$-graded where $A_n = Dv_n$, $v_n = X^n$ for $n > 0$, $v_n = Y^{-n}$ for $n < 0$ and $v_0 = 1$. It follows from the above relations that $v_nv_m = (n, m)v_{n+m} = v_{n+m}(n, m)$ for some $(n, m)$ and $(n, m) \in D$. If $n > 0$ and $m > 0$ then

$$n \geq m : (n, m) = \sigma^n(a)\cdots\sigma^{n-m+1}(\alpha), \ (-n, m) = \sigma^{-n+1}(a)\cdots\sigma^{-m}(\alpha),$$

$$n \leq m : (n, m) = \sigma^n(a)\cdots\sigma(a), \ (-n, m) = \sigma^{-n+1}(a)\cdots\sigma(a),$$

in other cases $(n, m) = 1$. Clearly, $(n, m) = \sigma^{-n-m}(n, m)$.

*Definition, [5].* Let $D$ be an ring and $\sigma$ be its automorphism. Suppose that elements $b$ and $\rho$ belong to the centre of the ring $D$, $\rho$ is invertible and $\sigma(\rho) = \rho$. Then $E := D(\sigma; b, \rho) := D[X, Y; \sigma, b, \rho]$ is a ring generated by $D$, $X$ and $Y$ subject to the defining relations:

$$X\alpha = \sigma(a)X \text{ and } Y\alpha = \sigma^{-1}(\alpha)Y \text{ for all } \alpha \in D, \ YX = \rho XY = b.$$

If $D$ is commutative domain, $\rho = 1$ and $b = u - \sigma(u)$ for some $u \in D$ (resp., if $D$ is a commutative finitely generated domain over a field $\mathbb{K}$ and $\rho \in \mathbb{K}^*$) the algebras $E$ were considered in [29] (resp., [30]).

The ring $E$ is the iterated skew polynomial ring $E = D[Y; \sigma^{-1}]|X; \sigma, \partial| where \partial is the \sigma-derivation of $D[Y; \sigma^{-1}]$ such that $\partial D = 0$ and $\partial Y = b$ (here the automorphism $\sigma$ is extended from $D$ to $D[Y; \sigma^{-1}]$ by the rule $\sigma(Y) = \rho Y$).

An element $d$ of a ring $D$ is normal if $d D = D d$. The next proposition shows that the rings $E$ are GWAs and under a certain (mild) conditions they have a ‘canonical’ normal element.

**Proposition 2.1** Let $E = D[X, Y; \sigma, b, \rho]$. Then

1. [5, Lemma 1.2] The ring $E$ is the GWA $D[H]|X, Y; \sigma, H|$ where $\sigma(H) = \rho H + b$.
2. [5, Lemma 1.3] The following statements are equivalent:

   (a) [5, Corollary 1.4] $C = \rho(\alpha YX + \alpha) = XY + \sigma(\alpha)$ is a normal element in $E$ for some central element $\alpha \in D$,

   (b) $\rho \alpha - \sigma(\alpha) = b$ for some central element $\alpha \in D$. 
3. [5, Corollary 1.4] If one of the equivalent conditions of statement 2 holds then the ring $E = D(C)[X, Y; \sigma, a = \rho^{-1}C - \alpha]$ is a GWA where $\sigma(C) = \rho C$.

The Algebra $E$ is a GWA Let $E$ be the subalgebra of $A$ generated by the elements $X$, $E$ and $Y$. The generators of the algebra $E$ satisfy the defining relations

$$EX = qXE, \quad YX = q^{-1}XY \quad \text{and} \quad EY - q^{-1}YE = X.$$ 

So, $E = \mathbb{K}[X][E, Y; \sigma, b = X, \rho = q^{-1}]$ where $\sigma(X) = qX$. The polynomial $\alpha = \frac{x}{q^{-1} - q}$ is a solution to the equation $q^{-1}\alpha - \sigma(\alpha) = X$. By Proposition 2.1, the algebra $E = \mathbb{K}[X, C][E, Y; \sigma, a = qC - \alpha]$ is a GWA where $\sigma(X) = qX$, $\sigma(C) = q^{-1}C$ and $C = q^{-1}(YE + \frac{x}{q^{-1} - q}) = EY + \frac{x}{q^{-1} - q}$ is a normal element of the algebra $E$. Then the element $\varphi = q(q^{-1} - q)C$ is a normal element of the algebra $E$. Clearly, $\varphi = (q^{-1} - q)YE + X = (1 - q^2)EY + q^2X$. Then

$$E = \mathbb{K}[X, \varphi] \left[ E, Y; \sigma, a = \frac{\varphi - X}{q^{-1} - q} \right]$$

is a GWA where $\sigma(X) = qX$ and $\sigma(\varphi) = q^{-1}\varphi$. So, the algebra

$$A = E[\mathbb{Z}^\pm, \tau]$$

is a skew Laurent polynomial algebra where $\tau(E) = q^2E$, $\tau(X) = qX$, $\tau(Y) = q^{-1}Y$ and $\tau(\varphi) = q\varphi$. By the very definition, the algebra $A$ is a Noetherian domain of Gelfand-Kirillov dimension $\text{GK}(A) = 4$. The algebra $E$ is isomorphic to the algebra $U_q^+(\mathfrak{sl}_2)$ and the algebra $A$ is a subalgebra of $U_q(\mathfrak{sl}_3)$ (generated by $E_1$, $E_2$ and $K^{\pm1}$, see [15, Section I.6] for the notation).

Let $x_1, x_2, x_3$ be a permutation of the elements $X, Y, E$. Then $\{K^i x^\alpha \mid i \in \mathbb{Z}, \alpha \in \mathbb{N}^3\}$ is a $\mathbb{K}$-basis for the algebra $A$ where $x^\alpha = x_1^{\alpha_1}x_2^{\alpha_2}x_3^{\alpha_3}$ and $\alpha = (\alpha_1, \alpha_2, \alpha_3)$. The standard filtration associated with the canonical generators of the algebra $A$ is equal to $\{F_n\}_{n \geq 0}$ where $F_n = \sum_{|\alpha| \leq n} \mathbb{K}K^i x^\alpha$ where $|\alpha| = \alpha_1 + \alpha_2 + \alpha_3$. Therefore, the Gelfand-Kirillov dimension of the algebra $A$ is equal to $\text{GK}(A) = 4$.

Lemma 2.2 The following identities hold in the algebra $A$.

1. $YE^i = q^{-i}E^iY - \frac{q(1-q^{-2})}{1-q^2}XE_{i-1}$.
2. $YE^i = q^{-i}E^iY - \frac{q^{-2i}}{q^{-2} - 1}XY_{i-1} + q^{-i}Y^iE$.

Proof Both equalities can be proved by induction on $i$ and using the relation $YE = X + q^{-1}YE$. \hfill $\square$

For a left denominator set $S$ of a ring $R$, we denote by $S^{-1}R = \{s^{-1}r \mid s \in S, r \in R\}$ the left localization of the ring $R$ at $S$. If the left denominator set $S$ is generated by elements $X_1, \ldots, X_n$, we also use the notation $R(X_1,\ldots,X_n)$ to denote the ring $S^{-1}R$. If $M$ is a left $R$-module then the localization $S^{-1}M$ is also denoted by $M_{X_1,\ldots,X_n}$.

By Lemma 2.2, the set $S_Y := \{Y^i \mid i \geq 0\}$ is a left and right Ore set in the algebra $A$. Note that the algebra $U_q(\mathfrak{sl}_2)$ is the localization of its subalgebra, the quantum plane $\mathbb{K}(K, E \mid KE = q^2EK)$, at the powers of the element $K$ (the quantum plane is generated by elements $K$ and $E$ subject to the defining relation $KE = q^2EK$). Let $A_Y$ be the localization of $A$ at the powers of $Y$. Recall that $\varphi = YE - qYE = X + (q^{-1} - q)YE$, we have

$$X\varphi = \varphi X, \quad Y\varphi = q\varphi Y, \quad E\varphi = q^{-1}\varphi E, \quad K\varphi = q\varphi K.$$ (5)
is an iterated skew polynomial ring where $\sigma$ is the automorphism of $K[\varphi, X]$ defined by $\sigma(\varphi) = q\varphi$, $\sigma(X) = q^{-1}X$; and $\tau$ is the automorphism of the algebra $K[\varphi, X][Y^{\pm 1}; \sigma]$ defined by $\tau(\varphi) = q\varphi$, $\tau(X) = qX$, $\tau(Y) = q^{-1}Y$. Let $A_{Y, X, \varphi}$ be the localization of $A_y$ at the denominator set $\{X^i Y^j \mid i, j \in \mathbb{N}\}$, then $A_{Y, X, \varphi} = K[\varphi^{\pm 1}, X^{\pm 1}][Y^{\pm 1}; \sigma][K^{\pm 1}; \tau]$ is a quantum torus. For an algebra $A$ we denote by $Z(A)$ its centre. The next result shows that the algebra $A$ and some of its localizations have trivial centre.

**Lemma 2.3** 1. $Z(A_{Y, X, \varphi}) = K$.
2. $A_{Y, X, \varphi}$ is a simple algebra.
3. $Z(A_y) = K$.
4. $Z(A) = K$.

**Proof** 1. Let $u = \sum a_{i, j, k, l} X^i Y^j K^l \in Z(A_{Y, X, \varphi})$, where $a_{i, j, k, l} \in K$ and $i, j, k, l \in \mathbb{Z}$. Since $Ku = uK$, we have $i + j - k = 0$. The equality $Xu = uX$ implies that $k - l = 0$. Similarly, the equality $Yu = uY$ implies that $i - j + l = 0$. Finally, using $\varphi u = u \varphi$ we get $-k - l = 0$. Therefore, we have $i = j = k = l = 0$, and so $u \in K$. Thus $Z(A_{Y, X, \varphi}) = K$.

2. By [23, Corollary 1.5.(a)], contraction and extension provide mutually inverse isomorphisms between the lattices of ideals of a quantum torus and its centre. Then statement 2 follows from statement 1.

3. Since $K \subseteq Z(A_y) \subseteq Z(A_{Y, X, \varphi}) \cap A_y = K$, we have $Z(A_y) = K$.

4. Since $K \subseteq Z(A) \subseteq Z(A_y) \cap A = K$, we have $Z(A) = K$. □

**Lemma 2.4** The algebra $A_{X, \varphi}$ is a central simple algebra.

**Proof** By Lemma 2.3.(1), the algebra $A_{Y, X, \varphi}$ is central, hence so is the algebra $A_{X, \varphi}$. By Lemma 2.3.(2), the algebra $A_{X, \varphi}$ is a simple Noetherian domain. So, if $I$ is a nonzero ideal of the algebra $A_{X, \varphi}$, then $I_Y$ is a nonzero ideal of the algebra $A_{Y, X, \varphi}$, i.e., $I_Y = A_{Y, X, \varphi}$, and so $Y^i \in I$ for some $i \geq 0$. To finish the proof it suffices to show that

$$(Y^i) = A_{X, \varphi} \quad \text{for all } i \geq 1.$$  

(7)

To prove the equality we use induction on $i$. Let $i = 1$. Then $X = EY - q^{-1}YE \in (Y)$. Since $X$ is a unit of the algebra $A_{X, \varphi}$, the equality (7) holds for $i = 1$. Suppose that $i \geq 1$ and equality (7) holds for all $i'$ such that $i' < i$. By Lemma 2.2.(1), $Y^{i-1} \in (Y^i)$. Hence, $(Y^i) = (Y^{i-1}) = A_{X, \varphi}$, by induction. □

By Eq. 3, the localization $E_Y$ of the algebra $E$ at the powers of the element $Y$ is the skew Laurent polynomial algebra $E_Y = K[X, \varphi][Y^{\pm 1}; \sigma^{-1}]$ where $\sigma(X) = qX$ and $\sigma(\varphi) = q^{-1}\varphi$. Similarly, $E_E = K[X, \varphi][E^{\pm 1}; \sigma] \simeq E_Y$ where $\sigma(X) = qX$ and $\sigma(\varphi) = q^{-1}\varphi$. So, $A_Y = E_Y[K^{\pm 1}; \tau]$. The element $\varphi$ is a normal element of the algebras $E$ and $A$. So, the localizations of the algebras $E_Y$ and $A_Y$ at the powers of $\varphi$ are as follows

$E_{Y, \varphi} = K[X, \varphi^{\pm 1}][Y^{\pm 1}; \sigma^{-1}]$ and $A_{Y, \varphi} = E_{Y, \varphi}[K^{\pm 1}; \tau]$.  

(8)

Now, we introduce several factor algebras and localizations of $A$ that play a key role in finding the prime spectrum of the algebra $A$ (Theorem 2.9) and all the prime factor algebras.
of $\mathcal{A}$ (Theorem 2.9). In fact, explicit sets of generators and defining relations are found for all prime factor algebras of $\mathcal{A}$ (Theorem 2.9). Furthermore, all these algebras are domains, i.e., all prime ideals of $\mathcal{A}$ are completely prime (Corollary 2.13). For an element $a$ of an algebra $A$, we denote by $(a)$ the (two-sided) ideal it generates.

**The Algebra $\mathcal{A}/(X)$** The element $X$ is a normal element in the algebras $E$ and $\mathcal{A}$. By Eq. 3, the factor algebra

$$\mathbb{E}/(X) = \mathbb{K}[\varphi] \left[ E, Y; \sigma, a = \frac{\varphi}{q^{-1} - q} \right], \quad \sigma(\varphi) = q^{-1}\varphi,$$

is a GWA. Since $YE = \frac{\varphi}{q^{-1} - q}, \quad EY = q^{-1} \frac{\varphi}{q^{-1} - q} = q^{-1}YE$, the algebra

$$\mathbb{E}/(X) \simeq \mathbb{K}(E, Y | YE = q^{-1}YE)$$

is isomorphic to the quantum plane. It is a Noetherian domain of Gelfand-Kirillov dimension 2. Now, the factor algebra

$$\mathcal{A}/(X) \simeq \mathbb{E}/(X)[K^{\pm 1}; \tau]$$

is a skew Laurent polynomial algebra where $\tau(E) = q^2E$ and $\tau(Y) = q^{-1}Y$. It is a Noetherian domain of Gelfand-Kirillov dimension 3. The element of the algebra $\mathcal{A}/(X)$, $Z := \varphi YK^{-1} = (1 - q^{-2})EY^2K^{-1}$, belongs to the centre of the algebra $\mathcal{A}/(X)$. By Eq. 8, the localization of the algebra $\mathcal{A}/(X)$ at the powers of the central element $Z$,

$$\left(\mathcal{A}/(X)\right)_Z \simeq \frac{\mathcal{A}_Y, \varphi}{(X)_{Y, \varphi}} \simeq \mathbb{K}[Z^{\pm 1}] \otimes Y,$$

is the tensor product of algebras where the algebra $Y := \mathbb{K}[Y^{\pm 1}][K^{\pm 1}; \tau]$ is a central simple algebra since $\tau(Y) = q^{-1}Y$ and $q$ is not a root of unity. Hence, the centre of the algebra $(\mathcal{A}/(X))_Z$ is $\mathbb{K}[Z^{\pm 1}]$. The algebra $(\mathcal{A}/(X))_Z$ is a Noetherian domain of Gelfand-Kirillov dimension 3.

**Lemma 2.5**

1. $Z(\mathcal{A}/(X)) = \mathbb{K}[Z]$.
2. $Z\left(\mathcal{A}/(X)\right)_Z = \mathbb{K}[Z^{\pm 1}]$.

**Proof** By Eq. 12, $Z\left(\mathcal{A}/(X)\right)_Z = \mathbb{K}[Z^{\pm 1}]$, and so $Z(\mathcal{A}/(X)) = \mathcal{A}/(X) \cap Z\left(\mathcal{A}/(X)\right)_Z = \mathcal{A}/(X) \cap \mathbb{K}[Z^{\pm 1}] = \mathbb{K}[Z]$, by Eq. 11.

**The Algebra $\mathcal{A}/(\varphi)$** The element $\varphi$ is a normal element in the algebras $E$ and $\mathcal{A}$. By Eq. 3, the factor algebra

$$\mathbb{E}/(\varphi) = \mathbb{K}[X][E, Y; \sigma, a = -\frac{X}{q^{-1} - q}], \quad \sigma(X) = qX,$$

is a GWA. Since $YE = -\frac{X}{q^{-1} - q}$ and $EY = q(-\frac{X}{q^{-1} - q}) = qYE$, the algebra

$$\mathbb{E}/(\varphi) \simeq \mathbb{K}(E, Y | YE = qYE)$$

is isomorphic to the quantum plane. It is a Noetherian domain of Gelfand-Kirillov dimension 2. Now, the factor algebra

$$\mathcal{A}/(\varphi) \simeq \mathbb{E}/(\varphi)[K^{\pm 1}; \tau]$$

\[ \text{Springer} \]
is a skew Laurent polynomial algebra where $\tau(E) = q^2 E$ and $\tau(Y) = q^{-1} Y$. The algebra $A/(\varphi)$ is a Noetherian domain of Gelfand-Kirillov dimension 3. The element $C := XYK \in A/(\varphi)$ belongs to the centre of the algebra $A/(\varphi)$.

The localization $E_{X,Y}$ of the algebra $E$ at the Ore set $S = \{X^iY^j \mid i, j \in \mathbb{N}\}$, 

$$E_{X,Y} = \mathbb{K}[X^{\pm 1}, \varphi][Y^{\pm 1}; \sigma^{-1}], \quad \sigma(X) = qX, \quad \sigma(\varphi) = q^{-1} \varphi,$$  

(16) is a skew Laurent polynomial algebra. Then the localization $A_{X,Y}$ of the algebra $A$ at the Ore set $S$ is equal to $A_{X,Y} = E_{X,Y}[K^{\pm 1}; \tau]$. By Eqs. 14 and 15, the localization of the algebra $A/(\varphi)$ at the powers of the element $C$,

$$(A/(\varphi))_C \simeq A_{X,Y}/(\varphi)_{X,Y} \simeq (A_{X}/(\varphi))_Y \simeq \mathbb{K}[C^{\pm 1}] \otimes \mathbb{Y}$$  

(17) is a tensor product of algebras where $\mathbb{Y}$ is the central simple algebra as in Eq. 12. Hence, the centre of the algebra $(A/(\varphi))_C$ is $\mathbb{K}[C^{\pm 1}]$.

**Lemma 2.6** 1. $Z(A/(\varphi)) = \mathbb{K}[C]$.

2. $Z((A/(\varphi))_C) = \mathbb{K}[C^{\pm 1}]$.

**Proof** $Z(A/(\varphi)) = A/(\varphi) \cap Z((A/(\varphi))_C) = A/(\varphi) \cap \mathbb{K}[C^{\pm 1}] = \mathbb{K}[C]$, by Eq. 15. \hfill $\Box$

For an algebra $A$, Spec $(A)$ is the set of its prime ideals. The set (Spec $(A)$, $\subseteq$) is a partially ordered set (poset) with respect to inclusion. Let $f : A \to B$ be an algebra epimorphism. Then Spec $(B)$ can be seen as a subset of Spec $(A)$ via the injection Spec $(B) \to$ Spec $(A)$, $p \mapsto f^{-1}(p)$. So, Spec $(B) = \{q \in$ Spec $(A) \mid \ker (f) \subseteq q\}$. Given a left denominator set $S$ of the algebra $A$. Then $\sigma : A \to S^{-1} A$, $a \mapsto \frac{a}{1}$, is an algebra homomorphism. If the algebra $A$ is a Noetherian algebra then Spec $(S^{-1} A)$ can be seen as a subset of Spec $(A)$ via the injection Spec $(S^{-1} A) \to$ Spec $(A)$, $q \mapsto \sigma^{-1}(q)$.

Let $R$ be a ring. Then each element $x \in R$ determines two maps from $R$ to $R$, $r \cdot : x \mapsto rx$ and $\cdot r : x \mapsto xr$ where $x \in R$. Recall that for an element $r \in R$, we denote by $(r)$ the ideal of $R$ generated by the element $r$.

**Proposition 2.7** Let $R$ be a Noetherian ring and $s$ be an element of $R$ such that $S_s := \{s^i \mid i \in \mathbb{N}\}$ is a left denominator set of the ring $R$ and $(s^i) = (s)^i$ for all $i \geq 1$ (e.g., $s$ is a normal element such that ker $(s_R) \subseteq$ ker $(s_{R'})$). Then Spec $(R) = \text{Spec}(R, s) \sqcup \text{Spec}_s(R)$ where Spec $(R, s) := \{p \in \text{Spec}(R) \mid s \in p\}$, Spec $(s) := \{q \in \text{Spec}(R) \mid s \not\in q\}$ and

(a) the map Spec $(R, s) \to$ Spec $(R/(s))$, $p \mapsto p/(s)$, is a bijection with the inverse $q \mapsto \pi^{-1}(q)$ where $\pi : R \to R/(s)$, $r \mapsto r + (s)$,

(b) the map Spec $(s) \to$ Spec $(R_s)$, $p \mapsto S_s^{-1} p$, is a bijection with the inverse $q \mapsto \sigma^{-1}(q)$ where $\sigma : R \to R_s := S_s^{-1} R$, $r \mapsto \frac{r}{1}$.

(c) For all $p \in$ Spec $(R, s)$ and $q \in$ Spec $(s)$, $p \not\subseteq q$.

**Proof** Clearly, Spec $(R) = A_1 \sqcup A_0$ is a disjoint union where $A_1$ and $A_0$ are the subsets of Spec $(R)$ that consist of prime ideals $p$ of $R$ such that $p \cap S_s \neq \emptyset$ and $p \cap S_s = \emptyset$, respectively. If $p \in A_1$ then $s^i \in p$ for some $i \geq 1$, and so $p \supseteq (s^i) = (s)^i$, by the assumption. Therefore, $p \supseteq (s)$ (since $p$ is a prime ideal), i.e., $p \ni s$. This means that $A_1 = \text{Spec}(R, s)$. We have
shown that $s \in p$ iff $s^i \in p$ for some $i \geq 1$. By the very definition, $A_0 = \text{Spec} (R) \setminus A_1 = \text{Spec} (R) \setminus \{ p \in \text{Spec} (R) \mid s \notin p \} = \{ p \in \text{Spec} (A) \mid s \notin p \} = \text{Spec}_c (R)$.

The statement (a) is obvious since $s \in p$ iff $(s) \subseteq p$. The ring $R$ is Noetherian, by [41, Proposition 2.1.16.(vii)], the map $\text{Spec}_c (R) = \{ p \in \text{Spec} (R) \mid p \cap S = \emptyset \} \rightarrow \text{Spec} (R_x), p \mapsto S^{-1}p$, is a bijection with the inverse $q \mapsto \sigma^{-1} (q)$ and the statement (b) follows. The statement (c) is obvious.

In the proof of Theorem 2.9 the following very useful lemma is used repeatedly.

**Lemma 2.8** Let $A$ be a ring, $S$ be a left denominator set of $A$ and $\sigma : A \rightarrow S^{-1}A$, $a \mapsto \frac{a}{1}$. Let $q$ be a completely prime ideal of $S^{-1}A$, $p$ be an ideal of $A$ such that $p \subseteq \sigma^{-1} (q)$ and $S^{-1}p = q$. Then $p = \sigma^{-1} (q)$ iff $A/p$ is a domain.

**Proof** ($\Rightarrow$) Since $A/\sigma^{-1} (q) \subseteq S^{-1}A/q$ and $S^{-1}A/q$ is a domain (since $q$ is a completely prime ideal), the algebra $A/\sigma^{-1} (q)$ is a domain.

($\Leftarrow$) The left $S^{-1}A$-module $S^{-1}(A/p) \cong S^{-1}A/S^{-1}p \cong S^{-1}A/q$ is not equal to zero. In particular, $S \cap p = \emptyset$. So, for all $s \in S$, the elements $s + p$ are nonzero in $A/p$. Since $A/p$ is a domain, $\text{tor}_S (A/p) = 0$. Clearly, $\sigma^{-1} (q)/p \subseteq \text{tor}_S (A/p)$. Hence, $p = \sigma^{-1} (q)$. 

**The Prime Spectrum of the Algebra $A$** The key idea in finding the prime spectrum of the algebra $A$ is to use Proposition 2.7 repeatedly and the following diagram of algebra homomorphisms

\[
\begin{array}{ccc}
A & \rightarrow & A_X \\
\downarrow & & \downarrow \\
A/(X) & \rightarrow & A_X/(\varphi)_X \\
\downarrow & & \downarrow \\
A/(X, Z) & \rightarrow & (A/(X))_Z \\
\downarrow & & \downarrow \\
U = A/(X, Z, Y) & \rightarrow & (A/(X, Z))_Y \cong \mathbb{Y} \\
\downarrow & & \downarrow \\
L = U/(E) & \rightarrow & U_E \\
\end{array}
\]

(18)

that explains the choice of elements at which we localize. Using Eq. 18 and Proposition 2.7, we represent the spectrum $\text{Spec} (A)$ as the disjoint union of the following subsets where we identify the sets of prime ideals via the bijections given in the statements (a) and (b) of Proposition 2.7:

\[
\text{Spec} (A) = \text{Spec} (L) \sqcup \text{Spec} (U_E) \sqcup \text{Spec} (\mathbb{Y}) \sqcup \\
\sqcup \text{Spec} ((A/(X))_Z) \sqcup \text{Spec} (A_X/(\varphi)_X) \sqcup \text{Spec} (A_{X, \varphi}).
\]

(19)

A prime ideal $p$ of an algebra $A$ is called a completely prime ideal if $A/p$ is a domain. We denote by $\text{Spec}_c (A)$ the set of completely prime ideals of $A$, it is called the completely prime
The prime spectrum of $A$. The theorem below gives an explicit description of the prime ideals of the algebra $\mathcal{A}$ together with inclusions of prime ideals.

**Theorem 2.9** The prime spectrum $\text{Spec} (\mathcal{A})$ of the algebra $\mathcal{A}$ is the disjoint union of sets (19). In the diagram (20), all the inclusions of prime ideals are given (lines represent inclusions of primes). More precisely,

$$
\{(Y, E, p) \mid p \in \text{Max} (\mathbb{K}[K, K^{-1}])\}
$$

$$
\{(X, q) \mid q \in \text{Max} (\mathbb{K}[Z]) \setminus \{(Z)\}\}
$$

$$
\{(\varphi, \tau) \mid \tau \in \text{Max} (\mathbb{K}[C]) \setminus \{(C)\}\}
$$

where

1. $\text{Spec} (L) = \{(Y, E, p) \mid p \in \text{Spec} (\mathbb{K}[K^{\pm 1}])\}$ and $A/(Y, E, p) \simeq L/p$ where $L = \mathbb{K}[K^{\pm 1}]$.
2. $\text{Spec} (U_E) = \{(Y)\}$, $(Y) = (X, Y) = (X, Z, Y)$ and $A/(Y) \simeq \mathbb{K}[E][K^{\pm 1}; \tau]$ where $\tau (E) = q^2 E$.
3. $\text{Spec} (\mathcal{Y}) = \{(E)\}$, $(E) = (E, X) = (E, \varphi)$ and $A/(E) \simeq \mathbb{K}[Y][K^{\pm 1}; \tau]$ where $\tau (Y) = q^{-1} Y$.
4. $\text{Spec} \left( \left( A/(X) \right) _Z \right) = \{(X), (X, q) \mid q \in \text{Max} (\mathbb{K}[Z]) \setminus \{(Z)\}\}$, $Z = \varphi Y K^{-1}$,
   (a) $A/(X) \simeq \mathbb{E}/(X)[K^{\pm 1}; \tau]$ is a domain (see Eq. 11), and
   (b) $A/(X, q) \simeq \frac{A_{X,Y}}{(X, q)_Y} \simeq L_q \otimes Y$ is a simple domain which is a tensor product of algebras where $L_q := \mathbb{K}[Z]/q$ is a finite field extension of $\mathbb{K}$.
5. $\text{Spec} \left( \left( A_{X,(\varphi)} \right) _Y \right) = \{ (\varphi), (\varphi, \tau) \mid \tau \in \text{Max} (\mathbb{K}[C]) \setminus \{(C)\}\}$, $C = XYK$, $\frac{A_{X}}{(\varphi)_X} \simeq \frac{A_{X,Y}}{(\varphi)_Y} \simeq \mathbb{K}[C^{\pm 1}] \otimes Y$,
   (a) $A/(\varphi) \simeq \mathbb{E}/(\varphi)[K^{\pm 1}; \tau]$ is a domain (see Eq. 15),
   (b) $A/(\varphi, \tau) \simeq \frac{A_{X,Y}}{(\varphi, \tau)_Y} \simeq L_\tau \otimes Y$ is a simple domain which is a tensor product of algebras where $L_\tau := \mathbb{K}[C]/\tau$ is a finite field extension of $\mathbb{K}$.
6. $\text{Spec} (\mathcal{A}_{X,\varphi}) = \{0\}$.

**Proof** As it was already mentioned above, we identify the sets of prime ideals via the bijection given in the statements (a) and (b) of Proposition 2.7. Recall that the set $S_X = \{X^i \mid i \in \mathbb{N}\}$ is a left and right denominator set of $\mathcal{A}$ and $A_X := S_X^{-1} \mathcal{A} \simeq A S_X^{-1}$ is a Noetherian domain (since $\mathcal{A}$ is so). The element $X$ is a normal element of $\mathcal{A}$. By Proposition 2.7,

$$
\text{Spec} (\mathcal{A}) = \text{Spec} (\mathcal{A}, X) \sqcup \text{Spec} (\mathcal{A}_X)
$$

(21)
and none of the ideals of the set Spec $(A, X)$ is contained in an ideal of the set Spec $(A_X)$. Similarly, the element $\varphi$ is a normal element of $A_X$ and, by Proposition 2.7

$$\text{Spec}(A_X) = \text{Spec}\left(\left(\frac{A}{(\varphi)}\right)_X\right) \sqcup \text{Spec}(A_{X, \varphi}).$$  \tag{22}$$

By Lemma 2.4, the algebra $A_{X, \varphi}$ is a simple domain. Hence, Spec $(A_{X, \varphi}) = \{0\}$, and statement 6 is proved.

(i) $A_X/(\varphi) \cong A_{X, \varphi} \cong \mathbb{K}[C^1] \otimes \mathbb{Y}$: The second isomorphism holds, by Eq. 17. Using the equalities $\varphi = (q^{-1} - q)YE + X = (1 - q^2)YE + q^2X$ we see that the elements $Y$ and $E$ are invertible in the algebra $A_X/(\varphi)$, and so the first isomorphism holds.

(ii) $A/(\varphi, r) \cong A_{X, Y}/(\varphi, r)_{X, Y} \cong L_q \otimes \mathbb{Y}$ for all prime ideals $r \in \text{Max}(\mathbb{K}[C]) \setminus \{(C)\}$: Since $r \neq (C)$, the non-zero element $C = XYK \in L_q$ is invertible in the field $L_q$. Hence, the elements $X$ and $Y$ are invertible in the algebra $A/(\varphi, r)$. Hence,

$$A/(\varphi, r) = \frac{A_{X, Y}}{(\varphi, r)_{X, Y}}. \tag{23}$$

Now, the statement (ii) follows from Eq. 23 and the statement (i).

(iii) Statement 5 holds: Recall that the algebra $\mathbb{Y}$ is a central simple algebra. By the statement (i), the set Spec $(A_X/\varphi_X)$, as a subset of Spec $(A)$, is equal to $(A \cap (\varphi)_X, A \cap (\varphi, r)_X | r \in \text{Max}(\mathbb{K}[C]) \setminus \{(C)\})$. It remains to show that $A \cap (\varphi)_X = (\varphi)$ and $A \cap (\varphi, r)_X = (\varphi, r)$. The second equality follows from the statement (ii) since $(\varphi, r) \subseteq A \cap (\varphi, r)_X \subseteq A \cap (\varphi)_X \equiv (\varphi)$. Since $\mathbb{Y}$ is a central simple algebra, the statement (b) of statement 5 follows. The statement (a) of statement 5 is obvious (see Eq. 15). Hence, $(\varphi) = A \cap (\varphi)_X$, by Lemma 2.8. So, statement 5 holds.

By Proposition 2.7,

$$\text{Spec}(A/(X)) = \text{Spec}\left(\left(\frac{A}{(X)}\right)_Z\right) \sqcup \text{Spec}(\left(\frac{A}{(X)}\right)_Z)$$  \tag{24}$$

and none of the ideals of the set Spec $(A/(X, Z))$ is contained in an ideal of the set Spec $(\frac{A}{(X)}_Z)$.

(iv) $A/(X, q) \cong \frac{A_{Y, \varphi}}{(X, q)_{Y, \varphi}} \cong L_q \otimes \mathbb{Y}$ is a simple domain for all prime ideals $q \in \text{Max}(\mathbb{K}[Z]) \setminus \{(Z)\}$: Since $q \neq (Z)$, the non-zero element $Z = \varphi YK^{-1} \in L_q$ is invertible in the field $L_q$. Hence, the elements $\varphi$ and $Y$ are invertible in the algebra $A/(X, q)$. Therefore,

$$A/(X, q) \cong \frac{A_{Y, \varphi}}{(X, q)_{Y, \varphi}}. \tag{25}$$

Now, by Eq. 12, the statement (iv) holds.

(v) Statement 4 holds: The algebra $\mathbb{Y}$ is a central simple algebra. By Eq. 12, the set Spec $(\frac{A}{(X)}_Z)$, as a subset of Spec $(A)$, is equal to $(A \cap (X)_Y, A \cap (X, q)_Y | q \in \text{Max}(\mathbb{K}[Z]) \setminus \{(Z)\})$. We have to show that $A \cap (X)_Y = (X)$ and $A \cap (X, q)_Y = (X, q)$. The last equality follows from the statement (iv) (the algebra $A/(X, q)$ is simple and $(X, q) \subseteq A \cap (X, q)_Y \subseteq A$, hence $(X, q) = A \cap (X, q)_Y$). Now, the statement (b) of statement 4 holds. The statement (a) is obvious, see Eq. 11. Hence, $(X) = A \cap (X)_Y$, by Lemma 2.8. So, the proof of the statement (v) is complete.

In the algebra $A$, using the equality $\varphi = X + (q^{-1} - q)YE$ we see that

$$Z \equiv \varphi YK^{-1} \equiv (q^{-1} - q)Y E Y K^{-1} \equiv (1 - q^2)E Y^2 K^{-1} \mod (X). \tag{26}$$

(vi) $(Y) = (X, Y) = (X, Z, Y)$: The first equality follows from the relation $X = E Y - q^{-1}Y E$. Then the second equality follows from Eq. 26.
(vii) \((E) = (E, X) = (E, \varphi)\): The first equality follows from the relation \(X = EY - q^{-1}YE\). Then the second equality follows from the definition of the element \(\varphi = X + (q^{-1} - q)YE\).

(viii) **The elements \(Y\) and \(E\) are normal in \(\mathcal{A}/(X)\):** The statement follows from Eqs. 10 and 11.

\[
(\mathcal{A}/(X, Z))_Y \simeq (\mathcal{A}/(E))_Y \simeq \mathbb{Y} \text{ is a simple domain:}\]

By Eq. 26, \((X, Z) = (X, EY^2) \subseteq (X, E) \equiv (E),\) hence \((X, EY^2)_Y = (X, E)_Y = (E)_Y,\) by the statement (vii). Now, by Eq. 11,

\[
\left(\mathcal{A}/(X, Z)\right)_Y \simeq \mathcal{A}_Y/(E)_Y \simeq \mathcal{A}_Y/(E, X) \simeq \mathbb{Y}.
\]

By the statement (viii) and Proposition 2.7,

\[
\text{Spec} \left(\mathcal{A}/(X, Z)\right) = \text{Spec} \left(\mathcal{A}/(X, Z, Y)\right) \cup \text{Spec} \left(\mathcal{A}/(X, Z, Y)\right).
\]

By the statement (vi), \(\mathcal{A}/(X, Z, Y) \simeq \mathcal{A}/(X, Y) \simeq U := U_q^{>0}(\mathfrak{s}_I).\) By the statement (ix),

\[
\left(\mathcal{A}/(X, Z)\right)_Y \simeq \mathcal{A}_Y/(E)_Y \simeq \mathbb{Y} \text{ is a simple domain. So, the set Spec } \left(\mathcal{A}/(X, Z)\right)_Y \text{ as a subset of Spec } (\mathcal{A}, \text{ consists of the ideal } (E).\)

In more details, since \((X, Z) \subseteq (E), (X, Z)_Y = (E)_Y (\text{see the proof of the statement (ix)) and } \mathcal{A}/(E) = \mathcal{A}/(E, X) \equiv \mathbb{K}[Y][K^{\pm 1}; \tau] \text{ is a domain, the result follows from Lemma 2.8. So, statement 3 holds.}

The element \(E\) is a normal element of the algebra \(U.\) By Proposition 2.7,

\[
\text{Spec } (U) = \text{Spec } (U/(E)) \cup \text{Spec } (U_E).
\]

Since \(L = U/(E),\) statement 1 follows. The algebra \(U_E \simeq \mathbb{K}[E^{\pm 1}][K^{\pm 1}; \tau]\) is a central simple domain. Since \(U = \mathcal{A}/(Y) = \mathcal{A}/(X, Z, Y)\) (the statement (vii)) is the domain, the set Spec \((U_E),\) as a subset of Spec \((\mathcal{A},\) consists of a single ideal \((Y),\) and statement 2 follows.

We proved that Eq. 19 holds. Clearly, we have the inclusions as on the diagram (20). It remains to show that there is no other inclusions. The ideals \((Y, E, p), (X, q)\) and \((\varphi, \tau)\) are the maximal ideals of the algebra \(\mathcal{A}\) (see statement 1, 4, and 5). By Eq. 25 and the relations given in the diagram (20), there are no additional lines leading to the maximal ideals \((X, q)\). Similarly, by Eq. 23 and the relations given in the diagram (20), there are no additional lines leading to the maximal ideals \((\varphi, \tau)\). The elements \(X\) and \(\varphi\) are normal elements of the algebra \(\mathcal{A}\) such that \((X) \not\subseteq (\varphi)\) and \((X) \not\supseteq (\varphi)\), by Eq. 4. The proof of the theorem is complete.

For an algebra \(\mathcal{A}, \text{Max}(\mathcal{A})\) is the set of its maximal ideals. The next corollary is an explicit description of the set Max(\(\mathcal{A}\)).

**Corollary 2.10** \(\text{Max}(\mathcal{A}) = \mathcal{P} \cup \mathcal{Q} \cup \mathcal{R}\) where \(\mathcal{P} := \left\{(Y, E, p) \mid p \in \text{Max } (\mathbb{K}[K, K^{-1}])\right\}, \mathcal{Q} := \left\{(X, q) \mid q \in \text{Max } (\mathbb{K}[Z]) \setminus \{(Z)\}\right\}\) and \(\mathcal{R} := \left\{(\varphi, \tau) \mid \tau \in \text{Max } (\mathbb{K}[C]) \setminus \{(C)\}\right\}.

**Proof** The corollary follows from the diagram (20).

Let \(M\) be an \(\mathcal{A}\)-module, \(a \in \mathcal{A}\) and \(aM : M \to M, m \mapsto am\). The ideal of \(\mathcal{A}, \text{ann}_M(M) := \{a \in \mathcal{A} \mid aM = 0\}\) is called the annihilator of \(M.\) The \(\mathcal{A}\)-module is called **faithful** if it has zero annihilator. The next corollary is a faithfulness criterion for simple \(\mathcal{A}\)-modules.
Corollary 2.11 Let $M$ be a simple $A$-module. Then $M$ is a faithful $A$-module iff 
$kerm_{X} = kerm_{\varphi_{M}} = 0$ iff $M_{X} \neq 0$ and $M_{\varphi} \neq 0$ (where $M_{X}$ and $M_{\varphi}$ are the 
localizations of the $A$-module $M$ at the powers of the elements $X$ and $\varphi$, respectively).

Proof The $A$-module is simple, so $ann_{A}(M) \in Spec(A)$, the central elements $Z, C$ 
then $ann_{A}$.

Lemma 2.14

Proof

Corollary 2.13

Let $A$ be an algebra. The annihilator of each simple $A$-module is a prime ideal. Such 
prime ideals are called primitive and the set $Prim(A)$ of all of them is called the primitive 
spectrum of $A$.

Proposition 2.12 $Prim(A) = Max(A) \cup \{(Y), (E), 0\}$.

Proof

(i) Let us show that $(Y) \in Prim(A)$. For $\lambda \in \mathbb{K}^{*}$, let $I_{\lambda} = (Y) + A(E - \lambda)$. Since 
$A/(Y) \simeq U$, the left $A$-module $M(\lambda) := A/I(\lambda) \simeq U/U(E - \lambda) \simeq \mathbb{K}[K^{\pm 1}]$ is a simple 
$A$-module/$U$-module where $\tilde{I} = 1 + I(\lambda)$. By the very definition, the prime ideal $\alpha := ann_{A}(M(\lambda))$ contains the ideal $(Y)$ but does not contain the ideal $(Y, E)$ since otherwise 
we would have $0 = E\tilde{I} = \lambda\tilde{I} \neq 0$, a contradiction. By the diagram (20), $\alpha = (Y)$.

(ii) Let us show that $(E) \in Prim(A)$. By Theorem 2.9, $(E) = (E, X)$ and $\tilde{A} := A/(E)$ 
$simeq \mathbb{K}[Y][K^{\pm 1}; \sigma]$ where $\sigma(Y) = q^{-1}Y$. For $\lambda \in \mathbb{K}^{*}$, the $A$-module $T(\lambda) := A/(Y) \simeq \mathbb{K}[K^{\pm 1}]$ is a simple module (since $q$ is not a root of 1), where $\tilde{I} = 1 + A(Y - \lambda)$. Clearly, the prime ideal $b := ann_{A}(T(\lambda))$ contains the ideal $(E)$ but does not 
contain the ideal $(Y, E)$ since otherwise we would have $0 = Y\tilde{I} = \lambda\tilde{I} \neq 0$, a contradiction. 
By the diagram (20), $b = (E)$.

(iii) By Theorem 5.5, 0 is a primitive ideal of $A$.

Corollary 2.13

Every prime ideal of the algebra $A$ is completely prime, i.e., $Spec_{c}(A) = Spec(A)$.

Proof See Theorem 2.9.

The Dixmier-Moeglin Equivalence

The Dixmier-Moeglin equivalence states that for prime ideals the following properties are equivalent:

locally closed $\iff$ primitive $\iff$ rational.

The reader is referred to the book of Brown and Goodearl [15] for the details.

Lemma 2.14

The algebra $A$ satisfies the Nullstellensatz.
Proof Using similar arguments as in [42, 4.5–4.9] we can prove that the algebra $\mathcal{A}$ satisfies the Nullstellensatz.

The next lemma is used in the proof of Theorem 2.16.

**Lemma 2.15** ([15, Lemma II.7.7]) A prime ideal $P$ in a ring $R$ is locally closed in Spec $(R)$ if and only if the intersection of all prime ideals properly containing $P$ is an ideal properly containing $P$.

**Theorem 2.16** The algebra $\mathcal{A}$ satisfies the Dixmier-Moeglin equivalence.

Proof The algebra $\mathcal{A}$ is a Noetherian algebra that satisfies the Nullstellensatz (Lemma 2.14). Then, by [15, Lemma II.7.15], we have the implications

\[ \text{locally closed } \implies \text{primitive } \implies \text{rational}. \]

By the diagram (20) and Lemma 2.15, all ideals but $(X)$, $(\varphi)$ and $(Y, E)$ are locally closed, hence, rational (by Eq. 29). The ideals $(X)$, $(\varphi)$ and $(Y, E)$ are not rational as the centre of each factor algebra $\mathcal{A}/(X)$, $\mathcal{A}/(\varphi)$ and $\mathcal{A}/(Y, E)$ contains a transcendental element $(Z, C$ and $K$, respectively). Therefore, every rational prime ideal is locally closed, i.e., the algebra $\mathcal{A}$ satisfies the Dixmier-Moeglin equivalence. \qed

3 The Automorphism Group of $\mathcal{A}$

In this section, the group $G := \text{Aut}_K(\mathcal{A})$ of automorphisms of the algebra $\mathcal{A}$ is found (Theorem 3.1). Corollary 3.2 describes the orbits of the action of the group $G$ on Spec $(\mathcal{A})$ and the set of fixed points.

We introduce a degree filtration on the algebra $\mathcal{A}$ by setting $\deg(K) = \deg(K^{-1}) = 0$ and $\deg(E) = \deg(X) = \deg(Y) = 1$. So, $\mathcal{A} = \bigcup_{n \in \mathbb{N}} \mathcal{A}[n]$ where $\mathcal{A}[n] = \sum \mathbb{K}X^iY^jE^kK^l$ with $\deg(X^iY^jE^kK^l) := i + j + k \leq n$. Let $\text{gr}\mathcal{A} := \bigoplus_{i \in \mathbb{N}} \mathcal{A}[i]/\mathcal{A}[i-1]$ (where $\mathcal{A}[-1] := 0$) be the associated graded algebra of $\mathcal{A}$ with respect to the filtration $\{\mathcal{A}[n]\}_{n \geq 0}$. For an element $a \in \mathcal{A}$, we denote by $\text{gr}a \in \text{gr}\mathcal{A}$ the image of $a$ in $\text{gr}\mathcal{A}$. It is clear that $\text{gr}\mathcal{A}$ is an iterated Ore extension, $\text{gr}\mathcal{A} \simeq \mathbb{K}[X][Y; \alpha][E; \beta][K^{\pm 1}; \gamma]$ where $\alpha(X) = q^{-1}X$, $\beta(X) = qX$, $\beta(Y) = q^{-1}Y$, $\gamma(X) = qX$, $\gamma(Y) = q^{-1}Y$ and $\gamma(E) = q^2E$. In particular, $\text{gr}\mathcal{A}$ is a Noetherian domain of Gelfand-Kirillov dimension $\text{ GK}(\text{gr}\mathcal{A}) = 4$ and the elements $X, Y$ and $E$ are normal in $\text{gr}\mathcal{A}$.

The group of units $\mathcal{A}^\ast$ of the algebra $\mathcal{A}$ is equal to $\{\mathbb{K}^*K^i | i \in \mathbb{Z}\} = \mathbb{K}^* \times \langle K \rangle$ where $\langle K \rangle = \{K^i | i \in \mathbb{Z}\}$. The next theorem is an explicit description of the group $G$.

**Theorem 3.1** $\text{Aut}_K(\mathcal{A}) = \{\sigma_{\lambda,\mu,\gamma,i} | \lambda, \mu, \gamma \in \mathbb{K}^*, i \in \mathbb{Z}\} \simeq (\mathbb{K}^*)^3 \times \mathbb{Z}$ where $\sigma_{\lambda,\mu,\gamma,i} : X \mapsto \lambda K^iX$, $Y \mapsto \mu K^{-i}Y$, $K \mapsto \gamma K$, $E \mapsto \lambda \mu^{-1}q^{-2i}K^2E$ (and $\sigma_{\lambda,\mu,\gamma,i}(\varphi) = \lambda K^i\varphi$). Furthermore, $\sigma_{\lambda,\mu,\gamma,i}\sigma_{\lambda',\mu',\gamma',j} = \sigma_{\lambda \lambda',\mu \mu',\gamma \gamma',i+j}$ and $\sigma_{\lambda,\mu,\gamma,i}^{-1} = \sigma_{\lambda^{-1},\mu^{-1},\gamma^{-1},-i}$. \qed

Proof Using the defining relations of the algebra $\mathcal{A}$, one can verify that $\sigma_{\lambda,\mu,\gamma,i} \in G$ for all $\lambda, \mu, \gamma \in \mathbb{K}^*$ and $i \in \mathbb{Z}$. The subgroup $G'$ generated by these automorphisms is isomorphic
to the semi-direct product \((\mathbb{K}^*)^3 \times \mathbb{Z}\). It remains to show that \(G = G'\). Recall that the elements \(X\) and \(\varphi\) are normal in the algebra \(A\). Let \(\sigma \in G\), we have to show that \(\sigma \in G'\).

By the diagram (20), there are two options either the ideals \((X)\) and \((\varphi)\) are \(\sigma\)-invariant or, otherwise, they are interchanged. In more details, either, for some elements \(\lambda, \lambda' \in \mathbb{K}^*\) and \(i, j \in \mathbb{Z}\),

(a) \(\sigma(X) = \lambda K^i X\) and \(\sigma(\varphi) = \lambda' K^i \varphi\), or, otherwise,

(b) \(\sigma(X) = \lambda K^i \varphi\) and \(\sigma(\varphi) = \lambda' K^j X\).

We will show that the case (b) is not possible (see the statement (v) below) and then the group \(G\) will be found. Arguments are given in steps (i)–(viii).

(i) \(\sigma(K) = \gamma K\) for some \(\gamma \in \mathbb{K}^*\): The group of units \(A^*\) of the algebra \(A\) is equal to \(\{\gamma K^s \mid \gamma \in \mathbb{K}^*, s \in \mathbb{Z}\}\). So, either \(\sigma(K) = \gamma K\) or, otherwise, \(\sigma(K) = \gamma K^{-1}\) for some \(\gamma \in \mathbb{K}^*\). Let us show that the second case is not possible. Notice that \(K X = q K X\) and \(K \varphi = q \varphi K\), i.e., the elements \(X\) and \(\varphi\) have the same commutation relation with the element \(K\). Because of that it suffices to consider one of the cases (a) or (b) since then the other case can be treated similarly. Suppose that the case (a) holds and that \(\sigma(K) = \gamma K^{-1}\).

Then the equality \(\sigma(K)\sigma(X) = q \sigma(\varphi)\sigma(K)\) yields the equality \(\gamma K^{-1} \cdot \lambda K^i X = q \lambda K^i \varphi \cdot \gamma K^{-1} = q \lambda K^{-1} Y K^{-1} X\). Hence, \(q^2 = 1\), a contradiction.

(ii) \(\deg \sigma(X) = \deg \sigma(E) = 1\): Recall that \(Y E = q^{-1}(\varphi - X)\) where \(q' := q^{-1} - q\).

By applying to this equality we obtain the equality \(\sigma(X)\sigma(E) = q^{-1} \sigma(\varphi - X)\). Hence, \(\deg \left(\sigma(X)\sigma(E)\right) = \deg \left(q^{-1} \sigma(\varphi - X)\right) = 2\), in both cases (a) and (b). Thus, there are three options for the pair \(\left(\deg \sigma(Y), \deg \sigma(E)\right)\): (1, 1), (0, 2) or (2, 0). The last two options are not possible since otherwise we would have \(\sigma(Y) \in \mathbb{K}[K^{\pm 1}]\) or \(\sigma(E) \in \mathbb{K}[K^{\pm 1}]\), respectively. Hence, \(\sigma(Y)\sigma(K) = \sigma(K)\sigma(Y)\) or \(\sigma(E)\sigma(K) = \sigma(K)\sigma(E)\), respectively. But this is impossible since \(KY \neq KY\) and \(EK \neq KE\). Therefore, \(\deg \sigma(Y) = \deg \sigma(E) = 1\).

(iii) \(\sigma(Y) = a Y\) and \(\sigma(E) = b E\) for some nonzero elements \(a, b \in \mathbb{K}[K^{\pm 1}]\): Applying \(\sigma\) to the relation \(KEK^{-1} = q^2 E\) we obtain the equality \(KE\sigma(K)K^{-1} = q^2 \sigma(E)\). Since \(\deg \sigma(E) = 1\), \(\sigma(E) = b E + u X + v Y + w\) for some elements \(b, u, v, w \in \mathbb{K}[K^{\pm 1}]\). Using the relations \(KK^{-1} = q X\) and \(KYK^{-1} = q^{-1} Y\), we see that \(u = v = w = 0\), i.e., \(\sigma(E) = b E\). Similarly, applying \(\sigma\) to the relation \(KYK^{-1} = q^{-1} Y\), we obtain the equality \(K\sigma(Y)K^{-1} = q^{-1} \sigma(Y)\). Since \(\deg \sigma(Y) = 1\), \(\sigma(Y) = a Y + u'E + v'X + w'\) for some elements \(a, u', v', w' \in \mathbb{K}[K^{\pm 1}]\). Using the relations \(KK^{-1} = q X\), \(KYK^{-1} = q^{-1} Y\), and \(KEK^{-1} = q^2 E\), we see that \(u' = v' = w' = 0\), i.e., \(\sigma(Y) = a Y\).

(iv) \(i = j\) (see the cases (a) and (b)): The elements \(X\) and \(\varphi\) commute, hence \(\sigma(X)\sigma(\varphi) = \sigma(\varphi)\sigma(X)\). Substituting the values of \(\sigma(X)\) and \(\sigma(\varphi)\) into this equality yields \(q^{-i} = q^{-j}\) in both cases (a) and (b), i.e., \(i = j\) (since \(q\) is not a root of unity).

(v) The case (b) is not possible: Suppose that the case (b) holds, i.e., \(\sigma(X) = \lambda K^i \varphi\) and \(\sigma(\varphi) = \lambda' K^j X\) (see the statement (iv)), we seek a contradiction. To find the contradiction we use the relations \(q Y X = Y X\) and \(Y \varphi = q \varphi Y\). Applying the automorphism \(\sigma\) to the first equality gives \(\sigma(q Y X) = q a Y \cdot \lambda K^i \varphi = q a \lambda q K^j \varphi\) and \(\sigma(Y X) = \lambda K^i \varphi \cdot \lambda K^j \varphi = \lambda K^i \tau(a) \varphi Y = \lambda K^i 1 Y \varphi\) where \(\tau\) is the automorphism of the algebra \(\mathbb{K}[K^{\pm 1}]\) given by the rule \(\tau(K) = q^{-1} K\). Hence, \(\tau(a) = q^{i+2} a\), i.e., \(a = \xi K^{-i-2}\) for some \(\xi \in \mathbb{K}^*\). So, \(\sigma(Y) = \xi K^{i-2} Y\). Now applying \(\sigma\) to the second equality, \(Y \varphi = q \varphi Y\), we have the equalities \(\sigma(Y \varphi) = \xi K^{-i-2} Y \cdot \lambda' K^j X = \xi \lambda' q^i K^{-2} Y X\) and \(\sigma(q \varphi Y) = \xi \lambda' q^i K^{-2} Y X\) and \(\sigma(q \varphi Y) = \xi \lambda' q^i K^{-2} Y X\). Some of these equalities are impossible since otherwise we would have \(G = G'\).
$q\lambda' K^i X \cdot \xi K^{-i-2} Y = \xi \lambda' q^{i+3} K^{-2} XY = \xi \lambda' q^{i+4} K^{-2} Y X$. Therefore, $q^4 = 1$, a contradiction (since $q$ is not a root of unity). This means that the only case (a) holds. Summarizing, we have $\sigma(X) = \lambda K^i X$, $\sigma(K) = \gamma K$, $\sigma(\varphi) = \lambda' K' \varphi$, $\sigma(Y) = aY$, and $\sigma(E) = bE$.

(vi) $a = \mu K^{-i}$ for some $\mu \in \mathbb{K}^*$ (i.e., $\sigma(Y) = \mu K^{-i} Y$): Applying the automorphism $\sigma$ to the relation $q Y X = X Y$ yields: $\sigma(q Y X) = qaY \cdot \lambda K^i X = \lambda a q^i K^i q Y X = \lambda a q^i K^i X Y$ and $\sigma(X Y) = \lambda K^i X \cdot a Y = \lambda K^i \tau(a) Y X$. Therefore, $\tau(a) = q^4 a$, i.e., $a = \mu K^{-i}$ for some element $\mu \in \mathbb{K}^*$.

(vii) $b = \delta K^{2i}$ for some $\delta \in \mathbb{K}^*$ (i.e., $\sigma(E) = \delta K^{2i} E$): Applying the automorphism $\sigma$ to the relation $q X E = E X$ yields: $\sigma(q X E) = q \lambda K^i X \cdot b E = \lambda K^i \tau(b) q X E = \lambda K^i \tau(b) E X$ and $\sigma(E X) = b E \cdot \lambda K^i X = \lambda K^i b q^{-2i} E X$. Therefore, $\tau(b) = q^{-2i} b$, i.e., $b = \delta K^{2i}$ for some $\delta \in \mathbb{K}^*$.

(viii) $\delta = \lambda \mu^{-1} q^{-2i}$: Applying the automorphism $\sigma$ to the relation $E Y = X + q^{-1} Y E$ gives: $\sigma(E Y) = \delta K^{2i} E \cdot \mu K^{-i} Y = \delta \mu q^{2i} K^i E Y = \delta \mu q^{2i} K^i (X + q^{-1} Y E)$ and $\sigma(X + q^{-1} Y E) = \lambda K^i X + q^{-1} \mu K^{-i} Y \cdot \delta K^{2i} E = K^i (\lambda X + \delta \mu q^{2i} q^{-1} Y E)$. Therefore, $\delta \mu q^{2i} = \lambda$, and the statement (viii) follows. The proof of the theorem is complete. □

Corollary 3.2 1. The prime ideals $\mathcal{I} := \{0, (X), (\varphi), (Y), (E), (Y, E)\}$ are the only prime ideals of $\mathcal{A}$ that are invariant under action of the group $G$ of automorphisms of $\mathcal{A}$ (i.e., $G p = \{p\}$ for all $p \in \mathcal{I}$).

2. If, in addition, $\mathbb{K}$ is an algebraically closed field, then each of the three series of prime ideals in $\text{Spec}(\mathcal{A})$ is a single $G$-orbit. In particular, there are 9 $G$-orbits in $\text{Spec}(\mathcal{A})$.

Proof We keep the notation of Theorem 2.9. By Theorem 3.1, $G p = \{p\}$ for all $p \in \mathcal{I}$. Let $\sigma = \sigma_{\lambda, \mu, \gamma, i}$, then $\sigma(Z) = \lambda \mu \gamma^{-1} q^i Z$, $\sigma(C) = \lambda \mu \gamma q^i C$ and $\sigma(K) = \gamma K$. Now the corollary is obvious since $p = (K - \alpha)$, $q = (Z - \beta)$ and $r = (C - \gamma)$ for some $\alpha, \beta, \gamma \in \mathbb{K}^*$ where the ideals $p, q$ and $r$ are as in Theorem 2.9. □

4 Classification of Simple Unfaithful $\mathcal{A}$-Modules

The aim of this section is to classify all simple $\mathcal{A}$-modules with non-zero annihilators. The set of simple $\mathcal{A}$-modules are partitioned according to their annihilators which were described in Proposition 2.12. For each primitive ideal $p$ of $\mathcal{A}$, the factor algebra $\mathcal{A}/p$ is described by Theorem 2.9. They are of the type $R = D[t, t^{-1}; \sigma]$ where $D$ is a commutative Dedekind domain and the automorphism $\sigma$ of $D$ are of two types (I) or (F), see below. For our purposes we need only (I) $D = \mathbb{K}[H, H^{-1}]$, (F) $D = \mathbb{K}[H]$ and in both cases $\sigma(H) = q H$ where $q \in \mathbb{K}^*$ is not a root of 1.

Classification of Simple $R$-modules Let us recall the classification of simple $R$-modules where $R = D[t, t^{-1}; \sigma]$, $D$ is a commutative Dedekind domain and $\sigma$ satisfies one of the two conditions (I) or (F), see below). These results are very particular cases of classification of simple modules over a GWA $D(\sigma, a)$ obtained in [4, 6–11].

Let $\mathcal{S} = D \setminus \{0\}$ and $k = \mathcal{S}^{-1} D$ be the field of fractions of the ring $D$. The ring $R$ is a subring of $B := k[t, t^{-1}; \sigma]$. The ring $B = \mathcal{S}^{-1} R$ is a (left and right) localization of $R$ at $\mathcal{S}$. The ring $B$ is a Euclidean ring and so is a principle left and right ideal domain. Every simple
A **B-module** is isomorphic to $B/Bb$ for some **irreducible** element $b \in B$ (i.e., $b = ac$ implies either $a$ or $c$ is a unit in $B$). Two simple $B$-modules $B/Ba$ and $B/Bb$ are **isomorphic** if and only if the irreducible elements $a$ and $b$ are **similar**, i.e., there exists an element $c \in B$ such that $1$ is the greatest common right divisor of $b$ and $c$, and $ac$ is the least common left multiple of $b$ and $c$.

Let $G := \langle \sigma \rangle$ be the subgroup of $\text{Aut}(D)$ generated by $\sigma$. The group $G$ acts on the set $\text{Max}(D)$ of maximal ideals of $D$. For each $p \in \text{Max}(D)$, $\mathcal{O}(p) := \{ \sigma^i(p) | i \in \mathbb{Z} \}$ is the orbit of $p$. The set of all $G$-orbits in $\text{Max}(D)$ is denoted by $\text{Max}(D)/G$. The orbit $\mathcal{O}(p)$ is called an infinite or linear orbit if $|\mathcal{O}(p)| = \infty$; otherwise the orbit $\mathcal{O}(p)$ is called a finite or cyclic orbit. If $\mathcal{O}(p)$ is an infinite orbit then the map $\mathbb{Z} \to \mathcal{O}(p)$, $i \mapsto \sigma^i(p)$, is a bijection, and we write $\sigma^i(p) \leq \sigma^j(p)$ if $i \leq j$. So, the total ordering of $\mathbb{Z}$ is passed to $\mathcal{O}(p)$. This ordering does not depend on the choice of the ideal $p$ in the orbit $\mathcal{O}(p)$.

Given elements $\alpha, \beta \in D \setminus \{0\}$, we write $\alpha < \beta$ if there are no maximal ideals $p$ and $q$ that belong to the same infinite orbit and such that $\alpha \in p$, $\beta \in q$ and $p \supset q$. In particular, if $\alpha \in D^*$ is a unit of $D$ then $\alpha < \beta$ for all $\beta \in D \setminus \{0\}$. The relation $<$ is not a partial order on $D \setminus \{0\}$ as $1 < 1$. Clearly, $\alpha < \beta$ iff $\sigma^j(\alpha) < \sigma^j(\beta)$ for some/all $j \in \mathbb{Z}$.

**Definition** An element $b = t^m \beta_m + t^{m+1} \beta_{m+1} + \cdots + t^n \beta_n \in R$ where $\beta_i \in D$, $m < n$ and $\beta_m, \beta_n \neq 0$ is called an $l$-normal element if $\beta_n \leq \beta_m$.

**Definition** We say that the automorphism $\sigma$ of $D$ is of $(I)$-type automorphism, if all $G$-orbits in $\text{Max}(D)$ are infinite. We say that the automorphism $\sigma$ of $D$ is of $(F)$-type if there is a maximal ideal $p \in \text{Max}(D)$ which is $\sigma$-invariant (i.e., $\sigma(p) = p$), $\{p\}$ is the only finite orbit and the automorphism $\tilde{\sigma} : D/p \to D/p$, $d + p \mapsto \sigma(d) + p$, is the identity automorphism (or equivalently, the factor ring $R/p = D/p[t, t^{-1}; \tilde{\sigma}]$ is a commutative ring $D/p[t, t^{-1}]$). The ideal $p$ is called the exceptional ideal of $D$.

**Examples** 1. Let $D = \mathbb{K}[H, H^{-1}]$ and $\sigma(H) = qH$ where $q \in \mathbb{K}^*$ is not a root of one. The automorphism $\sigma$ is of $(I)$-type.

2. Let $D = \mathbb{K}[H]$ and $\sigma(H) = qH$ where $q \in \mathbb{K}^*$ is not a root of one. The automorphism $\sigma$ is of $(F)$-type.

Let $\hat{R}$ be the set of isomorphism classes $[M]$ of simple $R$-modules $M$. Then

$$
\hat{R} = \hat{R}(D\text{-torsion}) \sqcup \hat{R}(D\text{-torsionfree})
$$

is a disjoint union where $\hat{R}(D\text{-torsion}) := \{[M] \in \hat{R} | S^{-1}M = \{0\}\}$ and $\hat{R}(D\text{-torsionfree}) := \{[M] \in \hat{R} | S^{-1}M \neq \{0\}\}$. An $R$-module $M$ is called a weight $R$-module if $M$ is a semisimple $D$-module, i.e.,

$$
M = \bigoplus_{p \in \text{Max}(D)} M_p
$$

where $M_p = \{v \in M | pv = 0\}$ is called the component of $M$ of weight $p$. The set $\text{Supp}(M) = \{p \in \text{Max}(D) | M_p \neq 0\}$ is called the support of the weight $A$-module $M$. It is also denoted $\text{Supp}_D(M)$ and is called $D$-support if we want to stress over which ring $D$ we consider weight modules. Every weight $R$-module is $D$-torsion, but not vice versa. We denote by $\hat{R}(D\text{-torsion, infinite})$ and $\hat{R}(D\text{-torsion, finite})$ the sets of isomorphism classes of simple, weight $R$-modules with infinite and finite support, respectively.

The next theorem classifies the simple, $D$-torsion $R$-modules.
Theorem 4.1 1. [4, Theorem 1.7] Suppose that $\sigma$ is of (I)-type. Then the map \[ \text{Max}(D)/G \rightarrow \hat{R}(D\text{-torsion}), \quad \mathcal{O}(p) \mapsto R/Rp, \] is a bijection with the inverse $M \mapsto \text{Supp}(M)$.

2. [4, Theorem 1.7] Suppose that $\sigma$ is of (F)-type. Then $\hat{R}(D\text{-torsion}) = \hat{R}(D\text{-torsion, infinite}) \sqcup \hat{R}(D\text{-torsion, finite})$ is a disjoint union where

(a) the map \[ \left(\text{Max}(D) \setminus \{p\}\right)/G \rightarrow \hat{R}(D\text{-torsion, infinite}), \quad \mathcal{O}(p) \mapsto R/Rp, \] is a bijection with the inverse $M \mapsto \text{Supp}(M)$, and

(b) $\hat{R}(D\text{-torsion, finite}) = \hat{R}/(p) = \hat{D}/p[t, t^{-1}]$.

The next theorem is about classification of simple, $D$-torsionfree $R$-modules.

Theorem 4.2 1. [4, Theorem 5] Suppose that $\sigma$ is of (I)-type. Then $\hat{R}(D\text{-torsionfree}) = \{[R/R \cap Bb] | b \in R \text{ is an l-normal, irreducible element of } B\}$.

The simple $R$-modules $R/R \cap Bb$ and $R/R \cap Bb'$ are isomorphic iff the $B$-modules $B/Bb$ and $B/Bb'$ are isomorphic.

2. [9, Theorem A] Suppose that $\sigma$ is of (F)-type. Then $\hat{R}(D\text{-torsionfree}) = \{[R/R \cap Bb] | b \in R \text{ is an l-normal, irreducible element of } B \text{ such that } R = Rp + R \cap Bb\}$.

The simple $R$-modules $R/R \cap Bb$ and $R/R \cap Bb'$ are isomorphic iff the $B$-modules $B/Bb$ and $B/Bb'$ are isomorphic.

Classification of Simple $\mathcal{A}$-modules with Non-zero Annihilators The set $\hat{\mathcal{A}}$ is a disjoint union
\[ \hat{\mathcal{A}} = \bigsqcup_{p \in \text{Prim}(\mathcal{A})} \hat{\mathcal{A}}(p) \quad (30) \]
where $\hat{\mathcal{A}}(p) := \{[M] \in \hat{\mathcal{A}} | \text{ann}_{\mathcal{A}}(M) = p\}$. Below, a description of the set $\hat{\mathcal{A}}(p)$ is given for each nonzero primitive ideal $p \in \text{Prim}(\mathcal{A})$. We use the description of $\text{Prim}(\mathcal{A})$ (Proposition 2.12), and so we have to consider case (a)–(e), see below.

(a) Let $p \in \text{Spec}(\mathbb{K}[K^{\pm 1}]) \setminus \{0\}$ and $P = (Y, E, p) \in \mathcal{P}$. Then
\[ \hat{\mathcal{A}}(Y, E, p) = \{\mathcal{A}/(Y, E, p) \simeq \mathbb{K}[K^{\pm 1}]/p\}. \quad (31) \]

(b) Let $p = (Y)$. Then $\mathcal{A}/(Y) \simeq U = \mathbb{K}[E][K^{\pm 1}, \sigma]$ where $\sigma(E) = q^2E$ (Theorem 2.9.(2)) and the ideal $(E)$ is the only height 1 prime ideal of the algebra $U$ (see Eq. 20). The element $E$ is a normal element of the algebra $U$. The algebra $U$ is the ring of (F)-type, where $(E)$ is the exceptional ideal of $\mathbb{K}[E]$.

Lemma 4.3 $\hat{\mathcal{A}}(Y) = \hat{U}(\mathbb{K}[E]\text{-torsion, infinite}) \sqcup \hat{U}(\mathbb{K}[E]\text{-torsionfree})$ (see Theorem 4.1.(2) and Theorem 4.2.(2)).
Proof The result follows from Theorem 4.1.(2), Theorem 4.2.(2) and the fact that each simple module of the set $\hat{U}$ ($\mathbb{K}[E]$-torsion, finite) has annihilator strictly larger than $(Y)$.

(c) Let $p = (E)$. Then $A/(E) \simeq \mathbb{K}[Y][K^{\pm 1}; \tau]$ where $\tau(Y) = q^{-1}Y$ (Theorem 2.9.(3)). The automorphism $\tau$ of $\mathbb{K}[Y]$ is of (F)-type where $(Y)$ is the exceptional ideal of $\mathbb{K}[Y]$.

Lemma 4.4 Let $R = \mathbb{K}[Y][K^{\pm 1}; \tau]$ where $\tau(Y) = q^{-1}Y$. Then $\hat{A}((E)) = \hat{R}$ ($\mathbb{K}[Y]$-torsion, infinite) $\sqcup \hat{R}$ ($\mathbb{K}[Y]$-torsionfree) (see Theorem 4.1.(2) and Theorem 4.2.(2)).

Proof The result follows from Theorem 4.1.(2), Theorem 4.2.(2) and the fact that each simple module of the set $\hat{R}$ ($\mathbb{K}[Y]$-torsion, finite) has annihilator strictly larger than $(E)$.

(d) Let $p = (X, q)$ where $q \in \text{Max} (\mathbb{K}[Z]) \setminus \{(Z)\}$. By Theorem 2.9.(4), $A/(X, q) \simeq L[q][Y^{\pm 1}][K^{\pm 1}; \tau]$ where $\tau(Y) = q^{-1}Y$ and so the automorphism $\tau$ is of (I)-type.

Lemma 4.5 Let $R = L[q][Y^{\pm 1}][K^{\pm 1}; \tau]$ where $\tau(Y) = q^{-1}Y$. Then $\hat{A}((X, q)) = \hat{R}$.

(e) Let $p = (\phi, r)$ where $r \in \text{Max} (\mathbb{K}[C]) \setminus \{(C)\}$. By Theorem 2.9.(5), $A/(\phi, r) \simeq L[r][Y^{\pm 1}][K^{\pm 1}; \tau]$ where $\tau(Y) = q^{-1}Y$ and so the automorphism $\tau$ is of (I)-type.

Lemma 4.6 Let $R = L[r][Y^{\pm 1}][K^{\pm 1}; \tau]$ where $\tau(Y) = q^{-1}Y$. Then $\hat{A}((\phi, r)) = \hat{R}$.

Let $\hat{A}$(fin. dim.) be the set of isomorphism classes of simple finite dimensional $\mathcal{A}$-modules.

Theorem 4.7

\[ \hat{A} \text{(fin. dim.)} = \left\{ A/(Y, E, p) \simeq \mathbb{K}[K^{\pm 1}]/p \mid p \in \text{Max} (\mathbb{K}[K^{\pm 1}]) \right\} = \bigsqcup_{P \in P} \hat{A}(P). \]

Proof A finite dimensional module over an infinite dimensional algebra has necessarily nonzero annihilator. Among the simple modules with nonzero annihilators, the modules described in Eq. 31 are the only finite dimensional ones.

For a module $M$, $\text{GK}(M)$ is its Gelfand-Kirillov dimension.

Corollary 4.8 The Gelfand-Kirillov dimension of all simple, unfaithful, infinite dimensional $\mathcal{A}$-modules is 1.

Proof The statement follows from the above classification of simple, unfaithful, infinite dimensional $\mathcal{A}$-modules.

5 Classification of Simple Weight/$\mathbb{K}[K^{\pm 1}]$-Torsion $\mathcal{A}$-Modules

Let $D = \mathbb{K}[K, K^{-1}]$. The aim of this section is to give a classification of the set $\hat{A}(D$-torsion) of isomorphism classes of simple $D$-torsion $\mathcal{A}$-modules (Theorem 5.2 and Theorem
5.5. As a result, a classification of the set $\hat{A}$, the orbit (Corollary 5.6). For each generator $K$, and let $A$ be a weight $\mathcal{A}$-module. Then $\mathcal{A}$ is a simple weight $\mathcal{A}$-module if $(D^o)^{-1} M = 0$. An important case of $D$-torsion $\mathcal{A}$-modules are the weight $\mathcal{A}$-modules.

Let $M$ be a weight $\mathcal{A}$-module. For each $p \in \text{Supp}(M)$, $M_p$ is the sum of all the $D$-submodules of $M$ that are isomorphic to the $D$-module $D/p$. If $\mathcal{A}$ is a left and right Ore set of the domain $\mathcal{A}$. An $\mathcal{A}$-module $M$ is called a $D$-torsion $\mathcal{A}$-module if $(D^o)^{-1} M = 0$. An important case of $D$-torsion $\mathcal{A}$-modules are the weight $\mathcal{A}$-modules.

The set $\hat{A}$, the orbit (Corollary 5.6). For each simple module $\hat{A}$, and let $A$ be a weight $\mathcal{A}$-module. Then $\mathcal{A}$ is a simple weight $\mathcal{A}$-module if $(D^o)^{-1} M = 0$. An important case of $D$-torsion $\mathcal{A}$-modules are the weight $\mathcal{A}$-modules.

Let $M$ be a weight $\mathcal{A}$-module. For each $p \in \text{Supp}(M)$, $M_p$ is the sum of all the $D$-submodules of $M$ that are isomorphic to the $D$-module $D/p$. If $\mathcal{A}$ is an algebraically closed field then Max$(D) = \{ (K - \mu) | \mu \in \mathbb{K}^* \}$ and $\text{Max}(K - \mu) = \{ v \in M | Kv = \mu v \}$. The algebra $\mathcal{A}$ admits the inner automorphism $\omega_K : a \mapsto KaK^{-1}$. Each of the canonical generators $K_{\pm 1}$, $E$, $X$ and $Y$ of the algebra $\mathcal{A}$ are eigenvectors of the automorphism $\omega_K$ with eigenvalues, $1$, $q^2$, $q$ and $q^{-1}$, respectively. So, the algebra $\mathcal{A} = \bigoplus_{i \in \mathbb{Z}} \mathcal{A}_i$ is a $\mathbb{Z}$-graded algebra where $\mathcal{A}_i := \{ a \in \mathcal{A} | \omega_K(a) = q^i a \} \neq 0$ and $\mathcal{A}_0$ is the centralizer $C_{\mathcal{A}}(K) = \{ a \in \mathcal{A} | Ka = aK \}$ of the element $K$ in $\mathcal{A}$.

Let $\sigma \in \text{Aut}_\mathbb{K}(D)$ where $\sigma(K) = q K$. For all $a_i \in \mathcal{A}_i$, $K a_i = \omega_K(a_i) K = a_i q^i K = a_i \sigma^i(K)$. Therefore, for all $d \in D$, $d a_i = a_i \sigma^i(d)$. If $M = \bigoplus M_p$ is a weight $\mathcal{A}$-module then

$$A_i M_p \subseteq M_{\sigma^{-1}(p)}. \quad (32)$$

So, each weight $\mathcal{A}$-module $M$ is a direct sum of $\mathcal{A}$-submodules $M = \bigoplus_{\sigma \in \text{Max}(D)/(\sigma)} M(\sigma)$, $M(\sigma) := \bigoplus_{p \in \sigma} M_p$, \quad (33)

where $\text{Max}(D)/(\sigma)$ is the set of $\langle \sigma \rangle$-orbits $\sigma \in \text{Max}(D)$ (where $\sigma = \{ \sigma^i(p) | i \in \mathbb{Z} \}$).

By Eq. 33, if $M$ is a simple weight $\mathcal{A}$-module then necessarily $\text{Supp}(M) \subseteq \sigma$ for some orbit $\sigma$. In fact, for each simple infinite dimensional weight $\mathcal{A}$-module $M$, $\text{Supp}(M)$ is an orbit (Corollary 5.6). For each $p \in \text{Max}(D)$, the $\mathcal{A}$-module

$$\mathcal{A}(p) := A \otimes_D D/p = \bigoplus_{i \in \mathbb{Z}} A_i \otimes_D D/p$$

is a weight $\mathcal{A}$-module with $\text{Supp}(\mathcal{A}(p)) = \sigma(p) = \{ \sigma^i(p) | i \in \mathbb{Z} \}$ and $\mathcal{A}(p)_{\sigma^{-1}(p)} = A_i \otimes_D D/p$. Since $\mathcal{A}_D$ is a free right $D$-module, $\mathcal{A}(p) \simeq \mathcal{A}/\mathcal{A}p$.

Lemma 5.1 $\hat{A}$, the orbit (Corollary 5.6). The opposite inclusion follows from the fact that every simple $D$-torsion $\mathcal{A}$-module $M$ is an epimorphic image of the weight $\mathcal{A}$-module $\mathcal{A}(p)$ for some $p \in \text{Max}(D)$. Hence, $M$ is weight.

Let

$$\text{Prim}(\mathcal{A}, D\text{-torsion}) := \{ \text{ann}_{\mathcal{A}}(M) | M \in \hat{A} (D\text{-torsion}) \}.$$ 

For each primitive ideal $p \in \text{Prim}(\mathcal{A})$, let $\hat{A}(D\text{-torsion}, p) := \{ M \in \hat{A} (D\text{-torsion}) | \text{ann}_{\mathcal{A}}(M) = p \}$. For each non-empty subset $S \subseteq \text{Prim}(\mathcal{A})$, let

$$\hat{A}(D\text{-torsion}, S) := \bigcup_{p \in S} \hat{A}(D\text{-torsion}, p).$$

The set $\hat{A}(D\text{-torsion}, p)$ where $p \in \text{Max}(\mathcal{A})$ The next theorem shows that $\text{Prim}(\mathcal{A}, D\text{-torsion}) = \text{Max}(\mathcal{A}) \sqcup \{ 0 \}$ and gives an explicit description of the sets $\hat{A}(D\text{-torsion}, p)$ for all $p \in \text{Max}(\mathcal{A})$. 

\[ \hat{A}(D\text{-torsion}, p) \]
Theorem 5.2 Let $D = \mathbb{K}[K, K^{-1}]$.

1. $\text{Prim}(\mathcal{A}, \text{D-torsion}) = \text{Max}(\mathcal{A}) \sqcup \{0\}$. In particular, we have $\hat{\mathcal{A}}(\text{D-torsion}, (Y)) = \emptyset$ and $\hat{\mathcal{A}}(\text{D-torsion}, (E)) = \emptyset$.

2. Recall that $\text{Max}(\mathcal{A}) = \mathcal{P} \sqcup \mathcal{Q} \sqcup \mathcal{R}$. Then
   
   (a) $\hat{\mathcal{A}}(\text{D-torsion}, \mathcal{P}) = \hat{\mathcal{A}}(\text{fin. dim.})$. (See Theorem 4.7 for a classification.)

   (b) $\hat{\mathcal{A}}(\text{D-torsion}, \mathcal{Q}) = \bigcup_{p \in \mathcal{Q}} \hat{\mathcal{A}}(\text{D-torsion}, p)$. For each $p = (x, q) \in \mathcal{Q}$ where $q \in \text{Max}(\mathbb{K}[Z]) \setminus \{(z)\}$, $\hat{\mathcal{A}}/p \cong \varphi(L_q[\mathbb{K}^{\pm 1}]_{\rho}; \rho)$ where $\rho$ is an $L_q$-automorphism of the polynomial algebra $D_q := L_q[\mathbb{K}^{\pm 1}]$ given by the rule $\rho(K) = qK$ and $\hat{\mathcal{A}}(\text{D-torsion}, p) = \hat{\mathcal{A}}/p (D_q\text{-torsion})$. The map
   
   $$\text{Max}(D_q)/\langle \rho \rangle \rightarrow \hat{\mathcal{A}}/p (D_q\text{-torsion}), \quad \mathcal{O}(m) \mapsto (\mathcal{A}/p)/(\mathcal{A}/p)m,$$
   
   is a bijection with the inverse $M \mapsto \text{Supp}_{D_q}(M)$.

   (c) $\hat{\mathcal{A}}(\text{D-torsion}, \mathcal{R}) = \bigcup_{p \in \mathcal{R}} \hat{\mathcal{A}}(\text{D-torsion}, p)$. For each $p = (\varphi, \tau) \in \mathcal{R}$ where $\tau \in \text{Max}(\mathbb{K}[C]) \setminus \{(C)\}$, $\hat{\mathcal{A}}/p \cong \varphi(L_q[\mathbb{K}^{\pm 1}]_{\rho}; \rho)$ where $\rho$ is an $L_q$-automorphism of the polynomial algebra $D_q := L_q[\mathbb{K}^{\pm 1}]$ given by the rule $\rho(K) = qK$ and $\hat{\mathcal{A}}(\text{D-torsion}, p) = \hat{\mathcal{A}}/p (D_q\text{-torsion})$. The map
   
   $$\text{Max}(D_q)/\langle \rho \rangle \rightarrow \hat{\mathcal{A}}/p (D_q\text{-torsion}), \quad \mathcal{O}(m) \mapsto (\mathcal{A}/p)/(\mathcal{A}/p)m,$$
   
   is a bijection with the inverse $M \mapsto \text{Supp}_{D_q}(M)$.

   (d) The set $\hat{\mathcal{A}}(\text{D-torsion}, 0) \neq \emptyset$ is described in Theorem 5.5.

Proof By Proposition 2.12, $\text{Prim}(\mathcal{A}) = \text{Max}(\mathcal{A}) \sqcup \{(Y), (E), 0\}$ and $\text{Max}(\mathcal{A}) = \mathcal{P} \sqcup \mathcal{Q} \sqcup \mathcal{R}$, by Corollary 2.10.

(a) The statement (a) is obvious.

(b) Let $p = (x, q) \in \mathcal{Q}$ where $q \in \text{Max}(\mathbb{K}[Z]) \setminus \{(z)\}$. Since $L_q$ is a finite field extension of $\mathbb{K}$, i.e., $\dim_{\mathbb{K}}(L_q) < \infty$, we have the equality $\hat{\mathcal{A}}/p (D_q\text{-torsion}) = \hat{\mathcal{A}}(\text{D-torsion}, (X, q))$ and the statement (b) follows from Theorem 4.1.(1).

(c) The statement (c) is treated almost identically to the statement (b) (with obvious modifications).

(i) $\hat{\mathcal{A}}(\text{D-torsion}, (Y)) = \emptyset$ : The algebra $\mathcal{A}/(Y)$ is isomorphic to the algebra $U = D[E; \tau]$ where $\tau(K) = q^{-2}K$. So, $\hat{\mathcal{A}}(\text{D-torsion}, (Y)) = \hat{U}(\text{D-torsion}, 0)$. For each $p \in \text{Max}(D)$, the $U$-module $U(p) := U/(p) \cong \bigoplus_{i \geq 0} E^i \otimes D/p$ contains the largest submodule $U(p)_+ := \bigoplus_{i \geq 1} E^i \otimes D/p$ and the factor module $U(p)/U(p)_+ \cong D/p$ is simple with non-zero annihilator generated by the normal element $E$ of $U$, and the statement (i) follows.

(ii) $\hat{\mathcal{A}}(\text{D-torsion}, (E)) = \emptyset$ : By Theorem 2.9.(3), $\mathcal{A}/(E) \cong D[Y; \tau]$ where $\tau(K) = qK$. The statement (ii) follows from the statement (i) by replacing $q^{-2}$ by $q$.

Now, statement 1 follows from the statements (i) and (ii). 

The Centralizer of $K$ in $\mathcal{A}$ Now, we describe the centralizer $C_{\mathcal{A}}(K)$ of the element $K$ in the algebra $\mathcal{A}$. Recall that $C_{\mathcal{A}}(K) = \{a \in \mathcal{A} \mid Ka = aK\}$. Note that $\mathcal{A}$ is a $\mathbb{Z}$-graded algebra $\mathcal{A} = \bigoplus_{i \in \mathbb{Z}} \mathcal{A}_i$, where $\mathcal{A}_i = \{a \in \mathcal{A} \mid KaK^{-1} = q^i a\}$. We see that $C_{\mathcal{A}}(K) = \mathcal{A}_0$. 

\(\square\)
Proposition 5.3 Let \( t := YX \) and \( u := Y\varphi \), then \( \mathcal{A}_0 = \mathbb{K}[K^{\pm 1}] \otimes \Lambda \) is the tensor product of two algebras where \( \Lambda := \mathbb{K}(t, u \mid tu = q^2ut) \) is a quantum plane, and \( Z(\mathcal{A}_0) = \mathbb{K}[K^{\pm 1}] \).

Proof Notice that the quantum plane \( \mathbb{K}_q[X, Y] \) is a \( \mathbb{Z} \)-graded algebra \( \mathbb{K}_q[X, Y] = \bigoplus_{j \in \mathbb{Z}} \mathbb{K}[t]w_j \), where \( w_0 := 1, \) for \( j \geq 1, \) \( w_j = X^j \) and \( w_{-j} = Y^j \). Notice further that \( U = \bigoplus_{i \in \mathbb{N}} \mathbb{K}[K^{\pm 1}] E^i \). Since \( \mathcal{A} = U \otimes \mathbb{K}_q[X, Y] \) (a tensor product of vector spaces),

\[
\mathcal{A} = \bigoplus_{i \in \mathbb{N}} \mathbb{K}[K^{\pm 1}] E^i \otimes \mathbb{K}[t]w_j = \bigoplus_{i \in \mathbb{N}, j \in \mathbb{Z}} \mathbb{K}[K^{\pm 1}, t] E^i w_j
\]

Therefore, \( \mathcal{A}_0 = \bigoplus_{i \geq 0} \mathbb{K}[K^{\pm 1}, t] E^i Y^{2i} = \bigoplus_{i \geq 0} \mathbb{K}[K^{\pm 1}, t](EY^2)^i \). Then \( \mathcal{A}_0 = \mathbb{K}(K^{\pm 1}, t, EY^2) \). Since \( EY^2 = \frac{1}{q(1-q^2)} Y\varphi + \frac{q^3}{q-1} YX \), we see that \( \mathcal{A}_0 = \mathbb{K}(K^{\pm 1}, t, Y\varphi) = \mathbb{K}[K^{\pm 1}] \otimes \Lambda \) as required. Now, \( Z(\mathcal{A}_0) = \mathbb{K}[K^{\pm 1}] \otimes Z(\Lambda) = \mathbb{K}[K^{\pm 1}] \otimes \mathbb{K} = \mathbb{K}[K^{\pm 1}] \).

The set \( \hat{\mathcal{A}}(D\text{-torsion}, 0) \) Recall that \( D = \mathbb{K}[K^{\pm 1}] \), \( \sigma \in \text{Aut}_{\mathbb{K}}(D) \) where \( \sigma(K) = qK \) and \( \mathcal{A}_0 = D \otimes \Lambda \) is a tensor product of algebras. Then

\[
\mathcal{A}_Y = \mathcal{A}_0[Y^{\pm 1}; \sigma]
\]

where \( \sigma(K) = qK \), \( \sigma(t) = q^{-1}t \) and \( \sigma(u) = qu \). Clearly,

\[
\mathcal{A}_{Y, X, \varphi} = \mathcal{A}_{Y, t, u} = (D \otimes \Lambda_{t, u})[Y^{\pm 1}; \sigma] = \mathcal{A}_{0, t, u}[Y^{\pm 1}; \sigma]
\]

where \( \mathcal{A}_{0, t, u} = (\mathcal{A}_0)_{t, u} \) is the localization of \( \mathcal{A}_0 \) at the powers of the elements \( t \) and \( u \). The inner automorphism \( \omega_Y : a \mapsto YaY^{-1} \) of the algebra \( \mathcal{A}_{Y, X, \varphi} \) preserves the subalgebras \( \mathcal{A}_0 \) and \( \mathcal{A}_{0, t, u} \) since

\[
\omega_Y(K) = qK, \quad \omega_Y(t) = q^{-1}t \quad \text{and} \quad \omega_Y(u) = qu.
\]

So, \( \omega_Y \in \text{Aut}_{\mathbb{K}}(\mathcal{A}_0) \) and \( \omega_Y \in \text{Aut}_{\mathbb{K}}(\mathcal{A}_{0, t, u}) \). Clearly, \( (\omega_Y)^i = \omega_{Y^i} \) for all \( i \in \mathbb{Z} \).

The group \( \langle \sigma \rangle \) acts on the maximal spectrum \( \text{Max}(D) \) of the algebra \( D \). For each \( p \in \text{Max}(D) \), the orbit \( \mathcal{O}(p) := \{ \sigma^i(p) \mid i \in \mathbb{Z} \} \) is infinite. The set of all \( \langle \sigma \rangle \)-orbits in \( \text{Max}(D) \) is denoted by \( \text{Max}(D) / \langle \sigma \rangle \). For each orbit \( \mathcal{O} \), we fix a representative \( p \in \mathcal{O} \). Then the factor algebra \( \mathcal{A}_0 / (\mathcal{O}) \simeq D/p \otimes \Lambda = D/p(t, u \mid tu = q^2ut) \) is the quantum plane over the field \( D/p \). Let \( D/p \otimes \Lambda(\infty\text{-dim.}) \) be the set of isomorphism classes of simple infinite dimensional \( D/p \otimes \Lambda \)-modules. A classification of all simple \( \Lambda \)-modules is given in [8], [9] and [10]. In particular, the map

\[
D/p \otimes \Lambda(\infty\text{-dim.}) \longrightarrow D/p \otimes \Lambda_{t, u} (\text{soc}_{D/p \otimes \Lambda} \neq 0), \quad [N] \mapsto [N_{t, u}].
\]

is a bijection with the inverse \( M \mapsto \text{soc}_{D/p \otimes \Lambda}(M) \).

For each \( [N] \in D/p \otimes \Lambda(\infty\text{-dim.}) \), the vector space \( \mathcal{N}(N) := \mathbb{K}[Y, Y^{-1}] \otimes N = \bigoplus_{i \in \mathbb{Z}} Y^i \otimes N \) admits a structure of \( \mathcal{A} \)-module given by the rule (where \( v \in N \)):

\[
K(Y^i \otimes v) = Y^{-i} Y^i \otimes K v, \quad Y(Y^i \otimes v) = Y^{i+1} \otimes v, \quad X(Y^i \otimes v) = q^{-i} Y^i \otimes tv, \quad E(Y^i \otimes v) = Y^{-2} \otimes \frac{q^{-i} u - q^i t}{q - 1} v.
\]
One can verify this directly using the defining relations of the algebra $\mathbb{A}$ or, alternatively, this will be proved in the proof of Theorem 5.5. This construction gives all the elements of the set $\hat{A}(D$-torsion, 0) (Theorem 5.5).

Lemma 5.4 Let $M$ be a simple weight $\mathbb{A}$-module. If $M_Y = 0$ then $XM = 0$, and so $\text{ann}_\mathbb{A}(M) \neq 0$.

Proof Suppose that $M_Y = 0$. Then $N := \{m \in M \mid Ym = 0\}$ is a nonzero $\mathbb{K}[K^{\pm 1}]$-submodule of $M$. Hence, there exists a nonzero weight vector, say $v$, such that $Yv = 0$. Then $\mathbb{A}v = M$, by the simplicity of the $\mathbb{A}$-module $M$. Then $N := \mathbb{A}Xv$ is a submodule of $M$ such that $N \neq M$. Therefore, $N = 0$ (since $M$ is a simple $\mathbb{A}$-module), and the lemma follows. □

Let $R$ be a ring and $M$ be a left $R$-module. Let $\sigma$ be an automorphism of $R$. The twisted module $M^\sigma$ is a module obtained from $M$ by twisting the action of $R$ on $M$ by $\sigma$, i.e., $r \cdot m = \sigma(r)m$ for $r \in R$ and $m \in M$. The next theorem describes the set $\hat{A}(D$-torsion, 0).

Theorem 5.5 Let $D = \mathbb{K}[K, K^{-1}]$ and $\sigma \in \text{Aut}_\mathbb{K}(D)$ where $\sigma(K) = q K$. Then

1. $\hat{A}(D$-torsion, 0) $= \bigcup_{\mathcal{O} \in \text{Max}(D)/(\sigma)} \hat{A}(D$-torsion, 0, $\mathcal{O}$) where $\hat{A}(D$-torsion, 0, $\mathcal{O}$) $:= \{(M) \in \hat{A}(D$-torsion, 0) $\mid \text{Supp}(M) = \mathcal{O}\}.$

2. For each orbit $\mathcal{O} = \mathcal{O}(p) \in \text{Max}(D)/(\sigma)$ where $p = p_{\mathcal{O}}$ is a fixed element of $\mathcal{O}$, the map $D/p \otimes \Lambda(\infty$-dim.) $\rightarrow \hat{A}(D$-torsion, 0, $\mathcal{O}$), $[N] \mapsto [N(N)]$ is a bijection with the inverse $N \mapsto N_{\mathcal{O}}$.

3. For all $[M] \in \hat{A}(D$-torsion, 0), $GK(M) = 2$.

Proof 1 and 2. The algebra $\mathbb{A}$ is a subalgebra of the simple algebra $A_{Y_X,\varphi} = A_{Y_{t,u}} = (D \otimes \Lambda_{t,u})[Y^{\pm 1}; \sigma]$ (Lemma 2.3.(2)). Let $[M] \in \hat{A}(D$-torsion, 0). Since the elements $X$ and $\varphi$ are normal in $\mathbb{A}$, $\text{tor}_{X,\varphi}(M) = 0$ (otherwise, either $XM = 0$ or $\varphi M = 0$, a contradiction). Now, by Lemma 5.4, the $\mathbb{A}$-module $M$ is $(Y, t, u)$-torsionfree. So, the map

$$\hat{A}(D$-torsion, 0) $\rightarrow A_{Y_{t,u}} (D$-torsion, $\text{soc}_\mathbb{A} \neq 0$), $[M] \mapsto [M_{Y_{t,u}}]$, (39)$$

is a bijection with the inverse $[N] \mapsto [\text{soc}_\mathbb{A}(N)]$ where the condition $\text{soc}_\mathbb{A} \neq 0$ means that an $A_{Y_{t,u}}$-module has non-zero socle as an $\mathbb{A}$-module. Since $q$ is not a root of 1, the centralizer of the element $K$ in $A_{Y_{t,u}} = (D \otimes \Lambda_{t,u})[Y^{\pm 1}; \sigma]$ is $D \otimes \Lambda_{t,u}$. Therefore, every module $V \in \overline{A_{Y_{t,u}}}$ (D-torsion, $\text{soc}_\mathbb{A} \neq 0$) is of the type

$$V = A_{Y_{t,u}} \otimes D \otimes \Lambda_{t,u} N' = \mathbb{K}[Y^{\pm 1}] \otimes N' = \bigoplus_{i \in \mathbb{Z}} Y^i \otimes N'$$

for some $N' \in D/p \otimes \Lambda_{t,u}$ where $p \in \text{Max}(D)$. In more detail, the $D$-module $N'$ is a direct sum of copies of $D/p$. For each $i \in \mathbb{Z}$, the left $D$-module $Y^i \otimes N'$ is a direct sum of copies $D/\sigma^i(p)$ (since $\sigma^i(p)(Y^i \otimes N') = Y^i p \otimes N' = Y^i \otimes pN' = 0$). The ideals $\{\sigma^i(p) \mid i \in \mathbb{Z}\}$ are distinct (as $q$ is not a root of 1). Therefore, the $D$-modules $Y^i \otimes N'$ and $Y^j \otimes N'$ are not isomorphic for all $i \neq j$. Any nonzero submodule $M'$ of the $\mathbb{A}$-module $A_{Y_{t,u}} \otimes D \otimes \Lambda_{t,u} N' = \bigoplus_{i \in \mathbb{Z}} Y^i \otimes N'$ is necessarily of the form $\bigoplus_{i \in \mathbb{Z}} L_i$ for some...
\(I \subseteq \mathbb{Z}\) where for each \(i \in I\), \(L_i\) is a nonzero \(A_{0,t,u}\)-submodule of the simple \(A_{0,t,u}\)-module \(Y_i \otimes N'\). Therefore, \(L_i = Y_i \otimes N'\) for all \(i \in I\). Then necessarily \(I = \mathbb{Z}\), i.e., \(M' = \hat{A}_{Y,t,u} \otimes D_{\otimes} A_{0,t,u} N'\).

The action of the elements \(K, E, X\) and \(Y\) are given by Eq. 38. In more detail, notice that \(EY = q^{-1} \varphi - qX\) since \(EY = \varphi + qYE = \varphi + q^2(EY - X)\) and the equality (40) follows. Then

\[
E(Y^i \otimes v) = EY \cdot Y^{i-1} \otimes v = \frac{q^{-1} \varphi - qX}{q^{-1} - q} Y^{i-1} \otimes v
\]

\[
= \frac{Y^{i-1} q^{-i} \varphi - q^i X}{q^{-1} - q} \otimes v = Y^{i-2} \otimes \frac{q^{-i} u - q^i t}{q^{-1} - q} v.
\]

Notice that \(\text{Supp}(V) = \hat{\mathcal{O}}(p)\) as \(V_{\sigma^i(p)} = Y_i \otimes N' \neq 0\) for all \(i \in \mathbb{Z}\). By Eq. 37, we may assume that \(N' = N_{t,u}\) where \(N \in D/\mathfrak{p} \otimes \Lambda(\infty\text{-dim})\). Then by Eq. 38, the direct sum \(\mathcal{N}(N) = \bigoplus_{i \in \mathbb{Z}} Y^i \otimes N\) is an \(A\)-submodule of \(V\). The \(A_0\)-module \(N\) is simple, hence so are the \(A_0\)-modules \(Y^i \otimes N \simeq N_{\sigma^i}^{o^i}\). Therefore, \(\text{soc}_A(V) = \mathcal{N}(N)\). Since \(\text{Supp}(\text{soc}_A(V)) = \hat{\mathcal{O}}(p)\) as \(\text{soc}_A(V)_{\sigma^i(p)} = Y^i \otimes N \neq 0\) for all \(i \in \mathbb{Z}\), statement 1 follows.

Clearly, \(V = A_{Y,t,u} \otimes A_{0,t,u} N' = L_{Y,t,u} \otimes A_{0,t,u} N_{t,u} = A_{Y,t,u} \otimes A_{0,t,u} A_{0,t,u} \otimes A_{0} N \simeq A_{Y,t,u} \otimes A_{0} N\). Two simple \(D\)-torsion modules \(V \simeq A_{Y,t,u} \otimes A_{0} N\) and \(U \simeq A_{Y,t,u} \otimes A_{0} L\) are isomorphic where [\(N\)] \(\in D/\mathfrak{p} \otimes \Lambda\) and [\(L\)] \(\in D/\mathfrak{q} \otimes \Lambda\) iff \(\mathcal{O} := \text{Supp}(V) = \text{Supp}(U)\) and \(A_{0,t,u} V_p \simeq A_{0,t,u} U_p\) where \(p = p_\sigma\) is a fixed element of the orbit \(\mathcal{O}\) and \(A_{0,t,u} = (A_0)_{t,u}\).

Since \(V_p = N_{t,u}\) and \(U_p = U_{\sigma^i(q)} = Y^i \otimes L_{t,u} \simeq L_{\sigma^i}^{o^i}\) where \(p = \sigma^i(q)\) for some \(i \in \mathbb{Z}\), the simple \(A_{0,t,u}\)-modules \(V_p\) and \(U_p\) are isomorphic iff the simple \(A_0\)-modules \(\text{soc}_{A_0}(V_p) = N\) and \(\text{soc}_{A_0}(U_p) = \text{soc}_A(L_{\sigma^i}^{o^i}) \simeq L_{\sigma^i}^{o^i}\) are isomorphic. Now, statement 2 follows.

3. Statement 3 follows from statement 2 and the fact that \(\text{GK}(N) = 1\) for all \([N] \in D/\mathfrak{p} \otimes \Lambda(\infty\text{-dim})\).

So, Theorem 5.2 and Theorem 5.5 give an explicit description of the set \(\hat{A}(\text{weight})\) = \(\hat{A}(D\text{-torsion})\) (see Lemma 5.1).

**Corollary 5.6** Let \([M] \in \hat{A}(\text{weight}, \infty\text{-dim})\).

1. \(\text{Supp}(M)\) is a single orbit in \(\text{Max}(D)/\langle \sigma \rangle\).
2. \(\text{ann}_A(M) \neq 0\) iff \(\dim_{K}(M_p) < \infty\) for all \(p \in \text{Supp}(M)\). In this case, the dimension \(\dim_K(M_p)\) is the same for all \(p \in \text{Supp}(M)\); and if, in additional, \(K\) is an algebraically closed field. Then \(\dim_{K}(M_p) = 1\) for all \(p \in \text{Supp}(M)\).

**Proof** The result follows at once from the classification of simple weight \(A\)-modules. \(\square\)
