Supplemental Table 2

Results of the multinomial logistic regression analysis without and with age group. Odds ratios (OR) with 95% confidence interval (CI) for mortality at 12 months after subarachnoid hemorrhage are shown.

|                                | Multinomial model without age group | Multinomial model with age group |
|--------------------------------|------------------------------------|---------------------------------|
|                                | OR       | 95% CI        | OR       | 95% CI        |
| CCI score 1<sup>a</sup>         | 2.19     | (1.01-4.74)   | 1.45     | (0.63-3.33)   |
| CCI score at least 2<sup>a</sup>| 2.82     | (0.83-9.56)   | 1.85     | (0.49-6.96)   |
| Poor grade SAH (WFNS IV-V)      | 3.56     | (1.64-7.73)   | 5.02     | (2.15-11.75)  |
| Presence of acute hydrocephalus | 1.62     | (0.73-3.58)   | 1.77     | (0.77-4.09)   |
| Thick and diffuse hemorrhage    | 0.91     | (0.44-1.86)   | 0.56     | (0.25-1.23)   |
| Presence of intraventricular hemorrhage | 3.25     | (1.21-8.74)   | 3.42     | (1.26-9.30)   |
| Presence of intracerebral hemorrhage | 0.95     | (0.43-2.11)   | 1.04     | (0.46-2.37)   |
| Posterior circulation aneurysm<sup>b</sup> | 2.42     | (1.06-5.50)   | 2.35     | (1.00-5.52)   |
| Older age group                 |          |               | 7.04     | (3.25-15.27)  |

<sup>a</sup> Compared to CCI score 0
<sup>b</sup> Compared to anterior circulation aneurysm
