Abstract: A series of piperazin-1-yl substituted unfused heterobiaryls was synthesized as ligands of the 5-HT\textsubscript{7} receptors. The goal of this project was to elucidate the structural features that affect the 5-HT\textsubscript{7} binding affinity of this class of compounds represented by the model ligand 4-(3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (2). The SAR studies included systematical structural changes of the pyrimidine core moiety in 2 to quinazoline, pyridine and benzene, changes of the 3-furyl group to other heteroaryl substituents, the presence of various analogs of the 4-methylpiperazin-1-yl group, as well as additional substitutions at positions 5 and 6 of the pyrimidine. Substitution of position 6 of the pyrimidine in the model ligand with an alkyl group results in a substantial increase of the binding affinity (note a change in position numbers due to the nomenclature rules). It was also demonstrated that 4-(3-furyl) moiety is crucial for the 5-HT\textsubscript{7} binding affinity of the substituted pyrimidines, although, the pyrimidine core can be replaced with a pyridine ring without a dramatic loss of the binding affinity. The selected ethylpyrimidine (12) and butylpyrimidine (13) analogs of high 5-HT\textsubscript{7} binding affinity showed antagonistic properties in cAMP functional test and varied selectivity profile—compound 12 can be regarded as a dual 5-HT\textsubscript{7}/5-HT\textsubscript{2A}R ligand, and 13 as a multi-receptor (5-HT\textsubscript{7}, 5-HT\textsubscript{2A}, 5-HT\textsubscript{6} and D\textsubscript{2}) agent.

Keywords: 5-HT\textsubscript{7} receptor ligands; 5-HT; serotonin; synthesis; structure-affinity relationships (SAR); N-methylpiperazine; 3-furyl

1. Introduction

For more than 60 years, the studies on the role of serotonin (5-HT) within the central nervous system (CNS) have constantly provided evidence of the involvement of 5-HT receptors in the action of various psychiatric drugs. It is now evident that deregulation of serotonergic signaling is associated with pathogenesis of severe neuropsychological disorders like depression [1,2] Alzheimer’s...
disease [3,4] or schizophrenia [5], and not surprisingly the 5-HT signaling system is one of the major focuses of various CNS drug development strategies [6].

Among the plethora of functions influenced by fourteen 5-HT receptor subtypes, activation of 5-HT$_7$ receptors (5-HT$_7$R) in the CNS regulates circadian rhythms (facilitates diurnal phase shift and REM sleep) [7,8], thermoregulation (induces hypothermia) [9,10] and cognitive processes by facilitation of long and short-term memory consolidation [11–13]. Moreover, the presence of 5-HT$_7$ receptors in key cerebral areas as well as high affinity of numerous antidepressants and antipsychotics for the 5-HT$_7$ receptors, indicate their potential role in depression and schizophrenia [14–17]. The results of pre-clinical studies have shown that both genetic inactivation and pharmacological blockade of the 5-HT$_7$ receptors leads to antidepressant-like effects in animal models of depression [14,16]. Similarly, antagonism at 5-HT$_7$ receptors is one of the key pharmacological features of vortioxetine, an atypical antidepressant that was approved for medication in 2013 by the U.S. FDA [18]. Therefore, the new individual therapies targeting the blockade of 5-HT$_7$ receptors in combination with using antidepressants are currently under investigation [19].

In relation to schizophrenic disorders, the involvement of 5-HT$_7$ receptors in the pro-social action of amisulpride has been recently demonstrated, and 5-HT$_7$ receptor antagonism was postulated as a possible mechanism for the treatment of social withdrawal—one of the core negative symptoms of schizophrenia [20]. Other preclinical findings, implicating the role of 5-HT$_7$ receptors in learning and memory, suggest that blockade of this receptor may be beneficial against cognitive impairments in schizophrenia [21].

Given the role of 5-HT$_7$ receptors in the mechanism of action of antidepressants and antipsychotics, various groups of ligands have been developed but attributed mainly with linear arrangement of basic pharmacophore features that include long chain arylpiperazine structure [22,23]. Looking for new leads with different pattern of potential ligand-5-HT$_7$ receptor interactions, we screened our in-house compound library and high 5-HT$_7$R affinity was found for some 4-mono-, or 4,6-di-substituted 2-(4-methylpiperazino)pyrimidine derivatives, developed earlier as 5-HT$_2A$ antagonists [24]. Here we present synthesis and extensive structure-5-HT$_7$ receptor affinity study on piperazin-1-yl substituted unfused heterobiaryls and related compounds.

2. Results

2.1. Chemistry

The commercially available substituted pyrimidines, quinazolines, pyridines and benzenes were used as starting materials in the synthesis of a novel library of 5-HT$_7$ receptor ligands. Substituted pyrimidines are the most extensive class of compounds used in this study. The general synthetic approach developed in our laboratories includes the addition reaction of an aryl(heteroaryl)lithium reagent to generate a substituted dihydropyrimidine or dihydroquinazoline intermediate product, which, without isolation, undergoes aromatization upon treatment with 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) (Schemes 1 and 2) [24,25].

Many final products were obtained by nucleophilic displacement reaction of a halogen activated by an appropriately positioned ring nitrogen atom in pyrimidines, quinazolines and pyridines (Schemes 1 and 3, Schemes 4–8). By using this methodology, 4-substituted 2-chloropyrimidine or 2-chloroquinazoline substrates were easily functionalized with amines to give the final products 1, 2, 21, 23, 24, 26, 29, 30, 32, 36–46, and 48. With 2,4-dichloropyrimidines, such nucleophilic displacement is regioselective, giving rise to 4-amino-2-chloropyrimidines, often with yields exceeding 90% [26]. In this work, the regioselective displacement reaction of 2,4-dichloro-6-(3-furyl)pyrimidine with dimethylamine at ambient temperature yielded a 2-chloro-4-dimethylamino intermediate product, the subsequent treatment of which with N-methylpiperazine at an elevated temperature furnished the final product 4-dimethylamino-6-(3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (19). On the other hand, two consecutive introductions of heteroaryl groups at positions 4 and 6 of 2-chloropyrimidine followed
by nucleophilic displacement of the 2-chloro atom yielded a variety of substituted pyrimidines 11–20, 22, 25, 27, 28, 31 (Scheme 1).

The classical alkylation and acylation reactions of 1 provided facile entry to compounds 3–10 (Scheme 2). A similar strategy afforded a piperazinium derivative 47 (see Experimental). It was also found that the conjugate addition reaction of dimethylamine with 2-chloro-4-vinylquinazoline [27,28] proceeds cleanly to furnish 2-chloro-4-(2-dimethylamino)ethyl substituted quinazoline, the subsequent treatment of which with N-methylpiperazine yielded the desired product 50 (Scheme 5).

The Suzuki mono-coupling reaction of a dihalogeno-substituted pyridine with a heteroarylboronic acid followed by classical nucleophilic displacement of the second halogen were used to synthesize pyridine derivatives 51–59 (Schemes 6–8). The reaction sequence depended on type of substrate used.

In case of benzene derivatives, Buchwald-Hartwig amination of halogeno-substituted benzenes with N-methylpiperazine in the presence of a palladium catalyst provided piperazine-substituted products (Scheme 9). The Suzuki condensation of these intermediate products with heteroarylboronic acids yielded the desired heteroaryl-substituted benzenes 60–71. It should be noted that the majority of the two-step reactions discussed above were conducted with crude intermediate products. However, the final products were rigorously characterized in all cases studied.

2.2. Pharmacology

Novel scaffold endowed with 5-HT\(_7\)R activity was identified by screening of the in-house compound library in a single compound concentration of 1 \(\mu\)M in a competition radioligand binding assay using \[^3H\]5-CT and HEK293 cells overexpressing the human 5-HT\(_7\)b receptors. Compounds showing >60\% of inhibition, namely (4-(3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (2) and its two derivatives 11 and 18 were further tested in full binding experiments, and, as for all the newly synthesized compounds (1, 3–10, 12–17 and 19–71), 5-HT\(_7\)R affinity (\(K_i\) values \(\pm\) SD) was determined in at least two independent experiments run in triplicate [31]. The functional properties of two selected compounds 12 and 13 active on 5-HT\(_7\)R were further evaluated using their ability to inhibit cAMP production induced by 5-CT (10 nM) in the same cellular system [32,33]. In addition, compounds 12 and 13 were evaluated for their affinity at three other serotonergic receptors: 5-HT\(_1A\), 5-HT\(_2A\), 5-HT\(_6\) and dopaminergic D\(_2\) in standard competition binding assays by use of the appropriate radioligand: \[^3H\]8-OH-DPAT (187 Ci/mmol), \[^3H\]Ketanserin (66.9 Ci/mmol), \[^3H\]LSD (85.2 Ci/mmol) and \[^3H\]Raclopride (74.4 Ci/mmol), respectively, and cell line with overexpressed receptor (CHO for 5-HT\(_2A\) and HEK293 for all the others) [33,34].

3. Discussion

The objective of this study was to determine which combinations of structural features affect the 5-HT\(_7\) binding affinity of unfused heterobiaryls. The intended SAR studies included synthesis of new analogs of the model compound 2 and encompassed the following points: (1) substitution of the amino group within the piperazine ring; (2) introduction of alkyl, amino and bulky substituents into positions 4/6 and/or 5 of the pyrimidine ring; (3) modifications of the heteroaryl group in position 4/6 of the pyrimidine; (4) replacement of the piperazinyl group by other amino substituents; and (5) synthesis of a series of pyridines and benzenes allowing comparison of the influence of the central ring nitrogen atom(s) on the ligand affinity.

First, investigating the influence of substituents at the basic piperazine atom, it was found that unsubstituted (1), simple alkyls (3 and 4), arylalkyl (7), hydroxyalkyl (8) or even esters (9 and 10) provide a similar level of 5-HT\(_7\)R affinity (\(K_i = 1.4–10\) nM) as methylated hit compound 2 (\(K_i = 7.2\) nM). Slight decrease in 5-HT\(_7\)R affinity is observed for benzyl derivative 5 (\(K_i = 25\) nM) which is probably caused by a negative steric influence of the phenyl group on the key interaction between a protonated nitrogen and aspartic acid (D3.32) residue in the receptor [35]. Moreover, with the benzoyl group (6), there is an obvious negative effect on the affinity (\(K_i = 1405\) nM) that arises from diminished basicity of the piperazine nitrogen atom (Table 1).

In the literature, piperazine has been often a key element of 5-HT\(_7\)R ligands [22], and it is also optimal for heterobiaryl compounds, as its replacement results in decreased affinity (Table 2). Indeed, introduction of homopiperazine leads to ligand with a moderate affinity for 5-HT\(_7\)R (42, \(K_i = 148\) nM), whereas no affinity is observed for piperidine (43) and morpholine (44) derivatives that lack a basic nitrogen atom. In the group of compounds incorporating sterically hindered amines (45–47), only the ligand with positively charged quaternary nitrogen atom displayed moderate 5-HT\(_7\)R affinity (47, \(K_i = 299\) nM).
Further modifications of the model compound 2 involved introductions of substituents at position 6 of the pyrimidine ring. Alkyl groups (11–16) are very well tolerated in terms of 5-HT\(_7\) receptors affinity (\(K_i\) values in the range of 1.6 to 8.3 nM), while introduction of bulky cyclohexenylethynyl (17) and 3-furyl (18) groups results only in a minor reduction of the binding affinity with the \(K_i\) values of 18 and 22 nM, respectively. It can be seen, however, that amino groups (19) cannot substitute at position 6 and alkyl substituents at position 5 (21, 22) are highly detrimental for the affinity.

Next, the SAR analysis of the substituents at position 4 of the pyrimidine ring was investigated by modifications and replacement of the 3-furyl group. Compounds 23, 24 with methyl substituents within the 3-furyl ring display reduced affinities (\(K_i\) values of 1,920 and 462 nM, respectively). Interestingly, introduction of an \(n\)-hexyl group (25) at position 6 of the pyrimidine in compound 24 restores high affinity for 5-HT\(_7\)R (\(K_i = 12\) nM). A similar trend can be recognized for less active ligands 26 (2-furyl, \(K_i = 1,021\) nM) and 30 (3-thienyl, \(K_i = 83\) nM), where addition of a 6-alkyl substituent results in a 2- or 3-fold boost in affinity (ethyl, 27, \(K_i = 380\) nM; \(n\)-butyl, 28, \(K_i = 450\) nM and \(n\)-butyl, 31, \(K_i = 15\) nM). As a general rule, 3-furyl (2, 24) and 3-thienyl (30) derivatives are 5 to 140-fold more active than their 2-furyl (26, 29) and 2-thienyl (32) counterparts. Replacement of the 3-furyl group for \(o\)-, \(m\)-, \(p\)-hydroxyphenyl (33–35), pyridin-3-yl (39), thiazol-2-yl (40) or imidazol-1-yl (41) group as well as benzo-fused heterocyclic (36–38) moieties does not furnish ligands with noteworthy affinity for 5-HT\(_7\)R (\(K_i > 1000\) nM). Thus, it appears that the 3-furyl group is necessary for a high affinity of 5-HT\(_7\)R ligands or, alternatively, a 3-thienyl moiety but with an appropriate enhancing substituent at position 6 of the pyrimidine ring (Table 1).

Next it was found that quinazoline derivatives (48–50), which can be treated as 5,6-disubstituted pyrimidine analogs, were inactive (\(K_i > 1910\) nM). This result is fully consistent with our finding that substitution at position 5 is highly detrimental for 5-HT\(_7\)R affinity (Table 3).

**Table 2. Affinities of pyrimidines 42–47 for 5-HT\(_7\) receptor.**

| R                  | R                  | \(K_i \pm \text{S.D. (nM)}\) |
|--------------------|--------------------|-------------------------------|
| ![Pyrimidine 42](image1) | ![Pyrimidine 43](image2) | 148 ± 17                     |

Hence, the introduction of an alkyl substituent into position 6 of the pyridine ring results in a 2- or 3-fold boost in affinity (ethyl, position 6, 52, $K_i = 307 \text{ nM}$). However, for the 2-furyl derivatives, position 4 (52, $K_i = 307 \text{ nM}$) is preferred over position 6 (59, $K_i = 1135 \text{ nM}$) of the pyridine as the attachment site. The pyridine ligands incorporating 3-thienyl (58, $K_i = 79 \text{ nM}$) and 2-thienyl (53, $K_i = 396 \text{ nM}$) substituents are nearly equipotent compared to their pyrimidine counterparts (30, $K_i = 83 \text{ nM}$ and 32, $K_i = 480 \text{ nM}$). Similarly to pyrimidine ligands, introduction of an alkyl substituent into position 6 of the pyridine ring results in a 2- or 3-fold boost in affinity (54, $K_i = 8 \text{ nM}$; 55, $K_i = 139 \text{ nM}$ and 56, $K_i = 117 \text{ nM}$ vs 51, $K_i = 17 \text{ nM}$; 52, $K_i = 307 \text{ nM}$ and 53, $K_i = 396 \text{ nM}$, respectively).

**Table 3. Affinities of substituted quinazolines 48–50 for 5-HT7 receptor.**

| R        | $K_i \pm SD \text{ (nM)}$ |
|----------|---------------------------|
| 48       | 3-furyl 1910 ± 235         |
| 49       | N 7540 ± 1140             |
| 50       | (CH$_2$)$_2$N(Me)$_2$ >10,000 |

Having established reasonable SAR around pyrimidine central ring, we focused our attention on the role of the pyrimidine core itself, analyzing a series of substituted pyridine- and phenyl-piperazine analogs. The pyridine derivatives (51–59) were then synthesized to determine whether both nitrogen atoms within the central heterocycle are needed for the ligand to retain affinity for the binding pocket of the receptor (Table 4). The biological data show that both isomeric 4-(3-furyl) (51) and 6-(3-furyl) (57) pyridine ligands still demonstrate high affinities for the 5-HT7 receptor ($K_i = 17 \text{ nM}$ and 8 nM, respectively). However, for the 2-furyl derivatives, position 4 (52, $K_i = 307 \text{ nM}$) is preferred over position 6 (59, $K_i = 1135 \text{ nM}$) of the pyridine as the attachment site. The pyridine ligands incorporating 3-thienyl (58, $K_i = 79 \text{ nM}$) and 2-thienyl (53, $K_i = 396 \text{ nM}$) substituents are nearly equipotent compared to their pyrimidine counterparts (30, $K_i = 83 \text{ nM}$ and 32, $K_i = 480 \text{ nM}$). Similarly to pyrimidine ligands, introduction of an alkyl substituent into position 6 of the pyridine ring results in a 2- or 3-fold boost in affinity (54, $K_i = 8 \text{ nM}$; 55, $K_i = 139 \text{ nM}$ and 56, $K_i = 117 \text{ nM}$ vs 51, $K_i = 17 \text{ nM}$; 52, $K_i = 307 \text{ nM}$ and 53, $K_i = 396 \text{ nM}$, respectively).

**Table 4. Binding affinities of substituted pyridines 51–59 for 5-HT7 receptor (see Schemes 6–8).**

| X | Y | $K_i \pm S.D. \text{ (nM)}$ |
|---|---|-----------------------------|
| 51 | H | 3-furyl N CH 17 ± 2 |
| 52 | H | 2-furyl N CH 307 ± 42 |
| 53 | H | 2-thienyl N CH 396 ± 55 |
| 54 | Me | 3-furyl N CH 8 ± 1 |
| 55 | Me | 2-furyl N CH 139 ± 22 |
| 56 | Me | 2-thienyl N CH 117 ± 12 |
| 57 | H | 3-furyl CH N 11 ± 2 |
| 58 | H | 3-thienyl CH N 79 ± 14 |
| 59 | H | 2-furyl CH N 1135 ± 154 |
in 5-HT₇R affinity (62, \( K_i = 106 \) nM; 65, \( K_i = 743 \) nM; 68, \( K_i = 263 \) nM and 71, \( K_i = 734 \) nM). The observed phenomenon may arise from higher lipophilicity of the ligands, which increases non-specific interactions with the tested 5-HT₇ receptor.

Two selected compounds 12 and 13 with high 5-HT₇R affinity were next evaluated in in vitro functional cAMP assay (Figure 1) and their selectivity for other serotonin (5-HT₁₆, 5-HT₂₆, 5-HT₆) and dopamine D₂ receptors was investigated (Table 6). It was found that both 12 and 13, similarly to (2R)-1-((3-hydroxyphenyl)sulfonyl)-2-(2-(4-methyl-1-piperidinyl)ethyl)pyrrolidine (SB-269970) [32]—a selective 5-HT7R antagonist used as a control, dose-dependently decrease 5-CT-induced cAMP accumulation in transfected HEK cells expressing 5-HT₇ (Figure 1). It has to be stressed, however, that 5-HT₇R antagonistic properties of 12 and 13 are weaker (\( K_i = 12 \) and 60 nM, respectively) than that of SB-269970 (\( K_i = 1.9 \) nM) and that, unexpectedly, \( n \)-butyl derivative 13, despite showing higher affinity, is less potent 5-HT₇R antagonist than ethyl analog 12. Alkyl substituent at position 4 also influences selectivity profile—both compounds show almost the same, high affinity for 5-HT₂A (\( K_i = 10 \) and 12 nM for 12 and 13, respectively) but \( n \)-butyl derivative is 10- and 13-fold more active than 12 at 5-HT₆ and D₂ receptors. Both analogs are weak 5-HT₁₆R binders.

![Figure 1](image-url). The functional properties of compounds 12 and 13 and a reference antagonist SB-269970 on 5-HT₇R evaluated using their ability to inhibit cAMP production induced by 5-CT (10 nM) in HEK-293 cells expressing 5-HT₇R.

4. Materials and Methods

4.1. General Methods

All air-sensitive reactions were conducted under a nitrogen atmosphere. Tetrahydrofuran (THF) was distilled from sodium benzophenone ketyl immediately before use. Heteroaryllithium reagents were generated by direct lithiation of a heterocyclic substrate or by a bromine-lithium exchange reaction as previously reported [28]. Final products were purified on a chromatotron using silica gel-coated rotors. Oily products were transformed into hydrobromide salts by using a general procedure [30] and the salts were crystallized from 95% ethanol. Melting points (Pyrex capillary) are not corrected. The $^1$H-NMR (400 MHz) and $^{13}$C-NMR (100 MHz) spectra of free bases and hydrobromide salts were obtained in CDCl$_3$ and DMSO-$d_6$, respectively. Mass spectra were recorded using electrospray ionization in a positive ion mode.

4.2. Synthesis of Substituted Pyrimidines 1, 2, 21, 23, 24, 26, 29, 30, 32, 36–46 and Quinazoline 48

A solution of the corresponding lithium reagent (10 mmol) in THF (10 mL) was stirred at $-50^\circ$C and treated dropwise with a solution of 2-chloropyrimidine, 2-chloro-5-propylpyrimidine or 2-chloroquinazoline (12 mmol) in THF (15 mL). The mixture was allowed to reach 0 $^\circ$C within 2 h, then quenched with a solution of water in THF (1:5, 6 mL), stirred at 0 $^\circ$C and treated with a solution of DDQ (2.3 g, 10 mmol) in THF (5 mL). After stirring for an additional 10 min at 0 $^\circ$C, the mixture was treated with a cold solution of sodium hydroxide (4 M, 5 mL, 20 mmol), stirred and extracted immediately with ether/hexanes (1:1). The combined extracts were dried with anhydrous sodium sulfate, decolorized by filtration through a pad of silica gel (5 g) and concentrated on a rotary evaporator. The resultant crude 4-substituted 2-chloropyrimidine or 2-chloroquinazoline was treated with a primary or secondary amine (30 mmol) in toluene (20 mL) in the presence of anhydrous potassium carbonate and the mixture was heated at 75 $^\circ$C for 5–10 h, after which time a TLC analysis on silica gel eluting with ether/triethylamine (9:1) showed the absence of the substrate. Preparative chromatography was conducted eluting with ether/triethylamine/hexanes (9:5:5) to give product 1, 2, 21, 23, 24, 26, 29, 30, 32, 36–46 (Scheme 1) and 48 (Scheme 2).

4.3. Synthesis of Polysubstituted Pyrimidines 11–20, 22, 25, 27, 28, 31

Alternatively, the crude 4-substituted 2-chloropyrimidine, obtained as described above, was treated with a lithium reagent followed by aromatization with DDQ of the intermediate dihydropyrimidine under the conditions described above and the resultant crude 4,6-disubstituted 2-chloropyrimidine was allowed to react with N-methylpiperazine, as described above, to yield 4,6-disubstituted 2-(N-methylpiperazine-1-yl)pyrimidine 11–20, 22, 25, 27, 28, 31 (Scheme 1).

4.4. Synthesis of [N-Substituted 2-(Piperazin-1-yl)]pyrimidines 3–10 and 47

In the preparation of compounds 3–10, a mixture of 4-(3-furyl)-2-(piperazin-1-yl)pyrimidine (1, 200 mg, 0.87 mmol), synthesized as described above, and anhydrous potassium carbonate (300 mg, 2.2 mmol) in anhydrous acetonitrile (10 mL) was stirred at $-10^\circ$C and treated with ethyl bromide, propyl bromide, benzyl chloride, benzoyl chloride, 3-phenylpropyl bromide, 2-bromoethanol, ethyl 3-bromopropionate or ethyl 6-bromohexanoate (2.0 mmol) (Scheme 2). The mixture was stirred at 23 $^\circ$C for 2 h and then quenched with water (2 mL) and extracted with ether (3 $\times$ 20 mL). The extract was

---

Table 6. Extended results for compounds 12 and 13.

|       | $K_i$ ± S.D. (nM) |
|-------|------------------|
|       | $D_2$ | 5-HT$_{1A}$ | 5-HT$_{2A}$ | 5-HT$_6$ | 5-HT$_7$ |
| 12    | 466 ± 39 | 1501 ± 164 | 12 ± 2 | 121 ± 14 | 7.1 ± 1.4 |
| 13    | 37 ± 4  | 637 ± 53   | 10 ± 1 | 12 ± 2  | 1.6 ± 0.2 |
dried with anhydrous sodium sulfate and concentrated. Purification by chromatography eluting with dichloromethane/methanol (10:1) gave product 3-10.

In the preparation of 4-[4-(3-furyl)pyrimidin-2-yl]piperazine-1-spiro-1-morpholinium iodide (47), a mixture of compound 1 (1 mmol), 1-ido-2-(2-idoethoxy)ethane (1 mmol) and anhydrous potassium carbonate (140 mg, 1 mmol) in anhydrous acetonitrile (10 mL) was heated under reflux for 1 h and then quenched with water (5 mL). Product 47 was extracted with ethyl acetate and purified on a chromatotron eluting with dichloromethane/methanol (8:2).

4-(3-Furyl)-2-(piperazin-1-yl)pyrimidine (1). Yield 70% (free base); an oil; 1H-NMR: δ 8.33 (d, J = 5.1 Hz, 1H), 8.10 (s, 1H), 7.51 (m, 1H), 6.89 (m, 1H), 6.67 (d, J = 5.1 Hz, 1H), 3.88 (m, 4H), 2.98 (m, 4H). A hydrobromide salt: m.p. 241–242°C. Anal. Calcd for C_{12}H_{14}N_{4}O_{2}•HBr•0.5H_{2}O: C, 45.01; H, 5.03; N, 17.50. Found: C, 44.82; H, 4.85; N, 17.39.

4-(3-Furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (2) [24].

2-(4-Ethylpiperazin-1-yl)-4-(3-furyl)pyrimidine (3). Yield 61% (free base); an oil; 1H-NMR: δ 8.29 (d, J = 5.1 Hz, 1H), 8.07 (m, 1H), 7.48 (m, 1H), 6.86 (m, 1H), 6.63 (d, J = 5.1 Hz, 1H), 3.91 (m, 4H), 2.53 (m, 4H), 2.49 (q, J = 7.2 Hz, 2H), 1.14 (t, J = 7.2 Hz, 3H). A hydrobromide salt. Anal. Calcd for C_{14}H_{18}N_{4}O_{2}•2HBr•0.5H_{2}O: C, 39.18; H, 4.93; N, 13.06. Found: C, 39.29; H, 4.36; N, 12.81.

4-(3-Furyl)-2-(4-propylpiperazin-1-yl)pyrimidine (4). Yield 39% (free base); an oil; 1H-NMR: δ 8.29 (d, J = 5.1 Hz, 1H), 8.06 (s, 1H), 7.48 (s, 1H), 6.86 (s, 1H), 6.63 (d, J = 5.1 Hz, 1H), 3.90 (t, 4H), 2.52 (m, 4H), 2.36 (t, J = 7.4 Hz, 2H), 1.57 (m, 2H), 0.94 (t, J = 7.4 Hz, 3H). A hydrobromide salt: m.p. 274–277°C. Anal. Calcd for C_{15}H_{20}N_{4}O_{2}•2HBr•H_{2}O: C, 39.84; H, 5.35; N, 12.39. Found: C, 40.39; H, 4.84; N, 12.45.

2-(4-Benzylpiperazin-1-yl)-4-(3-furyl)pyrimidine (5). Yield 73% (free base); an oil; 1H-NMR: δ 8.28 (d, J = 5.1 Hz, 1H), 8.05 (m, 1H), 7.47 (m, 1H), 7.31 (m, 5H), 6.85 (s, 1H), 6.62 (d, J = 5.1 Hz, 1H), 3.89 (m, 4H), 3.57 (s, 2H), 2.53 (m, 4H). A hydrobromide salt: m.p. >280°C. Anal. Calcd for C_{19}H_{20}N_{4}O_{2}•2HBr•2H_{2}O: C, 45.62; H, 4.84; N, 11.20. Found: C, 45.93; H, 4.67; N, 11.11.

2-(4-Benzylpiperazin-1-yl)-4-(3-furyl)pyrimidine (6). Yield 33% (free base); an oil; 1H-NMR: δ 8.31 (d, J = 5.1 Hz, 1H), 8.06 (m, 1H), 7.48 (m, 1H), 7.44 (m, 5H), 6.85 (m, 1H), 6.69 (d, J = 5.1 Hz, 1H), 4.27 (broad m, 8H); 13C-NMR: δ 170.6, 161.7, 159.2, 158.13, 144.0, 143.1, 135.8, 129.8, 128.6, 127.1, 126.0, 108.5, 106.3, 44.0, 42.3. A hydrobromide salt: m.p. 221°C (dec.). Anal. Calcd for C_{19}H_{18}N_{4}O_{2}•2HBr•0.5H_{2}O: C, 53.79; H, 4.75; N, 13.20. Found: C, 53.97; H, 4.32; N, 13.15.

4-(3-Furyl)-2-[4-(4-phenylpropyl)piperazin-1-yl]pyrimidine (7). Yield 44% (free base); an oil; 1H-NMR: δ 8.27 (d, J = 5 Hz, 1H), 8.05 (s, 1H), 7.46 (t, J = 2 Hz, 1H), 7.27 (dd, J = 8 Hz and 15 Hz, 2H), 7.18 (m, 3H), 6.85 (t, J = 2 Hz, 1H), 6.61 (d, J = 5 Hz, 1H), 3.88 (t, t, J = 5 Hz, 4H), 2.67 (t, J = 8 Hz, 2H), 2.50 (t, J = 5 Hz, 4H), 2.41 (t, J = 7 Hz, 2H); 13C-NMR: δ 161.8, 159.0, 158.0, 143.8, 143.0, 142.1, 128.4, 128.3, 126.2, 125.7, 108.5, 105.6, 58.1, 53.1, 43.7, 33.7, 28.5. HR-MS (ESI). Calcd for C_{21}H_{25}N_{4}O (M^+ + 1): m/z 349.2028. Found: m/z 349.2022.

2-[4-(2-Hydroxyethyl)piperazin-1-yl]-4-(3-furyl)pyrimidine (8). Yield 58% (free base); an oil; 1H-NMR: δ 8.34 (t, J = 4.8 Hz, 1H), 8.27 (d, J = 5.2 Hz, 1H), 7.47 (d, J = 1.2 Hz, 1H), 6.85 (s, 1H), 6.62 (d, J = 5.2 Hz, 1H), 3.89 (t, J = 4.8 Hz, 4H), 3.68 (t, J = 5.2 Hz, 2H), 3.20 (broad s, exchangeable with D_{2}O, 1H), 2.58 (m, 6H); 13C-NMR: δ 161.9, 159.2, 158.2, 143.3, 143.1, 126.3, 108.7, 105.9, 59.8, 58.0, 53.0, 43.8. HR-MS (ESI). Calcd for C_{14}H_{19}N_{4}O (M^+ + 1): m/z 275.1508. Found: m/z 275.1508. A hydrobromide salt: m.p. >280°C. Anal. Calcd for C_{14}H_{19}N_{4}O_{2}•2HBr•H_{2}O: C, 37.02; H, 4.88; N, 12.34. Found: C, 37.12; H, 4.51; N, 12.32.

Ethyl 3-[4-[4-(3-furyl)pyrimidin-2-yl]piperazin-1-yl]propanoate (9). Yield 50% (free base); an oil; 1H-NMR: δ 8.27 (d, J = 5 Hz, 1H), 8.06 (s, 1H), 7.47 (t, J = 2 Hz, 1H), 6.85 (m, 1H), 6.62 (d, J = 5 Hz, 1H), 4.15 (q, J = 7 Hz, 2H), 3.87 (t, J = 5 Hz, 4H), 2.74 (m, 2H), 2.54 (m, 6H), 1.26 (t, J = 7 Hz, 3H); 13C-NMR: δ 172.6,
4-(Furyl)-6-n-hexyl-2-(4-methylpiperazin-1-yl)pyrimidine (12). Yield 51% (free base); an oil; 1H-NMR: \( \delta 0.90 \) (m, 3H), 1.32 (m, 6H), 1.70 (m, 2H), 2.34 (s, 3H), 2.47 (s, 3H), 2.57 (t, J = 7.5 Hz, 2H), 2.57 (t, J = 7.5 Hz, 2H), 3.91 (t, J = 5 Hz, 4H), 6.51 (s, 1H), 6.85 (m, 1H), 7.46 (m, 1H), 8.06 (m, 1H); 13C-NMR: \( \delta 121.5, 19.6, 29.1, 134.4, 134.7, 134.5, 55.1, 103.7, 108.6, 126.5, 142.7, 143.6, 156.8, 162.0, 175.8. A dihydrobromide salt: m.p. 165–170 °C. Anal. Calcd for C_{19}H_{29}N_{4}O_{2}•2HBr•0.5H_{2}O: C, 54.54; H, 7.23; N, 13.39. Found: C, 54.34; H, 7.06; N, 13.29.

4-sec-Butyl-6-(3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (15). Yield 37% (free base); an oil; 1H-NMR: \( \delta 0.87 \) (t, J = 7.5 Hz, 3H), 1.25 (m, 3H), 1.57 (m, 1H), 1.76 (m, 1H), 2.34 (s, 3H), 2.47 (t, J = 5 Hz), 2.57 (m, 1H), 2.90 (t, J = 5 Hz, 4H), 6.49 (s, 1H), 6.87 (m, 1H), 7.47 (m, 1H), 8.06 (m, 1H); 13C-NMR: \( \delta 121.5, 19.6, 29.1, 134.4, 134.7, 134.5, 55.1, 103.7, 108.6, 126.5, 142.7, 143.6, 156.8, 162.0, 175.8. A dihydrobromide salt: m.p. 165–170 °C. Anal. Calcd for C_{19}H_{29}N_{4}O_{2}•2HBr•0.5H_{2}O: C, 54.33; H, 5.77; N, 11.89. Found: C, 43.05; H, 5.64; N, 11.88.

4-(3-Furyl)-2-(4-methylpiperazin-1-yl)-6-(trifluoromethyl)pyrimidine (16). Yield 81% (free base); an oil. A hydrochloride salt: m.p. \( >300 °C \); 1H-NMR: \( \delta 8.77 \) (s, 1H), 7.88 (m, 1H), 7.56 (m, 1H), 3.98 (m, 4H), 2.55 (m, 4H), 2.39 (s, 3H). Anal. Calcd for C_{14}H_{15}N_{4}F_{3}O•HCl•0.25H_{2}O: C, 47.00; H, 4.71; N, 15.86. Found: C, 47.40; H, 4.61; N, 15.72.

4-(Cyclohexenylethynyl)-6-(3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (17). Yield 8%; a colorless oil (free base); 1H-NMR: 1.68 (m, 4H, CH_{2}), 2.18 (m, 2H), 2.27 (m, 2H), 2.34 (s, 3H, CH_{3}), 2.48 (t, J = 5 Hz, 4H), 3.90 (t, J = 5 Hz, 4H), 6.39 (m, 1H), 6.74 (s, 1H), 6.86 (m, 1H), 7.49 (m, 1H), 8.07 (m, 1H); 13C-NMR: \( \delta 21.3, 22.2, 25.9, 28.7, 43.6, 46.2, 55.0, 85.7, 93.2, 108.3, 108.5, 119.9, 125.9, 138.5, 143.1, 143.9, 151.8, 159.1, 161.8. A dihydrobromide salt: m.p. 188–190 °C. Anal. Calcd for C_{21}H_{24}N_{4}O•2HBr•1.75H_{2}O: C, 46.55; H, 5.49; N, 10.34. Found: C, 46.63; H, 5.09; N, 10.00.

4,6-Bis(3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (18) [24].

4.5. Synthesis of 4-Dimethylamino-6-(3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (19)

This compound was obtained by: (1) addition reaction of 3-furyllithium with 2,4-dichloropyrimidine; (2) amination of the intermediate dihydropyrimidine with DDQ by using the general procedure described above; (3) treatment of the crude product [2,4-dichloro-6-
(3-furyl)pyrimidine] with dimethyamine in ethanol at 23 °C, which caused a selective displacement of the 4-chloro atom to yield 2-chloro-4-dimethylamino-6-(3-furyl)pyrimidine; and (4) the treatment of this product with 4-methylpiperazine at elevated temperature using the general procedure described above.

Yield 30%; a colorless oil (free base); 1H-NMR: δ 8.17 (m, 1H), 7.90 (m, 1H), 7.48 (m, 1H), 6.95 (s, 1H), 3.86 (m, 4H), 2.48 (m, 4H), 2.35 (s, 3H), 2.20 (s, 6H); 1H-NMR NOE experiment: Irradiation at δ 2.20 (NMe₂) gave a strong NOE signal at δ 6.95 for C5-H of the pyrimidine, which is fully consistent with the given structure. HR-MS (ESI). Calcd for C₁₅H₂₁N₅O: m/z 287.1745. Found: m/z 2871748.

4-(3-Furyl)-2,4-bis(4-methylpiperazin-1-yl)pyrimidine (20)

This compound was obtained by treatment of 2,4-dichloro-6-(furan-3-yl)pyrimidine described above with 4-methylpiperazine at 75 °C by using the general procedure described above.

Yield 37% (free base); an oil; 1H-NMR: δ 7.47 (m, 1H), 7.05 (m, 1H), 6.53 (s, 1H), 6.31 (s, 1H), 3.85 (t, J = 4.8 Hz, 4H), 3.67 (t, J = 4.8 Hz, 4H), 2.47 (t, J = 4.8 Hz, 2H), 2.34 (s, 6H); 13C-NMR: δ 163.4, 161.7, 155.4, 153.8, 143.2, 111.8, 109.7, 86.9, 55.2, 54.8, 46.3, 46.2, 43.9, 43.8. Anal. Calcd for C₁₈H₂₆N₆O•3HBr: C, 36.94; H, 5.00; N, 14.36. Found: C, 37.14; H, 5.29; N, 14.62.

4-(3-Furyl)-2-(4-methylpiperazin-5-yl)pyrimidine (21). Yield 44%; an oil; 1H-NMR (free base): δ 8.17 (m, 1H), 7.91 (m, 1H), 7.48 (m, 1H), 6.95 (s, 1H), 3.85 (m, 4H), 2.59 (t, J = 7.6 Hz, 2H), 2.49 (m, 4H), 2.35 (s, 3H), 1.59 (sxt, J = 7.6 Hz, 2H), 0.99 (t, J = 7.6 Hz, 3H). A hydrobromide salt: m.p. 206–208 °C. Anal. Calcd for C₁₅H₂₆N₆O•3HBr: C, 52.32; H, 6.31; N, 15.25. Found: C, 52.34; H, 6.11; N, 15.12.

4-n-Butyl-6-(3-furyl)-2-(4-methylpiperazin-5-yl)pyrimidine (22). Yield 73% (free base); an oil; 1H-NMR: δ 7.80 (m, 1H), 7.47 (m, 1H), 6.86 (m, 1H), 3.84 (m, 4H), 2.66 (m, 2H), 2.59 (m, 2H), 2.47 (m, 4H), 2.34 (s, 3H), 1.69 (m, 2H), 1.47 (m, 4H), 1.01 (t, J = 7.6 Hz, 3H), 0.96 (t, J = 7.6 Hz, 3H). A dihydrobromide salt: m.p. 203 °C (dec.). Anal. Calcd for C₂₀H₃₀N₄O•2HBr: C, 47.63; H, 6.40; N, 11.11. Found: C, 47.34; H, 6.65; N, 11.08.

4-(2-Methyl-3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (23). Yield 39% (free base); an oil. A dihydrobromide salt: m.p. 263–265 °C; 1H-NMR: δ 2.66 (s, 3H, CH₃), 2.85 (s, 3H), 3.11 (m, 2H), 3.40 (m, 2H, CH₂), 3.55 (m, 2H), 4.73 (m, 2H), 6.96 (m, 1H), 6.98 (m, 1H), 7.59 (m, 1H), 8.41 (m, 1H), 10.00 (bs, 1H, exchangeable with D₂O). Anal. Calcd for C₁₄H₁₈N₄O•2HBr•0.5 H₂O: C, 39.18; H, 4.93; N, 13.06. Found: C, 39.18; H, 4.77; N, 13.32.

4-(5-Methyl-3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (24). Yield 58% (free base); an oil. A dihydrobromide salt: m.p. 275 °C (dec.); 1H-NMR: δ 2.30 (s, 3H, CH₃), 2.84 (m, 3H, CH₃), 3.10 (m, 2H), 3.31 (m, 2H), 3.53 (m, 2H), 4.79 (m, 2H), 6.72 (m, 1H), 7.04 (m, 1H), 8.14 (m, 2H), 9.98 (bs, 1H, exchangeable with D₂O). Anal. Calcd for C₁₄H₁₈N₄O•2HBr•0.5 H₂O: C, 39.18; H, 4.93; N, 13.06. Found: C, 39.01; H, 4.70; N, 13.02.

4-n-Hexyl-6-(5-methyl-3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (25). Yield 22% (free base); an oil. A dihydrobromide salt: m.p. 242 °C (dec.); 1H-NMR: δ 0.88 (m, 3H), 1.34 (m, 6H), 1.69 (m, 2H), 2.31 (s, 3H), 2.57 (t, J = 4.5 Hz, 2H), 2.86 (m, 3H), 3.10 (m, 2H), 3.26 (m, 2H), 3.50 (m, 2H), 4.81 (m, 2H), 6.67 (s, 1H), 6.91 (s, 1H), 8.28 (s, 1H), 9.37 (bs, 1H, exchangeable with D₂O). Anal. Calcd for C₂₀H₃₀N₄O•2HBr•H₂O: C, 45.99; H, 6.56; N, 10.73. Found: C, 45.81; H, 6.44; N, 10.54.

4-(2-Furanyl)-2-(4-methylpiperazin-1-yl)pyrimidine (26) [29].

4-Ethyl-6-(2-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (27). Yield 61% (free base); an oil; 1H-NMR: δ 7.52 (m, 1H), 7.12 (d, J = 3.2 Hz, 1H), 6.77 (s, 1H), 6.51 (m, 1H), 3.91 (t, J = 4.8 Hz, 4H), 2.64 (q, J = 7.4 Hz, 2H), 2.48 (t, J = 4.8 Hz, 4H), 2.34 (s, 3H), 1.27 (t, J = 7.4 Hz, 3H); 13C-NMR: δ 173.2, 162.0, 155.8, 153.3, 144.1, 112.1, 110.8, 102.4, 55.3, 46.5, 43.8, 31.4, 12.7. HR-MS (ESI). Calcd for C₁₅H₁₈N₄O (M⁺ + 1): m/z 273.1725.
Found: m/z 273.1715. A hydrobromide salt: m.p. >250 °C. Anal. Calcd for C_{15}H_{20}N_{4}O•2HBr: C, 41.50; H, 5.11; N, 12.70. Found: C, 41.79; H, 4.87; N, 12.38.

4-n-Butyl-6-(2-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (28). Yield 78% (free base); an oil; \(^1\)H-NMR: \(\delta \) 7.52 (m, 1H), 7.11 (d, \(J = 3.2\) Hz, 1H), 6.75 (s, 1H), 6.51 (m, 1H), 3.90 (t, \(J = 4.6\) Hz, 4H), 2.60 (t, \(J = 7.4\) Hz, 2H), 2.48 (t, \(J = 4.6\) Hz, 4H), 2.34 (s, 3H), 1.70 (m, 2H), 1.40 (m, 2H), 0.94 (t, \(J = 7.4\) Hz, 3H); \(^13\)C-NMR: \(\delta \) 172.4, 162.1, 155.8, 153.4, 144.1, 112.2, 110.8, 103.1, 55.3, 46.5, 43.9, 38.1, 30.8, 22.7, 14.2. HR-MS (ESI). Calcd for C\(_{17}\)H\(_{25}\)N\(_4\)O (M\(^+\) + 1): m/z 301.2026. Found: m/z 301.2028. Anal. Calcd for C\(_{17}\)H\(_{25}\)N\(_4\)O•HBr: C, 53.55; H, 6.61; N, 14.10. Found: C, 53.34; H, 6.60; N, 14.49.

4-(5-Methyl-2-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (29). Yield 48% (free base); an oil. A dihydrobromide salt: m.p. 263–265 °C; \(^1\)H-NMR: \(\delta \) 2.39 (s, 3H), 2.85 (m, 3H), 3.11 (m, 2H), 3.28 (m), 3.54 (m, 2H), 4.79 (m, 2H), 6.36 (m, 1H), 6.99 (m, 1H), 7.28 (m, 1H), 8.45 (m, 1H), 9.78 (bs, 1H, exchangeable with D\(_2\)O). Anal. Calcd for C\(_{14}\)H\(_{18}\)N\(_4\)O•2HBr: C, 40.02; H, 4.80; N, 13.34. Found: C, 39.70; H, 4.85; N, 13.25.

2-(Methylpiperazin-1-yl)-4-(3-thienyl)pyrimidine (30) [25].

4-n-Butyl-2-(methylpiperazin-1-yl)-6-(3-thienyl)pyrimidine (31) [30].

2-(Methylpiperazin-1-yl)-4-(2-thienyl)pyrimidine (32) [24,26].

4-(2-Hydroxyphenyl)-2-(4-methylpiperazin-1-yl)pyrimidine (33) [27].

4-(3-Hydroxyphenyl)-2-(4-methylpiperazin-1-yl)pyrimidine (34) [27].

4-(4-Hydroxyphenyl)-2-(4-methylpiperazin-1-yl)pyrimidine (35) [27].

4-(Benzothiophen-2-yl)-2-(4-methylpiperazin-1-yl)pyrimidine (36). Yield 71% (free base); an oil; \(^1\)H-NMR: \(\delta \) 8.45 (m, 1H), 7.69 (m, 1H), 7.58 (m, 1H), 7.42 (m, 1H), 7.30 (m, 2H), 7.09 (m, 1H), 3.98 (m, 4H), 2.55 (m, 4H), 2.39 (s, 3H). A hydrobromide salt: m.p. >300 °C. Anal. Calcd for C\(_{17}\)H\(_{18}\)N\(_4\)O•2HBr: C, 44.76; H, 4.42; N, 12.28. Found: C, 44.60; H, 4.48; N, 12.15.

4-(Benzofuran-2-yl)-2-(4-methylpiperazin-1-yl)pyrimidine (37). Yield 78% (free base); an oil; \(^1\)H-NMR: \(\delta \) 8.39 (d, \(J = 5.1\) Hz, 1H), 7.96 (s, 1H), 7.88 (m, 2H), 7.41 (m, 2H), 6.99 (d, \(J = 5.1\) Hz, 1H), 3.98 (m, 4H), 2.55 (m, 4H), 2.40 (s, 3H). A hydrobromide salt: m.p. 299–300 °C. Anal. Calcd for C\(_{17}\)H\(_{18}\)N\(_4\)S•2HBr: C, 43.24; H, 4.27; N, 11.86. Found: C, 43.20; H, 4.33; N, 11.80.

4-(1-Methylindol-2-yl)-2-(4-methylpiperazin-1-yl)pyrimidine (38) [27].

2-(Methylpiperazin-1-yl)-4-(pyridin-3-yl)pyrimidine (39) [27].

2-(4-Methylpiperazin-1-yl)-4-(thiazol-2-yl)pyrimidine (40). Yield 77% (free base); an oil; \(^1\)H-NMR: \(\delta \) 8.44 (d, \(J = 5.0\) Hz, 1H), 7.95 (d, \(J = 3.2\) Hz, 1H), 7.48 (d, \(J = 3.2\) Hz, 1H), 7.29 (d, \(J = 5.0\) Hz, 1H), 3.92 (t, \(J = 5.0\) Hz, 4H), 2.50 (t, \(J = 5.0\) Hz, 4H), 2.36 (s, 3H), \(^13\)C-NMR: \(\delta \) 168.4, 161.4, 159.0, 157.7, 144.3, 122.1, 104.3, 54.8, 46.1, 43.5. A hydrobromide salt: m.p. 273 °C (decomp.). Anal. Calcd for C\(_{12}\)H\(_{15}\)N\(_5\)S•HBr•0.5H\(_2\)O: C, 41.03; H, 4.88; N, 19.49. Found: C, 41.32; H, 4.64; N, 19.93.

1H-Imidazol-1-yl)-2-(4-methylpiperazin-1-yl)pyrimidine (41). Yield 87% (free base); an oil; \(^1\)H-NMR: \(\delta \) 8.36 (s, 1H), 8.36 (d, \(J = 5.4\) Hz, 1H), 7.60 (s, 1H), 7.17 (s, 1H), 6.50 (d, \(J = 5.4\) Hz, 1H), 3.90 (t, \(J = 5.1\) Hz, 4H), 2.49 (t, \(J = 5.1\) Hz, 4H), 2.35 (s, 3H), \(^13\)C-NMR: \(\delta \) 161.4, 160.1, 155.3, 135.0, 130.8, 115.6, 96.5, 54.8, 46.1, 43.7. A hydrobromide salt: m.p. 229–231 °C. Anal. Calcd for C\(_{12}\)H\(_{15}\)N\(_5\)S•2HBr•H\(_2\)O: C, 33.98; H, 4.75; N, 19.81. Found: C, 33.93; H, 4.55; N, 19.60.

4-(3-Furyl)-2-(4-methylhomopiperazin-1-yl)pyrimidine (42). Yield 69% (free base); an oil; \(^1\)H-NMR: \(\delta \) 8.32 (d, \(J = 5.1\) Hz, 1H), 8.08 (s, 1H), 7.50 (m, 1H), 6.88 (m, 1H), 6.64 (d, \(J = 5.1\) Hz, 1H), 4.01 (m, 2H), 3.89 (m, 2H), 2.74 (m, 2H), 2.60 (m, 2H), 2.41 (s, 3H), 2.04 (m, 2H). A hydrobromide salt: m.p. 176–177 °C. Anal. Calcd for C\(_{14}\)H\(_{18}\)N\(_4\)O•2HBr•1.25H\(_2\)O: C, 37.99; H, 5.12; N, 12.66. Found: C, 37.96; H, 5.12; N, 12.51.
4-(3-Furyl)-2-(piperidin-1-yl)pyrimidine (43). Yield 68% (free base); an oil; \(^1\)H-NMR: \(\delta\) 8.32 (d, \(J = 5.1\) Hz, 1H), 8.10 (m, 1H), 7.51 (m, 1H), 6.90 (m, 1H), 6.62 (d, \(J = 5.1\) Hz, 1H), 3.89 (m, 4H), 1.67 (m, 6H). A hydrobromide salt: m.p. 190–191 °C. Anal. Calcd for C\(_{15}\)H\(_{15}\)N\(_3\)O\(_2\)\(\cdot\)HBr•0.25H\(_2\)O: C, 49.66; H, 5.28; N, 13.35. Found: C, 49.60; H, 5.11, N, 13.37.

4-(4-(3-Furyl)-1-morpholin-4-yl)pyrimidine (44). Yield 53% (free base); a white solid: m.p. 58–59 °C; \(^1\)H-NMR: \(\delta\) 3.79 (m, 4H), 3.87 (m, 4H), 6.68 (d, \(J = 4.8\) Hz, 1H), 6.88 (m, 1H), 7.49 (m, 1H), 8.08 (m, 1H), 8.31 (d, \(J = 4.8\) Hz, 1H). A hydrobromide salt: m.p. 215–216 °C; Anal. Calcd for C\(_{12}\)H\(_{13}\)N\(_2\)O\(_2\)\(\cdot\)HBr•0.25H\(_2\)O: C, 45.51; H, 4.62; N, 13.27. Found: C, 45.38; H, 4.52; N, 13.37.

4-(3-Furyl)-N-[2-(morpholin-4-yl)ethyl]pyrimidin-2-amine (45). Yield 66%; m.p. >200 °C. Yield 46%; (free base); an oil; \(^1\)H-NMR: \(\delta\) 8.47 (d, \(J = 5.2\) Hz, 1H), 8.07 (s, 1H), 7.48 (d, \(J = 1.8\) Hz, 1H), 8.65 (m, 1H), 6.66 (d, \(J = 5.2\) Hz, 1H), 5.78 (s, 1H), 3.71 (t, \(J = 4.4\) Hz, 4H), 2.59 (t, \(J = 6\) Hz, 2H), 2.49 (t, \(J = 4.4\) Hz, 4H). A hydrobromide salt: m.p. 143–146 °C. Anal. Calcd for C\(_{14}\)H\(_{18}\)N\(_4\)O\(_2\)\(\cdot\)2HBr•0.5H\(_2\)O: C, 37.77; H, 4.75; N, 12.59. Found: C, 37.78; H, 4.76; N, 12.20.

4-(3-Furyl)-N-[3-(1H-imidazol-2-yl)propyl]pyrimidin-2-amine (46). Yield 62% (free base); an oil; \(^1\)H-NMR: \(\delta\) 8.24 (d, \(J = 5.2\) Hz, 1H), 8.06 (m, 1H), 7.49 (m, 2H), 7.06 (s, 1H), 6.94 (s, 1H), 6.84 (m, 1H), 6.70 (d, \(J = 5.2\) Hz, 1H), 4.04 (t, \(J = 6.8\) Hz, 2H), 3.46 (t, \(J = 6.8\) Hz, 2H), 2.09 (m, 2H). A hydrobromide salt: m.p. 234–236 °C. Anal. Calcd for C\(_{16}\)H\(_{18}\)N\(_5\)O\(_2\)\(\cdot\)2HBr•0.5H\(_2\)O: C, 38.30; H, 4.12; N, 15.91. Found: C, 38.23; H, 3.93; N, 15.78.

4.6. Synthesis of 4-[4-(3-Furyl)pyrimidin-2-yl]piperazine-1-spiro-1-morpholinium iodide (47)

A mixture of compound 1 (1 mmol), 1-iodo-2-(2-idoethoxy)ethane (1 mmol) and anhydrous potassium carbonate (140 mg, 1 mmol) in anhydrous acetonitrile (10 mL) was heated under reflux for 1 h and then quenched with water (5 mL). Product 47 was extracted with ethyl acetate and purified on a chromatotron eluting with dichloromethane/methanol (8:2).

Yield 66%; m.p. >200 °C (decomp.); \(^1\)H-NMR (DMSO-\(d_6\)): \(\delta\) 8.55 (m, 1H), 8.46 (d, \(J = 5.2\) Hz, 1H), 7.83 (m, 1H), 7.10 (m, 2H), 4.13 (m, 4H), 3.98 (m, 4H), 3.74 (m, 4H), 3.67 (m, 4H). HR-MS (ESI). Calcd for C\(_{16}\)H\(_{21}\)N\(_3\)O\(_2\) (M\(^+\)): m/z 301.1665. Found: m/z 301.1650. Anal. Calcd for C\(_{18}\)H\(_{21}\)O\(_4\): C, 44.87; H, 4.94; N, 13.08. Found: C, 44.97; H, 5.09; N, 12.69.

4-(3-Furyl)-2-(methylpiperazin-1-yl)quinazoline (48) [27].

4.7. Synthesis of 2,4-bis(4-Methylpiperazin-1-yl)quinazoline (49)

This compound was obtained by treatment of 2,4-dichloroquinazoline with 4-methylpiperazine by using the general neucleophilic displacement procedure described above.

Yield 46% (free base); an oil; \(^1\)H-NMR: \(\delta\) 7.67 (d, \(J = 8.4\) Hz, 1H), 7.51 (m, 2H), 7.05 (m, 1H), 3.93 (m, 4H), 3.70 (t, \(J = 4.6\) Hz, 4H), 2.61 (t, \(J = 4.6\) Hz, 4H), 2.51 (t, \(J = 4.6\) Hz, 4H), 2.37 2s, 6H). \(^1^3\)C-NMR: \(\delta\) 165.8, 158.4, 154.6, 132.6, 126.4, 125.3, 120.8, 112.2, 55.3, 55.1, 49.9, 46.4, 46.3, 40.4, 1. HR-MS (ESI). Calcd for C\(_{18}\)H\(_{27}\)N\(_6\) (M\(^+\) + 1): m/z 327.2282. Found: m/z 327.2297. A hydrobromide salt: m.p. 108–112 °C. Anal. Calcd for C\(_{18}\)H\(_{26}\)N\(_6\)•2HBr•C, 44.28; H, 5.78; N, 17.21. Found: C, 44.60; H, 5.73; N, 17.42.

4.8. Synthesis of 4-[2-(Dimethylamino)ethyl]-2-[4-(4-methylpiperazin-1-yl)quinazoline (50)

The starting material, 2-chloro-4-vinylquinazoline, was obtained by the reaction of 2-chloroquinazoline with vinyl lithium followed by aromatization of the resultant 4-vinylidihydroquinazoline adduct by treatment with potassium ferricyanide(III) according to the described procedure [36].

The conjugate addition reaction of dimethylamine with 2-chloro-4-vinylquinazoline to give 2-chloro-4-(2-dimethylaminoethyl)quinazoline was conducted as described for the preparation of...
analogous compounds [27]. Treatment of this compound with 4-methylpiperazine to give the final product 50 was conducted by using a general procedure described above.

Yield 27% (free base), an oil; 1H-NMR: δ 7.86 (d, J = 8.0 Hz, 1H), 7.59 (m, 2H), 7.18 (t, J = 7.2 Hz, 1H), 3.99 (t, J = 5.0 Hz, 4H), 3.29 (t, J = 7.2 Hz, 2H), 2.85 (t, J = 7.2 Hz, 2H), 2.51 (t, J = 5.0 Hz, 4H), 2.36 (s, 6H), 2.35 (s, 3H); 13C-NMR: δ 170.1, 158.4, 152.3, 133.3, 126.4, 124.6, 122.1, 118.6, 57.6, 55.1, 46.3, 45.5, 43.8, 32.4. HR-MS (ESI). Calcd for C17H25N5 (M+ + 1): m/z 300.2175. Found: m/z 300.2188. A hydrobromide salt: m.p. >250 °C. Anal. Calcd for C17H25N5•3.5HBr•H2O: C, 34.00; H, 5.12; N, 11.66. Found: C, 33.74; H, 5.40; N, 11.26.

4.9. Synthesis of 2-(4-Methylpiperazin-1-yl)pyridines 51–53

A mixture of furan-3-boronic acid, furan-2-boronic acid or thiophene-2-boronic acid (3.4 mmol), 4-bromo-2-chloropyrimidine (0.25 mL, 2.3 mmol), potassium carbonate (1.0 g, 7 mmol) and tetrakis(triphenylphosphine)palladium [Pd(PPh3)4, 0.2 g, 0.2 mmol] in anhydrous dioxane (6 mL) was dissolved in ethyl acetate (20 mL). The solution was washed with water (3 × 25 mL) and concentrated under reduced pressure. The residue was subjected to chromatography eluting with dichloromethane/methanol (95:5) to yield analytically pure product 51–53.

4-(3-Furyl)-2-(4-methylpiperazin-1-yl)pyridine (51). Yield 20% (free base); an oil; 1H-NMR: δ 8.16 (m, 1H), 7.81 (s, 1H), 7.49 (m, 1H), 6.72 (m, 3H), 3.60 (t, J = 5.0 Hz, 4H), 2.53 (t, J = 5.0 Hz, 4H), 2.34 (s, 3H); 13C-NMR: δ 160.1, 148.4, 144.0, 141.4, 140.0, 125.2, 110.9, 108.5, 103.5, 54.9, 46.1, 45.2. A hydrobromide salt: m.p. >250 °C. Anal. Calcd for C14H17N3O•2HBr: C, 41.51; H, 4.73; N, 10.37. Found: C, 41.14; H, 4.39; N, 11.07.

4-(2-Furyl)-2-(4-methylpiperazin-1-yl)pyridine (52). Yield 55% (free base); an oil; 1H-NMR: δ 8.17 (m, 1H), 7.49 (m, 1H), 6.39 (s, 1H), 6.86 (m, 1H), 6.78 (m, 1H), 6.49(m, 1H), 3.62 (t, J = 5.0 Hz, 4H), 2.54 (t, J = 5.0 Hz, 4H), 2.35 (s, 3H); 13C-NMR: δ 160.1, 152.3, 148.3, 143.1, 138.8, 111.9, 108.4, 107.9, 100.9, 54.9, 46.2, 45.2. HR-MS (ESI). Calcd for C14H15N3O (M+ + 1): m/z 244.1450. Found: m/z 244.1459. A hydrobromide salt: m.p. >250 °C. Anal. Calcd for C14H17N3O•2HBr: C, 41.51; H, 4.73; N, 10.37. Found: C, 41.24; H, 4.78; N, 10.51.

2-(4-Methylpiperazin-1-yl)-4-(2-thienyl)pyridine (53). Yield 34% (free base); an oil; 1H-NMR: δ 8.18 (d, J = 5.2 Hz, 1H), 7.44 (m, 1H), 7.36 (d, J = 4.5 Hz, 1H), 7.11 (m, 1H), 6.86 (m, 1H), 6.85 (s, 1H), 3.62 (t, J = 5.0 Hz, 4H), 2.55 (t, J = 5.0 Hz, 4H), 2.36 (s, 3H); 13C-NMR: δ 160.1, 148.5, 142.8, 142.5, 128.1, 126.3, 124.8, 110.7, 103.2, 54.9, 46.2, 45.3. A hydrobromide salt: m.p. >250 °C. Anal. Calcd for C14H15N3S•2HBr•0.5H2O: C, 39.09; H, 4.69; N, 9.77. Found: C, 39.46; H, 4.80; N, 9.44.

4.10. Synthesis of Pyridines 54–59

A mixture of 4-bromo-6-methyl-2-(methylpiperazin-1-yl)pyridine or 4-bromo-2-(methylpiperazin-1-yl)pyridine (0.4 mmol), furan-3-boronic acid, furan-2-boronic acid or thiophene-2-boronic acid (0.5 mmol), tetrakis(triphenylphosphine) palladium (0.03 g, 0.03 mmol) and potassium carbonate 0.17 g, 1.1 mmol in DMF (4.0 mL) containing water (0.3 mL) in a sealed tube under a nitrogen atmosphere was stirred at 90 °C for 12 h. After cooling, the mixture was filtered through Celite and dissolved in ethyl acetate (20 mL). The solution was washed with water (3 × 25 mL), brine (20 mL) and concentrated under reduced pressure. The residue was subjected to chromatography eluting with hexanes/ether (4:1, 200 mL; 1:1, 150 mL) and finally with hexanes/ether/methanol (10:10:1, 200 mL) to give product 54–59.

4-(3-Furyl)-2-methyl-6-(4-methylpiperazin-1-yl)pyridine (54). Yield 31% (free base); an oil; 1H-NMR: δ 7.79 (s, 1H), 7.48 (s, 1H), 6.69 (s, 1H), 6.62 (s, 1H), 6.61 (s, 1H), 3.60 (t, J = 4.8 Hz, 4H), 2.55 (t, J = 4.8 Hz, 4H), 2.42 (s, 3H), 2.36 (s, 3H); 13C-NMR: δ 157.5, 144.0, 141.8, 140.0, 128.7, 125.6, 110.5, 108.8, 100.6,
4-(2-Furyl)-2-methyl-6-(4-methylpiperazin-1-yl)pyridine (55). Yield 10% (free base); an oil; \(^1\)H-NMR: \(\delta \) 7.47 (s, 1H), 6.75 (m, 2H), 6.72 (s, 1H), 6.47 (m, 1H), 3.62 (t, \(J = 4.8\) Hz, 4H), 2.54 (t, \(J = 4.8\) Hz, 4H), 2.41 (s, 3H), 2.35 (s, 3H); \(^{13}\)C-NMR: 159.9, 157.5, 152.8, 143.0, 139.4, 111.9, 108.0, 107.7, 98.2, 55.0, 46.2, 45.3, 24.8. HR-MS (ESI). Calcd for \(\text{C}_{15}\text{H}_{17}\text{N}_{3}\text{O}\) (M\(^+\) + 1): \(m/z \) 258.1606. Found: \(m/z \) 258.1598. A hydrobromide salt: m.p. >250 °C. Anal. Calcd for \(\text{C}_{15}\text{H}_{19}\text{N}_{3}\text{O}\cdot\text{HBr}\cdot0.5\text{H}_{2}\text{O}: \) C, 51.88; H, 6.10; N, 12.10. Found: C, 51.90; H, 6.50; N, 12.06.

2-Methyl-6-(4-methylpiperazin-1-yl)-4-(2-thiényl)pyridine (56). Yield 6% (free base); an oil; \(^1\)H-NMR: \(\delta \) 7.41 (d, \(J = 3.2\) Hz, 1H), 7.34 (d, \(J = 4.8\) Hz, 1H), 7.09 (m, 1H), 6.74 (s, 1H), 6.63 (s, 1H), 3.61 (t, \(J = 4.8\) Hz, 4H), 2.55 (t, \(J = 4.8\) Hz, 4H), 2.43 (s, 3H), 2.36 (s, 3H). A hydrobromide salt: m.p. 132–134 °C. Anal. Calcd for \(\text{C}_{15}\text{H}_{17}\text{N}_{3}\text{S}\cdot\text{HBr}: \) C, 50.85; H, 5.68; N, 11.86. Found: C, 51.10; H, 5.69; N, 11.53.

6-(3-Furyl)-2-(4-methylpiperazin-1-yl)pyridine (57). Yield 80% (free base); an oil; \(^1\)H-NMR: \(\delta \) 7.99 (s, 1H), 7.49 (m, 1H), 7.30 (m, 2H), 6.85 (m, 1H), 6.54 (m, 1H), 3.64 (t, \(J = 5.0\) Hz, 4H), 2.57 (t, \(J = 5.0\) Hz, 4H), 2.37 (s, 3H); \(^{13}\)C-NMR: \(\delta \) 159.1, 149.8, 143.4, 141.1, 138.0, 127.7, 109.5, 108.8, 105.0, 54.9, 46.3, 45.5. HR-MS (ESI). Calcd for \(\text{C}_{14}\text{H}_{18}\text{N}_{3}\text{O}\) (M\(^+\) + 1): \(m/z \) 244.1461. Found: \(m/z \) 244.1450. A hydrobromide salt: m.p. >250 °C. Anal. Calcd for \(\text{C}_{14}\text{H}_{17}\text{N}_{3}\text{O}\cdot2\text{HBr}\cdot2\text{H}_{2}\text{O}: \) C, 38.12; H, 5.25; N, 9.52. Found: C, 38.23; H, 5.33; N, 9.72.

2-(4-Methylpiperazin-1-yl)-6-(3-thiényl)pyridine (58). Yield 42% (free base); an oil; \(^1\)H-NMR: \(\delta \) 7.86 (m, 1H), 7.63 (m, 1H), 7.49 (t, \(J = 4.0\) Hz, 1H), 7.33 (m, 1H), 6.97 (d, \(J = 4.0\) Hz, 1H), 6.54 (d, \(J = 4.0\) Hz, 1H), 3.64 (t, \(J = 5.0\) Hz, 4H), 2.53 (t, \(J = 5.0\) Hz, 4H), 2.35 (s, 3H); \(^{13}\)C-NMR: \(\delta \) 159.0, 154.4, 143.0, 138.2, 126.4, 125.7, 123.0, 109.7, 105.2, 55.0, 46.3, 45.1. A hydrobromide salt: m.p. >250 °C. Anal. Calcd for \(\text{C}_{14}\text{H}_{17}\text{N}_{3}\text{S}\cdot2\text{HBr}\cdot2\text{H}_{2}\text{O}: \) C, 39.09; H, 4.69; N, 9.77. Found: C, 39.11; H, 4.79; N, 9.90.

4.11. Synthesis of Substituted Benzenes 60–71

A mixture of 1,3-dibromobenzene, 1,3-dibromo-5-methylbenzene or 1,3-dibromo-5-n-butylbenzene (21 mmol) and N-methylpiperazine (0.8 mL, 7.0 mmol) in toluene (20 mL) was stirred under a nitrogen atmosphere and treated quickly with 2,2'-bis(diphenylphosphino)-1,1'-binapthyl (BINAP, 0.13 g, 0.21 mmol) and tris (dibenzylideneacetone)dipalladium(0) (Pd(db2)_3, 0.05 g, 0.06 mmol). The flask was refilled with nitrogen, capped with a rubber septum, and 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU, 2.6 mL, 17.5 mmol) was added via a syringe. The mixture was warmed to 60 °C before treatment with sodium tert-butoxide (0.01 g, 0.05 mmol) in one portion. The mixture was heated at 110 °C for 12 h, then cooled and partitioned between ethyl acetate (EtOAc, 40 mL) and water (40 mL). The aqueous layer was extracted with EtOAc (40mL). The organic layers were combined and washed with hydrochloric acid (1.6 M, 2 × 25 mL). The aqueous acidic layer containing product was made basic with NaOH solution (1M, 50 mL) and the mixture was extracted with EtOAc (2 × 40 mL). The extract was washed with brine (25 mL), dried over magnesium sulfate, filtered and concentrated under reduced pressure to provide an analytically pure product.

1-(3-Bromophenyl)-4-methylpiperazine; yield 30%; an oil; \(^{13}\)C-NMR: \(\delta \) 152.6, 130.5, 123.4, 122.3, 118.8, 114.5, 55.1, 48.8, 46.3. HR-MS (ESI). Calcd for \(\text{C}_{11}\text{H}_{15}\text{BrN}_{2}: \) C, 37.94; H, 5.02; N, 9.54.
1-(3-Bromo-5-methylphenyl)-4-methylpiperazine; yield 54%; an oil; \(^{13}\text{C-NMR: } \delta = 152.5, 140.6, 131.1, 123.2, 116.1, 115.4, 55.2, 48.9, 46.3, 21.7.\) HR-MS (ESI). Calcd for C\(_{12}\)H\(_{17}\)BrN\(_2\) (M\(^+ + 1\)): \(m/z\) 269.0653. Found: 269.0653.

1-(3-Bromo-5-n-butylphenyl)-4-methylpiperazine; yield 32%; an oil; \(^{13}\text{C-NMR: } \delta = 152.3, 145.5, 122.9, 122.4, 116.0, 114.7, 55.0, 48.7, 46.1, 35.8, 33.4, 22.3, 13.9.\) HR-MS (ESI). Calcd for C\(_{15}\)H\(_{23}\)BrN\(_2\) (M\(^+ + 1\)): \(m/z\) 311.1123. Found: \(m/z\) 311.1133.

A bromophenylpiperazine derivative (1.2 mmol), obtained as described above, was allowed to react with furan-3-boronic acid, furan-2-boronic acid, thiophene-3-boronic acid or thiophene-2-boronic acid (1.8 mmol) in DMF (5 mL) and water (0.5 mL) in the presence of tetrais(triphenylphosphine)palladium(0) (0.09 mmol) and potassium carbonate (0.5 g, 3.6 mmol) at 90 °C under a nitrogen atmosphere in a sealed tube for 12 h. After cooling, the mixture was filtered through Celite and the adsorbent was washed with EtOAc (20 mL). Concentration followed by chromatography eluting with hexanes/ether (4:1) gave the oily product 60–71 that was additionally purified by crystallization of a hydrobromide salt from ethanol.

1-[3-(3-Furyl)phenyl]-4-methylpiperazine (60). Yield 34%; \(^{1}\text{H-NMR: } \delta = 7.70\) (s, 1H), 7.46 (s, 1H), 7.26 (t, \(J = 5.6\) Hz, 1H), 7.03 (s, 1H), 6.99 (d, \(J = 7.6\) Hz, 1H), 6.85 (m, 1H), 6.68 (s, 1H), 3.27 (t, \(J = 4.8\) Hz, 4H), 2.62 (t, \(J = 4.8\) Hz, 4H), 2.38 (s, 3H); \(^{13}\text{C-NMR: } \delta = 151.9, 143.6, 138.7, 133.5, 129.7, 127.1, 117.8, 115.0, 113.9, 109.2, 55.3, 49.3, 46.3.\) HR-MS (ESI). Calcd for C\(_{15}\)H\(_{19}\)N\(_2\)O (M\(^+ + 1\)): \(m/z\) 243.1497. Found: \(m/z\) 243.1492. A hydrobromide salt: m.p. 215–217 °C. Anal. Calcd for C\(_{15}\)H\(_{18}\)N\(_2\)O\(_2\)Br: C, 44.58; H, 4.99; N, 6.93. Found: C, 44.31; H, 4.99; N, 6.62.

1-[3-(3-Furyl)-5-methylphenyl]-4-methylpiperazine (62). Yield 25%; \(^{1}\text{H-NMR: } \delta = 7.68\) (s, 1H), 7.44 (s, 1H), 6.85 (s, 1H), 6.82 (s, 1H), 6.67 (s, 2H), 3.23 (t, \(J = 4.8\) Hz, 4H), 2.59 (t, \(J = 4.8\) Hz, 4H), 2.34 (s, 6H); \(^{13}\text{C-NMR: } \delta = 151.7, 143.4, 139.2, 138.5, 133.1, 126.9, 118.6, 115.7, 111.1, 109.1, 55.1, 49.2, 46.1, 21.7.\) HR-MS (ESI). Calcd for C\(_{16}\)H\(_{21}\)N\(_2\)O (M\(^+ + 1\)): \(m/z\) 257.1654. Found: \(m/z\) 257.1657. A hydrobromide salt: m.p. 230–232 °C. Anal. Calcd for C\(_{16}\)H\(_{20}\)N\(_2\)O\(_2\)Br: C, 45.96; H, 5.30; N, 6.70. Found: C, 46.30; H, 5.28; N, 6.34.

1-[3-n-Butyl-5-(3-furyl)phenyl]-4-methylpiperazine (64). Yield 15%; \(^{1}\text{H-NMR: } \delta = 7.44\) (s, 1H), 7.27 (m, 2H), 7.16 (d, \(J = 7.6\) Hz, 1H), 6.84 (d, \(J = 7.6\) Hz, 1H), 6.62 (m, 1H), 6.45 (m, 1H), 3.27 (t, \(J = 4.6\) Hz, 4H), 2.60 (t, \(J = 4.6\) Hz, 4H), 2.36 (s, 3H); \(^{13}\text{C-NMR: } \delta = 154.5, 151.7, 142.0, 131.8, 129.6, 115.5, 115.4, 111.7, 111.5, 105.1, 55.3, 49.2, 46.3.\) HR-MS (ESI): Calcd for C\(_{16}\)H\(_{21}\)N\(_2\)O (M\(^+ + 1\)): \(m/z\) 243.1497. 1-Methyl-4-[3-methyl-5-(2-thienyl)phenyl]piperazine (70). Yield 27%; 1H-NMR: δ 7.26 (m, 2H), 7.05 (t, J = 3.6 Hz, 1H), 6.97 (m, 2H), 6.69 (s, 1H), 3.26 (t, J = 4.8 Hz, 4H), 2.62 (t, J = 4.8 Hz, 4H), 2.34 (s, 3H), 2.36 (s, 3H); 13C-NMR: δ 151.7, 145.0, 139.3, 135.1, 127.8, 124.4, 123.0, 118.7, 116.2, 111.1, 55.1, 49.1, 46.1. HR-MS (ESI). Calcd for C19H20N2S (M+ + 1): m/z 273.1425. Found: m/z 273.1432. A hydrobromide salt: m.p. >250 °C. Anal. Calcd for C16H20N2S•2HBr•0.5H2O: C, 43.36; H, 5.23; N, 6.23. Found: C, 43.47; H, 5.15; N, 6.61.

1-[3-n-Butyl-5-(2-thienyl)phenyl]4-methylpiperazine (71). Yield 26%; 1H-NMR: δ 7.25 (m, 2H), 7.05 (m, 1H), 6.97 (t, J = 2.0 Hz, 1H), 6.94, (s, 1H), 6.70 (s, 1H), 3.25 (t, J = 5.2 Hz, 4H), 2.59 (m, 6H), 2.60 (s, 3H), 1.59 9M, 2H), 1.37 (m, 2H), 0.93 (t, J = 7.2 Hz, 3H); 13C-NMR: δ 151.9, 145.4, 144.6, 135.2,127.9, 124.6, 123.1, 118.3, 115.9, 111.5, 55.3, 49.4, 46.3, 36.2, 33.8, 22.7, 14.2. HR-MS (ESI). Calcd for C19H23N2O (M+ + 1): m/z 315.1859. Found: m/z 315.1885. A hydrobromide salt: m.p. 234–236 °C. Anal. Calcd for C19H25N2S•1.5HBr: C, 52.36; H, 6.36; N, 6.34. Found: C, 52.01; H, 6.40; N, 6.50.

5. Conclusions

Piperazin-1-yl substituted unfused heterobiaryls incorporating 4-(3-furyl) moiety demonstrate high affinities for 5-HT7 receptor. The SAR studies on the model ligand 4-(3-furyl)-2-(4-methylpiperazin-1-yl)pyrimidine (2) (Ki = 7.2 nM) revealed that introduction of an alkyl group to position 6 of the pyrimidine leads to increase in the binding affinity, however, a substituent at position 5 is highly detrimental. It was also shown that the pyrimidine core can be replaced with a pyridine ring without a significant loss of the binding affinity, although piperazine moiety is optimal, as its
replacement results in decreased 5-HT\textsubscript{7} affinity. The selected 6-ethylpyrimidine 12 (\(K_i = 7.1\) nM) and 6-butylypyrimidine 13 (\(K_i = 1.6\) nM) ligands demonstrated 5-HT\textsubscript{7} antagonistic properties in cAMP functional test (\(K_B = 12\) and 60 nM, respectively). The extended selectivity studies with use of other types of serotonin (5-HT\textsubscript{1A}, 5-HT\textsubscript{2A}, 5-HT\textsubscript{3}) and dopamine D\textsubscript{2} receptors showed that compound 12 displays also pronounced affinity for 5-HT\textsubscript{2A} receptors (\(K_i = 12\) nM), which is consistent with our previous studies of piperazin-1-yl substituted heterobiaryl derivatives. 6-Butylpyrimidine analog 13 lacks selectivity towards 5-HT\textsubscript{2A}, 5-HT\textsubscript{6} and dopamine D\textsubscript{2} receptors. In summary, piperazin-1-yl substituted heterobiaryls constitute a potent group of serotonergic agents that could be further studied in animal models of CNS disorders.

**Acknowledgments:** This work was supported by the Program in Brains and Behavior at Georgia State University (L.S.) and, in part, by the Polish Ministry of Science and Higher Education, Grant No. 2-P05F-019-30 (A.J.B.)

**Author Contributions:** The structural design of compounds, the design of synthetic routes to compounds, and analysis of data were conducted by L.S. at Georgia State University. Compounds were synthesized and purified by his graduate students E.A.R., N.T.F., J.K., S.P., A.L.B., A.J.E., S.B., T.C.B., S.M.S. and his postdoctoral research associate A.R. A substantial amount of work indicated above was provided by J.S. a visiting professor to the L.S. research group and subsequently an independent researcher at the Medical University of Gdańsk. Compounds were assayed at the National Institutes of Health, Bethesda, USA and by G.S. in the A.J.B. laboratories using the same procedures. A.J.B. helped analyze the affinity results. L.S., J.S. and A.J.B. wrote the manuscript.

**Conflicts of Interest:** The authors declare no conflict of interest.
