Abstract

We study higher order KdV equations from the $GL(2, \mathbb{R}) \cong SO(2,1)$ Lie group point of view. We find elliptic solutions of higher order KdV equations up to the ninth order. We argue that the main structure of the trigonometric/hyperbolic/elliptic $N$-soliton solutions for higher order KdV equations is the same as that of the original KdV equation. Pointing out that the difference is only the time dependence, we find $N$-soliton solutions of higher order KdV equations can be constructed from those of the original KdV equation by properly replacing the time-dependence. We discuss that there always exist elliptic solutions for all higher order KdV equations.

1. Introduction

The soliton system is taken an interest in for a long time by considering that the soliton equation is the concrete example of the exactly solvable nonlinear differential equation [1–12]. Nonlinear differential equation relates to the interesting non-perturbative phenomena, so that studies of the soliton system are important to unveil mechanisms of various interesting physical phenomena such as those in superstring theories. It is quite surprising that such nonlinear soliton equations can be exactly solvable and have $N$-soliton solutions. Then we have a dogma that there must be the Lie group structure behind the soliton system, which is a key stone to make nonlinear differential equations exactly solvable.

For the KdV soliton system, the Lie group structure is implicitly built in the Lax operator $L = \partial_x^2 - u(x, t)$. In order to see the Lie group structure, it is appropriate to formulate by using the linear differential operator $\partial_x$ as the Schrödinger representation of the Lie algebra, which naturally comes to use the AKNS formalism [4] for the Lax equation

$$\frac{\partial}{\partial x} \begin{pmatrix} \psi_1(x, t) \\ \psi_2(x, t) \end{pmatrix} = \begin{pmatrix} a/2 & -u(x, t) \\ -1 & -a/2 \end{pmatrix} \begin{pmatrix} \psi_1(x, t) \\ \psi_2(x, t) \end{pmatrix}.$$ 

Then the Lie group becomes $GL(2, \mathbb{R}) \cong SO(2,1)$ for the KdV equation. An addition formula for elements of this Lie group is the well-known KdV type Bäcklund transformation.

In our previous papers [13–16], we have studied $GL(2, \mathbb{R}) \cong SO(2,1)$ Lie group approach for the unified soliton systems of KdV/mKdV/sinh-Gordon equations. Using the well-known KdV type Bäcklund transformation as the addition formula, we have algebraically constructed $N$-soliton solutions from various trigonometric/hyperbolic 1-soliton solutions [13, 15, 16]. Since the Lie group structure of KdV equation is the $GL(2, \mathbb{R}) \cong SO(2,1)$, which has elliptic solution, we expect that elliptic $N$-soliton solutions for the KdV equation can be constructed by using the Bäcklund transformation as the addition formula. We then really have succeeded in constructing elliptic $N$-soliton solutions [14].

We can interpret this fact in the following way: The KdV equation, which is a typical 2-dimensional soliton equation, has the $SO(2,1)$ Lie group structure and the well-known KdV type Bäcklund transformation can be interpreted as the addition formula of this Lie group. Then the elliptic function appears as a representation of the Bäcklund transformation. While, 2-dimensional Ising model, which is a typical 2-dimensional statistical
integrable model, has the SO(3) Lie group structure and the Yang-Baxter relation can be interpreted as the addition formula of this Lie group. Then the elliptic function appears as a representation of the Yang-Baxter relation, which is equivalent to the addition formula of the spherical trigonometry [17, 18]. In 2-dimensional integrable, soliton, and statistical models, there is the SO(2, 1)/SO(3) Lie group structure behind the model. As representations of the addition formula, the Bäcklund transformation, and the Yang-Baxter relation, there appears an algebraic function such as the trigonometric/hyperbolic/elliptic functions, which is the key stone to make the 2-dimensional integrable model into the exactly solvable model.

In this paper, we consider Lax type higher order KdV equations and study trigonometric/hyperbolic/elliptic solutions. So far special hyperelliptic solutions for more than the fifth order KdV equation have been vigorously studied by formulating it into the Jacobi’s inversion problem [19–24]. Since the Lie group structure GL(2, \mathbb{R}) \cong SO(2, 1) and the Bäcklund transformation are common even for higher order KdV equations, we expect that there always exist elliptic solutions even for higher order. Then we study to find elliptic solutions up to the ninth order KdV equation, instead of special hyperelliptic solutions. We would like to conclude that we always have elliptic solutions for all higher order KdV equations.

As the application of the third order KdV equation, this equation is first obtained in the analysis of shallow water solitary wave [25]. Even recently, the third order KdV equation becomes important in the analysis of various non-linear phenomena. For example, in the recent interesting works, the third order KdV equation comes out in the analysis of the non-linear acoustic solitary wave in the electron–ion plasma [26–29]. As the application of the higher order KdV equation, some special fifth order KdV equation (KdV5), which is different from the Lax type equation, is recently experimentally and theoretically interested in. This KdV5 equation comes out in the analysis of various non-linear phenomena, such as cold collisionless plasma [30], gravity-capillary wave [31], shallow water wave with surface tension [32] etc. Theoretically, it is shown that Camassa-Holm equation is transformed into this KdV5 equation [33, 34] and multi-soliton solutions is obtained [35]. In this way, the KdV equation becomes important in the analysis of various non-linear phenomena.

The paper is organized as follows: In section 2, we study trigonometric/hyperbolic solutions for higher order KdV equations. We construct elliptic solutions for higher order KdV equations in section 3. In section 4, we consider the KdV type Bäcklund transformation as an addition formula for solutions of the Weierstrass type elliptic differential equation. In section 5, we study special 1-variable hyperelliptic solutions, and we discuss a relation between such special 1-variable hyperelliptic solutions and our elliptic solutions. We devote a final section to summarize this paper and to give discussions.

2. Trigonometric/hyperbolic solutions for the Lax type higher order KdV equations

Lax pair equations for higher order KdV equations are given by

\[ L\psi = \frac{u^2}{4} \psi, \]

(2.1)

\[ \frac{\partial \psi}{\partial t_{2n+1}} = B_{2n+1} \psi, \]

(2.2)

where \( L = \partial^2_x - u \). By using the pseudo-differential operator \( \partial^{-1}_x \), \( B_{2n+1} \) are constructed from \( L \) in the form [36, 37]

\[ B_{2n+1} = (L^{2n+1})_{\geq 0} = \partial^{-2n+1}_x = \frac{2n}{2} u \partial^{-2n+1}_x + \cdots, \]

(2.3)

with

\[ L = L^{1/2} = \partial_x - \frac{u}{2} \partial^{-1}_x + \frac{u}{4} \partial^{-2}_x + \cdots, \]

where we denote ‘\( \geq 0 \)’ to take positive differential operator parts or function parts for general pseudo-differential operators. The integrability condition gives higher order KdV equations

\[ \frac{\partial L}{\partial t_{2n+1}} = [B_{2n+1}, L]. \]

(2.4)

As these higher order KdV equations comes from the Lax formalism, these higher order KdV equations are called the Lax type. There are various higher order KdV equations such as the Sawada–Kotera type, which is the higher order generalization of the Hirota form KdV equation [38]. As operators \( B_{2n+1} \) are constructed from \( L \), higher order KdV equations also have the same Lie group structure GL(2, \mathbb{R}) \cong SO(2, 1) as that of the original KdV (third order KdV) equation. Using \( u = z_x \), the KdV type Bäcklund transformation is given in the form.
\[ z'_x + z_x = -\frac{a^2}{2} + \frac{(z' - z)^2}{2}, \]  

(2.5)

which comes from equation (2.1) only, so that it is valid even for the higher order KdV equations. In the Lie group approach to the soliton system, if we find 1-soliton solutions, we can construct N-soliton solutions from various 1-soliton solutions by the Bäcklund transformation equation (2.5) as an addition formula of the Lie group.

For 1-soliton solution of equation (2.4), if \( x \) and \( t_{2n+1} \) come in the combination \( X^{(2n+1)} = \alpha x + \beta t_{2n+1} + \delta, \) then if \( \gamma = 1 \), the right-hand side of equation (2.4) is a function of only \( X \), while the left-hand side is a function of \( X \) and \( t \). Therefore, \( \gamma = 1 \) is necessary, that is, \( X = \alpha x + \beta t_{2n+1} + \delta \). N-soliton solutions are constructed from various 1-soliton solutions by the Bäcklund transformation. Then the main structure of N-soliton solutions, which are expressed with \( X^{(2n+1)}, (i = 1, 2, \cdots, N) \), takes the same functional forms in higher order KdV equations and in the original KdV equation. The difference is only the time dependence of \( X_i = \alpha_i x + \beta_i t_{2n+1} + \delta_i, (i = 1, 2, \cdots, N) \), that is, coefficients \( \beta_i \). This is valid not only for the trigonometric/hyperbolic N-soliton solutions but also for elliptic N-soliton solutions.

For the trigonometric/hyperbolic N-soliton solutions, we can easily determine the time dependence without knowing details of \( B_{2n+1} \). For dimensional analysis, we have \( \{ \beta_i \} = M, \{ u_i \} = M^2 \) in the unit of mass dimension \( M \). Further, we notice that \( \{ B_{2n+1}, L \} \) does not contain differential operators but it contains only functions. Then we have

\[ \frac{\partial u}{\partial t_{2n+1}} = \partial_x^{2n+1} u + \mathcal{O}(u^2). \]  

(2.6)

As equation (2.6) is the Lie group type differential equation, we take the Lie algebraic limit. Putting \( u = \epsilon \hat{u} \) first, equation (2.6) takes in the form

\[ \epsilon \frac{\partial \hat{u}}{\partial t_{2n+1}} = \epsilon \partial_x^{2n+1} \hat{u} + \mathcal{O}(\epsilon^2 \hat{u}^2), \]  

(2.7)

and afterwards we take the limit \( \epsilon \to 0 \), which gives

\[ \frac{\partial \hat{u}}{\partial t_{2n+1}} = \partial_x^{2n+1} \hat{u}. \]  

(2.8)

Then for trigonometric/hyperbolic solutions, we see that \( x \) and \( t_{2n+1} \) come in a combination \( X_i = a_i x + \delta_i \to X_i = a_i x + a_i^{2n+1} t_{2n+1} + \delta_i \) for 1-soliton solutions. In this way, the time dependence for trigonometric/hyperbolic solutions is easily determined without knowing details of \( B_{2n+1} \). We can then obtain trigonometric/hyperbolic N-soliton solutions for the \((2n+1)\)-th order KdV equation from the original KdV N-soliton solutions just by replacing \( X_i^{(3)} = a_i x + a_i^3 t_i + \delta_i \to X_i^{(2n+1)} = a_i x + a_i^{2n+1} t_{2n+1} + \delta_i, (i = 1, 2, \cdots, N) \).

For example, the original third order KdV equation is given by

\[ u_{t_3} = u_{3x} - 6uu_{xx}, \]  

(2.9)

and the fifth order KdV equation is given by \([38]\),

\[ u_{t_5} = u_{5x} - 10uu_{3x} - 20u_t u_{2x} + 30u^2 u_x. \]  

(2.10)

These two equations look quite different, but the 1-soliton solution for the third order KdV equation is given by \( z = -a \tanh((ax + a^3 t + \delta)/2), \) while 1-soliton solution for the fifth order KdV equation is given by \( z = -a \tanh((ax + a^3 t + \delta)/2) \). In this way, even for any N-soliton solutions, we can obtain the fifth order KdV solution from third order KdV solution just by replacing \( X_i^{(3)} = a_i x + a_i^3 t + \delta_i \to X_i^{(5)} = a_i x + a_i^5 t + \delta_i \). See more details in the Wazwaz’s nice textbook \([38]\).

However, as we explain in the next section, the way to determine the time dependence by taking the Lie algebraic limit does not applicable for elliptic solutions.

3. Elliptic solutions for the Lax type higher order KdV equations

We consider here elliptic 1-soliton solutions for higher order KdV equations up to ninth order. We first study whether higher order KdV equations reduces to differential equations of the elliptic curves. If a differential equation of the elliptic curve exists, via dimensional analysis, \( \{ \beta_i \} = M, \{ u_i \} = M^2 \), \( \{ k_i \} = M^3 \), \( \{ k_0 \} = M^4 \), that must be the differential equation of the Weierstrass type elliptic curve

\[ u_x^2 = k_3 u^3 + k_2 u^2 + k_1 u + k_0, \]  

(3.1)

We use the notation \( u_t = \partial_t u, u_{xx} = \partial_x^2 u, \cdots \) throughout the paper.
where \( k_j (i = 0, 1, 2, 3) \) are constants. We cannot use the method to take the Lie algebraic limit to find the time dependence of the elliptic 1-soliton solution, because we cannot take \( u \to 0 \) as \( k_0 = 0 \) is essential in the elliptic case. By differentiating equation (3.1), we have the following relations:

\[
\begin{align*}
\frac{d}{dx} (u_{2x}) &= \frac{3}{2} k_3 u^2 + k_2 u + \frac{1}{2} k_1, \\
\frac{d}{dx} (u_{3x}) &= 3 k_3 u u_x + k_2 u_x, \\
\frac{d}{dx} (u_{4x}) &= 3 k_3 u_{2x} + 3 k_3 u_x^2 + k_2 u_{2x}, \\
\frac{d}{dx} (u_{5x}) &= 9 k_3 u_x u_{2x} + 3 k_3 u_{3x} + k_2 u_{3x}, \\
\frac{d}{dx} (u_{6x}) &= 12 k_3 u_x u_{3x} + 9 k_3 u_{2x}^2 + 3 k_3 u u_{4x} + k_2 u_{4x}, \\
\frac{d}{dx} (u_{7x}) &= 30 k_3 u_{2x} u_{3x} + 15 k_3 u_x u_{4x} + 3 k_3 u u_{5x} + k_2 u_{5x}, \\
\frac{d}{dx} (u_{8x}) &= 45 k_3 u_x u_{4x} + 30 k_3 u_{3x}^2 + 18 k_3 u_x u_{5x} + 3 k_3 u u_{6x} + k_2 u_{6x}.
\end{align*}
\]

### 3.1. Elliptic solution for the third order KdV (original KdV) equation

The third order KdV (original KdV) equation is given by

\[
\frac{d}{dt} u_x = \frac{1}{6} u u_x - u u_{2x} + \frac{1}{2} u_{3x} + \frac{1}{3} u_x.
\]

We consider the 1-soliton solution, where \( x \) and \( t \) come in the combination \( X = x + c_3 t + \delta \), then we have

\[
\frac{d}{dx} (u_{2x}) = 3 u^2 - c_5 u = \frac{k_1}{2},
\]

where \( k_1/2 \) is an integration constant. Further multiplying \( u_x \) and integrating, we have the following differential equation of the Weierstrass type elliptic curve

\[
u x^2 = 2 u^3 + k_3 u^2 + k_2 u + k_0,
\]

where \( k_2, k_1, \) and \( k_0 \) are constants and \( c_5 \) is determined as \( c_5 = k_3 \), which gives the time-dependence of the 1-soliton solution. If we put \( \varphi = u/2 + k_2/12 \), we have the standard differential equation of the Weierstrass \( \wp \) function type

\[
\varphi_x^2 = 4 \varphi^3 - g_2 \varphi - g_3,
\]

with

\[
\begin{align*}
g_2 &= k_2^2/12 - k_2/2, \\
g_3 &= -k_2^2/216 + k_2 k_2/24 - k_0/4.
\end{align*}
\]

Elliptic 1-soliton solution is given by

\[
u(x, t_5) = \nu(X^{(3)}) = 2 \wp(X^{(3)}) - \frac{k_2}{6},
\]

with

\[
X^{(3)} = x + c_3 t_5 + \delta, \quad c_3 = k_3.
\]

We sketch the graphs of the third order KdV solution in figure 1.

It should be noted that we must parametrize the differential equation of the Weierstrass type elliptic curve by \( k_2, k_1, \) and \( k_0 \) instead of \( g_2, g_3 \), because coefficients \( c_{2n+1} \) in higher order KdV equations, which determine the time dependence, are expressed with \( k_2, k_1, \) and \( k_0 \). According to the method of our previous paper, if we find various 1-soliton solutions, we can construct \( N \)-soliton solutions [14].

### 3.2. Elliptic solution for the fifth order KdV equation

The fifth order KdV equation is given by [38],

\[
u_{15} = (u_{4x} - 10 u u_{2x} - 5 u_x^2 + 10 u^3)_x = 0.
\]

We consider the elliptic solution, where \( x \) and \( t_5 \) come in the combination of \( X = x + c_5 t_5 + \delta \), which gives

\[
c_5 u - (u_{4x} - 10 u u_{2x} - 5 u_x^2 + 10 u^3) + C = 0,
\]

where \( C \) is an integration constant. We will show that the above equation reduces to the same differential equation of the Weierstrass type elliptic curve equation (3.1). Substituting equation (3.1), \( \cdots \), and equation (3.2c) into equation (3.10) and comparing coefficients of \( u^4, u^2, u^3, \) and \( u^5 \), we have 4 conditions for 6 constants \( k_3, k_2, k_1, \) and \( C \) in the form
Then we have two solutions

\begin{align}
\text{i)} \quad & (k_3 - 2)(3k_3 - 2) = 0, \quad \text{(3.11a)} \\
\text{ii)} \quad & k_2(k_3 - 2) = 0, \quad \text{(3.11b)} \\
\text{iii)} \quad & c_5 = (9k_3/2 - 10)k_1 + k_2^2, \quad \text{(3.11c)} \\
\text{iv)} \quad & C = (3k_3 - 5)k_0 + k_1k_2/2. \quad \text{(3.11d)}
\end{align}

Then we have two solutions

\begin{align}
\text{I) } \quad & k_3 = 2, \quad k_2, k_1, k_0 : \text{arbitrary}, \quad c_5 = -k_1 + k_2^2, \quad C = k_0 + k_1k_2/2, \quad \text{(3.12)} \\
\text{II) } \quad & k_3 = 2/3, \quad k_2 = 0, \quad k_1, k_0 : \text{arbitrary}, \quad c_5 = -7k_1, \quad C = -3k_0. \quad \text{(3.13)}
\end{align}

We here take the most general solution, i.e., I case, which gives the same differential equation of the elliptic curve $u_x^2 = 2u^3 + k_2 u^2 + k_2^2 u + k_0$ as that of the third order KdV equation equation (3.5) and $c_5$ is determined as $c_5 = -k_1 + k_2^2$. Elliptic 1-soliton solution is given by

\begin{equation}
\begin{aligned}
u(x, t) &= u(X^{(5)}) = 2\varphi(X^{(5)}) - \frac{k_2}{6}, \quad \text{(3.14)}
\end{aligned}
\end{equation}

with

\begin{equation}
X^{(5)} = x + c_5 t + \delta, \quad c_5 = -k_1 + k_2^2.
\end{equation}

We sketch the graphs of the fifth order KdV solution in figure 2.
3.3. Elliptic solution for the seventh order KdV equation

The seventh order KdV equation is given by [38],

\[ u_t - (u_{6x} - 14u_{4x} - 28u_{2x}u_{3x} - 21u_{2x}^2 + 70u^2u_{2x} + 70uu_x^2 - 35u^4)x = 0. \tag{3.15} \]

In this case, assuming that \( x \) and \( t \) come in the combination of \( X = x + \psi t + \delta \), we have

\[ (u_{6x} - 14u_{4x} - 28u_{2x}u_{3x} - 21u_{2x}^2 + 70u^2u_{2x} + 70uu_x^2 - 35u^4) + C = 0. \tag{3.16} \]

Repeatedly substituting equation (3.1), ···, and equation (3.2c) into equation (3.16) and comparing coefficients of \( u^4, u^3, u^2, u^1, \) and \( u^0 \), we have 5 conditions for 6 constants \( k_3, k_2, k_1, k_0, c_7, \) and \( C \) of the form

i) \((k_3 - 2)(3k_2 - 2)(3k_3 - 1) = 0, \tag{3.17a}\)

ii) \(k_2(k_3 - 2)(3k_2 - 2) = 0, \tag{3.17b}\)

iii) \(k_1(k_3 - 2) + 3k_2^2(k_3 - 2) = 0, \tag{3.17c}\)

iv) \(c = (45k_2^2 - 126k_3 + 70)k_0 + (27k_3 - 56)k_1k_2 + k_3^3, \tag{3.17d}\)

v) \(C = 15(k_3 - 28)k_0k_2 + (9k_3 - 21)k_2^2/4 + k_1k_2^2/2. \tag{3.17e}\)

Then we get 3 solutions

I) \(k_3 = 2, \quad k_2, k_1, k_0 : \text{arbitrary,} \quad \psi = -2k_0 - 2k_1k_2 + k_2^3, \tag{3.18}\)

\[ C = 2k_0k_2 - 3k_2^2/4 + k_1k_2^2/2, \]

II) \(k_3 = 2/3, \quad k_1 = 3k_2^2, \quad k_2, k_0 : \text{arbitrary,} \quad \psi = 6k_0 - 113k_3^3, \tag{3.19}\)

\[ C = -18k_0k_2 - 129k_3^2/4, \]

III) \(k_3 = 1/3, \quad k_0 = 0, \quad k_1 = 0, \quad k_0 : \text{arbitrary,} \quad \psi = 33k_0, \quad C = 0. \tag{3.20}\)

We take the most general solution i.e., I) case, which is the same differential equation of the elliptic curve as that of the third order KdV equation equation (3.5) and \( c_7 \) is determined as \( \psi = -2k_0 - 2k_1k_2 + k_2^3 \). Elliptic 1-soliton solution is given by

\[ u(x, t) = u(X^{(1)}) = 2\psi(X^{(1)}) - \frac{k_2}{6}, \tag{3.21} \]

with

\( X^{(1)} = x + \psi t + \delta, \quad \psi = -2k_0 - 2k_1k_2 + k_2^3. \)

3.4. Elliptic solution for the ninth order KdV equation

The ninth order KdV equation is given by [39],

\[ u_t - (u_{8x} - 18u_{6x} - 54u_{4x}u_{3x} - 114u_{4x}u_{2x} - 69u_{4x}^2 + 126u^2u_{2x} + 504uu_xu_{3x} + 462u_{3x}^2u_{2x} + 378uu_x^2 - 630u_{2x}^2 - 420u_{2x}^3u_{2x} + 126u_5)x = 0. \tag{3.22} \]

Assuming that \( x \) and \( t \) come in the combination of \( X = x + \phi t + \delta \), we have

\[ (u_{8x} - 18u_{6x} - 54u_{4x}u_{3x} - 114u_{4x}u_{2x} - 69u_{4x}^2 + 126u^2u_{2x} + 504uu_xu_{3x} + 462u_{3x}^2u_{2x} + 378uu_x^2 - 630u_{2x}^2 - 420u_{2x}^3u_{2x} + 126u_5) + C = 0. \tag{3.23} \]

Substituting equation (3.1), ···, and equation (3.2g) into equation (3.23) and comparing coefficients of \( u^8, u^7, u^6, \)

\( u^5, u^4, \) and \( u^0 \), we have 6 conditions for 6 constants \( k_3, k_2, k_1, k_0, c_9, \) and \( C \) in the following form

i) \((k_3 - 2)(3k_2 - 2)(3k_3 - 1)(5k_3 - 1) = 0, \tag{3.24a}\)

ii) \(k_2(k_3 - 2)(3k_2 - 2)(3k_2 - 1) = 0, \tag{3.24b}\)

iii) \(k_1(k_3 - 2)(3k_2 - 2)(9k_3 - 4) + 7k_2^2(k_3 - 2)(3k_2 - 1) = 0, \tag{3.24c}\)

iv) \(3k_0(k_3 - 2)(225k_3^2 - 252k_3 + 70) + k_2(k_3 - 2)(720k_3 - 546k_1 + 85k_2^2) = 0, \tag{3.24d}\)

v) \(c_9 = (675k_2^2 - 1836k_3 + 966)k_0k_2 + (378k_2^2 - 1080k_3 + 651)k_1^2/2 + (243k_3 - 492)k_1k_2^2/2 + k_2^4, \tag{3.24e}\)

vi) \(C = (297k_2^2 - 828k_3 + 462)k_0k_2/2 + (63k_3 - 123)k_0k_2^2 + (27k_3 - 57)k_1^2k_2/2 + k_1k_2^3/2. \tag{3.24f}\)

Then we obtain 4 solutions

I) \(k_3 = 2, \quad k_2, k_1, k_0 : \text{arbitrary,} \quad \psi = -6k_0 - 3k_2^2/2 - 3k_1k_2^2 + k_2^4, \tag{3.25}\)

\[ C = -3k_0k_1 + 3k_0k_2^2 - 3k_2^2k_2/2 + k_1k_2^2/2, \]
II) \( k_2 = 2/3, \quad k_0 = (66k_2k_2 - 85k_3^3)/6, \quad k_3 : \) arbitrary,
\[
c_9 = (99k_1^2 + 594k_2k_2^2 - 1188k_2^3)/2,
C = (423k_2^2k_2 - 2376k_2k_3^3 + 2295k_3^2)/2, \quad (3.26)
\]
III) \( k_2 = 1/3, \quad k_3 = 7k_2^2, \quad k_0 = 187k_3^3/3, \quad k_3 : \) arbitrary,
\[
c_9 = 33462k_4^4, \quad C = 40248k_5^5, \quad (3.27)
\]
IV) \( k_2 = 1/5, \quad k_3 = 0, \quad k_0 = 0, \quad c_9 = 0, \quad C = 0. \quad (3.28)

We take the most general solution i.e., I case, which gives the same differential equation of the elliptic curve as that of the third order KdV equation equation (3.5), and \( c_9 \) is determined as
\[
c_9 = -6k_0k_2 + 3k_2^2/2 - 3k_3k_2^2 + k_4^2. \quad (3.29)
\]
with
\[
X^{(9)} = x + c_9t_9 + \delta, \quad c_9 = -6k_0k_2 + 3k_2^2/2 - 3k_3k_2^2 + k_4^2.
\]

In this way, even for higher order KdV equations, the main structure of the elliptic solution, which is expressed by \( X^{(2n+1)} \), takes the same functional form except the time dependence, that is, \( c_{n+1} \) in \( X^{(2n+1)} = x + c_{n+1}t_{n+1} + \delta \). Compared with the trigonometric/hyperbolic case, \( c_{n+1} \) becomes complicated for elliptic solutions of higher order KdV equations.

In the general \( (2n + 1) \)-th order KdV equation, by dimensional analysis \( [u_{xxx}] = [u^{n+1}] = M^{2n+2} \), integrated differential equation gives the \( (n + 1) \)-th order polynomial of \( u \). Then the number of the conditions is \( n + 2 \), while the number of constants is 6. So, \( n \geq 5 \) becomes the overdetermined case, but we expect the existence of the differential equation of the elliptic curve for more than eleventh order KdV equation owing to the nice SO(2, 1) Lie group symmetry. Although the existence of such elliptic curve is a priori not guaranteed, we will show later that the elliptic solutions really exist for all higher order KdV equations.

4. Bäcklund transformation for the differential equation of the elliptic curve

Here we will show that the Bäcklund transformation connects one solution to another solution of the same differential equation of the Weierstrass type elliptic curve. The Lie group structure of KdV equation is given by \( GL(2, \mathbb{R}) \cong SO(2, 1) \) and the Bäcklund transformation can be considered as the self gauge transformation of this Lie group. We consider two solutions for the KdV equation, that is, two solutions \( u(x, t_0) \) and \( u(x, t_2) \) for \( u_{xxxx} - u_{xxx} + 6uu_x = 0 \) and \( u_{xxxx} - 6u_x = 0 \). We put the time dependence in the forms;
\[
X' = x + c_1t_1 + c_2t_2 + \delta \quad \text{for} \quad u(x, t_0) \quad \text{and} \quad \text{that of} \quad X = x + c_3t_3 + \delta \quad \text{for} \quad u(x, t_2).
\]
In order to connect two solutions by the Bäcklund transformation and to construct N-soliton solutions, \( c_1, c_2 \) and \( c_3 \) must take the same common value. By integrating twice, we have the same differential equation of the elliptic curve
\[
\begin{align*}
\frac{u'}{u} &= 2u^3 + 2u + k_1' \quad \text{(4.1)}
\frac{u''}{u} &= 2u^3 + 2u + k_1 + k_0, \quad \text{(4.2)}
\end{align*}
\]
with same coefficients \( k_0, k_1, \) and \( k_0, \) where we take \( c_1 = c_1' = c_2. \) By taking a constant shift of \( u \rightarrow u - k_2/6, \) we consider the same two differential equations of the Weierstrass type elliptic curve
\[
\begin{align*}
\frac{u''}{u} &= 2u^3 + 2u + k_1 + k_0, \quad \text{(4.3)}
\frac{u''}{u} &= 2u^3 + 2u + k_1 + k_0, \quad \text{(4.4)}
\end{align*}
\]
where \( g_2 \) and \( g_3 \) are given by equations (3.7a) and (3.7b). It should be mentioned that this differential equation of the Weierstrass type elliptic curve has not only the solution \( u(x) = 2x^2 \) but also N-soliton solutions [14].

Here we will show that we can connect two solutions of equations (4.3) and (4.4) by the following Bäcklund transformation
\[
z'' + z = -\frac{a^2}{2} + \frac{(z' - z)^2}{2}, \quad (4.5)
\]
where \( u = z \) and \( u' = z'. \) We introduce \( U = u' + u = z' + z \) and \( V = z' - z \), which gives \( V_x = z' - z = u' - u. \) Then we have \( u' = (U + V_x)/2 \) and \( u = (U - V_x)/2. \) Equations (4.3) and (4.4) are given by
\[
\begin{align*}
(U_x + V_{xx})^2 &= (U + V_x)^3 - 4g_2(U + V_x) - 16g_3, \quad (4.6)
(U_x - V_{xx})^2 &= (U - V_x)^3 - 4g_2(U - V_x) - 16g_3. \quad (4.7)
\end{align*}
\]
The Bäcklund transformation (4.5) is given by

\[ U = \frac{V^2}{2} - \frac{a^2}{2}, \]  

(4.8)

which gives \( U_e = VV_e \).

First, by taking equations (4.6)–(4.7), we have

\[ U, V = \frac{1}{2} (3U^2V_e + V_e^3) - 2g_2V, \]  

(4.9)

which reads the form

\[ VV_e = \frac{3}{8} (V^2 - a^2)^2 + \frac{1}{2} V_e^2 - 2g_2 = \frac{1}{2} V_e^2 + \frac{3}{8} V^4 - \frac{3}{4} a^2V^2 + \frac{3}{8} a^4 - 2g_2, \]  

(4.10)

through the relation (4.8). By dimensional analysis, we have

\[ V_e^2 = m_4V^4 + m_3V^3 + m_2V^2 + m_1V + m_0, \]  

(4.11)

where \( m_i (i = 0, 1, \cdots, 4) \) are constants. By differentiating this relation, we have

\[ V_e = 2m_4V^3 + \frac{3}{2} m_3V^2 + m_2V + \frac{1}{2} m_1. \]  

(4.12)

Substituting this relation into equation (4.10), we have

\[ 2m_4V^4 + \frac{3}{2} m_3V^3 + m_2V^2 + \frac{1}{2} m_1V = \frac{1}{2} V_e^2 + \frac{3}{8} V^4 - \frac{3}{4} a^2V^2 + \frac{3}{8} a^4 - 2g_2, \]  

(4.13)

which gives

\[ V_e^2 = \left(4m_4 - \frac{3}{4}\right)V^4 + 3m_3V^3 + \left(2m_2 + \frac{3}{2} a^2\right)V^2 + m_1V - \frac{3}{4} a^4 + 4g_2 \]

\[ = m_4V^4 + m_3V^3 + m_2V^2 + m_1V + m_0, \]  

(4.14)

Comparing coefficients of the power of \( V \), we have \( m_4 = 1/4, m_3 = 0, m_2 = -3a^2/2, m_1 = (undetermined), m_0 = -3a^4/4 + 4g_2 \), which gives

\[ V_e^2 = \frac{1}{4} V^4 - \frac{3}{2} a^2V^2 + m_1V - \frac{3}{4} a^4 + 4g_2, \]  

(4.15)

\[ V_e = \frac{1}{2} V^3 - \frac{3}{2} a^2V + \frac{1}{2} m_1. \]  

(4.16)

Second, by taking equation (4.6) + equation (4.7), we have

\[ U^2 + V_e^2 = U^3 + 3UV - 4g_2U - 16g_3. \]  

(4.17)

Using equation (4.8), we have

\[ V^2V_e + V_e^2 = \left(\frac{V^2}{2} - \frac{a^2}{2}\right)^3 + \frac{3}{2} \left(\frac{V^2}{2} - \frac{a^2}{2}\right)V^2 - 4g_2 \left(\frac{V^2}{2} - \frac{a^2}{2}\right) - 16g_3. \]  

(4.18)

Substituting \( V_e^2 \) and \( V_e^2 \) into equation (4.18) and by using equation (4.15) and equation (4.16), we have the condition \( m_1^2 = 4a^6 - 16a^2g_2 - 64g_3 \). Then the undetermined coefficient \( m_1 \) is determined, and we have the differential equation of the Jacobi type elliptic curve for \( V = z' - z \)

\[ V_e^2 = \frac{1}{4} V^4 - \frac{3}{2} a^2V^2 \pm \sqrt{4a^6 - 16a^2g_2 - 64g_3} \]  

\[ = \frac{3}{4} a^4 + 4g_2. \]  

(4.19)

In this way, the set of equations \{ equations (4.3), (4.5) \} is equivalent to the set of those \{ equations (4.4), (4.5) \}. This means that the Bäcklund transformation (4.5) connects one soliton solution \( u \) to another soliton solution \( u' \) for the same differential equation equation (4.5) and equation (4.4) of the Weierstrass type elliptic curve. In order to construct \( N \)-soliton solutions of the \((2n + 1)\)-th order KdV equation by the Bäcklund transformation, the time dependence for each 1-soliton solution, \( q_{n+1}, (i = 1, 2, \cdots, N) \), must be the same common value, then \( x_i \) and \( t_{n+1} \) come in the combination \( X_i^{(2n+1)} = x + q_{n+1}t_{2n+1} + \delta \).

In our previous work [14], by using the explicit soliton solution given by \( \wp \)-function and \( \zeta \)-function, we connect one soliton solution to another soliton solution by the Bäcklund transformation. Here we have shown that Bäcklund transformation connects one soliton solution to another soliton solution of the same differential equation of the Weierstrass type elliptic curve without using the explicit expression of the solution.
5. Special hyperelliptic solutions for higher order KdV equations

By using the method of commutative ordinary operators [19, 20], we can formulate higher order KdV equations into the Jacobi’s inversion problem. By solving the general Jacobi’s inversion problem, we can find solutions for higher order KdV equations [20–24]. Here we consider the fifth order KdV equation in order to explain how to solve the Jacobi’s inversion problem. Integrated fifth order KdV equation is given by

\[ u_{4t} - 10uu_{2x} - 5u_x^2 + 10u^3 = c_3u + C. \]  

(5.1)

According to the Tanaka–Date’s nice paper [20], this fifth order KdV equation is reformulated in the following form. We introduce auxiliary fields \( \mu_1(x) \), \( \mu_2(x) \),

\[ u(x) = 2(\mu_1(x) + \mu_2(x)), \]

(5.2)

\[ \mu_1(x)_x = \frac{\pm 2f_1'(\mu_1(x))}{\mu_1(x) - \mu_2(x)}, \]

(5.3)

\[ \mu_2(x)_x = \frac{\pm 2f_1'(\mu_2(x))}{\mu_2(x) - \mu_1(x)}, \]

(5.4)

where \( \alpha_3, \alpha_2, \alpha_1, \) and \( \alpha_0 \) are constants. Surprisingly, this \( u(x) \) satisfies

\[ u_{4t} - 10uu_{2x} - 5u_x^2 + 10u^3 = -8\alpha_3u + 16\alpha_2. \]

(5.6)

which determines \( c_5 = 8\alpha_3, C = 16\alpha_2 \). Then if we can find the solution \( \mu_1(x), \mu_2(x) \), we can construct the solution \( u(x, t) \) of the fifth order KdV equation by \( u(x, t) = u(X^5) = 2(\mu_1(X^5) + \mu_2(X^5)) \) where \( X^5 = x + c_5t + \delta \).

Equations (5.3) and (5.4) can be written in the form of the genus two Jacobi’s inversion problem [40]

\[ \frac{d\mu_1(x)}{\sqrt{f_1'(\mu_1(x))}} + \frac{d\mu_2(x)}{\sqrt{f_1'(\mu_2(x))}} = 0, \]

(5.7)

\[ \frac{\mu_1(x)d\mu_1(x)}{\sqrt{f_1'(\mu_1(x))}} + \frac{\mu_2(x)d\mu_2(x)}{\sqrt{f_1'(\mu_2(x))}} = \pm 2 dx. \]

(5.8)

The solution of the Jacobi’s inversion problem is that the symmetric combination of \( \mu_1(x) \) and \( \mu_2(x) \), that is , \( \mu_1(x) + \mu_2(x) (= u(x)/2) \) and \( \mu_1(x) \mu_2(x) \) are given by the ratio of the genus two hyperelliptic theta function. However, the above Jacobi’s inversion problem is special as the right-hand side of equation (5.7) is zero. Then the genus two hyperelliptic theta function takes in the following special 1-variable form

\[ \vartheta(\vartheta, \tau_1, \tau_2) = \sum_{m,n \in \mathbb{Z}} \exp \{ \pi i m^2 + \tau_2 n^2 + 2\tau_1 mn \} \]

(5.9)

Then \( F(x, t) = \vartheta(x, d_{21}, t_{21}, t_{12}) \) satisfies the diffusion equation \( \partial_t F(x, t) = -i\partial_x^4 F(x, t)/4\pi \). Further, \( F(x, t) \) has the trivial periodicity \( F(x + 1, t) = F(x, t) \). It is shown in the Mukom’s nice textbook [41] that if \( F(x, t) \) satisfies i) periodicity \( F(x + 1, t) = F(x, t) \), ii) diffusion equation \( \partial_t F(x, t) = -i\partial_x^4 F(x, t)/4\pi \), \( F(x, t) \) becomes the genus one elliptic theta function of 1-variable \( x \). By solving the Jacobi’s inversion problem, the solution \( u(x, t) = u(X^5) = u(x + c_5t + \delta) \) of the fifth order KdV equation is given by the ratio of the special 1-variable hyperelliptic theta function, which gives the elliptic solution. For the (2n + 1)-th order KdV equation, the solution of the Jacobi’s inversion problem gives \( u(x, t_{2n+1}) = u(X^{(2n+1)}) \) as the ratio of the special 1-variable genus \( n \) hyperelliptic theta function of the form \( \vartheta(\pm 2x + d_{i1}, d_{i2}, \ldots, d_{in}) \), which also becomes the genus one elliptic theta function.

For higher order KdV equations, it is shown that solutions are expressed with above special 1-variable hyperelliptic theta functions, which becomes elliptic theta functions. Then we can conclude that all higher order KdV equations always have elliptic solutions, though we have explicitly constructed elliptic solutions only up to the ninth order KdV equation.

6. Summary and discussions

We have studied to construct \( N \)-soliton solution for the Lax type higher order KdV equations by using the \( \text{GL}(2, \mathbb{R}) \cong \text{SO}(2,1) \) Lie group structure. The main structure of \( N \)-soliton solutions, expressed with
\( X_i = \alpha_i x + \beta_i t + \delta_i, \quad (i = 1, 2, \ldots, N) \) is the same even for higher order KdV equations. The difference of N-soliton solutions in various higher order KdV equations is the time dependence, that is, coefficients \( \beta_i \).

In trigonometric/hyperbolic solutions, by taking the Lie algebra limit, we can easily determine the time dependence. For the \((2n + 1)\)-th order KdV equation, we can obtain N-soliton solutions from those of the original KdV equation by just the replacement \( X_i^{(n)} = a_i x + a_i^3 t_i + \delta_i \rightarrow X_i^{(2n+1)} = a_i x + a_i^{2n+1} t_{2n+1} + \delta_i, \quad (i = 1, 2, \ldots, N) \).

For elliptic solutions, up to the ninth order KdV equation, we have obtained N-soliton solutions from those of the original KdV equation by just the replacement \( X_i^{(3)} = x + c_i t_i + \delta_i \rightarrow X_i^{(6n+1)} = x + c_{2n+1} t_{2n+1} + \delta_i, \quad (i = 1, 2, 3, 4) \) where \( c_{2n+1} \) are given by \( c_5 = k_0, \ c_6 = -k_1 + k_2^2, \ c_7 = -2k_0 - 2k_1 k_2 + k_3^2 \), and \( c_9 = -6k_0 k_2 + 3k_0^2 / 2 - 3k_1 k_2^2 + k_3^4 \) by using coefficients of differential equation of the Weierstrass type elliptic curve \( u_0^2 = 2u + k_0 t + k_1 u + k_0 \).

For higher order KdV equations, equations becomes quite complicated, and it became difficult to use our method to show that elliptic solutions always exist. But we can show that the elliptic solution for all higher order KdV equation always exists by the following two different ways.

First way is to use the GL(2, \( \mathbb{R} \))\( \subseteq \text{SO}(2,1) \) Lie group structure. For all higher order KdV equations, we have the same GL(2, \( \mathbb{R} \))\( \subseteq \text{SO}(2,1) \) Lie group structure and the same Bäcklund transformation, which means that the main structure expressed with the variable \( X^{(2n+1)} = x + c_{2n+1} t_{2n+1} + \delta \) is the same and difference is only the time dependence \( c_{2n+1} \). Then, as the elliptic solution of the third order KdV equation exist with \( X^{(3)} \) variable, the existence of the elliptic solution of all higher order KdV equation with \( X^{(2n+1)} \) is guaranteed.

Second way is to formulate in the Jacobi’s inversion problem. For the general \((2n + 1)\)-th order KdV equation, it can be formulated in the Jacobi’s inversion problem [18, 20], and it is known that there exist solutions expressed with the special 1-variable hyperelliptic theta function of the form \( \vartheta(\pm 2x + d_0, d_2, \ldots, n) \) [20–24], which is shown to be the elliptic theta function according to the Mumford’s argument [41]. We can say in another way. As the soliton solution \( u(x, t) = u(X), \ (X = ax + \beta t_{2n+1} + \delta) \), which is expressed as the ratio of special 1-variable hyperelliptic theta functions, as it has the trivial periodicity \( X \rightarrow X + 1, \ u(X) \) must be the trigonometric/hyperbolic or the elliptic function. Then it becomes the elliptic function according to the Mumford’s argument.

By using these two different ways, we can conclude that we always have the elliptic solutions for the general higher order KdV equations.

Further, without using the explicit form of the solution expressed with the \( \varphi \) function, we have shown that the KdV type Bäcklund transformation connects one solution to another solution of the same differential equation of the Weierstrass type elliptic curve.
