Abstract
This paper investigates the economic impacts of COVID-19 on households based on differences in the Socio-Economic Status (SES). We determine the household-level effects of the COVID-19 by using Religion, Mother tongue, Social background, Age, Education Qualification, Type of family, Marital status and Household Income. Poor households and households with low Socio-Economic prerequisites are struggling the most due to the pandemic. We used primary data of 50 sample respondents collected through snowball sampling technique using an Interview Schedule from Coimbatore. Poor households were less resilient and more likely to fall back into poverty due to COVID-19, while the opposite stands true for non-poor households with high SES. There are nonetheless very few literature articles associated with the influences of shocks on the Socio-Economic Status of specific households and communities in the developing world like India.

Keywords: COVID 19, Health, Socio Economic Status (SES), Income, Poverty Trap

Introduction
Ever seeing that the opening of 2019 and at present, the world economic system has been started up by using a new structure of Coronavirus termed Novel Coronavirus Pneumonia (NCP) or COVID-19. COVID-19 has affected the socio-economic stipulations worldwide, particularly in the case of developing economies and poverty. Poor households and households with low Socio-Economic prerequisites are struggling the most due to the pandemic. There seems a disparity in the influences of COVID-19 at household degrees due to variants in the Socio-Economic symptoms of the households. Therefore, it is indispensable to find out about the consequences of exterior financial shocks on one-of-a-kind households and the response of the households to such shocks. The monetary elements may also supply a higher perception of the variations in the elements and applicable coverage implications for households. Although the unfold of COVID-19 has impacted the majority of households in India, especially Coimbatore, it is discovered that some of the households are better-off at some stage in the pandemic as in contrast to the different households.

Similarly, the poverty state of affairs and Socio-Economic prerequisites of the households differ in results and resilience toward exterior elements like COVID-19, with some bad and prone households are assumed to have suffered extra severely. These variations grant a probability for appreciation of why some households are affected insignificantly whilst others are affected significantly. Based on a comparable assumption, the learn about of household’s Socio-Economic Status (SES) for the estimation of the impact of COVID-19 on households may also furnish complete and favorable.
In this paper, we name for thinking about and having an impact on COVID-19 on the international economy. The learn about asserted that fundamental impact on a novel COVID-19 outbreak would be on grant facet of the market. However, the redress being viewed presently is generally focusing on the demand side. It additionally concludes that underneath sensible ongoing scenarios, an international recession is an awful lot in all likelihood to occur.

S. Mahendra Dev., et al. (2020) The goal of this lookup used to be to locate the Socio-Economic Status of COVID-19. The learn about has analyzed Indian economic system state of affairs throughout sectors earlier than the outbreak and after the outbreak. It has been noted that measures like nationwide lockdown, restriction on worldwide change &commerce, closure of non-essential services, constrained movement all will lead to adversely affect the monetary fitness of the Nation. Further, the find out about has cited that the magnitude of financial status will rely upon the severity and length of a health crisis, length of lockdown, how successfully lockdown is dealt with, and additionally on how the state of affairs unfolds as soon as the lockdown is lifted.

Socio-Economic Status
Socio-Economic Status (SES) of a household is a vital component in signifying the results associated with their Income. It can affect the outcomes of a financial phenomenon in distinct ways. According to the American Psychological Association, the Socio-Economic Status (SES) is a character or group’s social classification or repute which is regularly calculated using combining education, profits, and occupation. As cited by using Adler & Snibble, households with greater SES have higher get entry to health care, housing, understanding, and vitamin as in contrast to decrease SES households. Several lookup research has centered on the effects of distinctive shocks on households primarily based on the status. Some have highlighted the influences of financial shocks such as joblessness or profits decline and their outcomes on the household’s status. At the same time, others have argued on the fitness shocks results on person’s health and in flip the productiveness of the employees sooner or later main to decline in profits stage of the households. There are nonetheless very few literature articles associated
with the influences of shocks on the Socio-Economic Status of specific households and communities in the developing world. According to our research, the Socio-Economic Status is regularly calculated using Religion, Mother tongue, Social background, Age, Education Qualification, Type of family, Marital status, and Household Income.

| Urdu                      | 10        | 20.0       |
| Social background         |           |            |
| MBC                       | 25        | 50.0       |
| OC                        | 15        | 30.0       |
| BC                        | 10        | 20.0       |
| Age                       |           |            |
| 20-24                     | 15        | 30.0       |
| 25-29                     | 22        | 44.0       |
| 30-35                     | 9         | 18.0       |
| 36-40                     | 4         | 8.0        |
| Education qualification   |           |            |
| Degree/diploma            | 23        | 46.0       |
| Primary                   | 16        | 32.0       |
| Professional              | 5         | 10.0       |
| Higher secondary          | 6         | 12.0       |
| Type of family            |           |            |
| Nuclear                   | 50        | 100.0      |
| Marital Status            |           |            |
| Married                   | 32        | 64.0       |
| Unmarried                 | 18        | 36.0       |
| Household Income (in Rs)  |           |            |
| Below-30000               | 38        | 76.0       |
| 30001-above               | 12        | 24.0       |
| Total                     | 50        | 100.0      |

**Source:** Primary Data

Socio-Economic Status of the sample respondents is classified according to their Religion, Mother tongue, Social background, Age, Education Qualification, Type of family, Marital status, and Household Income. In this study, Around 50 samples of the COVID-19 patients were treated in the private hospitals in Coimbatore. It is evident from the above study that a majority of the respondents are Hindus and Tamil is the most speaking language amongst the sample respondents, i.e., 40 samples of the COVID-19 patients treated in the private hospitals in Coimbatore (80.0 percent) were native speakers of Tamil. The social groups have been broadly divided into three categories, namely, the Most Backward Caste (MBC), Backward Caste (BC), and Other Caste (OC). It may be shown from the above study that out of the total sample respondents, the majority of them belonged to the MBC community (50.0 percent), followed by the BC community (20.0 percent) and the OC community at 30.00 percent. Scheduled caste and scheduled tribe (SC&ST) were except because the reason sample was not identified. The age of the respondents is grouped into four categories. It states that 30.0 percent of the respondents (i.e. 15 respondents) were from the age group between 20 to 24 years, and there were 22 respondents (i.e.44.0 percent) who come under the age category 25-29. About 18.0 percent of the respondents (i.e. 09 respondents are from the age group of 30-35 years.
