Abstract

In this work, we apply the idea of composite matrices arising from group rings to derive a number of different techniques for constructing self-dual codes over finite commutative Frobenius rings. By applying these techniques over different alphabets, we construct best known singly-even binary self-dual codes of lengths 80, 84 and 96 as well as doubly-even binary self-dual codes of length 96 that were not known in the literature before.

1 Introduction

Self-dual codes form a family of widely studied linear codes which have many interesting properties and are intimately connected with many mathematical structures such as designs, lattices, modular forms and sphere packings. In recent history, much work has particularly been invested in developing techniques to construct extremal and optimal binary self-dual codes. The most famous of these techniques is quite possibly the pure double circulant construction, which utilises a generator matrix of the form $G = (I_n | A)$ where $I_n$ is the $n \times n$ identity matrix and $A$ is an $n \times n$ circulant matrix. It follows that $G$ is a generator matrix of a self-dual $[2n, n]$ code if and only if $AA^T = -I_n$. This technique has since been generalised by assuming a generator matrix of the form $G = (I_n | \sigma(v))$ where $\sigma$ is an isomorphism from a group ring to the ring of matrices which was introduced in [22]. The isomorphism $\sigma$ is such that $G$ is a generator matrix of a self-dual $[2n, n]$ code if and only if $v$ is a unitary unit in the group ring. See [15, 7, 1, 14] for recent applications of this isomorphism in constructing self-dual codes.

In this work, we assume a generator matrix of the form $G = (I_n | \Omega(v))$ where $\Omega(v)$ is a matrix that arises from group rings which we call a composite matrix. It clearly follows that $(I_n | \Omega(v))$ is a generator matrix of a self-dual code if and only if $\Omega(v)\Omega(v)^T = -I_n$. The idea of composite matrices was first introduced in [10] as a way of generalising the structure of $\sigma(v)$. The primary motivation for employing this technique is obtaining codes whose structures are atypical compared with those of codes constructed by more classical techniques. The main problem we face when attempting to construct codes with such a generator matrix is choosing parameters in such a way that allows for structural complexity of $\Omega(v)$ while also allowing for a reasonable set of necessary and sufficient conditions for the satisfaction of $\Omega(v)\Omega(v)^T = -I_n$.

Using generator matrices of the form $(I_n \mid \Omega(v))$ for a number of different composite matrices $\Omega(v)$, we find many self-dual codes with weight enumerator parameters of previously unknown values (relative to referenced sources). In total, 361 new codes are found, including 28 singly-even binary self-dual $[80, 40, 14]$ codes, 107 binary self-dual $[84, 42, 14]$ codes, 105 singly-even binary self-dual $[96, 48, 16]$ codes and 121 doubly-even binary self-dual $[96, 48, 16]$ codes.

The rest of the work is organised as follows. In Section 2, we give preliminary definitions on self-dual codes, Gray maps, circulant matrices and the alphabets we use. We also prove a few results concerning a simple matrix transformation, which we use in two of the composite matrix definitions. In Section 3, we define the composite matrices which we utilise in our constructions and we also prove the necessary and sufficient conditions needed by each construction to produce a self-dual code. In Section 4, we apply the constructions to obtain the new self-dual codes of length 80, 84 and 96 whose weight enumerator parameter values and automorphism group orders we detail. We also tabulate the results in this section. We finish with concluding remarks and discussion of possible expansion on this work.

2 Preliminaries

2.1 Self-Dual Codes

Let $R$ be a commutative Frobenius ring. Throughout this work, we always assume $R$ has unity. A code $C$ of length $n$ over $R$ is a subset of $R^n$ whose elements are called codewords. If $C$ is a submodule of $R^n$, then we say that $C$ is linear. Let $x, y \in R^n$ where $x = (x_1, x_2, \ldots, x_n)$ and $y = (y_1, y_2, \ldots, y_n)$. The (Euclidean) dual $C^\perp$ of $C$ is given by

$$C^\perp = \{ x \in R^n : \langle x, y \rangle = 0, \forall y \in C \},$$

where $\langle , \rangle$ denotes the Euclidean inner product defined by

$$\langle x, y \rangle = \sum_{i=1}^{n} x_i y_i.$$

We say that $C$ is self-orthogonal if $C \subseteq C^\perp$ and self-dual if $C = C^\perp$.

A binary self-dual code $C$ is said to be doubly-even (Type II), if all codewords $c \in C$ have weight $w(c) \equiv 0 \pmod{4}$, otherwise $C$ is said to be singly-even (Type I).

An upper bound on the minimum (Hamming) distance of a doubly-even binary self-dual code was given in [26] and likewise for a singly-even binary self-dual code in...
Let $d_I(n)$ and $d_{II}(n)$ be the minimum distance of a singly-even and doubly-even binary self-dual code of length $n$, respectively. Then
\[
d_{II}(n) \leq 4\lfloor n/24 \rfloor + 4
\]
and
\[
d_I(n) \leq \begin{cases} 
4\lfloor n/24 \rfloor + 2, & n \equiv 0 \pmod{24}, \\
4\lfloor n/24 \rfloor + 4, & n \not\equiv 22 \pmod{24}, \\
4\lfloor n/24 \rfloor + 6, & n \equiv 22 \pmod{24}.
\end{cases}
\]

A self-dual code whose minimum distance meets its corresponding bound is called extremal. A self-dual code with the highest possible minimum distance for its length is said to be optimal. Extremal codes are necessarily optimal but optimal codes are not necessarily extremal. A best known self-dual code is a self-dual code with the highest known minimum distance for its length.

### 2.2 Alphabets

In this paper, we consider the alphabets $\mathbb{F}_2$, $\mathbb{F}_2 + u\mathbb{F}_2$ and $\mathbb{F}_4$.

Define
\[
\mathbb{F}_2 + u\mathbb{F}_2 = \{a + bu : a, b \in \mathbb{F}_2, u^2 = 0\}.
\]

Then $\mathbb{F}_2 + u\mathbb{F}_2$ is a commutative ring of order 4 and characteristic 2 such that $\mathbb{F}_2 + u\mathbb{F}_2 \cong \mathbb{F}_2[u]/(u^2)$.

We define $\mathbb{F}_4 \cong \mathbb{F}_2[\omega]/(\omega^2 + \omega + 1)$ so that
\[
\mathbb{F}_4 = \{a\omega + b(1 + \omega) : a, b \in \mathbb{F}_2, \omega^2 + \omega + 1 = 0\}.
\]

We recall the following Gray maps from $[6, 12]$:

\[
\varphi_{\mathbb{F}_2 + u\mathbb{F}_2} : (\mathbb{F}_2 + u\mathbb{F}_2)^n \rightarrow \mathbb{F}_2^{2^n}
\]
\[
a + bu \mapsto (b, a + b), \quad a, b \in \mathbb{F}_2^n,
\]

\[
\psi_{\mathbb{F}_4} : \mathbb{F}_4^n \rightarrow \mathbb{F}_2^{2^n}
\]
\[
a\omega + b(1 + \omega) \mapsto (a, b), \quad a, b \in \mathbb{F}_2^n.
\]

Note that these Gray maps preserve orthogonality in their respective alphabets. The Lee weight of a codeword is defined to be the Hamming weight of its binary image under any of the aforementioned Gray maps. A self-dual code in $R^n$ where $R$ is equipped with a Gray map to the binary Hamming space is said to be of Type II if the Lee weights of all codewords are multiples of 4, otherwise it is said to be of Type I.

**Proposition 2.1.** ([6]) Let $C$ be a code over $\mathbb{F}_2 + u\mathbb{F}_2$. If $C$ is self-orthogonal, then $\varphi_{\mathbb{F}_2 + u\mathbb{F}_2}(C)$ is self-orthogonal. The code $C$ is a Type I (resp. Type II) code over $\mathbb{F}_2 + u\mathbb{F}_2$ if and only if $\varphi_{\mathbb{F}_2 + u\mathbb{F}_2}(C)$ is a Type I (resp. Type II) code over $\mathbb{F}_2$. The minimum Lee weight of $C$ is equal to the minimum Hamming weight of $\varphi_{\mathbb{F}_2 + u\mathbb{F}_2}(C)$.

**Proposition 2.2.** ([12]) Let $C$ be a code over $\mathbb{F}_4$. If $C$ is self-orthogonal, then $\psi_{\mathbb{F}_4}(C)$ is self-orthogonal. The code $C$ is a Type I (resp. Type II) code over $\mathbb{F}_4$ if and only if $\psi_{\mathbb{F}_4}(C)$ is a Type I (resp. Type II) code over $\mathbb{F}_2$. The minimum Lee weight of $C$ is equal to the minimum Hamming weight of $\psi_{\mathbb{F}_4}(C)$.
The next two corollaries follow directly from Propositions 2.1 and 2.2, respectively.

Corollary 2.3. Let $C$ be a self-dual code over $\mathbb{F}_2 + u\mathbb{F}_2$ of length $n$ and minimum Lee distance $d$. Then $\varphi_{\mathbb{F}_2 + u\mathbb{F}_2}(C)$ is a binary self-dual $[2n, n, d]$ code. Moreover, the Lee weight enumerator of $C$ is equal to the Hamming weight enumerator of $\varphi_{\mathbb{F}_2 + u\mathbb{F}_2}(C)$. If $C$ is a Type I (resp. Type II) code, then $\varphi_{\mathbb{F}_2 + u\mathbb{F}_2}(C)$ is a Type I (resp. Type II) code.

Corollary 2.4. Let $C$ be a self-dual code over $\mathbb{F}_4$ of length $n$ and minimum Lee distance $d$. Then $\psi_{\mathbb{F}_4}(C)$ is a binary self-dual $[2n, n, d]$ code. Moreover, the Lee weight enumerator of $C$ is equal to the Hamming weight enumerator of $\psi_{\mathbb{F}_4}(C)$. If $C$ is a Type I (resp. Type II) code, then $\psi_{\mathbb{F}_4}(C)$ is a Type I (resp. Type II) code.

2.3 Special Matrices

We now recall the definitions and properties of some special matrices which we use in our work. We begin by defining a matrix transformation whose properties we utilise in some of the composite constructions we consider. The properties are easy to prove but we do so for completeness.

Proposition 2.5. Let $A$ be an $n \times n$ matrix over a commutative ring $R$. Let $\ast : R^{n \times n} \to R^{n \times n}$ be the transformation such that $A^\ast$ is defined to be the matrix obtained after circularly shifting the columns of $A$ to the right by one position. If $P = \begin{pmatrix} 0 & I_{n-1} \\ 1 & 0 \end{pmatrix}$, then $A^\ast = AP$.

Proof. Assume $A$ is an $n \times n$ matrix over a commutative ring $R$ where $n \geq 2$. Suppose we decompose $A$ into blocks such that

$$A = \begin{pmatrix} x & z \\ X & y^T \end{pmatrix}$$

where $x, y \in R^{1 \times (n-1)}$, $z \in R$ and $X \in R^{(n-1) \times (n-1)}$. Then by block-wise multiplication we obtain

$$AP = \begin{pmatrix} x & z \\ X & y^T \end{pmatrix} \begin{pmatrix} 0 & I_{n-1} \\ 1 & 0 \end{pmatrix} = \begin{pmatrix} z & x \\ y^T & X \end{pmatrix}$$

and so $AP$ corresponds to $A$ after circularly shifting its columns to the right by one position. Thus, $A^\ast = AP$. 

The matrix $P$ as defined in Proposition 2.5 is a permutation matrix and is therefore orthogonal, i.e. $PP^T = I_n$. To see this, we have

$$P^T = \begin{pmatrix} 0 & 1 \\ I_{n-1} & 0 \end{pmatrix},$$

which corresponds to $P$ after circularly shifting its columns to the right by $n-2$ places and so by Proposition 2.5 we have $P^T = PP^{n-2} = P^{n-1}$. Clearly, if we circularly shift the columns of $P^T$ to the right by one place we obtain $I_n$ so that $P^T P = P^{n-1} P = P_n = I_n$. 

4
It also follows that \((P^k)^T = P^{-(k \mod n)}\) for \(k \in \mathbb{N}_0\). We can easily prove this by induction on \(k \in \mathbb{N}_0\). The cases \(k = 0\) and \(k = 1\) are trivial. Assume \((P^k)^T = P^{-(k \mod n)}\). Then we have \((P^{k+1})^T = (P^k P)^T = P^T (P^k)^T = P^{n-k-1} P^{-(k \mod n)}\) which concludes our induction step.

We also have the following properties which are easy to prove.

**Lemma 2.6.** Let \(A\) and \(B\) be \(n \times n\) matrices over a commutative ring \(R\) where \(n \geq 2\) and let \(*\) be the transformation defined in Proposition 2.5.

(i) \((A + B)^* = A^* + B^*\).

(ii) \(AB^T = A^* B^{*T}\).

**Proof.** (i). By Proposition 2.5, we have \((A + B)^* = (A + B)P = AP + BP = A^* + B^*\).

(ii). By Proposition 2.5 and the fact that \(P\) is orthogonal, we have \(A^* B^{*T} = AP(BP)^T = APP^TB^T = A(I_n)B^T = AB^T\). \(\square\)

Let \(a = (a_0, a_1, \ldots, a_{n-1}) \in R^n\) where \(R\) is a commutative ring and let

\[
A = \begin{pmatrix}
  a_0 & a_1 & a_2 & \cdots & a_{n-1} \\
  a_{n-1} & a_0 & a_1 & \cdots & a_{n-2} \\
  a_{n-2} & a_{n-1} & a_0 & \cdots & a_{n-3} \\
  \vdots & \vdots & \vdots & \ddots & \vdots \\
  a_1 & a_2 & a_3 & \cdots & a_0
\end{pmatrix}.
\]

Then \(A\) is an \(n \times n\) matrix called the *circulant* matrix generated \(a\), denoted by \(A = \text{circ}(a)\).

If \(A = \text{circ}(a_0, a_1, \ldots, a_{n-1})\), then we see that \(A = a_0I_n + a_1 I_n^* + a_2 (I_n^*)^* + \ldots\) and so on. Using Proposition 2.5 and the properties of the matrix \(P\), it follows that \(A = \sum_{i=0}^{n-1} a_i P^i\). Clearly, the sum of any two circulant matrices is also a circulant matrix. If \(B = \text{circ}(b)\) where \(b = (b_0, b_1, \ldots, b_{n-1}) \in R^n\), then \(AB = \sum_{i=0}^{n-1} \sum_{j=0}^{n-1} a_i b_j P^i P^j\).

Since \(P^n = I_n\), there exist \(c_k \in R\) such that \(AB = \sum_{k=0}^{n-1} c_k P^k\) so that \(AB\) is also circulant. In fact, it is true that

\[
c_k = \sum_{[i+j]_n = k} a_i b_j = x_i y_{k+1}
\]

for \(k \in [0..n-1]\), where \(x_i\) and \(y_j\) respectively denote the \(i\)th row and column of \(A\) and \(B\) and \([i+j]_n\) denotes the smallest non-negative integer such that \([i+j]_n \equiv i + j \mod n\). From this, we can see that circulant matrices commute multiplicatively.

We also see that \(A^*\) is circulant such that \(A^* = \sum_{i=0}^{n-1} a_i (P^i)^* = \sum_{i=0}^{n-1} a_i P^{n-i}\).

**Lemma 2.7.** Let \(A\) be an \(n \times n\) matrix over a commutative ring \(R\) where \(n \geq 2\) and let \(*\) be the transformation defined in Proposition 2.5. Let \(B\) be an \(n \times n\) circulant matrix over \(R\).

(i) \(BP = PB\).

(ii) \((AB^T)^* = A^* B^{*T}\).

(iii) \((AB^{*T})^* = AB^T\).

**Proof.** (i). Let \(B = \text{circ}(b_0, b_1, \ldots, b_{n-1})\). Then \(B\) can be expressed as \(B = \sum_{i=0}^{n-1} b_i P^i\) and so it is obvious that \(BP = PB\).
(ii). Since \( B \) is circulant, then \( B^T \) is circulant and so by (i), we have \((AB^T)^* = (AB^T)P = A(AB^T P) = AB^TP = A^*B^T\).

(iii). Since \( B \) is circulant, then \( B^T \) is circulant and so by (i) and the fact that \( P \) is orthogonal, we have \((AB^*)^* = (A(BP)^*)P = AP^TB^TP = A(I_0)B^T = AB^T\).

Let \( J_n \) be an \( n \times n \) matrix over \( R \) whose \((i,j)\)th entry is 1 if \( i + j = n + 1 \) and 0 if otherwise. Then \( J_n \) is called the \( n \times n \) exchange matrix and corresponds to the row-reversed (or column-reversed) version of \( I_n \). Note that \([i + j]_n \) corresponds to the \((i + 1, j + 1)\)th entry of the matrix \( J_n \). Define \( J_n V \) where \( V = \text{circ}(n-1,0,1,\ldots,n-2) \) for \( i, j \in [0..n-1] \).

Let \( A_0, A_1, \ldots, A_{k-1} \) be \( m \times n \) matrices over \( R \) and let

\[
X = \begin{pmatrix}
A_0 & A_1 & A_2 & \cdots & A_{k-1} \\
A_{k-1} & A_0 & A_1 & \cdots & A_{k-2} \\
A_{k-2} & A_{k-1} & A_0 & \cdots & A_{k-3} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
A_1 & A_2 & A_3 & \cdots & A_0
\end{pmatrix}
\]

Then \( X \) is an \( km \times kn \) matrix called the block circulant matrix generated \( A_0, A_1, \ldots, A_{k-1} \), denoted by \( X = \text{CIRC}(A_0, A_1, \ldots, A_{k-1}) \).

### 2.4 Group Rings and Composite Matrices

In this section, we recall the basic definition of a finite group ring and proceed to define the concept of a composite matrix.

Let \( G \) be a finite group order \( n \) and let \( R \) be a finite commutative Frobenius ring. Let \( RG = \{ \sum_{i=1}^{n} \alpha_i g_i : \alpha_i \in R, g_i \in G \} \) and define addition in \( RG \) by

\[
\sum_{i=1}^{n} \alpha_i g_i + \sum_{i=1}^{n} \beta_j g_j = \sum_{i=1}^{n} (\alpha_i + \beta_j) g_i
\]

and define multiplication in \( RG \) by

\[
\sum_{i=1}^{n} \alpha_i g_i \cdot \sum_{j=1}^{n} \beta_j g_j = \sum_{k=1}^{n} \left( \sum_{i,j,g_k=g_i \beta_j} \alpha_i \beta_j \right) g_k.
\]

Then \( RG \) is called the group ring of \( G \) over \( R \) and is a ring with respect to the aforementioned definitions of addition and multiplication.

Let \( (g_1, g_2, \ldots, g_n) \) be a fixed listing of the elements of \( G \) with \( g_1 = 1 \) and let \( v = \sum_{i=1}^{n} \alpha_i g_i \in RG \). Define \( \sigma(v) \) to be the \( n \times n \) matrix whose \((i,j)\)th entry is \( \alpha_{g_k} \) where \( g_k = g_i^{-1} g_j \) for \( i, j \in [1..n] \), i.e.

\[
\sigma(v) = \begin{pmatrix}
\alpha_{g_1^{-1} g_1} & \alpha_{g_1^{-1} g_2} & \cdots & \alpha_{g_1^{-1} g_n} \\
\alpha_{g_2^{-1} g_1} & \alpha_{g_2^{-1} g_2} & \cdots & \alpha_{g_2^{-1} g_n} \\
\vdots & \vdots & \ddots & \vdots \\
\alpha_{g_n^{-1} g_1} & \alpha_{g_n^{-1} g_2} & \cdots & \alpha_{g_n^{-1} g_n}
\end{pmatrix}
\]

The matrix \( \sigma(v) \) was first given in [22] wherein it was proved that \( \sigma \) is an isomorphism from the ring \( RG \) to \( R^{n \times n} \).
Suppose now that \( n > 1 \) is composite and let \( r \) be a fixed integer such that \( r \mid n \) and \( m = n/r \). Let \( \{H_1, H_2, \ldots, H_\eta\} \) be a collection of \( \eta \) groups of order \( r \). Let \( H_t \) be a representative of one of these groups for \( t \in [1..\eta] \) and let \((h_{t1}, h_{t2}, \ldots, h_{tr})\) be a fixed listing of the elements of \( H_t \) with \( h_{t1} = 1 \). Let \( H' \) be an \( m \times m \) matrix whose \((y,z)\)th entry is \( h_{y,z} \in [1..\eta] \) for \( y, z \in [1..m] \) and let \( P' \) be an \( m \times m \) matrix whose \((y,z)\)th entry is \( p_{y,z} \in \mathbb{F}_2 \) for \( y, z \in [1..m] \). Define the mapping \( g(y,z,i,j) = g_{c(y-1)+d} \) for \( y, z \in [1..m] \) and \( i, j \in [1..r] \).

Define \( Z_{y,z} \) to be the \( r \times r \) matrix whose \((i,j)\)th entry is given by

\[
Z_{y,z}(i,j) = \alpha_{(y,z,i,j)}
\]

and define \( Z_{y,z}(i,j) \) to be the \( r \times r \) matrix whose \((i,j)\)th entry is given by

\[
Z'_{y,z}(i,j) = \alpha_{(y,z,1,\mathcal{M}_H(i,j))}
\]

where \( \mathcal{M}_H(i,j) \) is the \((i,j)\)th entry of the matrix of integers \( \ell \in [1..r] \) such that \( h_{t\ell} = h_{t1}^{i-1} \) for \( i, j \in [1..r] \).

Define \( \Omega(v) \) to be the block matrix whose \((y,z)\)th block entry is given by

\[
\omega_{y,z} = \begin{cases} Z_{y,z}, & p_{y,z} = 0, \\ Z'_{y,z}, & p_{y,z} = 1. \end{cases}
\]

Then \( \Omega(v) \) is an \( n \times n \) matrix composed of \( m^2 \) blocks of size \( r \times r \) which we call the composite \((G,H_1,H_2,\ldots,H_\eta)\)-matrix of \( v \in RG \) with respect to \( H' \) and \( P' \). If \( P' = 0 \) (i.e. the \( m \times m \) zero matrix), the matrix \( \Omega(v) \) reduces to \( \sigma(v) \).

The concept of composite matrices defined in this way was first introduced in [10] as a way of generalising the structure of \( \sigma(v) \). See [9, 8, 25] for recent applications of composite matrices in constructing binary self-dual codes.

**Example 2.8.** Let \( G \cong D_4 \cong \langle a, b \mid a^4 = b^2 = 1, bab = a^{-1} \rangle \) with the fixed listing \( G = \langle g_{2j+1} \rangle = a^{i}b^{j} \) for \( i \in [0..3] \) and \( j \in [0..1] \). Then \( n = 8 \) and suppose we let \( r = 4 \mid n \) so that \( m = n/r = 2 \). Let \( \{H_1, H_2\} \) be a collection of groups of order \( r = 4 \). Let \( H_1 \cong C_2 \times C_2 \cong \langle e, d \mid c^2 = d^2 = 1, cd = dc \rangle \) with the fixed listing \( H_1 = (h_{12j+1}) = c^{i}d^{j} \) for \( i \in [0..1] \) and \( j \in [0..1] \). Let \( H_2 \cong C_2 \cong \langle e \mid e^{2} = 1 \rangle \) with the fixed listing \( H_2 = (h_{2j+1}) = e^{2i+j} \) for \( i \in [0..1] \) and \( j \in [0..1] \). Let

\[
H' = \begin{pmatrix} 1 & 2 \\ 2 & 1 \end{pmatrix}
\]

and let \( P' = 1 \) (i.e. the \( 2 \times 2 \) matrix of ones). Let \( v = \sum_{i=1}^{n} \alpha_i g_i \in RG \) and let \( \Omega(v) \) be the composite \((G,H_1,H_2)\)-matrix of \( v \in RG \) with respect to \( H' \) and \( P' \). We have

\[
\Omega(v) = \begin{pmatrix} \omega_{1,1} & \omega_{1,2} \\ \omega_{2,1} & \omega_{2,2} \end{pmatrix} = \begin{pmatrix} Z'_{h_{1,1},1,1} & Z'_{h_{1,1},2,1} \\ Z'_{h_{2,1},1,2} & Z'_{h_{2,1},2,2} \end{pmatrix} = \begin{pmatrix} Z'_{1,1,1} & Z'_{2,1,2} \\ Z_{2,2,1} & Z_{1,2,2} \end{pmatrix}
\]

and we also find that

\[
\mathcal{M}_{H_1} = \begin{pmatrix} 1 & 2 & 3 & 4 \\ 2 & 1 & 4 & 3 \\ 3 & 4 & 1 & 2 \\ 4 & 3 & 2 & 1 \end{pmatrix} \quad \text{and} \quad \mathcal{M}_{H_2} = \begin{pmatrix} 1 & 2 & 3 & 4 \\ 2 & 1 & 4 & 3 \\ 4 & 3 & 1 & 2 \\ 3 & 4 & 2 & 1 \end{pmatrix}
\]
By definition, the \((i, j)\)th entry of \(Z'_{1,1,1}\) is given by \(\alpha_{g(1,1,1),M_{H_1}(i,j)}\) where \(g(1, 1, 1, M_{H_1}(i,j)) = g^{-1}g_{M_{H_1}(i,j)} = g_{M_{H_1}(i,j)}\) so that

\[
Z'_{1,1,1} = \begin{pmatrix}
\alpha_{g_1} & \alpha_{g_2} & \alpha_{g_3} & \alpha_{g_4} \\
\alpha_{g_5} & \alpha_{g_6} & \alpha_{g_7} & \alpha_{g_8} \\
\alpha_{g_3} & \alpha_{g_4} & \alpha_{g_1} & \alpha_{g_2} \\
\alpha_{g_4} & \alpha_{g_3} & \alpha_{g_2} & \alpha_{g_1}
\end{pmatrix}
\]

and similarly we find that

\[
Z'_{2,1,2} = \begin{pmatrix}
\alpha_{g_9} & \alpha_{g_5} & \alpha_{g_7} & \alpha_{g_8} \\
\alpha_{g_6} & \alpha_{g_5} & \alpha_{g_7} & \alpha_{g_8} \\
\alpha_{g_7} & \alpha_{g_5} & \alpha_{g_7} & \alpha_{g_8} \\
\alpha_{g_8} & \alpha_{g_5} & \alpha_{g_7} & \alpha_{g_8}
\end{pmatrix},
\]

\[
Z'_{2,2,1} = \begin{pmatrix}
\alpha_{g_9} & \alpha_{g_6} & \alpha_{g_7} & \alpha_{g_8} \\
\alpha_{g_5} & \alpha_{g_6} & \alpha_{g_7} & \alpha_{g_8} \\
\alpha_{g_7} & \alpha_{g_6} & \alpha_{g_7} & \alpha_{g_8} \\
\alpha_{g_8} & \alpha_{g_6} & \alpha_{g_7} & \alpha_{g_8}
\end{pmatrix},
\]

\[
Z'_{1,2,2} = \begin{pmatrix}
\alpha_{g_1} & \alpha_{g_4} & \alpha_{g_3} & \alpha_{g_2} \\
\alpha_{g_4} & \alpha_{g_3} & \alpha_{g_2} & \alpha_{g_1} \\
\alpha_{g_3} & \alpha_{g_2} & \alpha_{g_1} & \alpha_{g_4} \\
\alpha_{g_2} & \alpha_{g_3} & \alpha_{g_4} & \alpha_{g_1}
\end{pmatrix}
\]

Therefore, we obtain

\[
\Omega(v) = \begin{pmatrix}
Z'_{1,1,1} & Z'_{2,1,2} \n
Z'_{2,2,1} & Z'_{1,2,2}
\end{pmatrix} = \begin{pmatrix}
A_1 & A_2 & B_1 & B_2 \\
A_2 & A_1 & B_2 & B_1 \\
C_1 & C_2 & D_1 & D_2 \\
C_2 & C_1 & D_2 & D_1
\end{pmatrix}
\]

where \(A_1 = \text{circ}(\alpha_{g_1}, \alpha_{g_2}), A_2 = \text{circ}(\alpha_{g_2}, \alpha_{g_4}), B_1 = \text{circ}(\alpha_{g_5}, \alpha_{g_6}), B_2 = \text{circ}(\alpha_{g_7}, \alpha_{g_8}), C_1 = \text{circ}(\alpha_{g_9}, \alpha_{g_3}), C_2 = \text{circ}(\alpha_{g_9}, \alpha_{g_4})\) and \(D_1 = \text{circ}(\alpha_{g_9}, \alpha_{g_4}), D_2 = \text{circ}(\alpha_{g_9}, \alpha_{g_2})\).

### 3 Composite Matrix Constructions

In this section, we present our constructions which assume a generator matrix of the form \((I_n | \Omega(v))\) where \(\Omega(v)\) is a composite matrix. For each construction, we first define the structure of the corresponding composite matrix \(\Omega(v)\) and subsequently prove the conditions that hold if and only if \((I_n | \Omega(v))\) is a generator matrix of a self-dual \([2n, n]\) code over \(R\). We will hereafter assume that \(R\) is a finite commutative Frobenius ring of characteristic 2. For each \(v = \sum_{i=1}^{n} \alpha_{g_i} g_i \in RG\) that we define, we denote \(v = (v_1, v_2, \ldots, v_n) = (\alpha_{g_1}, \alpha_{g_2}, \ldots, \alpha_{g_n})\) where \(v_i\) denotes \(v_i = \alpha_{g_i}\) for \(i \in [1..n]\). We also use the following notation

\[v_{i,j} = \begin{cases} (v_i, v_{i+1}, v_{i+2}, \ldots, v_{j-1}, v_j), & i < j, \\ (v_i, v_{i-1}, v_{i-2}, \ldots, v_{j+1}, v_j), & i > j, \end{cases}\]

for \(i, j \in [1..n]\). We also let \(\text{circ}(u, v)\) denote \(\text{circ}(u_1, u_2, \ldots, u_n, v_1, v_2, \ldots, v_n)\) for any \(u, v \in R^n\) such that \(u = (u_1, u_2, \ldots, u_n)\) and \(v = (v_1, v_2, \ldots, v_n)\).
Definition 3.1. Let $G \cong D_{10} \cong \langle a, b \mid a^{10} = b^2 = 1, bab = a^{-1} \rangle$ with the fixed listing $G = (g_{i,j+1}) = a^ib^j$ for $i \in \{0..9\}$ and $j \in \{0..1\}$. Let $H \cong D_5 \cong \langle c, d \mid c^5 = d^2 = 1, dcd = c^{-1} \rangle$ with the fixed listing $H = (h_{i,j+1}) = a^ib^j$ for $i \in \{0..4\}$ and $j \in \{0..1\}$. Let $H' = 1$ and $P' = 1$. Let $v = \sum_{i=1}^{20} a_{i,j}g_i \in \mathbb{R}G$. If $\Omega_1^{20}(v)$ is the composite $(G, H)$-matrix of $v \in \mathbb{R}G$ with respect to $H'$ and $P'$, then

$$\Omega_1^{20}(v) = \begin{pmatrix} A_1 & B_1 & C_1 & D_1 \\ B_1^T & A_1^T & D_1^T & C_1^T \\ C_2 & D_2 & A_2 & B_2 \\ D_2^T & C_2^T & B_2^T & A_2^T \end{pmatrix},$$

where $A_1 = \text{circ}(v_{1:5})$, $B_1 = \text{circ}(v_{6:10})$, $C_1 = \text{circ}(v_{11:15})$, $D_1 = \text{circ}(v_{16:20})$, $A_2 = \text{circ}(v_{1:10})$, $B_2 = \text{circ}(v_{11:15})$, $C_2 = \text{circ}(v_{16:20})$ and $D_2 = \text{circ}(v_{17:20})$.

Theorem 3.2. Let $G = (I \mid \Omega_1^{20}(v))$ where $\Omega_1^{20}(v)$ is as defined in Definition 3.1. Then $G$ is a generator matrix of a self-dual $[40, 20]$ code over $R$ if and only if

$$\begin{aligned} A_1A_1^T + B_1B_1^T + C_1C_1^T + D_1D_1^T &= I_5, \\ A_2A_2^T + B_2B_2^T + C_2C_2^T + D_2D_2^T &= I_5, \\ A_1C_2^T + B_1D_2^T + C_1A_2^T + D_1B_2^T &= 0, \\ A_1D_2 + B_1C_2 + C_1B_2 + D_1A_2 &= 0. \end{aligned}$$

Proof. We know that $G$ is a generator matrix of a self-dual $[40, 20]$ code over $R$ if and only if $\Omega_1^{20}(v)\Omega_1^{20}(v)^T = I_{20}$. We find that

$$\Omega_1^{20}(v)\Omega_1^{20}(v)^T = \begin{pmatrix} X_1 & 0 & Y_1 & Y_2 \\ 0 & X_1 & Y_1^T & Y_2^T \\ Y_1 & Y_2 & X_1 & 0 \\ Y_2 & Y_1 & 0 & X_2 \end{pmatrix},$$

where

$$X_1 = A_1A_1^T + B_1B_1^T + C_1C_1^T + D_1D_1^T,$$

$$X_2 = A_2A_2^T + B_2B_2^T + C_2C_2^T + D_2D_2^T,$$

and

$$Y_1 = A_1C_2^T + B_1D_2^T + C_1A_2^T + D_1B_2^T,$$

$$Y_2 = A_1D_2 + B_1C_2 + C_1B_2 + D_1A_2.$$

Clearly, $Y_i = 0$ if and only if $Y_i^T = 0$ for $i \in \{1..2\}$. Thus, $\Omega_1^{20}(v)\Omega_1^{20}(v)^T = I_{20}$ if and only if

$$\begin{aligned} X_1 &= X_2 = I_5, \\ Y_1 &= Y_2 = 0. \end{aligned}$$

Definition 3.3. Let $G \cong C_5 \times C_4 \cong \langle a, b \mid a^5 = b^4 = 1, ab = ba \rangle$ with the fixed listing $G = (g_{i,j+1}) = a^ib^j$ for $i \in \{0..4\}$ and $j \in \{0..3\}$. Let $H \cong D_5 \cong \langle c, d \mid c^5 = d^2 = 1, dcd = c^{-1} \rangle$ with the fixed listing $H = (h_{i,j+1}) = a^ib^j$ for $i \in \{0..4\}$ and $j \in \{0..1\}$.
Let $H' = 1$ and $P' = 1$. Let $v = \sum_{i=1}^{20} a_i g_i \in RG$. If $\Omega_2^{20}(v)$ is the composite $(G,H)$-matrix of $v \in RG$ with respect to $H'$ and $P'$, then

$$\Omega_2^{20}(v) = \begin{pmatrix} A & B & C & D \\ B^T & A^T & D^T & C^T \\ C & D & A & B \\ D^T & C^T & B^T & A^T \end{pmatrix},$$

where $A = \text{circ}(v_{1:5})$, $B = \text{circ}(v_{6:10})$, $C = \text{circ}(v_{11:15})$ and $D = \text{circ}(v_{16:20})$.

**Theorem 3.4.** Let $G = \langle I \mid \Omega_2^{20}(v) \rangle$ where $\Omega_2^{20}(v)$ is as defined in Definition 3.3. Then $G$ is a generator matrix of a self-dual $[40, 20]$ code over $R$ if and only if

$$\begin{cases} AA^T + BB^T + CC^T + DD^T = I_5, \\ AC^T + BD^T + CA^T + DB^T = 0. \end{cases}$$

**Proof.** We know that $G$ is a generator matrix of a self-dual $[40, 20]$ code over $R$ if and only if $\Omega_2^{20}(v)\Omega_2^{20}(v)^T = I_{20}$. We find that

$$\Omega_2^{20}(v)\Omega_2^{20}(v)^T = \text{circ}(X,0,Y,0),$$

where

$$X = AA^T + BB^T + CC^T + DD^T$$

and

$$Y = AC^T + BD^T + CA^T + DB^T.$$

Thus, $\Omega_2^{20}(v)\Omega_2^{20}(v)^T = I_{20}$ if and only if

$$\begin{cases} X = I_5, \\ Y = 0. \end{cases}$$

\[\square\]

**Definition 3.5.** Let $G \cong D_{21} \cong \langle a, b \mid a^{21} = b^2 = 1, bab = a^{-1} \rangle$ with the fixed listing $G = (g_{21j+1}) = a^ib^j$ for $i \in [0..20]$ and $j \in [0..1]$. Let $H \cong C_7 \times C_3 \cong \langle c, d \mid c^7 = d^3 = 1, cd = dc \rangle$ with the fixed listing $H = (h_{7j+1}) = a^ib^j$ for $i \in [0..6]$ and $j \in [0..2]$. Let $H' = 1$ and $P' = 1$. Let $v = \sum_{i=1}^{20} a_i g_i \in RG$. If $\Omega_1^{20}(v)$ is the composite $(G,H)$-matrix of $v \in RG$ with respect to $H'$ and $P'$, then

$$\Omega_1^{20}(v) = \begin{pmatrix} \text{CIRC}(A_1, A_2, A_3) \\ \text{CIRC}(B_1, B_2, B_3) \\ \text{CIRC}(C_1, C_2, C_3) \\ \text{CIRC}(D_1, D_2, D_3) \end{pmatrix},$$

where $A_1 = \text{circ}(v_{1:7})$, $A_2 = \text{circ}(v_{8:14})$, $A_3 = \text{circ}(v_{15:21})$, $B_1 = \text{circ}(v_{22:28})$, $B_2 = \text{circ}(v_{29:35})$, $B_3 = \text{circ}(v_{36:42})$, $C_1 = \text{circ}(v_{43:49})$, $C_2 = \text{circ}(v_{50:56})$, $C_3 = \text{circ}(v_{57:63})$, $D_1 = \text{circ}(v_{1,21:16})$, $D_2 = \text{circ}(v_{15:10})$ and $D_2 = \text{circ}(v_{8:2})$. 

10
Theorem 3.6. Let $G = (I \mid \Omega_1^{t2}(v))$ where $\Omega_1^{t2}(v)$ is as defined in Definition 3.5. Then $G$ is a generator matrix of a self-dual [84, 42] code over $R$ if and only if

$$
\begin{align*}
A_1A_1^T + A_2A_2^T + A_3A_3^T + B_1B_1^T + B_2B_2^T + B_3B_3^T &= I_7, \\
C_1C_1^T + C_2C_2^T + C_3C_3^T + D_1D_1^T + D_2D_2^T + D_3D_3^T &= I_7, \\
A_1A_3^T + A_2A_4^T + A_3A_5^T + B_1B_4^T + B_2B_5^T + B_3B_6^T &= 0, \\
A_1C_1^T + A_2C_2^T + A_3C_3^T + B_1D_1^T + B_2D_2^T + B_3D_3^T &= 0, \\
A_1C_3^T + A_2C_4^T + A_3C_5^T + B_1D_2^T + B_2D_3^T + B_3D_4^T &= 0, \\
A_1C_5^T + A_2C_6^T + A_3C_7^T + D_1D_2^T + D_2D_3^T + D_3D_4^T &= 0.
\end{align*}
$$

Proof. We know that $G$ is a generator matrix of a self-dual [84, 42] code over $R$ if and only if $\Omega_1^{t2}(v)\Omega_1^{t2}(v)^T = I_{42}$. We find that

$$
\Omega_1^{t2}(v)\Omega_1^{t2}(v)^T = \begin{pmatrix} \text{CIRC}(X_1, Y_1, Y_1^T) & \text{CIRC}(X_2, Y_3, Y_4) \\ \text{CIRC}(Y_2, Y_4^T, Y_3^T) & \text{CIRC}(X_2, Y_5, Y_5^T) \end{pmatrix},
$$

where

$$
X_1 = A_1A_1^T + A_2A_2^T + A_3A_3^T + B_1B_1^T + B_2B_2^T + B_3B_3^T, \\
X_2 = C_1C_1^T + C_2C_2^T + C_3C_3^T + D_1D_1^T + D_2D_2^T + D_3D_3^T
$$

and

$$
Y_1 = A_1A_2^T + A_2A_3^T + A_3A_4^T + B_1B_2^T + B_2B_3^T + B_3B_4^T, \\
Y_2 = A_1C_1^T + A_2C_2^T + A_3C_3^T + B_1D_1^T + B_2D_2^T + B_3D_3^T, \\
Y_3 = A_1C_3^T + A_2C_4^T + A_3C_5^T + D_1D_2^T + D_2D_3^T + D_3D_4^T, \\
Y_4 = A_1C_5^T + A_2C_6^T + A_3C_7^T + B_1D_2^T + B_2D_3^T + B_3D_4^T, \\
Y_5 = C_1C_3^T + C_2C_4^T + C_3C_5^T + D_1D_3^T + D_2D_4^T + D_3D_5^T.
$$

Clearly, $Y_i = 0$ if and only if $Y_i^T = 0$ for $i \in [1..5]$. Thus, $\Omega_1^{t2}(v)\Omega_1^{t2}(v)^T = I_{42}$ if and only if

$$
\begin{cases} 
X_1 = X_2 = I_7, \\
Y_1 = Y_2 = Y_3 = Y_4 = Y_5 = 0.
\end{cases}
$$

\[\square\]

Definition 3.7. Let $G \cong D_{21} \cong \langle a, b \mid a^{21} = b^2 = 1, bab = a^{-1} \rangle$ with the fixed listing $G = (g_{21i+j+1}) = a^ib^j$ for $i \in [0..20]$ and $j \in [0..1]$. Let $H \cong C_3 \times C_7 \cong \langle c, d \mid c^3 = b^7 = 1, cd = dc \rangle$ with the fixed listing $H = (h_{3j+i+1}) = c^id^j$ for $i \in [0..2]$ and $j \in [0..6]$. Let $H' = 1$ and $P' = 1$. Let $v = \sum_{i,j=1}^{21} a_{ij} g_{ij} \in RG$. If $\Omega_1^{t2}(v)$ is the composite $(G, H)$-matrix of $v \in RG$ with respect to $H'$ and $P'$, then

$$
\Omega_1^{t2}(v) = \begin{pmatrix} A_1 & A_2 & A_3 & B_1 & B_2 & B_3 \\ A_1^* & A_2 & A_3 & B_1^* & B_2^* & B_3^* \\ A_2 & A_3^* & A_1 & B_2 & B_3^* & B_1 \\ C_1 & C_2 & C_3 & D_1 & D_2 & D_3 \\ C_2 & C_3^* & C_1 & D_2 & D_3^* & D_1 \\ C_3 & C_1^* & C_2 & D_3 & D_1^* & D_2 \\ C_1^* & C_2^* & C_3^* & D_2^* & D_3^* & D_1 \\ C_2^* & C_3^* & C_1^* & D_3^* & D_1^* & D_2 \\ C_3^* & C_1^* & C_2^* & D_1^* & D_2^* & D_3 \
\end{pmatrix},
$$

11
where \( A_1 = \text{circ}(v_{1.7}) \), \( A_2 = \text{circ}(v_{8.14}) \), \( A_3 = \text{circ}(v_{15.21}) \), \( B_1 = \text{circ}(v_{22.28}) \), \( B_2 = \text{circ}(v_{29.35}) \), \( B_3 = \text{circ}(v_{36.42}) \), \( C_1 = \text{circ}(v_{22, 32.37}) \), \( C_2 = \text{circ}(v_{36.30}) \), \( C_3 = \text{circ}(v_{29.23}) \), \( D_1 = \text{circ}(v_{1, 21.16}) \), \( D_2 = \text{circ}(v_{15.9}) \), \( D_2 = \text{circ}(v_{8.2}) \) and \( \ast \) is the transformation defined in Proposition 2.5.

**Theorem 3.8.** Let \( G = (I | \Omega_2^{32}(v)) \) where \( \Omega_2^{32}(v) \) is as defined in Definition 3.7. Then \( G \) is a generator matrix of a self-dual \([84, 42]\) code over \( R \) if and only if

\[
\begin{align*}
A_1 A_1^T + A_2 A_2^T + A_3 A_3^T + B_1 B_1^T + B_2 B_2^T + B_3 B_3^T &= I_7, \\
C_1 C_1^T + C_2 C_2^T + C_3 C_3^T + D_1 D_1^T + D_2 D_2^T + D_3 D_3^T &= I_7, \\
A_2 A_1^T + A_3 A_2^T + A_1 A_3^T + B_2 B_1^T + B_3 B_2^T + B_1 B_3^T &= 0, \\
A_1 C_1^T + A_2 C_2^T + A_3 C_3^T + B_1 D_1^T + B_2 D_2^T + B_3 D_3^T &= 0, \\
A_2 C_1^T + A_3 C_2^T + A_1 C_3^T + B_2 D_1^T + B_3 D_2^T + B_1 D_3^T &= 0, \\
A_1 C_1^T + A_2 C_2^T + A_3 C_3^T + B_3 D_1^T + B_1 D_2^T + B_2 D_3^T &= 0, \\
C_2 C_1^T + C_3 C_2^T + C_1 C_3^T + D_1 D_1^T + D_2 D_2^T + D_3 D_3^T &= 0.
\end{align*}
\]

**Proof.** We know that \( G \) is a generator matrix of a self-dual \([84, 42]\) code over \( R \) if and only if \( \Omega_2^{32}(v) \Omega_2^{32}(v)^T = I_{42} \). Using Lemmas 2.6 and 2.7, we find that

\[
\Omega_2^{32}(v) \Omega_2^{32}(v)^T = \begin{pmatrix}
X_1 & Y_1 & Y_1^T & Y_2 & Y_3 & Y_4 \\
Y_1^T & X_3 & Y_1 & Y_2 & Y_3 & Y_4 \\
Y_2^T & Y_4^T & X_1 & Y_3 & Y_2 & Y_3 \\
Y_3^T & Y_5^T & Y_2^T & X_2 & Y_5 & Y_3 \\
Y_4^T & Y_5^T & Y_5^T & X_2 & Y_5 & Y_5 \\
Y_5^T & Y_2^T & Y_5^T & X_2 & Y_5 & Y_5
\end{pmatrix},
\]

where

\[
X_1 = A_1 A_1^T + A_2 A_2^T + A_3 A_3^T + B_1 B_1^T + B_2 B_2^T + B_3 B_3^T,
X_2 = C_1 C_1^T + C_2 C_2^T + C_3 C_3^T + D_1 D_1^T + D_2 D_2^T + D_3 D_3^T
\]

and

\[
Y_1 = A_2 A_1^T + A_3 A_2^T + A_1 A_3^T + B_2 B_1^T + B_3 B_2^T + B_1 B_3^T,
Y_2 = A_1 C_1^T + A_2 C_2^T + A_3 C_3^T + B_1 D_1^T + B_2 D_2^T + B_3 D_3^T,
Y_3 = A_2 C_1^T + A_3 C_2^T + A_1 C_3^T + B_2 D_1^T + B_3 D_2^T + B_1 D_3^T,
Y_4 = A_1 C_1^T + A_2 C_2^T + A_3 C_3^T + B_3 D_1^T + B_1 D_2^T + B_2 D_3^T,
Y_5 = C_2 C_1^T + C_3 C_2^T + C_1 C_3^T + D_1 D_1^T + D_2 D_2^T + D_1 D_3^T.
\]

Clearly, \( Y_i = 0 \) if and only if \( Y_i^T = 0 \), \( Y_i^* = 0 \) and \( Y_i^{*T} = 0 \) for \( i \in [1..5] \). Thus, \( \Omega_2^{32}(v) \Omega_2^{32}(v)^T = I_{42} \) if and only if

\[
\begin{align*}
X_1 &= X_2 = I_5, \\
Y_1 &= Y_2 = Y_3 = Y_4 = Y_5 = 0.
\end{align*}
\]

\( \square \)
Definition 3.9. Let $G \cong C_{12} \times C_2 \cong \langle a, b \mid a^{12} = b^2 = 1, ab = ba \rangle$ with the fixed listing $G = \langle g_{12j+i+1} \rangle = a^i b^j$ for $i \in \{0, 11 \}$ and $j \in \{0, 1 \}$. Let $H \cong D_3 \cong \langle c, d \mid c^3 = d^2 = 1, dcd = c^{-1} \rangle$ with the fixed listing $H = \langle h_{3j+i+1} \rangle = c^i d^j$ for $i \in \{0, 1, 2 \}$ and $j \in \{0, 1 \}$. Let $H' = 1$ and $P' = 1$. Let $v = \sum_{i=1}^{24} a_i g_i \in RG$. If $\Omega_1^{24}(v)$ is the composite $(G, H)$-matrix of $v \in RG$ with respect to $H'$ and $P'$, then

$$\Omega_1^{24}(v) = I_2 \otimes \text{CIRC}(\tilde{A}, \tilde{B}) + J_2 \otimes \text{CIRC}(\tilde{C}, \tilde{D}),$$

where $\otimes$, $I_2$ and $J_2$ denote the Kronecker product, $2 \times 2$ identity matrix and $2 \times 2$ exchange matrix, respectively and

$$\tilde{A} = \begin{pmatrix} A_1 & A_2 \\ A_2^T & A_1^T \end{pmatrix}, \quad \tilde{B} = \begin{pmatrix} B_1 & B_2 \\ B_2^T & B_1^T \end{pmatrix},$$

$$\tilde{C} = \begin{pmatrix} C_1 & C_2 \\ C_2^T & C_1^T \end{pmatrix}, \quad \tilde{D} = \begin{pmatrix} D_1 & D_2 \\ D_2^T & D_1^T \end{pmatrix},$$

where $A_1 = \text{circ}(v_{1:3}), A_2 = \text{circ}(v_{4:6}), B_1 = \text{circ}(v_{7:9}), B_2 = \text{circ}(v_{10:12}), C_1 = \text{circ}(v_{13:15}), C_2 = \text{circ}(v_{16:18}), D_1 = \text{circ}(v_{19:21})$ and $D_2 = \text{circ}(v_{22:24}).$

Theorem 3.10. Let $G = (I \mid \Omega_1^{24}(v))$ where $\Omega_1^{24}(v)$ is as defined in Definition 3.9. Then $G$ is a generator matrix of a self-dual [48, 24] code over $R$ if and only if

$$\begin{cases}
A_1A_1^T + A_2A_2^T + B_1B_1^T + B_2B_2^T + C_1C_1^T + C_2C_2^T + D_1D_1^T + D_2D_2^T = I_3, \\
A_1B_1^T + A_2B_2^T + B_1A_1^T + B_2A_2^T + C_1D_1^T + C_2D_2^T + D_1C_1^T + D_2C_2^T = 0, \\
A_1C_1^T + A_2C_2^T + B_1D_1^T + B_2D_2^T + C_1A_1^T + C_2A_2^T + D_1B_1^T + D_2B_2^T = 0, \\
A_1D_1^T + A_2D_2^T + B_1C_1^T + B_2C_2^T + C_1B_1^T + C_2B_2^T + D_1A_1^T + D_2A_2^T = 0.
\end{cases}$$

Proof. We know that $G$ is a generator matrix of a self-dual [48, 24] code over $R$ if and only if $\Omega_1^{24}(v)\Omega_1^{24}(v)^T = I_{24}$. We find that

$$\Omega_1^{24}(v)\Omega_1^{24}(v)^T = I_2 \otimes \text{CIRC}(\tilde{X}, \tilde{Y}_1) + J_2 \otimes \text{CIRC}(\tilde{Y}_2, \tilde{Y}_3),$$

where

$$\tilde{X} = \begin{pmatrix} X & 0 \\ 0 & X \end{pmatrix}, \quad \tilde{Y}_1 = \begin{pmatrix} Y_1 & 0 \\ 0 & Y_1 \end{pmatrix},$$

$$\tilde{Y}_2 = \begin{pmatrix} Y_2 & 0 \\ 0 & Y_2 \end{pmatrix}, \quad \tilde{Y}_3 = \begin{pmatrix} Y_3 & 0 \\ 0 & Y_3 \end{pmatrix}$$

with

$$X = A_1A_1^T + A_2A_2^T + B_1B_1^T + B_2B_2^T + C_1C_1^T + C_2C_2^T + D_1D_1^T + D_2D_2^T$$

and

$$Y_1 = A_1B_1^T + A_2B_2^T + B_1A_1^T + B_2A_2^T + C_1D_1^T + C_2D_2^T + D_1C_1^T + D_2C_2^T,$$

$$Y_2 = A_1C_1^T + A_2C_2^T + B_1D_1^T + B_2D_2^T + C_1A_1^T + C_2A_2^T + D_1B_1^T + D_2B_2^T,$$

$$Y_3 = A_1D_1^T + A_2D_2^T + B_1C_1^T + B_2C_2^T + C_1B_1^T + C_2B_2^T + D_1A_1^T + D_2A_2^T.$$

Thus, $\Omega_1^{24}(v)\Omega_1^{24}(v)^T = I_{24}$ if and only if

$$\begin{cases}
X_1 = X_2 = X_3, \\
Y_1 = Y_2 = Y_3 = 0.
\end{cases}$$
Definition 3.11. Let $G \cong D_{12} \cong \langle a, b \mid a^{12} = b^2 = 1, bab = a^{-1} \rangle$ with the fixed listing $G = (g(i + j + 1)) = a^ib^j$ for $i \in \{0 \ldots 11\}$ and $j \in \{0 \ldots 1\}$. Let $H \cong C_{24} \cong \langle c \mid c^{24} = 1 \rangle$ with the fixed listing $H = (c(i + j)) = c^{24}$ for $i \in \{0 \ldots 5\}$ and $j \in \{0 \ldots 1\}$. Let $H' = 1$ and $P' = 1$. Let $v = \sum_{i=1}^{24} a_i g_i \in RG$. If $\Omega_2^{24}(v)$ is the composite $(G, H)$-matrix of $v \in RG$ with respect to $H'$ and $P'$, then

$$\Omega_2^{24}(v) = \begin{pmatrix} A_1 & A_2 & B_1 & B_2 \\ A_1^* & A_1 & B_1^* & B_1 \\ C_1 & C_2 & D_1 & D_2 \\ C_1^* & C_1^* & D_1^* & D_1^* \end{pmatrix},$$

where $A_1 = \text{circ}(v_{1,6})$, $A_2 = \text{circ}(v_{7,12})$, $B_1 = \text{circ}(v_{13,18})$, $B_2 = \text{circ}(v_{19,24})$, $C_1 = \text{circ}(v_{13,24,20})$, $C_2 = \text{circ}(v_{19,14})$, $D_1 = \text{circ}(v_{1,12,8})$, $D_2 = \text{circ}(v_{7,2})$ and $*$ is the transformation defined in Proposition 2.5.

Theorem 3.12. Let $G = (I \mid \Omega_2^{24}(v))$ where $\Omega_2^{24}(v)$ is as defined in Definition 3.11. Then $G$ is a generator matrix of a self-dual [48, 24] code over $R$ if and only if

$$\Omega_2^{24}(v)\Omega_2^{24}(v)^T = I_{24}.$$ 

Proof. We know that $G$ is a generator matrix of a self-dual [48, 24] code over $R$ if and only if $\Omega_2^{24}(v)\Omega_2^{24}(v)^T = I_{24}$. Using Lemmas 2.6 and 2.7, we find that

$$\Omega_2^{24}(v)\Omega_2^{24}(v)^T = \begin{pmatrix} X_1 & Y_1 & Y_2 & Y_3 \\ Y_1^T & X_1 & Y_2^* & Y_3^* \\ Y_2 & Y_2^* & X_2 & Y_3 \\ Y_3^* & Y_3^* & Y_3^* & X_3 \end{pmatrix},$$

where

$$X_1 = A_1 A_1^T + A_2 A_2^T + B_1 B_1^T + B_2 B_2^T,$$

$$X_2 = C_1 C_1^T + C_2 C_2^T + D_1 D_1^T + D_2 D_2^T$$

and

$$Y_1 = A_1 A_2^T + A_2 A_1^T + B_1 B_2^T + B_2 B_1^T,$$

$$Y_2 = A_1 C_1^T + A_2 C_2^T + B_1 D_1^T + B_2 D_2^T,$$

$$Y_3 = A_1 C_2^T + A_2 C_1^T + B_1 D_2^T + B_2 D_1^T,$$

$$Y_4 = C_1 C_1^T + C_2 C_2^T + D_1 D_2^T + D_2 D_1^T.$$

Clearly, $Y_i = 0$ if and only if $Y_i = 0$, $Y_i^* = 0$ and $Y_i^* = 0$ for $i \in \{1 \ldots 4\}$. Thus, $\Omega_2^{24}(v)\Omega_2^{24}(v)^T = I_{24}$ if and only if

$$\begin{cases} X_1 = X_2 = I_6, \\ Y_1 = Y_2 = Y_3 = Y_4 = 0. \end{cases}$$
**Definition 3.13.** Let $G \cong D_{12} \cong \langle a, b \mid a^{12} = b^2 = 1, bab = a^{-1} \rangle$ with the fixed listing $G = (g_{12j+i+1}) = a^{ib^j}$ for $i \in [0..11]$ and $j \in [0..1]$. Let $H \cong D_{6} \cong \langle c, d \mid c^6 = d^2 = 1, dcd = c^{-1} \rangle$ with the fixed listing $H = (h_{6j+i+1}) = c^{jd^i}$ for $i \in [0..5]$ and $j \in [0..1]$. Let $H' = I$ and $P' = 1$. Let $v = \sum_{i=1}^{24} a_i g_i \in RG$. If $\Omega_3^{24}(v)$ is the composite $(G, H)$-matrix of $v \in RG$ with respect to $H'$ and $P'$, then

$$
\Omega_3^{24}(v) = \begin{pmatrix}
A_1 & A_2 & B_1 & B_2 \\
A_1^T & A_2^T & B_1^T & B_2^T \\
C_1 & C_2 & D_1 & D_2 \\
C_1^T & C_2^T & D_1^T & D_2^T
\end{pmatrix},
$$

where $A_1 = \text{circ}(v_{1,6})$, $A_2 = \text{circ}(v_{7,12})$, $B_1 = \text{circ}(v_{13,18})$, $B_2 = \text{circ}(v_{19,24})$, $C_1 = \text{circ}(v_{13, 24}, 20)$, $C_2 = \text{circ}(v_{19,14})$, $D_1 = \text{circ}(v_1, v_{12,8})$ and $D_2 = \text{circ}(v_{7,2})$.

**Theorem 3.14.** Let $G = (I \mid \Omega_3^{24}(v))$ where $\Omega_3^{24}(v)$ is as defined in Definition 3.13. Then $G$ is a generator matrix of a self-dual [48, 24] code over $R$ if and only if

\[
\begin{align*}
A_1A_1^T + A_2A_2^T + B_1B_1^T + B_2B_2^T &= I_6, \\
C_1C_1^T + C_2C_2^T + D_1D_1^T + D_2D_2^T &= I_6, \\
A_1C_1^T + A_2C_2^T + B_1D_1^T + B_2D_2^T &= 0, \\
A_1C_2 + A_2C_1 + B_1D_2 + B_2D_1 &= 0.
\end{align*}
\]

Proof. We know that $G$ is a generator matrix of a self-dual [48, 24] code over $R$ if and only if $\Omega_3^{24}(v)\Omega_3^{24}(v)^T = I_{24}$. We find that

\[
\Omega_3^{24}(v)\Omega_3^{24}(v)^T = \begin{pmatrix}
X_1 & 0 & Y_1 & Y_2 \\
0 & X_2 & Y_2^T & Y_1^T \\
Y_1 & Y_2 & X_2 & 0 \\
Y_2^T & Y_1 & 0 & X_2
\end{pmatrix},
\]

where

\[
X_1 = A_1A_1^T + A_2A_2^T + B_1B_1^T + B_2B_2^T,
X_2 = C_1C_1^T + C_2C_2^T + D_1D_1^T + D_2D_2^T
\]

and

\[
Y_1 = A_1C_1^T + A_2C_2^T + B_1D_1^T + B_2D_2^T,
Y_2 = A_1C_2 + A_2C_1 + B_1D_2 + B_2D_1.
\]

Clearly, $Y_i = 0$ if and only if $Y_i^T = 0$ for $i \in [1..2]$. Thus, $\Omega_3^{24}(v)\Omega_3^{24}(v)^T = I_{24}$ if and only if

\[
\begin{cases}
X_1 = X_2 = I_6, \\
Y_1 = Y_2 = 0.
\end{cases}
\]

\[\square\]

### 4 Results

In this section, we apply the theorems given in the previous section to obtain many new best known binary self-dual codes. In particular, we obtain 28 singly-even [80, 40, 14]...
codes, 107 \([84, 42, 14]\) codes, 105 singly-even \([96, 48, 16]\) codes and 121 doubly-even \([96, 48, 16]\) codes.

We search for these codes using MATLAB and determine their properties using Q-extension [3] and Magma [2]. In MATLAB, we employ an algorithm which randomly searches for the construction parameters that satisfy the necessary and sufficient conditions stated in the corresponding theorem. For such parameters, we then build the corresponding binary generator matrices and print them to text files. We then use Q-extension to read these text files and determine the minimum distance and partial weight enumerator of each corresponding code. Furthermore, we determine the automorphism group order of each code using Magma. A database of generator matrices of the new codes is given online at [18]. The database is partitioned into text files (interpretable by Q-extension) corresponding to each code type. In these files, specific properties of the codes including the construction parameters, weight enumerator parameter values and automorphism group order are formatted as comments above the generator matrices. Partial weight enumerators of the codes are also formatted as comments below the generator matrices. Table 1 gives the quaternary notation system we use to represent elements of \(\mathbb{F}_2 + u\mathbb{F}_2\) and \(\mathbb{F}_4\).

Table 1: Quaternary notation system for elements of \(\mathbb{F}_2 + u\mathbb{F}_2\) and \(\mathbb{F}_4\).

| \(\mathbb{F}_2 + u\mathbb{F}_2\) | \(\mathbb{F}_4\) | Symbol |
|-----------------|-----------------|--------|
| 0               | 0               | 0      |
| 1               | 1               | 1      |
| \(u\)           | \(w\)           | 2      |
| \(1 + u\)       | \(1 + w\)       | 3      |

### 4.1 New Self-Dual Codes of Length 80

The weight enumerator of a singly-even binary self-dual \([80, 40, 14]\) code is given in [31] as

\[
W_{80} = 1 + (3200 + 4\alpha)x^{14} + (47645 - 8\alpha + 256\beta)x^{16} + \cdots ,
\]

where \(\alpha, \beta \in \mathbb{Z}\). Previously known \((\alpha, \beta)\) values for weight enumerator \(W_{80}\) can be found online at [29] (see [19, 31, 13, 16, 15, 28, 17]).

We obtain 28 new best known singly-even binary self-dual codes of length 80 which have weight enumerator \(W_{80}\) for

- \(\beta = 0\) and \(\alpha \in \{-z : z = 65, 80, 120, 125, 130, 135, 140, 145, 150, 155, 165, 175, 190, 195, 205, 210, 215, 220, 235, 250, 270, 275, 280, 360\}\);
- \(\beta = 10\) and \(\alpha \in \{-2z : z = 130, 150, 160, 185\}\).

Of the 28 new codes, 19 are constructed by applying Theorem 3.2 over \(\mathbb{F}_4\) (Table 2); 4 are constructed by applying Theorem 3.4 over \(\mathbb{F}_2 + u\mathbb{F}_2\) (Table 3) and 5 are constructed by applying Theorem 3.4 over \(\mathbb{F}_4\) (Table 4).
Table 2: New singly-even binary self-dual [80, 40, 14] codes from Theorem 3.2 over $\mathbb{F}_4$.

4.2 New Self-Dual Codes of Length 84

The possible weight enumerators of a binary self-dual [84, 42, 14] code are given in [5, 31] as

\[ W_{84,1} = 1 + (4080 - \alpha)x^{14} + 39524x^{16} \]
\[ + (247264 + 14\alpha)x^{18} + \cdots, \]
\[ W_{84,2} = 1 + (4080 - \alpha)x^{14} + (28644 + 64\beta)x^{16} \]
\[ + (390368 + 14\alpha - 384\beta)x^{18} + \cdots, \]
\[ W_{84,3} = 1 + (4080 - \alpha)x^{14} + (28644 + 64\beta)x^{16} \]
\[ + (394464 + 14\alpha - 384\beta)x^{18} + \cdots, \]

where \( \alpha, \beta \in \mathbb{Z} \). Previously known \((\alpha, \beta)\) values for weight enumerators \(W_{84,1}\) and \(W_{84,2}\) can be found online at [29] (see [19, 31]). It is unknown whether or not a code with weight enumerator \(W_{84,3}\) has been previously reported.

We obtain 107 new best known binary self-dual codes of length 84 which have weight enumerator \(W_{84,3}\) for

\( \beta = 0 \) and \( \alpha \in \{6z : z = 336, 350, 358, 365, 372, 386, 392, 393, 399, 400, 406, 407, 413, 414, 420, 421, 427, 428, 434, 441, 442, 448, 449, 455, 456, 462, 463, 469, 470, 476, 477, 483, 484, 490, 491, 497, 498, 504, 505, 511, 512, 518, 519, 525, 526, 532, 533, 539, 540, 546, 553, 554, 560, 567\}\};

\( \beta = 21 \) and \( \alpha \in \{6z : z = 413, 434, 435, 441, 442, 449, 455, 456, 462, 463, 469, 470, 476, 477, 483, 484, 490, 491, 497, 498, 504, 505, 511, 512, 518, 519, 525, 526, 532, 533, 539, 540, 546, 553, 560, 568, 575, 595\}\};

\( \beta = 42 \) and \( \alpha \in \{6z : z = 490, 512, 518, 525, 526, 539, 540, 547, 553, 560, 568\}\};

\( \beta = 63 \) and \( \alpha \in \{6z : z = 574, 575\}\}.

Of the 107 new codes, 55 are constructed by applying Theorem 3.6 over \( \mathbb{F}_2 \) (Table 5) and 52 are constructed by applying Theorem 3.8 over \( \mathbb{F}_2 \) (Table 6). In Tables 5 and 6, we only list 10 codes to save space. We refer to Database 2 of [18] for the remaining unlisted codes.

**Table 5**: New binary self-dual [84, 42, 14] codes from Theorem 3.6 over \( \mathbb{F}_2 \) (see Database 2 of [18] for codes \( C_{84,11} \) to \( C_{84,55} \)).

| \( C_{84,i} \) | \( v \) | \( W_{84,j} \) | \( \alpha \) | \( \beta \) | \( |\text{Aut}(C_{84,i})|\) |
|----------------|-----|----------------|-----|-----|----------------|

4.3 New Self-Dual Codes of Length 96

The possible weight enumerators of a singly-even binary self-dual \([96,48,16]\) code are given in [20] as

\[
W^1_{96,1} = 1 + (\alpha - 5814)x^{16} + (97280 + 64\beta) x^{18} \\
+ (1784320 - 16\alpha - 384\beta)x^{20} \\
+ (17626112 + 192\beta)x^{22} + \cdots ,
\]

\[
W^1_{96,2} = 1 + (\alpha - 5814)x^{16} + (97280 + 64\beta) x^{18} \\
+ (1694208 - 16\alpha - 384\beta + 4096\gamma)x^{20} \\
+ (18969600 + 192\beta - 49152\gamma)x^{22} + \cdots ,
\]

where \(\alpha, \beta, \gamma \in \mathbb{Z}\). Previously known \((\alpha, \beta, \gamma)\) values for weight enumerators \(W^1_{96,1}\) and \(W^1_{96,2}\) can be found online at [29] (see [32, 20]).

We obtain 105 new best known singly-even binary self-dual codes of length 96 which have weight enumerator \(W^1_{96,2}\) for

\[
\gamma = 0 \quad \text{and} \quad (\alpha, \beta) \in \{(12z_1, -4z_2) : (z_1, z_2) \in \{(580, 0), (896, 0), (904, 0), (805, 1), (854, 3), (808, 4), (837, 6), (926, 8), (822, 7), (865, 9), (860, 10), (860, 12), (897, 12), (900, 12), (920, 12), (1014, 12), (877, 13), (910, 15), (877, 16), (933, 18), (908, 19), (938, 21), (952, 22), (957, 24), (990, 24), (965, 25), (1003, 27), (947, 28), (1038, 30), (1052, 31), (971, 34), (1045, 36), (1222, 36), (1148, 46), (1244, 48), (1260, 48), (1204, 52), (1278, 60)\};
\]

\[
\gamma = 6 \quad \text{and} \quad (\alpha, \beta) \in \{(12z_1, -4z_2) : (z_1, z_2) \in \{(909, 30), (913, 31), (922, 33), (901, 34), (902, 36), (918, 37), (944, 39), (948, 40), (932, 42), (995, 43), (949, 45), (980, 46), (1034, 48), (1018, 49), (969, 51), (978, 52), (1120, 64)\};
\]

\[
\gamma = 12 \quad \text{and} \quad (\alpha, \beta) \in \{(12z_1, -4z_2) : (z_1, z_2) \in \{(928, 60), (988, 60), (992, 60), (1048, 60), (1056, 60), (1076, 60), (1096, 60), (1104, 60), (1120, 60), (1148, 60), (1160, 60), (1168, 60), (1176, 60), (1208, 60), (1216, 60), (1232, 60), (1240, 60), (1264, 60), (1280, 60), (1288, 60), (1320, 60), (1336, 60), (1520, 60), (982, 61), (975, 63), (984, 64), (997, 66), (1133, 66), (1148, 66), (1236, 66), (977, 67), (1075, 69), (1042, 70), (1080, 72), (1112, 72), (1120, 72), (1137, 72), (1272, 72), (1544, 72), (1036, 73), (1046, 76), (1098, 78), (1121, 78), (1072, 79), (1226, 84), (1352, 84), (1528, 84), (1224, 85), (1332, 100), (1384, 108)\}.
\]
Of the 105 new codes, 5 are constructed by applying Theorem 3.10 over $\mathbb{F}_2 + u\mathbb{F}_2$ (Table 7); 56 are constructed by applying Theorem 3.10 over $\mathbb{F}_4$ (Table 8); 29 are constructed by applying Theorem 3.12 over $\mathbb{F}_2 + u\mathbb{F}_2$ (Table 9) and 15 are constructed by applying Theorem 3.14 over $\mathbb{F}_2 + u\mathbb{F}_2$ (Table 10). In Tables 8 and 9, we only list 10 codes to save space. We refer to Database 3 of [18] for the remaining unlisted codes.

in [20] as

$$W_{96}^{II} = 1 + \alpha x^{16} + (3217056 - 16 \alpha)x^{20} + \cdots,$$

where $\alpha \in \mathbb{Z}$. Previously known $\alpha$ values for weight enumerator $W_{96}^{II}$ can be found online at [29] (see [11, 5, 4, 21, 24, 30, 23, 20]).

We obtain 121 new best known doubly-even binary self-dual codes of length 96 which have weight enumerator $W_{96}^{II}$ for

$$\alpha \in \{6z : z = 1379, 1403, 1419, 1443, 1459, 1473, 1499, 1507, 1523, 1539, 1547, 1563, 1579, 1603, 1619, 1627, 1643, 1659, 1667, 1683, 1699, 1707, 1723, 1747, 1759, 1763, 1779, 1787, 1795, 1803, 1811, 1819, 1827, 1835, 1843, 1851, 1859, 1867, 1875, 1879, 1883, 1891, 1899, 1903, 1907, 1913, 1915, 1921, 1923, 1931, 1939, 1947, 1957, 1963, 1971, 1975, 1979, 1987, 1995, 2003, 2007, 2011, 2015, 2019, 2023, 2027, 2031, 2039, 2043, 2055, 2059, 2067, 2071, 2079, 2083, 2087, 2091, 2095, 2103, 2107, 2119, 2127, 2135, 2143, 2147, 2151, 2163, 2167, 2175, 2195, 2199, 2203, 2207, 2211, 2215, 2223, 2231, 2247, 2255, 2259, 2263, 2279, 2283, 2295, 2311, 2359, 2379, 2407, 2423, 2471, 2483, 2503, 2519, 2567, 2599, 2663, 2695, 2711, 2759, 2887, 4751\}.$$

Of the 121 new codes, 88 are constructed by applying Theorem 3.10 over $\mathbb{F}_2 + u\mathbb{F}_2$ (Table 11); 8 are constructed by applying Theorem 3.10 over $\mathbb{F}_4$ (Table 12); 13 are constructed by applying Theorem 3.12 over $\mathbb{F}_2 + u\mathbb{F}_2$ (Table 13) and 12 are constructed by applying Theorem 3.14 over $\mathbb{F}_2 + u\mathbb{F}_2$ (Table 14). In Table 11, we only list 10 codes to save space. We refer to Database 4 of [18] for the remaining unlisted codes.

5 Conclusion

In this work, we applied the idea of composite matrices $\Omega(v)$ to derive a number of techniques assuming a generator matrix of the form $(I_n | \Omega(v))$ to construct new binary self-dual codes. We defined each of the composite matrices that were implemented in the techniques and we proved the necessary conditions required by the techniques to produce self-dual codes. We applied these techniques directly over $\mathbb{F}_2$ as well as over
Table 11: New doubly-even binary self-dual $[96, 48, 16]$ codes from Theorem 3.10 over $\mathbb{F}_2 + u\mathbb{F}_2$ (see Database 4 of [18] for codes $C_{96,11}$ to $C_{96,88}$).

By so doing, we were able to construct new best known binary self-dual codes with many different weight enumerator parameter values. In particular, we constructed 28 singly-even $[80, 40, 14]$ codes, 107 $[84, 42, 14]$ codes, 105 singly-even $[96, 48, 16]$ codes and 121 doubly-even $[96, 48, 16]$ codes.
The advantage of using composite matrices is that there are many different combinations of their determining parameters, i.e. the groups $G$ and $\{H_1, H_2, \ldots, H_\eta\}$ and the parameter matrices $H'$ and $P'$. This allows for many different forms of the matrices $\Omega(v)$ which often have very unusual structures. For each of the composite matrices we defined, we assumed that $H' = 1$ and $P' = 1$. A suggestion for future work could be to investigate different choices for both $H'$ and $P'$. Another suggestion would be to use composite matrices determined by groups $G$ and $\{H_1, H_2, \ldots, H_\eta\}$ of different orders. We could also investigate applying composite matrices over rings other than those used in this work.
