(Dated: 14 April 2017)

Simplified models of transport in mesoscopic systems are often based on a small sample connected to a finite number of leads. The leads are often modelled using the Laplacian on the discrete half-line $\mathbb{N}$. Detailed studies of the transport near thresholds require detailed information on the resolvent of the Laplacian on the discrete half-line. This paper presents a complete study of threshold resonance states and resolvent expansions at a threshold for the Schrödinger operator on the discrete half-line $\mathbb{N}$ with a general boundary condition. A precise description of the expansion coefficients reveals their exact correspondence to the generalized eigenspaces, or the threshold types. The presentation of the paper is adapted from that of Ito-Jensen \cite[Rev. Math. Phys. 27 (2015), 1550002 (45 pages)]{Ito-Jensen}, implementing the expansion scheme of Jensen-Nenciu \cite[Rev. Math. Phys. 13 (2001), 717–754, 16 (2004), 675–677]{Jensen-Nenciu} in its full generality.

I. INTRODUCTION

Simplified models of transport in mesoscopic systems are often based on a small sample connected to a finite number of leads. The leads are often modelled using the Laplacian on the discrete half-line $\mathbb{N}$. Detailed studies of the transport near thresholds require detailed information on the resolvent of the Laplacian on the discrete half-line. For an example see Cornean-Jensen-Nenciu\cite{Cornean-Jensen-Nenciu} and references therein. The results in this paper allow one to obtain more detailed information on the adiabatic limit studied in Cornean-Jensen-Nenciu\cite{Cornean-Jensen-Nenciu}.

Let $H_0$ be the positive Laplacian on the discrete half-line $\mathbb{N} = \{1, 2, \ldots\}$, i.e., for any sequence $x : \mathbb{N} \to \mathbb{C}$ we define the sequence $H_0 x : \mathbb{N} \to \mathbb{C}$ by

$$\begin{align*}
(H_0 x)[n] &= -(x[n+1] + x[n-1] - 2x[n]).
\end{align*}
$$

The definition (I.1) is incomplete without assigning a boundary condition, or a boundary value $x[0]$ for each sequence $x : \mathbb{N} \to \mathbb{C}$. In this paper we focus on the Dirichlet boundary condition

$$x[0] = 0.
$$

In other words, we set for any sequence $x : \mathbb{N} \to \mathbb{C}$

$$\begin{align*}
(H_0 x)[n] &= \begin{cases}
2x[1] - x[2] & \text{for } n = 1, \\
2x[n] - x[n+1] - x[n-1] & \text{for } n \geq 2.
\end{cases}
\end{align*}
$$

The restriction of $H_0$ to the Hilbert space $\mathcal{H} = \ell^2(\mathbb{N})$ is bounded and self-adjoint, and its spectrum is

$$\sigma(H_0) = \sigma_{\text{ac}}(H_0) = [0, 4].
$$
The points $0, 4 \in \sigma(H_0)$ are called the *thresholds*. The purpose of this paper is to analyze the threshold behavior of a perturbed Laplacian $H = H_0 + V$ on the discrete half-line $\mathbb{N}$. We compute an asymptotic expansion of the resolvent $R(z) = (H - z)^{-1}$ at the threshold $z = 0$, and, in particular, describe a precise relation between the expansion coefficients and the generalized eigenspaces. The generalized eigenspace considered here is the largest possible one, and includes the threshold resonance states as a part of it. These investigations are done in the same manner as in Ito-Jensen$^2$, employing the expansion scheme given in Jensen-Nenciu$^3,4$. The technique used in Ito-Jensen$^2$ to treat the threshold 4 can be applied here. Hence we discuss only the threshold zero.

The starting point of our analysis is the free resolvent kernel discussed in Section II. The main results of the paper will be presented in Section III. Actually general boundary conditions are included in our setting as specific forms of perturbations of the Dirichlet Laplacian. We will see this in Section IV. Section V is devoted to an analysis of the generalized eigenspace. After a short preliminary presentation in Section VI, the proofs of the main theorems will be provided in Sections VII–X according to each threshold type. There we will repeatedly use the inversion formula from Jensen-Nenciu$^3$, adapted to the case at hand. As a reference we will quote the formula in the form given in Ito-Jensen$^2$ in Appendix A.

There is a large number of papers on discrete Schrödinger operators. However, as far as we are aware, the complete threshold analyses and the resolvent expansions presented here are new.

II. THE FREE LAPLACIAN

In this section we discuss properties of the free Dirichlet Laplacian $H_0$ on the discrete half-line $\mathbb{N}$ defined by (I.1) and (I.2), or by (I.3). The properties presented here may be considered as a prototype of our main results for a perturbed Laplacian. They will be employed repeatedly both in stating and in proving the main theorems.

Let $\mathcal{H} = L^2(0, \pi)$, and define the Fourier transform $\mathcal{F}: \mathcal{H} \to \mathcal{H}$ and its inverse $\mathcal{F}^*: \mathcal{H} \to \mathcal{H}$ by

$$\mathcal{F}x(\theta) = \sqrt{\frac{2}{\pi}} \sum_{n=1}^{\infty} x[n] \sin(n\theta),$$
$$\mathcal{F}^* f[n] = \sqrt{\frac{2}{\pi}} \int_0^\pi f(\theta) \sin(n\theta) \, d\theta.$$  

Then we have a spectral representation of $H_0$:

$$\mathcal{F}H_0\mathcal{F}^* = 2 - 2\cos \theta = 4 \sin^2(\theta/2).$$  \hspace{1cm} (II.1)

This in fact verifies (I.4). Using the expression (II.1), or antisymmetrizing the kernel of resolvent on the whole line $\mathbb{Z}$, see e.g. Ito-Jensen$^2$, we can compute the kernel of resolvent $R_0(z) = (H_0 - z)^{-1}$: For $z \in \mathbb{C} \setminus [0, 4]$ with $z \sim 0$ we have

$$R_0(z)[n, m] = \frac{i}{2\sin \phi} (e^{i\phi(n-m)} - e^{i\phi(n+m)}), \quad n, m \in \mathbb{N}. \hspace{1cm} (II.2)$$

Here the variable $z \in \mathbb{C} \setminus [0, 4]$ is related to $\phi$ through the correspondence

$$z = 4 \sin^2(\phi/2), \quad \text{Im } \phi > 0.$$  

Using the expression (II.2), we can explicitly compute the expansion of $R_0(z)$ around $z = 0$. Before stating it let us introduce the notation employed in this paper.

**Notation.** In expansions we change variable from $z \in \mathbb{C} \setminus [0, \infty)$ to $\kappa$. These variables are related as

$$\kappa = -i\sqrt{z}, \quad \text{Im } \kappa > 0, \quad \text{Im } \sqrt{z} > 0. \hspace{1cm} (II.3)$$
We freely write $R(z)$ as $R(\kappa)$, etc. We use the notation

$$n \wedge m = \min\{n, m\}, \quad n \vee m = \max\{n, m\}.$$  

For $s \in \mathbb{R}$ we let

$$\mathcal{L}^s = \ell^{1,s}(\mathbb{N})$$

$$= \{ x : \mathbb{N} \to \mathbb{C}; \quad \|x\|_{1,s} = \sum_{n \in \mathbb{N}} (1 + n^2)^{s/2}|x[n]| < \infty \},$$

$$(\mathcal{L}^s)^* = \ell^{\infty,-s}(\mathbb{N})$$

$$= \{ x : \mathbb{N} \to \mathbb{C}; \quad \|x\|_{\infty,-s} = \sup_{n \in \mathbb{N}} (1 + n^2)^{-s/2}|x[n]| < \infty \}.$$

We denote the set of all bounded operators from a general Banach space $\mathcal{K}$ to another $\mathcal{K}'$ by $\mathcal{B}(\mathcal{K}, \mathcal{K}')$, and abbreviate $\mathcal{B}(\mathcal{K}) = \mathcal{B}(\mathcal{K}, \mathcal{K})$. In particular, we write

$$\mathcal{B}^s = \mathcal{B}(\mathcal{L}^s, (\mathcal{L}^s)^*).$$

We replace $\mathcal{B}$ by $\mathcal{C}$ when considering the corresponding spaces of compact operators. Define the sequences $n \in (\mathcal{L}^1)^*$ and $1 \in (\mathcal{L}^0)^*$ by

$$n[m] = m \quad \text{and} \quad 1[m] = 1, \quad m \in \mathbb{N},$$  

(II.4)

respectively. Throughout the paper we frequently use the pseudo-inverse $A^\dagger$ of a self-adjoint operator $A$. For this concept we refer to Appendix A.

**Proposition II.1.** Let $N \geq 0$ be any integer. As $\kappa \to 0$ with $\operatorname{Re}\kappa > 0$, the resolvent $R_0(\kappa)$ has the expansion:

$$R_0(\kappa) = \sum_{j=0}^{N} \kappa^j G_{0,j} + O(\kappa^{N+1}) \quad \text{in} \ \mathcal{B}^{N+2},$$  

(II.5)

with $G_{0,j} \in \mathcal{B}^{j+1}$ for $j$ even, and $G_{0,j} \in \mathcal{B}^{j}$ for $j$ odd, satisfying

$$H_0 G_{0,j} = G_{0,j+1} H_0 = 0,$$

$$H_0 G_{0,j} = G_{0,j-1} H_0 = -G_{0,j-2} \quad \text{for} \ j \geq 2.$$  

(II.6)

The coefficients $G_{0,j}$ have explicit kernels, and the first few are given by

$$G_{0,0}[n,m] = n \wedge m,$$

(II.7)

$$G_{0,1}[n,m] = -n \cdot m,$$

(II.8)

$$G_{0,2}[n,m] = \frac{1}{6}(n \wedge m)^3 + \frac{1}{2} n \cdot m \cdot (n \vee m),$$

(II.9)

$$G_{0,3}[n,m] = \frac{5}{24} n^3 \cdot m - \frac{1}{6} n^3 \cdot m - \frac{1}{6} n \cdot m^3.$$  

(II.10)

**Proof.** The expansion (II.5) with expressions (II.7)–(II.10) follows directly from (II.2), cf. Ito-Jensen² (Proposition 2.1). To see the identities in (II.6) it suffices to note that for any rapidly decreasing sequence $\Psi : \mathbb{N} \to \mathbb{C}$ we have

$$(H_0 + \kappa^2) R_0(\kappa) \Psi = R_0(\kappa)(H_0 + \kappa^2) \Psi = \Psi$$

for $\operatorname{Re}\kappa > 0$. The details of the computations are omitted. \qed
We note that the sequence $n \in (L^1)^*$ is a generalized eigenfunction for $H_0$, and the coefficient $G_{0,1}$ is a generalized projection onto it:

$$H_0 n = 0, \quad G_{0,1} = -|n \rangle \langle n|.$$

On the other hand, the sequence $1 \in (L^0)^*$, which with $n$ forms a basis of the generalized eigenspace for the Laplacian on the whole line $\mathbb{Z}$, is not a generalized eigenfunction on $\mathbb{N}$. It does not appear in the above expansion coefficients, either.

### III. THE PERTURBED LAPLACIAN

Now we consider the perturbed Laplacian $H = H_0 + V$ on $\mathbb{N}$, and state the main theorems of the paper. These theorems reveal a precise relation between the generalized eigenspace and the expansion coefficients of the resolvent at threshold.

The class of interactions considered here is from Ito-Jensen\textsuperscript{2}. It is general enough to contain non-local interactions, but is formulated a little abstractly. We refer to Ito-Jensen\textsuperscript{2} (Appendix B) for examples. We note that this class of interactions is closed under addition, see Ito-Jensen\textsuperscript{2}.

Recall the notation defined right before Proposition II.1.

**Assumption III.1.** Let $V \in \mathcal{B}(H)$ be self-adjoint, and assume that there exist an injective operator $v \in \mathcal{B}(K, L^\beta) \cap \mathcal{C}(K, L^1)$ with $\beta \geq 1$ and a self-adjoint unitary operator $U \in \mathcal{B}(K)$, both defined on some Hilbert space $K$, such that

$$V = vUv^* \in \mathcal{B}((L^\beta)^*, L^\beta) \cap \mathcal{C}((L^1)^*, L^1).$$

Under Assumption III.1 we let

$$H = H_0 + V, \quad R(z) = (H - z)^{-1}.$$  

The operator $H$ is a bounded self-adjoint operator on $\mathcal{H}$ with $\sigma_{\text{ess}}(H) = [0, 4]$. Using the Mourre method (see Boutet de Monvel-Shabani\textsuperscript{5}) one can show that $\sigma_{\text{sc}}(H) = \emptyset$. For local $V$ other conditions for $\sigma_{\text{sc}}(H) = \emptyset$ are given in Damanik-Killip\textsuperscript{6}.

Let us consider the solutions to the equation $H \Psi = 0$ in the largest space where it can be defined. Define the (generalized) zero eigenspaces by

$$E = E^0 = \{ \Psi \in (L^\beta)^* | H \Psi = 0 \},$$  

$$E^0 = \mathcal{E} \cap (C^1 \oplus L^{\beta-2}),$$  

$$E = \mathcal{E} \cap L^{\beta-2}.$$  

These spaces will be analyzed in detail in Section V. Here we only quote some of the results given there: Under Assumption III.1 with $\beta \geq 1$ the generalized eigenfunctions have a specific asymptotics:

$$\mathcal{E} \subset \mathbb{C}n \oplus C^1 \oplus L^{\beta-2},$$  

and their dimensions satisfy

$$\dim(\mathcal{E}/\mathcal{E}) + \dim(\mathcal{E}/E) = 1, \quad 0 \leq \dim \mathcal{E} < \infty.$$  

We introduce the same classification of the threshold as in Ito-Jensen\textsuperscript{2} (Definition 1.6).

**Definition III.2.** The threshold $z = 0$ is said to be

1. a regular point, if $\mathcal{E} = E = \{0\}$;

2. an exceptional point of the first kind, if $\mathcal{E} \supsetneq E = \{0\}$;
3. an exceptional point of the second kind, if \( \mathcal{E} = \mathcal{E} \supseteq \{0\} \);

4. an exceptional point of the third kind, if \( \mathcal{E} \supseteq \mathcal{E} \supseteq \{0\} \).

It would be more precise to call a function in \( \tilde{\mathcal{E}} \) a generalized eigenfunction, that in \( \mathcal{E} \) a resonance function, and that in \( \mathcal{E} \) an eigenfunction, but sometimes all of them are called simply eigenfunctions. In particular, we call \( \Psi_c \in \mathcal{E} \) a canonical resonance function if it satisfies

\[
\forall \Psi \in \mathcal{E} \quad \langle \Psi, \Psi_c \rangle = 0, \quad \text{and} \quad \Psi_c - 1 \in L^{\beta-2}.
\]

We remark that the latter asymptotics for \( \Psi_c \in \mathcal{E} \) is equivalent to

\[
\langle V n, \Psi_c \rangle = -1.
\]

We will prove this equivalence in Proposition V.1.

We now state the resolvent expansions in the four cases given in Definition III.2. We impose assumptions on the parameter \( \beta \) from Assumption III.1 in each of the four cases. For simplicity we state the results for integer values of \( \beta \). The extension to general \( \beta \) is straightforward but leads to more complicated statements of the results and requires a different approach to the error estimates in the theorems below. Let us set

\[
M_0 = U + v^* G_0, \quad \text{where} \quad G_0 = G_{0,0} - G_{0,0} v^* M_0^* v G_{0,0},
\]

and denote its pseudo-inverse by \( M_0^\dagger \), see Appendix A.

**Theorem III.3.** Assume that the threshold \( 0 \) is a regular point, and that Assumption III.1 is fulfilled for some integer \( \beta \geq 2 \). Then

\[
R(\kappa) = \sum_{j=0}^{\beta-2} \kappa^j G_j + \mathcal{O}(\kappa^{\beta-1}) \quad \text{in} \quad B^{\beta-2}
\]  

with \( G_j \in B^{j+1} \) for \( j \) even, and \( G_j \in B^{j} \) for \( j \) odd. The coefficients \( G_j \) can be computed explicitly. The first two coefficients can be expressed as

\[
G_0 = G_{0,0} - G_{0,0} v^* M_0^* v G_{0,0}, \quad G_1 = -\langle \tilde{\Psi}_c | \tilde{\Psi}_c \rangle,
\]

where \( \tilde{\Psi}_c \in \tilde{\mathcal{E}} \) is a generalized eigenfunction with asymptotics

\[
m^{-1} \tilde{\Psi}_c[m] \to 1 \quad \text{as} \quad m \to \infty.
\]

**Remark III.4.** Under the assumption of Theorem III.3 the operator \( M_0 \) is actually invertible: \( M_0^{-1} = M_0^\dagger \). The operators \( I + G_{0,0} V \) and \( I + V G_{0,0} \) are also invertible, and we have the expressions

\[
I - G_{0,0} v M_0^* v = (I + G_{0,0} V)^{-1},
\]

\[
I - v M_0^* v G_{0,0} = (I + V G_{0,0})^{-1}.
\]

We will verify these right after the proof of Theorem III.3.

**Theorem III.5.** Assume that the threshold \( 0 \) is an exceptional point of the first kind, and that Assumption III.1 is fulfilled for some integer \( \beta \geq 3 \). Then

\[
R(\kappa) = \sum_{j=-1}^{\beta-4} \kappa^j G_j + \mathcal{O}(\kappa^{\beta-3}) \quad \text{in} \quad B^{\beta-1}
\]
with \( G_j \in \mathcal{B}^{j+3} \) for \( j \) even, and \( G_j \in \mathcal{B}^{j+2} \) for \( j \) odd. The coefficients \( G_j \) can be computed explicitly. The first two coefficients can be expressed as

\[
G_{-2} = P_0, \\
G_{-1} = 0,
\]

where \( P_0 \) is the projection onto \( E \).

**Theorem III.7.** Assume that the threshold 0 is an exceptional point of the third kind, and that Assumption III.1 is fulfilled for some integer \( \beta \geq 4 \). Then

\[
R(\kappa) = \sum_{j=-2}^{\beta-6} \kappa^j G_j + \mathcal{O}(\kappa^{\beta-5}) \quad \text{in } \mathcal{B}^{\beta-2}
\]

(III.18)

with \( G_j \in \mathcal{B}^{j+3} \) for \( j \) even, and \( G_j \in \mathcal{B}^{j+2} \) for \( j \) odd. The coefficients \( G_j \) can be computed explicitly. The first two coefficients can be expressed as

\[
G_{-2} = P_0, \\
G_{-1} = |\Psi_c\rangle \langle \Psi_c|,
\]

where \( P_0 \) is the projection onto \( E \), and \( \Psi_c \in \mathcal{E} \) is the canonical resonance function.

**Corollary III.8.** The coefficients \( G_j \) from Theorems III.3–III.7 satisfy

\[
HG_j = G_j H = 0 \quad \text{for } j = -2, -1, \\
HG_0 = G_0 H = I - P_0, \\
HG_j = G_j H = -G_{j-2} \quad \text{for } j \geq 1,
\]

where \( P_0 \) is the projection onto \( E \).
Proof. The assertion is verified by Theorems III.3–III.7 and the identities

\[(H + \kappa^2)R(\kappa)\Psi = R(\kappa)(H + \kappa^2)\Psi = \Psi\]

for any rapidly decreasing function \(\Psi: \mathbb{N} \to \mathbb{C}\) and any \(\kappa \sim 0\) with \(\text{Re}\kappa > 0\).

We shall prove Theorems III.3–III.7 following the procedure given in Ito-Jensen\(^2\). The proofs will be given in Sections VII–X with preliminaries in the preceding sections.

IV. GENERAL BOUNDARY CONDITIONS

In this section we comment on discrete analogues of general boundary conditions at the origin of the half-line, such as the Neumann and the Robin conditions. In particular, we introduce specific potentials that allows us to deal with such a general boundary condition as a perturbation of the Dirichlet condition.

On the discrete half-line a boundary condition is realized simply by assigning a value to \(x[0]\) for each function \(x: \mathbb{N} \to \mathbb{C}\), as in (I.2). The natural realization of the Neumann boundary condition is to assign the difference there to be 0, i.e.,

\[x[1] - x[0] = 0\]

or \(x[0] = x[1]\).

Similarly, a more general Robin condition is realized by setting

\[ax[0] + b(x[0] - x[1]) = 0; \quad (a, b) \neq (0, 0).\]

Here we may take \(a \neq -b\). Otherwise it reduces to the shifted Dirichlet condition \(x[1] = 0\).

Let us remark that there is yet another realization of the Dirichlet boundary condition:

\[x[0] = -x[1]; \quad (IV.1)\]

which models functions vanishing at \(n = 1/2\). In other words, (IV.1) may be understood as arising from sampling a continuous function \(f\) at the points \(n + 1/2\): \(x[n] = f(n + 1/2)\).

In such a model the Neumann condition is given by

\[x[1] - x[0] = 0,\]

and the Robin condition by

\[ax[0] + b(x[1] - x[0]) = 0; \quad (a, b) \neq (0, 0).\]

In any case all the above boundary conditions are unified as

\[x[0] = \alpha x[1]; \quad \alpha \in \mathbb{R}.\]

Denote the corresponding Laplacian by \(H_{\alpha}\), i.e., for any sequence \(x: \mathbb{N} \to \mathbb{C}\)

\[(H_{\alpha}x)[n] = \begin{cases} (2 - \alpha)x[1] - x[2] & \text{for } n = 1, \\ 2x[n] - x[n + 1] - x[n - 1] & \text{for } n \geq 2. \end{cases} \quad (IV.2)\]

We note that the operator \(H_{\alpha}\) is in fact bounded and self-adjoint on \(\mathcal{H} = \ell^2(\mathbb{N})\).

Let \(e_1 = (1, 0, 0, \ldots)\) be the first canonical basis vector and define the potential

\[V_{\alpha} = -\alpha|e_1\rangle\langle e_1|. \quad (IV.3)\]

Then, comparing definitions (I.3) and (IV.2), we see that

\[H_{\alpha} = H_0 + V_{\alpha}. \quad (IV.4)\]
The potential $V_\alpha$ satisfies Assumption III.1 with $\mathcal{K} = \mathbb{C}$ and
\[ v = \sqrt{|\alpha|}e_1, \quad v^* = \sqrt{|\alpha|}\langle e_1 |, \quad U = -\text{sgn} \, \alpha. \] (IV.5)
Actually $V_\alpha$ is a multiplication operator. We can directly compute
\[ \mathcal{E} = \mathbb{C}((1 - \alpha)n + \alpha 1), \quad \mathcal{E} = \{0\}. \]
Note that these eigenspaces can also be computed by applying the results of Section V to (IV.5). The above description of the eigenspaces implies the following:

**Lemma IV.1.** The threshold 0 for the operator $H_\alpha$ is
1. a regular point if $\alpha \neq 1$;
2. an exceptional point of the first kind if $\alpha = 1$.

We can construct the Fourier transform associated with $H_\alpha$, and compute its expansion coefficients explicitly, which of course coincide with those computed from Theorems III.3–III.7 and Lemma IV.1. We remark that we may choose the Neumann Laplacian as the free operator, instead of the Dirichlet Laplacian, and formulate our main results for its perturbations. However, then the proofs get much more complicated, since its threshold 0 is an exceptional point of the first kind, which otherwise is regular.

**V. GENERALIZED EIGENSACES**

In this section we write down the eigenspaces using subspaces of $\mathcal{K}$, and then derive some useful properties. In particular, we reveal the relation between invertibility of intermediate operators and threshold types. Compared with the full line discussed in Ito-Jensen, the half-line has a very clear correspondence between them, and the threshold structure is much simpler. This is because the free resolvent on the half-line does not have a singular term, and hence that of the perturbed resolvent comes only and directly from those intermediate operators.

To state the main results of this section let us introduce some notation. Let
\[ M_0 = U + v^*G_{0,0}v, \quad M_1 = v^*G_{0,1}v = -|v^*n\rangle\langle v^*n|. \] (V.1)
and $Q, S \in \mathcal{B}(\mathcal{K})$ be the orthogonal projections onto $\text{Ker} \, M_0, \text{Ker} \, M_1$, respectively. Then we set
\[ m_0 = QM_1Q = -|Qv^*n\rangle\langle Qv^*n|. \] (V.2)
The operators $M_0$ and $m_0$ are, so to say, the intermediate operators in the terminology of Ito-Jensen for the half-line case. They actually appear as expansion coefficients of certain operators in the later sections, but at least here we can define them independently of these expansions. They are well-defined for any $\beta \geq 1$ in Assumption III.1. In addition, we also define the operators $w \in \mathcal{B}(L^0, K)$ and $z \in \mathcal{B}(K, L^0)$ by
\[ w = Uv^*, \quad z = \|v^*n\|^2\langle M_0 v^*n, \cdot \rangle - G_{0,0}v, \] (V.3)
where $a^*$ denotes the pseudo-inverse of $a \in \mathbb{C}$, see (A.2).

**Proposition V.1.** Suppose that $\beta \geq 1$ in Assumption III.1. Then the eigenspaces are expressed as
\[ \widehat{\mathcal{E}} = z(\text{Ker} \, SM_0) \oplus (\mathbb{C}n \cap \text{Ker} \, v^*), \] (V.4)
\[ \mathcal{E} = z(\text{Ker} \, M_0), \] (V.5)
\[ \mathcal{E} = z(\text{Ker} \, M_0 \cap \text{Ker} \, M_1) = z(\text{Ker} \, M_0 \cap \text{Ker} \, m_0). \] (V.6)

In particular, the generalized eigenfunctions have the special asymptotics (III.4), and, also, a function $\Psi \in \mathcal{E}$ has the asymptotics $\Psi - 1 \in L^{\beta - 2}$ if and only if $\langle Vn, \Psi \rangle = -1$. 
**Corollary V.2.** Suppose that $\beta \geq 1$ in Assumption III.1.

1. The threshold $0$ is a regular point if and only if $M_0$ is invertible in $B(K)$. In addition, if the threshold $0$ is a regular point,
   \[ \dim(\mathcal{E}/\mathcal{E}) = 1, \quad \dim(\mathcal{E}/E) = \dim E = 0. \]

2. The threshold $0$ is an exceptional point of the first kind if and only if $M_0$ is not invertible in $B(K)$ and $m_0$ is invertible in $B(QK)$. In addition, if the threshold $0$ is an exceptional point of the first kind,
   \[ \dim(\mathcal{E}/\mathcal{E}) = 0, \quad \dim(\mathcal{E}/E) = 1, \quad \dim E = 0. \]

3. The threshold $0$ is an exceptional point of the second kind if and only if $M_0$ is not invertible in $B(K)$ and $m_0 = 0$. In addition, if the threshold $0$ is an exceptional point of the second kind,
   \[ \dim(\mathcal{E}/\mathcal{E}) = 1, \quad \dim(\mathcal{E}/E) = 0, \quad 1 \leq \dim E < \infty. \]

4. The threshold $0$ is an exceptional point of the third kind if and only if $M_0$ and $m_0$ are not invertible in $B(K)$ and $B(QK)$, respectively, and $m_0 \neq 0$. In addition, if the threshold $0$ is an exceptional point of the third kind,
   \[ \dim(\mathcal{E}/\mathcal{E}) = 0, \quad \dim(\mathcal{E}/E) = 1, \quad 1 \leq \dim E < \infty. \]

**Corollary V.3.** Suppose that $\beta \geq 1$ in Assumption III.1, and that $V$ is local. Then
   \[ \dim \mathcal{E} = 1, \quad \dim E = 0, \quad (V.7) \]
i.e., the threshold $0$ is either a regular point or an exceptional point of the first kind.

In the remainder of this section we prove Proposition V.1, and Corollaries V.2 and V.3, using a sequence of lemmas given below.

**Lemma V.4.** For any $x \in L^s$, $s \geq 1$, the sequence $G_{0,0}x \in L^s$ is expressed as
   \[ (G_{0,0}x)[n] = (n, x) - \sum_{m=n}^{\infty} (m - n)x[m] \quad \text{for } n \in \mathbb{N}. \quad (V.8) \]
In particular, $G_{0,0}x \in L^{s-2}$ if and only if $\langle n, x \rangle = 0$.

**Proof.** By (II.7) we can write
   \[ (G_{0,0}x)[n] = \sum_{m=1}^{n-1} mx[m] + \sum_{m=n}^{\infty} nx[m], \]
which immediately implies (V.8). Noting that
   \[ \sum_{n=1}^{\infty} (1 + n^2)^{(s-2)/2} \sum_{m=n}^{\infty} (m - n)x[m] \leq C\|x\|_{1,s} < \infty, \]
we can deduce that the second term on the right-hand side of (V.8) belongs to $L^{s-2}$. Then by the fact that $1 \notin L^{s-2}$ for $s \geq 1$ we can verify the last assertion.

**Lemma V.5.** The compositions $H_0G_{0,0}$ and $G_{0,0}H_0$, defined on $L^1$ and $\mathbb{C}n \oplus \mathbb{C}1 \oplus L^1$, respectively, are expressed as
   \[ H_0G_{0,0} = I_{L^1}, \quad G_{0,0}H_0 = \Pi, \]
where $\Pi: \mathbb{C}n \oplus \mathbb{C}1 \oplus L^1 \to \mathbb{C}1 \oplus L^1$ is the projection.
Remark V.6. Lemmas V.4 and V.5 in particular imply that for any \( s \geq 1 \)
\[
\mathbb{C} \oplus L^s \subset G_{0,0}(L^s) \subset \mathbb{C} \oplus L^{s-2}.
\]

Proof. By direct computation employing the expression (V.8) we can verify that for any \( x \in L^1 \)
\[
H_0G_{0,0}x = G_{0,0}H_0x = x.
\]
We can also compute
\[
H_0n = 0, \quad G_{0,0}H_01 = 1.
\]
Then the assertion follows by the above identities.

Lemma V.7. For any \( \Phi \in \text{Ker} SM_0 \) and \( \Psi \in \tilde{E} \)
\[
wz\Phi = \Phi, \quad zw\Psi \in \tilde{E}.
\]
In addition,
\[
\begin{align*}
z^{-1}(\tilde{E}) &= \text{Ker} SM_0, \\
z^{-1}(E) &= \text{Ker} M_0, \\
z^{-1}(F) &= \text{Ker} M_0 \cap \text{Ker} M_1,
\end{align*}
\]
\[
\begin{align*}
\tilde{E} \cap \text{Ker} w &= \mathbb{C}n \cap \text{Ker} v^*, \\
E \cap \text{Ker} w &= \{0\}, \\
F \cap \text{Ker} w &= \{0\}.
\end{align*}
\]

Proof. Step 1. We prove the first assertion of (V.10). Let \( \Phi \in \text{Ker} SM_0 \). Then, using \( v^*G_{0,0}v = M_0 - U \), we can compute
\[
wz\Phi = Uv \left[ \|v^*n\|^2 \langle M_0v^*n, \Phi \rangle n - G_{0,0}v\Phi \right]
= U(1 - S)M_0\Phi - UM_0\Phi + \Phi
= \Phi.
\]

Step 2. Before the second assertion of (V.10) we prove (V.11). We first note that by Lemma V.5 and \( v^*G_{0,0}v = M_0 - U \) for any \( \Phi \in \mathcal{K} \)
\[
Hz\Phi = (H_0 + vUv^*) \left[ \|v^*n\|^2 \langle M_0v^*n, \Phi \rangle n - G_{0,0}v\Phi \right]
= -v\Phi
+ \|v^*n\|^2 \langle M_0v^*n, \Phi \rangle vUv^*n - vU(M_0 - U)\Phi
= -vUSM_0\Phi.
\]
Then, since \( vU \) is injective, it follows that \( z\Phi \in \tilde{E} \) if and only if \( \Phi \in \text{Ker} SM_0 \), which implies the first identity of (V.11). As for the second, we first note that for any \( \Psi \in \tilde{E} \cap \text{Ker} w \)
\[
H_0\Psi = 0, \quad v^*\Psi = 0.
\]
Since the first identity \( H_0\Psi = 0 \) can be rephrased as \( \Psi \in \mathbb{C}n \), we obtain \( \Psi \in \mathbb{C}n \cap \text{Ker} v^* \). The inverse inclusion is almost obvious, and hence the second identity of (V.11).

Step 3. Now we prove the second assertion of (V.10). Let \( \Psi \in \tilde{E} \). Then by reusing (V.14) and noting \( M_0 = U + v^*G_{0,0}v \) and Lemma V.5
\[
Hzw\Psi = -vUS(v^* + v^*G_{0,0}V)\Psi
= -vUSv^*G_{0,0}(H_0 + V)\Psi
= 0,
\]
which implies \( zw\Psi \in \tilde{E} \).

**Step 4.** Let us prove (V.12). Let \( \Phi \in K \). By Lemma V.4 we can write

\[
z\Phi[n] = \|v^*n\|^21(v^*n, M_0\Phi)n[n] - \langle v^*n, \Phi \rangle 1[n] + \sum_{m=n}^{\infty} (m-n)(v\Phi)[m].
\]

As in the proof of Lemma V.4, the last term in (V.15) belong to \( L^{\beta-2} \). This fact combined with the first identity of (V.11) implies that \( z\Phi \in E \) if and only if

\[
\Phi \in \text{Ker } M_0, \quad \|v^*n\|^21(v^*n, M_0\Phi) = 0.
\]

Hence the first identity of (V.12) is obtained. As for the second one we can proceed as in Step 2, and it is almost obvious.

**Step 5.** The assertion (V.13) can be shown similarly to Step 4, and we omit the details.

**Proof of Proposition V.1.** From (V.10) and the first identity of (V.11) we can deduce that the restrictions

\[
z|_{\text{Ker } M_0}: \text{Ker } M_0 \to \tilde{E}, \quad w|_{\tilde{E}}: \tilde{E} \to \text{Ker } M_0
\]

are injective and surjective, respectively. Hence, the asserted isomorphisms (V.4)–(V.6) are direct consequences of (V.11)–(V.13), respectively. We note that the last inequality of (V.6) is obvious by the definitions (V.1) and (V.2).

The asymptotics (III.4) follows immediately by (V.4), (V.3) and (V.9). Next, for any \( \Psi \in E \) we let \( \Phi = w\Psi = Uv^*\Psi \in \text{Ker } M_0 \). Then, since \( \Psi = z\Phi = -G_{0,0}v\Phi \), Lemma V.4 implies that \( \Psi - 1 \in L^{\beta-2} \) if and only if \( \langle n, -v\Phi \rangle = 1 \), which in turn is equivalent to \( \langle vn, \Psi \rangle = -1 \). Hence we are done.

**Proof of Corollary V.2.** We first claim that

\[
\dim(\tilde{E}/E) \leq 1, \quad \dim(E/E) \leq 1, \quad \dim E < \infty.
\]

The first and second inequalities of (V.16) are obvious by (III.4), (III.2) and (III.3). For the last inequality of (V.16) we note that \( Uv^*G_{0,0}v \in C(K) \). Then

\[
\dim E \leq \dim \tilde{E} = \dim \text{Ker } M_0 = \dim \text{Ker}(1 + Uv^*G_{0,0}v) < \infty.
\]

Hence the claim follows.

Now we prove the assertions 1–4 of the corollary. We note that the former parts of 1–4 are obvious by Proposition V.1, and hence we may discuss only the latter parts.

1. Let the threshold 0 be a regular point. Then by definition we have

\[
\dim E = \dim \tilde{E} = 0.
\]

If \( v^*n = 0 \), then, since \( S = I_K \), we have by (V.4) that \( \tilde{E} = Cn \). Otherwise, noting that \( M_0 \) is invertible, we have by (V.4) that \( \tilde{E} = CzM^{-1}v^*n \). In either cases we can conclude that

\[
\dim \tilde{E} = 1.
\]

2. Let the threshold 0 be an exceptional point of the first kind. Then by definition and claim (V.16)

\[
\dim E = 1, \quad \dim \tilde{E} = 0.
\]
Let us show that $\tilde{E} = \mathcal{E}$. Since $QK$ is nontrivial and $m_0 = -|Qv^*n\rangle\langle Qv^*n|$ is invertible there, it follows that

$$Qv^*n \neq 0. \quad (V.17)$$

Now it suffices to show that $\text{Ker} \, SM_0 \subset \text{Ker} \, M_0$. Let $\Phi \in \text{Ker} \, SM_0$. Since $S$ is the orthogonal projections onto the kernel of $M_1$ given by (V.1), there exists $c \in \mathbb{C}$ such that

$$M_0\Phi = cv^*n.$$ 

Apply $Q$ to both sides above, then by (V.17) it follows that $c = 0$. Hence $\Phi \in \text{Ker} \, M_0$, and the latter assertion is verified.

3. Let the threshold 0 be an exceptional point of the second kind. Then by definition and claim (V.16)

$$\dim(\mathcal{E}/\mathcal{E}) = 0, \quad 1 \leq \dim \mathcal{E} < \infty.$$ 

If $v^*n = 0$, then $S = I_K$, and hence by (V.4)

$$\tilde{E} = z(\text{Ker} \, M_0) \oplus \mathbb{C}n = \tilde{E} \oplus \mathbb{C}n.$$ 

Otherwise, since $m_0 = -|Qv^*n\rangle\langle Qv^*n| = 0$, we have

$$0 \neq v^*n \in (\text{Ker} \, M_0)^\perp = \text{Ran} \, M_0,$$

and hence we can find $\Phi \in \mathcal{K} \setminus \{0\}$ such that $M_0\Phi = v^*n$. Such $\Phi$ is unique up to $\text{Ker} \, M_0$, and then by (V.4)

$$\tilde{E} = z(\text{Ker} \, M_0 \oplus \mathbb{C}\Phi) = \mathcal{E} \oplus \mathbb{C}z\Phi.$$ 

In either cases we obtain

$$\dim(\tilde{E}/\mathcal{E}) = 1.$$ 

4. Let the threshold 0 be an exceptional point of the third kind. Then by definition and claim (V.16)

$$\dim(\mathcal{E}/\mathcal{E}) = 1, \quad 1 \leq \dim \mathcal{E} < \infty.$$ 

Now it suffices to show that $\tilde{E} = \mathcal{E}$, but this can be proved exactly the same manner as in the proof of the assertion 2 above. Hence we are done. 

**Proof of Corollary V.3.** It suffices to show that $\mathcal{E} = \{0\}$. Let $\Psi \in \mathcal{E}$. Then it follows by Lemma V.7 that $\Psi = zw\Psi$. This equation can be rephrased as

$$\Psi[n] = \sum_{m=n}^{\infty} (m-n)V[m]\Psi[m] \quad (V.18)$$

by Lemma V.4 and the asymptotics of $\Psi$ as $n \to \infty$. Since $V \in \mathcal{L}^{\beta}$, we can choose large $n_0 \geq 0$ such that

$$\sum_{n=n_0}^{\infty} n|V[n]| \leq \frac{1}{2}. \quad (V.19)$$

By (V.18) and (V.19) we obtain

$$|\Psi[n]| \leq \frac{1}{2} \sup_{m \geq n_0} |\Psi[m]| \text{ for } n \geq n_0,$$

or

$$\Psi[n] = 0 \text{ for } n \geq n_0.$$ 

Since the equation $H\Psi = 0$ is a difference equation, the above initial condition at infinity yields $\Psi = 0$, and hence $\mathcal{E} = \{0\}$. Hence we are done.
VI. THE FIRST STEP IN RESOLVENT EXPANSION

This section gives a short preliminary computation for the proofs of Theorems III.3–III.7 given in the following sections. These computations are common to all the proofs.

Define the operator \( M(\kappa) \in \mathcal{B}(\mathcal{K}) \) for \( \text{Re}\, \kappa > 0 \) by

\[
M(\kappa) = U + v^* R_0(\kappa) v. \tag{VI.1}
\]

Fix \( \kappa_0 > 0 \) such that \( z = -\kappa^2 \) belongs to the resolvent set of \( H \) for any \( \text{Re}\, \kappa \in (0, \kappa_0) \). This is possible due to the decay assumptions on \( V \).

Lemma VI.1. Let the operator \( M(\kappa) \) be defined as above.

1. Let Assumption III.1 hold for some integer \( \beta \geq 2 \). Then

\[
M(\kappa) = \sum_{j=0}^{\beta-2} \kappa^j M_j + \mathcal{O}(\kappa^{\beta-1}) \quad \text{in} \ \mathcal{B}(\mathcal{K}) \tag{VI.2}
\]

with \( M_j \in \mathcal{B}(\mathcal{K}) \) given by

\[
M_0 = U + v^* G_{0,0} v, \quad M_j = v^* G_{0,j} v \quad \text{for} \ j \geq 1. \tag{VI.3}
\]

2. Let Assumption III.1 hold with \( \beta \geq 1 \). For any \( 0 < \text{Re}\, \kappa < \kappa_0 \) the operator \( M(\kappa) \) is invertible in \( \mathcal{B}(\mathcal{K}) \), and

\[
M(\kappa)^{-1} = U - U v^* R(\kappa) v U.
\]

Moreover,

\[
R(\kappa) = R_0(\kappa) - R_0(\kappa) v M(\kappa)^{-1} v^* R_0(\kappa). \tag{VI.4}
\]

Proof. 1. This result follows from Assumption III.1 and Proposition II.1.

2. The assertion is verified by direct computations, see Ito-Jensen\(^2\) (Proposition 1.13). \( \square \)

Note that the operators \( M_0 \) and \( M_1 \) coincide with those defined in Section V.

By Lemma VI.1.1 the operator \( M(\kappa) \) has an expansion, and by Lemma VI.1.2 and Proposition II.1 an expansion of \( R(\kappa) \) is reduced to that of the inverse \( M(\kappa)^{-1} \). If the leading operator \( M_0 \in \mathcal{B}(\mathcal{K}) \) is invertible, or by Proposition V.1, if the threshold 0 is a regular point, we can employ the Neumann series to compute the expansion of \( M(\kappa)^{-1} \). Otherwise, we shall employ an inversion formula introduced in Jensen-Nenciu\(^3\) in a way similar to Ito-Jensen\(^2\). We note that we are also going to use the pseudo-inverse several times. For reference we present the inversion formula and the pseudo-inverse in Appendix A.

VII. REGULAR THRESHOLD

In this section we prove Theorem III.3. In this case the leading operator \( M_0 \) in the expansion (VI.2) is invertible by Corollary V.2. Hence the inversion formula in Appendix A is not needed.

Proof of Theorem III.3. By the assumption and Corollary V.2 it follows that \( M_0 \) is invertible in \( \mathcal{B}(\mathcal{K}) \). Hence we can use the Neumann series to invert (VI.2). Let us write it as

\[
M(\kappa)^{-1} = \sum_{j=0}^{\beta-2} \kappa^j A_j + \mathcal{O}(\kappa^{\beta-1}), \quad A_j \in \mathcal{B}(\mathcal{K}). \tag{VII.1}
\]
The coefficients $A_j$ are written explicitly in terms of the $M_j$. The first two terms are

$$A_0 = M_0^{-1}, \quad A_1 = -M_0^{-1}M_0^{-1}. \quad \text{(VII.2)}$$

We insert the expansions (II.5) with $N = \beta - 2$ and (VII.1) into (VI.4), and then obtain the expansion

$$R(\kappa) = \sum_{j=0}^{\beta-2} \kappa^j G_j + \mathcal{O}(\kappa^{\beta-1});$$

$$G_j = G_{0,j} - \sum_{j_1 + j_2 + j_3 = j} G_{0,j_1} v A_{j_2} v^* G_{0,j_3}.$$ 

This result and (VII.2) in particular leads to the expressions

$$G_0 = G_{0,0} - G_{0,0} v M_0^{-1} v^* G_{0,0},$$

$$G_1 = G_{0,1} - G_{0,1} v M_0^{-1} v^* G_{0,0} + G_{0,0} v M_0^{-1} M_1 M_0^{-1} v^* G_{0,0} - G_{0,0} v M_0^{-1} v^* G_{0,1} = (I - G_{0,0} v M_0^{-1} v^*) G_{0,1} (I - v M_0^{-1} v^* G_{0,0}).$$

The expression (III.6) is obtained. The expression (III.7) follows by noting

$$(I - G_{0,0} v M_0^{-1} v^*) n = \tilde{\Psi}_c,$$

which can be verified with ease by (V.4).

**Verification of** (III.9). The first identity in (III.9) follows by

$$(I + G_{0,0} V)(I - G_{0,0} v M_0^{-1} v^*) = I - G_{0,0} v M_0^{-1} v^* + G_{0,0} V G_{0,0} v M_0^{-1} v^* - G_{0,0} V G_{0,0} v M_0^{-1} v^* + G_{0,0} V = I,$$

$$(I - G_{0,0} v M_0^{-1} v^*)(I + G_{0,0} V) = I - G_{0,0} v M_0^{-1} v^* + G_{0,0} V - G_{0,0} v M_0^{-1} v^* G_{0,0} V = I - G_{0,0} v M_0^{-1}(U + v^* G_{0,0} v) U v^* + G_{0,0} V = I.$$

The second identity is verified analogously.

**VIII. EXCEPTIONAL THRESHOLD OF THE FIRST KIND**

In this section we prove Theorem III.5. In this case the leading operator $M_0 \in \mathcal{B}(\mathcal{K})$ in (VI.2) is not invertible, and we need the inversion formula given in Appendix A to invert the expansion (VI.2).

**Proof of Theorem III.5.** By the assumption and Corollary V.2 the leading operator $M_0$ from (VI.2) is not invertible in $\mathcal{B}(\mathcal{K})$, and we are going to apply Proposition A.2. Let us write the expansion (VI.2) as

$$M(\kappa) = \sum_{j=0}^{\beta-2} \kappa^j M_j + \mathcal{O}(\kappa^{\beta-1}) = M_0 + \kappa \tilde{M}_1(\kappa). \quad \text{(VIII.1)}$$
Let $Q$ be the orthogonal projection onto $\text{Ker } M_0$, cf. Section V, and define

$$m(\kappa) = \sum_{j=0}^{\infty} (-1)^j \kappa^j Q M_1(\kappa) \left[ (M_0^\dagger + Q) \widetilde{M}_1(\kappa) \right]^j Q.$$  \hspace{1cm} (VIII.2)

Then by Proposition A.2 we have

$$M(\kappa)^{-1} = (M(\kappa) + Q)^{-1}$$

$$+ \frac{1}{\kappa} (M(\kappa) + Q)^{-1} m(\kappa) (M(\kappa) + Q)^{-1}.$$  \hspace{1cm} (VIII.3)

Note that by using (VIII.1) we can rewrite (VIII.2) in the form

$$m(\kappa) = \sum_{j=0}^{\beta-3} \kappa^j m_j + O(\kappa^{\beta-2}); \quad m_j \in \mathcal{B}(Q\mathcal{K}).$$  \hspace{1cm} (VIII.4)

We have the following expressions for the first four coefficients:

$$m_0 = Q M_1 Q,$$  \hspace{1cm} (VIII.5)

$$m_1 = Q M_2 Q - Q M_1 (M_0^\dagger + Q) M_1 Q,$$  \hspace{1cm} (VIII.6)

$$m_2 = Q M_3 Q - Q M_1 (M_0^\dagger + Q) M_2 Q$$

$$- Q M_2 (M_0^\dagger + Q) M_1 Q$$

$$+ Q M_1 (M_0^\dagger + Q) M_1 (M_0^\dagger + Q) M_1 Q,$$  \hspace{1cm} (VIII.7)

$$m_3 = Q M_4 Q - Q M_1 (M_0^\dagger + Q) M_3 Q$$

$$- Q M_2 (M_0^\dagger + Q) M_2 Q - Q M_3 (M_0^\dagger + Q) M_1 Q$$

$$+ Q M_1 (M_0^\dagger + Q) M_1 (M_0^\dagger + Q) M_2 Q$$

$$+ Q M_1 (M_0^\dagger + Q) M_2 (M_0^\dagger + Q) M_1 Q$$

$$+ Q M_2 (M_0^\dagger + Q) M_1 (M_0^\dagger + Q) M_1 Q$$

$$- Q M_1 (M_0^\dagger + Q) M_1 (M_0^\dagger + Q) M_1 (M_0^\dagger + Q) M_1 Q.$$  \hspace{1cm} (VIII.8)

Then by the assumption and Corollary V.2 the coefficient $m_0 = Q M_1 Q$ is invertible in $\mathcal{B}(Q\mathcal{K})$. Thus the Neumann series provides the expansion of the inverse $m(\kappa)^\dagger$. Let us write it as

$$m(\kappa)^\dagger = \sum_{j=0}^{\beta-3} \kappa^j A_j + O(\kappa^{\beta-2}),$$  \hspace{1cm} (VIII.9)

$$A_0 = m_0^\dagger, \quad A_j \in \mathcal{B}(Q\mathcal{K}).$$

The Neumann series also provide an expansion of $(M(\kappa) + Q)^{-1}$, which we write as

$$(M(\kappa) + Q)^{-1} = \sum_{j=0}^{\beta-2} \kappa^j B_j + O(\kappa^{\beta-1}),$$  \hspace{1cm} (VIII.10)

where $B_j \in \mathcal{B}(\mathcal{K})$. The first three coefficients can be written as follows:

$$B_0 = M_0^\dagger + Q,$$

$$B_1 = -(M_0^\dagger + Q) M_1 (M_0^\dagger + Q),$$

$$B_2 = -(M_0^\dagger + Q) M_2 (M_0^\dagger + Q)$$

$$+ (M_0^\dagger + Q) M_1 (M_0^\dagger + Q) M_1 (M_0^\dagger + Q).$$
Now we insert the expansions (VIII.9) and (VIII.10) into the formula (VIII.3), and then

\[ M(\kappa)^{-1} = \sum_{j=-1}^{\beta-4} \kappa^j C_j + \mathcal{O}(\kappa^{\beta-3}), \]

\[ C_j = B_j + \sum_{j_1 \geq 0, j_2 \geq 0, j_3 \geq 0 \atop j_1 + j_2 + j_3 = j} B_{j_1} A_{j_2} B_{j_3}, \tag{VIII.11} \]

with \( B_{-1} = 0 \). Next we insert the expansions (II.5) with \( N = \beta - 3 \) and (VIII.11) into the formula (VI.4). Then we obtain the expansion

\[ R(\kappa) = \sum_{j=-1}^{\beta-4} \kappa^j G_j + \mathcal{O}(\kappa^{\beta-3}), \]

\[ G_j = G_{0,j} - \sum_{j_1 \geq 0, j_2 \geq -1, j_3 \geq 0 \atop j_1 + j_2 + j_3 = j} G_{0,j_1} G_{j_2} v^* G_{0,j_3}, \]

with \( G_{0,-1} = 0 \). This verifies (III.10).

Next we compute \( G_{-1} \). By the above expressions we can write

\[ G_{-1} = -G_{0,0} v C_{-1} v^* G_{0,0} = -G_{0,0} v m_0^1 v^* G_{0,0}, \]

and by (II.8)

\[ m_0 = Q M_1 Q = -(Q v^* n) (Q v^* n). \tag{VIII.12} \]

The expression (VIII.12) implies that \( m_0 \) is at most of rank 1, but by the assumption and Corollary V.2 it is also invertible in \( B(O) \). Hence it follows that

\[ Q v^* n \neq 0, \quad \dim \text{Ker } M_0 = \dim Q K = 1. \]

Then we can write

\[ m_0^1 = -|\Phi_c|/|\Phi_c|; \tag{VIII.13} \]

\[ \Phi_c = -||Q v^* n||^{-2} Q v^* n \in Q K = \text{Ker } M_0, \tag{VIII.14} \]

such that

\[ G_{-1} = |\Psi_c|/|\Psi_c|; \quad \Psi_c = -G_{0,0} v \Phi_c \in \mathcal{E}. \]

Let us to show that the above resonance function \( \Psi_c \) is canonical. We have

\[ \langle V n, \Psi_c \rangle = -\langle v^* n, U (M_0 - U) \Phi_c \rangle = \langle v^* n, \Phi_c \rangle = -1, \]

and hence we obtain (III.11).

Finally we prove (III.12). We first express \( G_0 \) by \( A_* \) and \( B_* \), and then insert expressions for them:

\[ G_0 = G_{0,0} - G_{0,0} v C_{-1} v^* G_{0,1} - G_{0,1} v C_{-1} v^* G_{0,0} - G_{0,0} v C_0 v^* G_{0,0} \]

\[ = G_{0,0} - G_{0,0} v A_0 v^* G_{0,1} - G_{0,1} v A_0 v^* G_{0,0} \]

\[ - G_{0,0} v (B_0 + B_0 A_0 B_1 + B_1 A_0 B_0 + B_0 A_1 B_0) v^* G_{0,0} \]

\[ = G_{0,0} - G_{0,0} v m_0^1 v^* G_{0,1} - G_{0,1} v m_0^1 v^* G_{0,0} \]

\[ - G_{0,0} v \left( M_0^1 + Q - m_0^1 M_1 (M_0^1 + Q) - (M_0^1 + Q) M_1 m_0^1 - m_0^1 m_1 m_0^1 \right) v^* G_{0,0}. \]
We expand the terms in big parentheses and unfold $m_1$, noting $m_0 m_0^\dagger = m_0^\dagger m_0 = Q$:

\[
G_0 = G_{0,0} - G_{0,0} v m_0^\dagger v^* G_{0,1} - G_{0,1} v m_0^\dagger v^* G_{0,0} \\
- G_{0,0} v (M_0^\dagger - m_0^\dagger M_1 M_0^\dagger - M_0^\dagger M_1 m_0^\dagger) \\
- m_0^\dagger M_2 m_0^\dagger + m_0^\dagger M_1 M_0^\dagger M_1 m_0^\dagger) v^* G_{0,0} \\
= G_{0,0} + G_{0,0} v m_0^\dagger M_2 m_0^\dagger v^* G_{0,0} - G_{0,0} v m_0^\dagger v^* G_{0,1} \\
- G_{0,0} v (I - m_0^\dagger M_1) M_0^\dagger (I - M_1 m_0^\dagger) v^* G_{0,0}.
\]

Now we use (VIII.14) and the expressions $M_j = v^* G_{0,j} v$, $j \geq 1$, and $G_{0,1} = -|\mathbf{n}\rangle\langle \mathbf{n}|$:

\[
G_0 = G_{0,0} + |\Psi_c\rangle\langle v \Phi_c, G_{0,2} v \Phi_c \rangle (|\Psi_c\rangle - |\Psi_c\rangle - |\mathbf{n}\rangle\langle \Psi_c| \\
- (G_{0,0} - |\Psi_c\rangle\langle \mathbf{n}|) v M_0^\dagger v^* (G_{0,0} - |\mathbf{n}\rangle\langle \Psi_c|).
\]

Hence it remains to compute the coefficient of the second term in the last expression. We have by $\Phi_c = U v \Phi$

\[
\langle v \Phi_c, G_{0,2} v \Phi_c \rangle = \langle V \Psi_c, G_{0,2} V \Psi_c \rangle = (H_0 \Psi_c, G_{0,2} H_0 \Psi_c).
\]

Here we remark that we cannot directly use $G_{0,2} H_0 = -G_{0,0}$, since (II.6) holds as an extension from rapidly decaying functions, while $\Psi_c$ is not decaying. However, it suffices to subtract the leading asymptotics as follows.

\[
\langle v \Phi_c, G_{0,2} v \Phi_c \rangle \\
= \langle (H_0(\Psi_c - 1), G_{0,2} H_0 \Psi_c) + (G_{0,2} H_0 \Psi_c)[1] \\
= -\langle |\Psi_c - 1\rangle, G_{0,0} H_0 \Psi_c \rangle \\
+ (G_{0,2} H_0(\Psi_c - 1))[1] + (G_{0,2} H_0 \mathbf{1})[1] \\
= -\langle |\Psi_c - 1\rangle, G_{0,0} H_0 (\Psi_c - 1) \rangle \\
- (G_{0,0}(\Psi_c - 1))[1] \\
- (G_{0,0}(\Psi_c - 1))[1] + (G_{0,2} H_0 \mathbf{1})[1] \\
= -\|\Psi_c - 1\|^2 - 2 \text{Re}(G_{0,0}(\Psi_c - 1))[1] \\
+ (G_{0,2} H_0 \mathbf{1})[1].
\]

The last two terms are computed by using the explicit expressions (II.7) and (II.9). Then we obtain (III.12).

\section{Exceptional Threshold of the Second Kind}

Here we prove Theorem III.6. For the first part of the proof we can almost repeat the argument of the previous section, but the second part is rather non-trivial. In fact, we need the following lemma.

\textbf{Lemma IX.1.} Let $x_\nu \in \mathcal{L}^1$, $\nu = 1, 2$. Assume that

\[
\langle \mathbf{n}, x_\nu \rangle = 0, \quad \nu = 1, 2. \tag{IX.1}
\]

Then one has that $G_{0,0} x_\nu \in \mathcal{L}^2$, $\nu = 1, 2$, and that

\[
\langle x_1, G_{0,2} x_2 \rangle = -\langle G_{0,0} x_1, G_{0,0} x_2 \rangle. \tag{IX.2}
\]
Proof. We extend the sequences \( x_\nu \in \mathcal{L}^4, \nu = 1, 2 \), antisymmetrically to the whole line \( \mathbb{Z} \) by letting
\[
\bar{x}_\nu[n] = \text{sgn}[n]x_\nu|[n|, \quad n \in \mathbb{Z}.
\]
Noting that the kernels \( G_{0,0}[n, m] \) and \( G_{0,2}[n, m] \) have the expressions
\[
G_{0,0}[n, m] = \frac{1}{3}(|n - m| - (n + m))^3,
\]
\[
G_{0,2}[n, m] = \frac{1}{12}(|n - m| - |n - m|^3 - (n + m) + (n + m)^3),
\]
we also define operators \( \widetilde{G}_{0,0} \) and \( \widetilde{G}_{0,2} \) by the integral kernels
\[
\widetilde{G}_{0,0}[n, m] = -\frac{1}{3}|n - m|,
\]
\[
\widetilde{G}_{0,2}[n, m] = \frac{1}{12}(|n - m| - |n - m|^3),
\]
respectively. Then it is easy to check that for \( \nu = 1, 2, \; j = 0, 2 \) and \( n \geq 1 \)
\[
(G_{0,j}x_\nu)[n] = (\widetilde{G}_{0,j}\bar{x}_\nu)[n] = -(\widetilde{G}_{0,j}\bar{x}_\nu)[|n|].
\]
On the other hand, the kernels (IX.3) are the same as the convolution kernels in Ito-Jensen (equation (2.5)), and hence under assumption (IX.1) Ito-Jensen (Lemma 4.16) applies. It follows that \( \widetilde{G}_{0,0}\bar{x}_\nu \in \ell^1(\mathbb{Z}) \) and that
\[
\langle \bar{x}_1, \widetilde{G}_{0,2}\bar{x}_2 \rangle = -\langle \widetilde{G}_{0,0}\bar{x}_1, \widetilde{G}_{0,0}\bar{x}_2 \rangle.
\]

Then by (IX.4) and (IX.5) the assertion follows.

Proof of Theorem III.6. By the assumption and Corollary V.2 the leading operator \( M_0 \) from (VI.2) is not invertible in \( B(\mathcal{K}) \). Write the expansion (VI.2) in the same form as (VIII.1), let \( Q \) be the orthogonal projection onto \( \text{Ker} \; M_0 \), and define \( m(\kappa) \) by the same formula as (VIII.2). Then by Proposition A.2 we have the same formula as (VIII.3). Again, \( m(\kappa) \) defined by (VIII.2) has the same expansion (VIII.4) with the same expressions (VIII.5)–(VIII.8) for its coefficients, but this time we actually have
\[
m_0 = 0, \quad m_1 = QM_2Q, \quad m_2 = 0.
\]
In fact, by the assumption we have
\[
m_0 = QM_1Q = -|Qv^*n\rangle\langle Qv^*n| = 0,
\]
\[
or \quad Qv^*n = 0,
\]
and hence (IX.6) follows by (VI.3), (II.8), (IX.7) and (VIII.5)–(VIII.8). Now we note that then the operator \( m_1 \) has to be invertible in \( B(QK) \). Otherwise, we can apply Proposition A.2 once more, but this leads to a singularity of order \( \kappa^{-j}, \; j \geq 3 \), in the expansion of \( R(\kappa) \), which contradicts the self-adjointness of \( H \). Hence the Neumann series provides an expansion of \( m(\kappa)^{\dagger} \) of the form
\[
m(\kappa)^{\dagger} = \sum_{j = -1}^{\beta - 5} \kappa^j A_j + O(\kappa^{\beta - 4}), \quad A_j \in B(QK),
\]
with, e.g.
\[
A_{-1} = m_1^{\dagger}, \quad A_0 = -m_1^{\dagger}m_2m_1^{\dagger},
\]
\[
A_1 = -m_1^{\dagger}m_3m_1^{\dagger} + m_1^{\dagger}m_2m_1^{\dagger}m_2m_1^{\dagger}.
\]
These are actually simplified by (IX.6) as
\[ A_{-1} = m_1^1, \quad A_0 = 0, \quad A_1 = -m_1^1 m_3^1 m_1^1. \] (IX.9)

The Neumann series also provides an expansion of \((M(\kappa) + Q)^{-1}\) in the same form as (VIII.10) with the same coefficients given there. Now we insert the expansions (IX.8) and (VIII.10) into the formula (VIII.3), and then
\[ M(\kappa)^{-1} = \sum_{j=-2}^{\beta-6} \kappa^j C_j + O(\kappa^{\beta-5}); \]
\[ C_j = B_j + \sum_{j_1+2j_2+3j_3 = j} B_{j_1} A_{j_2} B_{j_3}, \] (IX.10)
with \(B_{-2} = B_{-1} = 0\). We then insert the expansions (II.5) with \(N = \beta - 4\) and (IX.10) into the formula (VI.4). Finally we obtain the expansion
\[ R(\kappa) = \sum_{j=-2}^{\beta-6} \kappa^j G_j + O(\kappa^{\beta-5}); \]
\[ G_j = G_{0,j} - \sum_{j_1+2j_2+3j_3 = j} G_{0,j_1} v C_{j_2} v^* G_{0,j_3}, \]
with \(G_{0,-2} = G_{0,-1} = 0\).

Next we compute the coefficients. We can use the above expressions of the coefficients to write
\[ G_{-2} = -G_{0,0} v C_{-2} v^* G_{0,0} \]
\[ = -G_{0,0} v m_1^1 v^* G_{0,0} \]
\[ = z(Q v^* G_{0,2} v Q)^1 z^*. \] (IX.11)

By this expression we can see that
\[ \text{Ran} G_{-2} = (\text{Ker} G_{-2})^\perp \subset \mathcal{E} = E. \]

In addition, by Proposition V.1 for any \(\Psi \in E\) we can write \(\Psi = z\Phi = -G_{0,0} v \Phi\) for some \(\Phi \in Q \mathcal{K}\), so that by Lemma IX.1
\[ \langle \Psi, G_{-2} \Psi \rangle = -\langle G_{0,0} v \Phi, G_{0,0} v (Q v^* G_{0,2} v Q)^1 z^* \Psi \rangle \]
\[ = \|\Psi\|_{B_1}^2. \]

Since \(G_{-2}\) is obviously self-adjoint on \(E\), this implies that \(G_{-2}\) coincides with the orthogonal projection \(P_0\) onto \(E\), as asserted in (III.14).

As for \(G_{-1}\), we can first write
\[ G_{-1} = -G_{0,0} v C_{-1} v^* G_{0,0} \]
\[ = -G_{0,0} v C_{-2} v^* G_{0,1} - G_{0,1} v C_{-2} v^* G_{0,0}. \]

If we make use of the vanishing in (IX.6), (IX.7) and (IX.9), we can easily verify (III.15) from this expression. We omit the details.
Next, we compute $G_1$. Let us write, implementing $B_0A_* = A_*, B_0 = A_*$,

\[
G_0 = G_{0,0} - G_{0,0}vC_0v^*G_{0,0} \\
- G_{0,0}vC_{-1}v^*G_{0,1} - G_{0,1}vC_{-1}v^*G_{0,0} \\
- G_{0,0}vC_{-2}v^*G_{0,2} - G_{0,1}vC_{-2}v^*G_{0,1} \\
- G_{0,2}vC_{-2}v^*G_{0,0}
\]

\[
= G_{0,0} - G_{0,0}v(B_0 + A_1 + A_0B_1 + B_1A_0) \\
+ B_1A_{-1}B_1 + A_{-1}B_2 + B_2A_{-1}v^*G_{0,0} \\
- G_{0,0}v(A_0 + A_{-1}B_1 + B_1A_{-1})v^*G_{1,0} \\
- G_{0,0}vA_{-1}v^*G_{0,2} - G_{0,1}vA_{-1}v^*G_{0,1} \\
- G_{0,2}vA_{-1}v^*G_{0,0}.
\]

Let us now use some vanishing relations coming from (IX.6), (IX.7), and (IX.9):

\[
G_0 = G_{0,0} - G_{0,0}v(B_0 + A_1 + B_1A_{-1}B_1) \\
+ A_{-1}B_2 + B_2A_{-1}v^*G_{0,0} \\
- G_{0,0}vA_{-1}B_1v^*G_{0,1} - G_{0,1}vB_1A_{-1}v^*G_{0,0} \\
- G_{0,0}vA_{-1}v^*G_{0,2} - G_{0,2}vA_{-1}v^*G_{0,0},
\]

and then insert expressions for $A_*$ and $B_*$, noting the kernels of operators and implementing (IX.6) and (IX.7). We omit some computations, obtaining

\[
G_0 = G_{0,0} - G_{0,0}v(M_0^1 + Q - m_1^1m_3^1v^*G_{0,0}) \\
- m_1^1M_0^1(Q - (M_0^1 + Q)M_2^1m_3^1)v^*G_{0,0} \\
- G_{0,0}vm_1^1v^*G_{0,2} - G_{0,2}vm_1^1v^*G_{0,0}.
\]

Next we unfold $m_3$. We use the expressions $m_3 = QM_1 - QM_2M_3M_2Q - m_1m_1$ and $QM_2 = m_1$ which hold under (IX.7), and then

\[
G_0 = G_{0,0} - G_{0,0}v(I - m_1^1M_2)M_0^1(I - M_2m_1^1)v^*G_{0,0} \\
- G_{0,0}v(Q + m_1^1m_1m_1^1) \\
- m_1^1m_1 - m_1^1m_1^1)v^*G_{0,0} \\
- G_{0,0}vm_1^1v^*G_{0,2} - G_{0,2}vm_1^1v^*G_{0,0} \\
+ G_{0,0}vm_1^1M_2m_1^1v^*G_{0,0},
\]

Now we note that by (IX.11) we have

\[
m_1^1 = -Uv^*P_0vU
\]

(IX.12)

and this operator is bijective as $QK \to QK$. Hence we have

\[
G_0 = G_{0,0} - (G_{0,0} + P_0VG_{0,2})vM_0^1v^*(G_{0,0} + G_{0,2}VP_0) \\
+ P_0VG_{0,2} + G_{0,2}VP_0 + P_0VG_{0,0}vP_0
\]

Furthermore, we make use of the identities $VP_0 = -H_0P_0$, $P_0V = -P_0H_0$ and $H_0G_{0,j} = G_{0,j}H_0 = G_{0,j-2}$ for $j \geq 2$:

\[
G_0 = G_{0,0} - (G_{0,0} - P_0G_{0,0})vM_0^1v^*(G_{0,0} - G_{0,0}P_0) \\
- P_0G_{0,0} - G_{0,0}P_0 + P_0G_{0,0}P_0 \\
= (I - P_0)[G_{0,0} \\
- G_{0,0}v(U + v^*G_{0,0}v^*)v^*G_{0,0}][1 - P_0].
\]
This paper. We only describe some of important steps. First we can write it, using only $A_1$ and $B_1$.

This verifies (III.16).

The computation of $G_1$ in this case is very long, and we do not present all the detail in this paper. We only describe some of important steps. First we can write it, using only $A_1$ and $B_1$.

$$G_1 = G_{0.1}$$

- $G_{0.0}vA_{-1}v^*G_{0.3} - G_{0.1}vA_{-1}v^*G_{0.2}$
- $G_{0.2}vA_{-1}v^*G_{0.1} - G_{0.3}vA_{-1}v^*G_{0.0}$
- $G_{0.0}v(A_{-1}B_1 + B_1A_{-1} + A_0)v^*G_{0.2}$
- $G_{0.1}v(A_{-1}B_1 + B_1A_{-1} + A_0)v^*G_{0.1}$
- $G_{0.2}v(A_{-1}B_1 + B_1A_{-1} + A_0)v^*G_{0.0}$
- $G_{0.0}v(B_0 + A_{-1}B_2 + B_1A_{-1}B_1 + B_2A_{-1})v^*G_{0.1}$
- $G_{0.1}v(B_0 + A_{-1}B_2 + B_1A_{-1}B_1 + B_2A_{-1})v^*G_{0.0}$
- $G_{0.0}v(B_1 + A_{-1}B_3 + B_1A_{-1}B_2 + B_2A_{-1}B_1 + B_3A_{-1} + A_0B_2 + B_1A_0B_1 + B_2A_0 + A_1B_1 + B_1A_1 + A_2)v^*G_{0.0}$.

Then we insert the expressions of $A_1$ and $B_1$. If we implement some of vanishing relations coming from (IX.6), (IX.7), and (IX.9), we arrive at

$$G_1 = G_{0.0}v - G_{0.0}vm_1^\dagger vG_{0.3} - G_{0.3}vm_1^\dagger v^*G_{0.0}$$

- $G_{0.0}v(M_0^1 - m_1^1M_2M_0^1)v^*G_{0.1}$
- $G_{0.1}v(M_0^1 - M_2^1M_2m_1^1)v^*G_{0.0}$
- $G_{0.0}v[-M_0^1M_1M_0^1]$

$$+ m_1^1(-M_3^1M_0^1 + M_2^1M_1M_0^1)$$

$$+ (-M_3^1M_3 + M_2^1M_1M_0^1m_1^1)$$

- $m_1^1m_4m_1^1]v^*G_{0.0}.$

If we insert (IX.12) and $m_4 = QM_5Q - QM_5JM_2Q - QM_5JM_2Q$, which holds especially in this case due to the vanishing relations noted above, we come to

$$G_1 = G_{0.1} + G_{0.0}VP_0VG_{0.3} + G_{0.3}VP_0VG_{0.0}$$

- $G_{0.0}(vM_0^1v^* + VP_0VG_{0.2}v^*G_{0.0})G_{0.1}$
- $G_{0.1}(vM_0^1v^* + vM_0^1v^*G_{0.2}VP_0V)G_{0.0}$
- $G_{0.0}[-vM_0^1v^*G_{0.1}vM_0^1v^* + VP_0VG_{0.3}vM_0^1v^*$

$$- VP_0VG_{0.2}vM_0^1v^*G_{0.1}vM_0^1v^*$$

$$+ vM_0^1v^*G_{0.3}VP_0V$$

$$- vM_0^1v^*G_{0.1}vM_0^1v^*G_{0.2}VP_0V$$

$$- VP_0VG_{0.5}VP_0V$$

$$+ VP_0VG_{0.2}vM_0^1v^*G_{0.3}VP_0V$$

$$+ VP_0VG_{0.3}vM_0^1v^*G_{0.2}VP_0V]G_{0.0}.$$
Finally we use \( V P_0 = -H_0 P_0 \), \( P_0 V = -P_0 H_0 \) and (II.6), and then the expression (III.17) is obtained. Hence we are done.

\[ \]

\section{Exceptional Threshold of the Third Kind}

Finally we prove Theorem III.7. Compared with the proof of Theorem III.6, this case needs one more application of the inversion formula, or Proposition A.2, and the formulas get much more complicated.

\textbf{Proof of Theorem III.7.} Let us repeat arguments of the previous section to some extent. We write the expansion (VI.2) in the same form as (VIII.1), let \( Q \) be the orthogonal projection onto \( \ker M_0 \), and define \( m(\kappa) \) by the same formula as (VIII.2). Then by Proposition A.2 we have the same formula as (VIII.3), again. The operator \( m(\kappa) \) defined by (VIII.2) has the same expansion as (VIII.4) with (VIII.5)–(VIII.8), but without (IX.6) or (IX.7) by the assumption and Corollary V.2. Now we apply the inversion formula, Proposition A.2, to the operator \( m(\kappa) \).

\[ m(\kappa) = m_0 + \kappa m_1(\kappa). \]  

(X.1)

The leading operator \( m_0 \) is non-zero and not invertible in \( B(QK) \) by the assumption and Corollary V.2. Let \( T \) be the orthogonal projection onto \( \ker m_0 \subset QK \), and set

\[ q(\kappa) = \sum_{j=0}^{\infty} (-1)^j \kappa^j T m_1(\kappa) \{ m_0 + T \} m_1(\kappa) ]^j T. \]  

(X.2)

Then we have by Proposition A.2 that

\[ m(\kappa)^\dagger = (m(\kappa) + T)^\dagger \]

\[ + \kappa q(\kappa) \{ m(\kappa) + T \} q(\kappa)^\dagger. \]  

(X.3)

Using (VIII.4) and (X.1), let us write (X.2) in the form

\[ q(\kappa) = \sum_{j=0}^{\beta-4} \kappa^j q_j + \mathcal{O}(\kappa^{\beta-3}); \quad q_j \in B(TK). \]

The first and the second coefficients are given as

\[ q_0 = T m_1 T, \quad q_1 = T m_2 T - T m_1 (m_0^\dagger + T) m_1 T. \]  

(X.4)

Here we note that the leading operator \( q_0 \) has to be invertible in \( B(TK) \). Otherwise, applying Proposition A.2 once again, we can show that \( R(\kappa) \) has a singularity of order \( \kappa^{-j} \), \( j \geq 3 \) in its expansion. This contradicts the self-adjointness of \( H \). Hence we can use the Neumann series to write \( q(\kappa)^\dagger \), and obtain

\[ q(\kappa)^\dagger = \sum_{j=0}^{\beta-4} \kappa^j A_j + \mathcal{O}(\kappa^{\beta-3}), \quad A_j \in B(TK), \]  

(X.5)

where

\[ A_0 = q_0^\dagger, \quad A_1 = -q_0^\dagger q_1 q_0^\dagger. \]

We also write \( (m(\kappa) + T)^\dagger \) employing the Neumann series as

\[ (m(\kappa) + T)^\dagger = \sum_{j=0}^{\beta-3} \kappa^j C_j + \mathcal{O}(\kappa^{\beta-2}) \]  

(X.6)
with \( C_j \in \mathcal{B}(QK) \) and
\[
C_0 = m_0^\dagger + T, \quad C_1 = -(m_0^\dagger + T)m_1(m_0^\dagger + T).
\]

We first insert the expansions (X.5) and (X.6) into (X.3):
\[
m(\kappa)^\dagger = \sum_{j=1}^{\beta-5} \kappa^j D_j + \mathcal{O}(\kappa^{\beta-4}), \quad (X.7)
\]
\[
D_j = C_j + \sum_{j_1 \geq 0, j_2 \geq 0, j_3 \geq 0} C_{j_1} A_{j_2} C_{j_3},
\]
with \( C_{-1} = 0 \). Next, noting that we have an expansion of \((M(\kappa) + Q)^{-1}\) in the same form as (VIII.10), we insert the expansions (X.7) and (VIII.10) into (VIII.3):
\[
M(\kappa)^{-1} = \sum_{j=2}^{\beta-6} \kappa^j E_j + \mathcal{O}(\kappa^{\beta-5}), \quad (X.8)
\]
\[
E_j = B_j + \sum_{j_1 \geq 0, j_2 \geq -1, j_3 \geq 0} B_{j_1} D_{j_2} B_{j_3},
\]
with \( B_{-2} = B_{-1} = 0 \). We finally inserting the expansions (II.5) with \( N = \beta - 4 \) and (X.8) into (VI.4), and then obtain the expansion
\[
R(\kappa) = \sum_{j=2}^{\beta-6} \kappa^j G_j + \mathcal{O}(\kappa^{\beta-5}),
\]
\[
G_j = G_{0,j} - \sum_{j_1 \geq 0, j_2 \geq -2, j_3 \geq 0} G_{0,j_1} v E_{j_2} v^* G_{0,j_3},
\]
with \( G_{0,-2} = G_{0,-1} = 0 \).

Next we compute the first two coefficients. Let us start with \( G_{-2} \). Unfolding the above expressions, we can see with ease that
\[
G_{-2} = -G_{0,0} v E_{-2} v^* G_{0,0}
\]
\[
= -G_{0,0} v (TM_2 T - TM_1 (M_0^\dagger + T)M_1 T)^\dagger v^* G_{0,0}.
\]
Since
\[
m_0 = QM_1 Q = -|Qv^* n\rangle\langle Qv^* n|,
\]
it follows that
\[
Tv^* n = TQv^* n = 0. \quad (X.10)
\]
Hence we have
\[
G_{-2} = -G_{0,0} v (Tv^* G_{0,2} v T)^\dagger v^* G_{0,0},
\]
and we can verify the identity \( G_{-2} = P_0 \) in exactly the same manner as in the proof of Theorem III.6.
As for $G_{-1}$, it requires a slightly longer computations, and we proceed step by step. We can first write, concerning $A_s, B_s, C_s, D_s, E_s$ only,

$$G_{-1} = -G_{0,0}v_{E-1}v^*G_{0,0} - G_{0,0}v_{E-2}v^*G_{0,1}$$

$$- G_{0,1}v_{E-2}v^*G_{0,0}$$

$$= -G_{0,0}v\left(B_0(C_0 + C_0A_1C_0) + C_0A_0C_1 + C_1A_0C_0\right)B_0$$

$$+ B_0C_0A_0C_0B_1 + B_1C_0A_0C_0B_0)\right)v^*G_{0,0}$$

$$- G_{0,0}v_{B_0C_0A_0C_0B_0}v^*G_{0,1}$$

$$- G_{0,1}v_{B_0C_0A_0C_0B_0}v^*G_{0,0}. $$

Next, we implement the identities $B_0C_s = C_sB_0 = C_s$ and $C_0A_s = A_sC_0 = A_s$. Insert expressions of $A_s, B_s, C_s$, and then use (X.10):

$$G_{-1} = -G_{0,0}v\left(C_0 + A_1 + A_0C_1\right)$$

$$+ C_1A_0 + A_0B_1 + B_1A_0\right)v^*G_{0,0}$$

$$- G_{0,0}v_{A_0}v^*G_{0,0} - G_{0,1}v_{A_0}v^*G_{0,0}$$

$$= -G_{0,0}v\left(m^\dagger_0 + T - q_0^1m^\dagger_0 - q_0^1m_0^\dagger + T\right)$$

$$- (m^\dagger_0 + T)m_1q_0^1$$

$$- q_0^1M_1(M^T_{0} + Q) - (M^T_{0} + Q)M_1q_0^1\right)v^*G_{0,0},$$

$$- C_{0,0}v_{q_0^1}v^*G_{0,1} - G_{0,1}v_{q_0^1}v^*G_{0,0}.$$ 

$$= -G_{0,0}v\left(m^\dagger_0 + T - q_0^1m^\dagger_0 - q_0^1m_0^\dagger + T\right)$$

$$- (m^\dagger_0 + T)m_1q_0^1\right)v^*G_{0,0}.$$ 

We further unfold $q_1$ and $m_1$ and use (X.10): 

$$G_{-1} = -G_{0,0}v\left(m^\dagger_0 + T + q_0^1M_2(m^\dagger_0 + T) + M_2q_0^1\right)$$

$$- q_0^1M_2(m^\dagger_0 + T) - (m^\dagger_0 + T + M_2q_0^1\right)v^*G_{0,0}$$

$$= -G_{0,0}v\left(I - q_0^1M_2\right)m^\dagger_0(I - M_2q_0^1\right)v^*G_{0,0}$$

$$- G_{0,0}v\left(I - q_0^1M_2\right)T(I - M_2q_0^1)v^*G_{0,0}. $$

Since $TM_2T = Tm_1T = q_0T$ by (X.10), the last term can actually be removed:

$$G_{-1} = -G_{0,0}v(I - q_0^1M_2)m^\dagger_0(I - M_2q_0^1)v^*G_{0,0}. $$

Finally by (X.9) we can write

$$m^\dagger_0 = -\|Qv^*n\|^{-1}|Qv^*n\rangle\langle Qv^*n|,$$

and hence we obtain

$$G_{-1} = |\Psi_c\rangle\langle \Psi_c|,$$

$$\Psi_c = \|Qv^*n\|^{-2}G_{0,0}v(I - q_0^1v^*G_{0,2}v)Qv^*n \in \mathcal{E}. $$
Let us verify that the above $\Psi_c$ is in fact the canonical resonance function. For any $\Psi \in \mathcal{E}$ set $\Phi = w\Psi \in T\mathcal{K}$. As in the proof of Theorem III.6 we can verify that
\[
\langle \Psi, \Psi_c \rangle = -\|Qv^*n\|^{-2} \\
\times \langle G_{0,0}vT\Psi, G_{0,0}v(I - q_0^1v^*G_{0,2}v)Qv^*n \rangle
\]
\[= 0.\]

We can also prove that
\[
\langle Vn, \Psi_c \rangle = \|Qv^*n\|^{-2} \\
\times \langle Vn, G_{0,0}v(I - q_0^1v^*G_{0,2}v)Qv^*n \rangle
\]
\[= \|Qv^*n\|^{-2} \langle Uv^*n, (M_0 - U)(I - q_0^1v^*G_{0,2}v)Qv^*n \rangle
\]
\[= -\|Qv^*n\|^{-2} \langle v^*n, (I - q_0^1v^*G_{0,2}v)Qv^*n \rangle
\]
\[= -1.\]

This concludes the proof. \hfill \square

**Appendix A: Inversion formula**

In this appendix we present an inversion formula needed in the proof of the main results of the paper. The formula is quoted from Ito-Jensen\(^2\) (Section 3.1), which in turn was adapted from Jensen-Nenciu\(^3\) (Corollary 2.2).

Let us argue in a general context.

**Assumption A.1.** Let $\mathcal{K}$ be a Hilbert space and $A(\kappa)$ a family of bounded operators on $\mathcal{K}$ with $\kappa \in D \subset \mathbb{C} \setminus \{0\}$. Suppose that

1. The set $D \subset \mathbb{C} \setminus \{0\}$ is invariant under complex conjugation and accumulates at $0 \in \mathbb{C}$.
2. For each $\kappa \in D$ the operator $A(\kappa)$ satisfies $A(\kappa)^* = A(\bar{\kappa})$ and has a bounded inverse $A(\kappa)^{-1} \in \mathcal{B}(\mathcal{K})$.
3. As $\kappa \to 0$ in $D$, the operator $A(\kappa)$ has an expansion in the uniform topology of the operators at $\mathcal{K}$:
   \[ A(\kappa) = A_0 + \kappa \bar{A}_1(\kappa); \quad \bar{A}_1(\kappa) = O(1). \] \hfill (A.1)
4. The spectrum of $A_0$ does not accumulate at $0 \in \mathbb{C}$ as a set.

If the leading operator $A_0$ is invertible in $\mathcal{B}(\mathcal{K})$, the Neumann series provides an inversion formula for the expansion of $A(\kappa)^{-1}$:
\[
A(\kappa)^{-1} = \sum_{j=0}^{\infty} (-1)^j \kappa^j A_0^{-1} [\bar{A}_1(\kappa)A_0^{-1}]^j.
\]

The inversion formula given below is useful when $A_0$ is not invertible in $\mathcal{B}(\mathcal{K})$.

We define the *pseudo-inverse* $a^\dagger$ for a complex number $a \in \mathbb{C}$ by
\[
a^\dagger = \begin{cases} 
0 & \text{if } a = 0, \\
\frac{1}{a} & \text{if } a \neq 0.
\end{cases}
\] \hfill (A.2)
Let $K' \subset K$ be a closed subspace. We always identify $B(K')$ with its embedding in $B(K)$ in the standard way. For an operator $A \in B(K') \subset B(K)$ we say that $A$ is invertible in $B(K')$ if there exists an operator $A^\dagger \in B(K')$ such that $A^\dagger A = AA^\dagger = I_{K'}$, which we identify with the orthogonal projection onto $K' \subset K$ as noted. For a general self-adjoint operator $A$ on $K$ we abuse the notation $A^\dagger$ also to denote the operator defined by the usual operational calculus for the function $(A.2)$. The operator $A^\dagger$ for a self-adjoint operator $A$ belongs to $B(K)$ if and only if the spectrum of $A$ does not accumulate at 0 as a set, and in such a case the above two $A^\dagger$ coincide. In either case we call $A^\dagger$ the pseudo-inverse of $A$. The reader should note that we always use the notation $A^*$ for the adjoint and the notation $A^\dagger$ for the pseudo-inverse.

**Proposition A.2.** Suppose Assumption A.1. Let $Q$ be the orthogonal projection onto $\text{Ker} A_0$, and define the operator $a(\kappa) \in B(QK)$ by

$$a(\kappa) = \frac{1}{2} \left\{ I_{QK} - Q(A(\kappa) + Q)^{-1}Q \right\} = \sum_{j=0}^{\infty} (-1)^j \kappa^j Q A_1(\kappa) \left[ (A_1^\dagger + Q) A_1(\kappa) \right]^j Q.$$  \hspace{1cm} (A.3)

Then $a(\kappa)$ is bounded in $B(QK)$ as $\kappa \to 0$ in $D$. Moreover, for each $\kappa \in D$ sufficiently close to 0 the operator $a(\kappa)$ is invertible in $B(QK)$, and

$$A(\kappa)^{-1} = (A(\kappa) + Q)^{-1} + \frac{1}{\kappa} (A(\kappa) + Q)^{-1} a(\kappa)^\dagger (A(\kappa) + Q)^{-1}.$$  \hspace{1cm} (A.4)
