On the Structure of Certain Natural Cones over Moduli Spaces of Genus-One Holomorphic Maps

Aleksey Zinger*

July 17, 2018

Abstract

We show that certain naturally arising cones over the main component of a moduli space of $J_0$-holomorphic maps into $\mathbb{P}^n$ have a well-defined euler class. We also prove that this is the case if the standard complex structure $J_0$ on $\mathbb{P}^n$ is replaced by a nearby almost complex structure $J$. The genus-zero analogue of the cone considered in this paper is a vector bundle. The genus-zero Gromov-Witten invariant of a projective complete intersection can be viewed as the euler class of such a vector bundle. As shown in a separate paper, this is also the case for the “genus-one part” of the genus-one GW-invariant. The remaining part is a multiple of the genus-zero GW-invariant.

1 Introduction

1.1 Motivation

The GW-invariants of symplectic manifolds have been an area of much research in the past decade. These invariants are however often hard to compute.

If \( Y \) is a compact Kahler submanifold of the complex projective space \( \mathbb{P}^n \), one could try to compute the GW-invariants of \( Y \) by relating them to the GW-invariants of \( \mathbb{P}^n \). For example, suppose \( Y \) is a hypersurface in \( \mathbb{P}^n \) of degree \( a \). In other words, if \( \gamma : \mathbb{P}^n \rightarrow \mathbb{P}^n \) is the tautological line bundle and \( \mathcal{L} = \gamma^* \mathcal{O} \rightarrow \mathbb{P}^n \), then

\[
Y = s^{-1}(0),
\]

for some \( s \in H^0(\mathbb{P}^n; \mathcal{L}) \) such that \( s \) is transverse to the zero set. If \( g, k, \) and \( d \) are nonnegative integers, let \( \mathcal{M}_{g,k}(\mathbb{P}^n, d) \) and \( \mathcal{M}_{g,k}(Y, d) \) denote the moduli spaces of stable \( J_0 \)-holomorphic degree-\( d \) maps from genus-\( g \) Riemann surfaces with \( k \) marked points to \( \mathbb{P}^n \) and \( Y \), respectively. These moduli spaces determine the genus-\( g \) degree-\( d \) GW-invariants of \( \mathbb{P}^n \) and \( Y \).

By definition, the moduli space \( \mathcal{M}_{g,k}(Y, d) \) is a subset of the moduli space \( \mathcal{M}_{g,k}(\mathbb{P}^n, d) \). In fact,

\[
\mathcal{M}_{g,k}(Y, d) = \{ [C, u] \in \mathcal{M}_{g,k}(\mathbb{P}^n, d) : s \circ u = 0 \in H^0(C; u^* \mathcal{L}) \}.
\]

Here \( [C, u] \) denotes the equivalence class of the holomorphic map \( u : C \rightarrow \mathbb{P}^n \) from a genus-\( g \) curve \( C \) with \( k \) marked points. The relationship (1.1) can be restated more globally as follows. Let

\[
\pi^d_{g,k} : \mathcal{U}_{g,k}(\mathbb{P}^n, d) \rightarrow \mathcal{M}_{g,k}(\mathbb{P}^n, d)
\]

be the semi-universal family and let

\[
ev^d_{g,k} : \mathcal{U}_{g,k}(\mathbb{P}^n, d) \rightarrow \mathbb{P}^n
\]

be the natural evaluation map. In other words, the fiber of \( \pi^d_{g,k} \) over \( [C, u] \) is the curve \( C \) with \( k \) marked points, while

\[
ev^d_{g,k}([C, u; z]) = u(z) \quad \text{if} \quad z \in C.
\]

We define the section \( s^d_{g,k} \) of the sheaf \( \pi^d_{g,k} \ast ev^d_{g,k} \mathcal{L} \rightarrow \mathcal{M}_{g,k}(\mathbb{P}^n, d) \) by

\[
s^d_{g,k}([C, u]) = [s \circ u].
\]

By (1.1), \( \mathcal{M}_{g,k}(Y, d) \) is the zero set of this section.

The previous paragraph suggests that it should be possible to relate the genus-\( g \) degree-\( d \) GW-invariants of the hypersurface \( Y \) to the moduli space \( \mathcal{M}_{g,k}(\mathbb{P}^n, d) \) in general and to the sheaf

\[
\pi^d_{g,k} \ast ev^d_{g,k} \mathcal{L} \rightarrow \mathcal{M}_{g,k}(\mathbb{P}^n, d)
\]

in particular. In fact, it can be shown that

\[
GW^Y_{0,k}(d; \psi) \equiv \langle \psi, [\mathcal{M}_{0,k}(Y, d)]^{vir} \rangle = \langle \psi \cdot e(\pi^d_{0,k} \ast ev^d_{0,k} \mathcal{L}), [\mathcal{M}_{0,k}(\mathbb{P}^n, d)] \rangle
\]

(1.2)
The Euler class of the sheaf \( g \) as shown in [LZ], a according to a low-degree check of [GP2] and [K] for a quintic threefold can be computed via the virtual localization theorem of [GP1]. However, if \( g > 0 \), the sheaf \( \pi_{0,k}^{d} \circ \text{ev}_{0,k}^{d} \mathcal{L} \rightarrow \overline{M}_{0,k}(\mathbb{P}^{n}, d) \) is not locally free and does not define an Euler class. Thus, the right-hand side of (1.2) does not even make sense if 0 is replaced by \( g > 0 \). Instead one might try to generalize (1.2) as

\[
GW_{g,k}^{Y}(d; \psi) \equiv \langle \psi, [\overline{M}_{g,k}(Y, d)]^{\text{vir}} \rangle = \langle \psi \cdot e\left(R_{0}^{d} \pi_{g,k}^{d} \circ \text{ev}_{g,k}^{d} \mathcal{L} - R_{1}^{d} \pi_{g,k}^{d} \circ \text{ev}_{g,k}^{d} \mathcal{L} \right), [\overline{M}_{g,k}(\mathbb{P}^{n}, d)]^{\text{vir}} \rangle,
\]

where \( R_{i}^{d} \pi_{g,k}^{d} \circ \text{ev}_{g,k}^{d} \mathcal{L} \rightarrow \overline{M}_{g,k}(\mathbb{P}^{n}, d) \) is the \( i \)th direct image sheaf. The right-hand side of (1.4) can be computed via the virtual localization theorem of [GP1]. However, for a quintic threefold \( Y \subset \mathbb{P}^{4} \),

\[
N_{1}(d) \equiv GW_{g,k}^{Y}(d) \neq \langle e\left(R_{0}^{d} \pi_{1,0}^{d} \circ \text{ev}_{1,0}^{d} \mathcal{L} - R_{1}^{d} \pi_{1,0}^{d} \circ \text{ev}_{1,0}^{d} \mathcal{L} \right), [\overline{M}_{1}(\mathbb{P}^{4}, d)]^{\text{vir}} \rangle,
\]

as shown in [LZ], a \( g = 1 \) analogue of the role played by the Euler class of sheaf (1.3) is played by the Euler class of the sheaf

\[
\pi_{1,k}^{d} \circ \text{ev}_{1,k}^{d} \mathcal{L} \rightarrow \overline{M}_{1,k}(\mathbb{P}^{n}, d),
\]

where \( \overline{M}_{1,k}(\mathbb{P}^{n}, d) \) is the primary, algebraically irreducible, component of \( \overline{M}_{1,k}(\mathbb{P}^{n}, d) \). In other words, \( \overline{M}_{1,k}(\mathbb{P}^{n}, d) \) is the closure in \( \overline{M}_{1,k}(\mathbb{P}^{n}, d) \), either in the stable-map or Zariski topology, of the subspace

\[
\mathcal{M}_{1,k}(\mathbb{P}^{n}, d) = \{ [C, u] \in \overline{M}_{1,k}(\mathbb{P}^{n}, d) : C \text{ is smooth} \}.
\]

One of the results of this paper is that the Euler class of the sheaf (1.5) is in fact well-defined:

**Theorem 1.1** If \( n, d, \) and \( a \) are positive integers, \( k \) is a nonnegative integer, \( \mathcal{L} = \gamma^{*} \mathcal{O} \rightarrow \mathbb{P}^{n} \),

\[
\pi_{1,k}^{d} : \mathcal{U}_{1,k}(\mathbb{P}^{n}, d) \rightarrow \overline{M}_{1,k}(\mathbb{P}^{n}, d)
\]

is the semi-universal family, and

\[
\text{ev}_{1,k}^{d} : \mathcal{U}_{1,k}(\mathbb{P}^{n}, d) \rightarrow \mathbb{P}^{n}
\]

is the natural evaluation map, the sheaf

\[
\pi_{1,k}^{d} \circ \text{ev}_{1,k}^{d} \mathcal{L} \rightarrow \overline{M}_{1,k}(\mathbb{P}^{n}, d)
\]
determines a homology class and a cohomology class on $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d)$:

$$PD_{\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d)}\left( e(\pi_{1,k,*}^d ev_{1,k}^d \mathcal{L}) \right) \in H_{2(d(n+1-a)+k)}(\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d); \mathbb{Q})$$

and

$$e(\pi_{1,k,*}^d ev_{1,k}^d \mathcal{L}) \in H^{2da}(\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d); \mathbb{Q}).$$

Remark: If $a_1, \ldots, a_m \in \mathbb{Z}^+$ and

$$\mathcal{L} = \gamma^{\otimes a_1} \oplus \ldots \oplus \gamma^{\otimes a_m} \to \mathbb{P}^n,$$

then the sheaf $\pi_{1,k,*}^d ev_{1,k}^d \mathcal{L}$ is the direct sum of the sheaves corresponding to the line bundles $\gamma^{\otimes a_j}$. Thus, Theorem 1.1 applies to any split vector bundle over $\mathbb{P}^n$.

One way to view the statement of this theorem is that the sheaf (1.5) admits a desingularization, and the euler class of every desingularization of (1.5) is the same, in the appropriate sense. This is not the point of view taken in this paper. However, one approach to computing the number

$$\langle \psi, PD_{\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d)}\left( e(\pi_{1,k,*}^d ev_{1,k}^d \mathcal{L}) \right) \rangle = \langle \psi \cdot e(\pi_{1,k,*}^d ev_{1,k}^d \mathcal{L}), [\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)] \rangle$$

(1.6)

for a natural cohomology class $\psi \in H^*(\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d); \mathbb{Q})$ is to apply the localization theorem of [AB] to a desingularization of (1.5). In [YZ], we construct a desingularization of the space $\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)$, i.e. a smooth orbivariety $\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)$ and a map

$$\tilde{\pi}: \overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d) \to \overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d),$$

which is biholomorphic onto $\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)$. This desingularization of $\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)$ comes with a desingularization of the sheaf (1.5), i.e. a vector bundle

$$\tilde{\mathcal{V}}^d_{1,k} \to \overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d) \text{ s.t. } \tilde{\pi}_*\tilde{\mathcal{V}}^d_{1,k} = \pi_{1,k,*}^d ev_{1,k}^d \mathcal{L}.$$

In particular,

$$\langle \psi \cdot e(\pi_{1,k,*}^d ev_{1,k}^d \mathcal{L}), [\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)] \rangle = \langle \tilde{\pi}^*\psi \cdot e(\tilde{\mathcal{V}}^d_{1,k}), [\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)] \rangle.$$

(1.7)

Since a group action on $\mathbb{P}^n$ induces actions on $\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)$ and on $\tilde{\mathcal{V}}^d_{1,k}$, the localization theorem of [AB] is directly applicable to the right-hand side of (1.7), for a natural cohomology class $\psi$.

Before the results of [LZ] were announced, no positive-genus analogue of (1.2) had been even conjectured. On the other hand, Theorem 1.1 suggests a natural genus-one analogue of (1.2), which is proved in [LZ], and a conjectural extension of (1.2) to higher genera, which is stated in [LZ].

Theorem 1.1 is the $J = J_0$ case of Theorem 1.2 which is stated in Subsection 1.3. In the next subsection, we describe the main topological arguments that lie behind the proof of Theorems 1.1 and 1.2.
1.2 General Approach

In this paper, we view Theorem 1.1 as a statement about a certain (orbi-)cone

\[ \pi : \mathcal{V}_{1,k} \rightarrow \mathcal{M}_{1,k}(\mathbb{P}^n, d). \]  

(1.8)

In other words, \( \pi \) is a continuous map between topological spaces such that every fiber of \( \pi \) is a vector space, up to a quotient by a finite group, and the vector space operations are continuous. In this case,

\[ \mathcal{V}_{1,k}[C, u] = \pi^{-1}(C, u) = H^0(C; u^* \mathcal{L})/\text{Aut}(C, u). \]

Furthermore, the space \( \mathcal{M}_{1,k}(\mathbb{P}^n, d) \) is stratified by smooth orbifolds, and the restriction of \( \mathcal{V}_{1,k} \) to every stratum of \( \mathcal{M}_{1,k}(\mathbb{P}^n, d) \) is a smooth vector bundle. We will show that the cone (1.8) admits a continuous multisection \( \varphi \) such that

1. \( \varphi |_{\mathcal{M}_{1,k}(\mathbb{P}^n, d)} \) is smooth and transverse to the zero set in \( \mathcal{V}_{1,k}[\mathcal{M}_{1,k}(\mathbb{P}^n, d)] \), and
2. the intersection of \( \varphi^{-1}(0) \) with a boundary stratum of \( \mathcal{M}_{1,k}(\mathbb{P}^n, d) \) is a smooth suborbifold of the stratum of real dimension of at most \( 2(d(n+1-a)+k) - 2 \).

These two properties, along with the structure of the space \( \mathcal{M}_{1,k}(\mathbb{P}^n, d) \), imply that \( \varphi^{-1}(0) \) determines an element of \( H_{2d(n+1-a)+2k}(\mathcal{M}_{1,k}(\mathbb{P}^n, d); \mathbb{Q}) \). We will also show that for any two continuous sections \( \varphi_0 \) and \( \varphi_1 \) of (1.8) satisfying (V1) and (V2), there exists a continuous homotopy

\[ \Phi : [0, 1] \times \mathcal{M}_{1,k}(\mathbb{P}^n, d) \rightarrow \mathcal{V}_{1,k} \]

such that \( \Phi|_{\{t\} \times \mathcal{M}_{1,k}(\mathbb{P}^n, d)} = \varphi_t \) for \( t = 0, 1 \),

1. \( \Phi|_{[0, 1] \times \mathcal{M}_{1,k}(\mathbb{P}^n, d)} \) is smooth and transverse to the zero set in \([0, 1] \times \mathcal{V}_{1,k}[\mathcal{M}_{1,k}(\mathbb{P}^n, d)], \) and
2. the intersection of \( \Phi^{-1}(0) \) with a stratum of \([0, 1] \times \mathcal{M}_{1,k}(\mathbb{P}^n, d) \) is a smooth suborbifold of the stratum of real dimension of at most \( 2(d(n+1-a)+k) - 1 \).

The existence of such a homotopy implies that

\[ [\varphi_0^{-1}(0)] = [\varphi_1^{-1}(0)] \in H_{2d(n+1-a)+k}(\mathcal{M}_{1,k}(\mathbb{P}^n, d); \mathbb{Q}). \]

We call this homology class the Poincare dual of the euler class of the cone (1.8) and of the sheaf (1.5).

The key fact we use in constructing a section \( \varphi \) of (1.8) satisfying (V1) and (V2) is Proposition 3.3. This proposition implies in particular that on a neighborhood of each boundary stratum of \( \mathcal{M}_{1,k}(\mathbb{P}^n, d) \) the cone \( \mathcal{V}_{1,k} \) contains a complex vector bundle of a rank sufficiently high to insure that a generic multisection \( \varphi \) of this bundle satisfies (V2).

Any homology class \( X \in H_{2da}(\mathcal{M}_{1,k}(\mathbb{P}^n, d); \mathbb{Q}) \) can be represented by a pseudocycle

\[ f_X : M_X \rightarrow \mathcal{M}_{1,k}(\mathbb{P}^n, d). \]

Here \( M_X \) is a compact topological space which is stratified by smooth orbifolds, such that the main stratum \( M_X^0 \) of \( M_X \) is an oriented orbifold of real dimension \( 2da \), while the complement of \( M_X^0 \) in \( M_X \) is a union of orbifolds of real dimension of at most \( 2da - 2 \), and \( f_X \) is a continuous map such
that the restriction of $f_X$ to each stratum of $M_X$ is smooth. In particular, every stratum of $M_X$ is mapped into a stratum of $\mathfrak{M}_{1,k}^0(\mathbb{P}^n,d)$; see Chapter 7 of [MS] for a discussion of pseudocycles in the basic manifold case. If $\varphi$ is a section of $\mathfrak{M}_1^0$ satisfying (V1) and (V2), we can also require that
\[(\varphi X) f_X(M_X) \cap \varphi^{-1}(0) \subset \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d), f_X^{-1}(\varphi^{-1}(0)) \subset M_X^0;\]
\[(\varphi X) f_X|_{\tilde{M}_X^0} \text{ intersects } \varphi^{-1}(0) \text{ transversally in } \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d).\]

These assumptions imply that $\varphi^{-1}(0) \cap f_X(M_X^0)$ is a compact oriented zero-dimensional suborbifold of $\mathfrak{M}_{1,k}^0(\mathbb{P}^n,d)$. We then set
\[\langle e(\pi_{1,k}^d, \text{ev}_{1,k}^d, Z), X \rangle = \pm |\varphi^{-1}(0) \cap f_X(M_X^0)|, \tag{1.9}\]
where $\pm |Z|$ denotes the cardinality of a compact oriented zero-dimensional orbifold $Z$, i.e. the number of elements in the finite set $Z$ counted with the appropriate multiplicities.

If $f_{X,0}: M_{X,0} \rightarrow \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d)$ and $f_{X,1}: M_{X,1} \rightarrow \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d)$ are two pseudocycles satisfying (\(\varphi X1\)) and (\(\varphi X2\)), we can choose a pseudocycle equivalence
\[F: \tilde{M} \rightarrow \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d)\]
between $f_{X,0}$ and $f_{X,1}$ such that
\[(\varphi X1') \ F(\tilde{M}) \cap \varphi^{-1}(0) \subset \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d), F^{-1}(\varphi^{-1}(0)) \subset \tilde{M}^0;\]
\[(\varphi X2') \ F|_{\tilde{M}^0} \text{ intersects } \varphi^{-1}(0) \text{ transversally in } \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d).\]

These two assumptions imply that $\varphi^{-1}(0) \cap F(\tilde{M}^0)$ is a compact oriented one-dimensional suborbifold of $\mathfrak{M}_{1,k}^0(\mathbb{P}^n,d)$ and
\[\partial(\varphi^{-1}(0) \cap F(\tilde{M}^0)) = \varphi^{-1}(0) \cap f_{X,1}(M_X^0,0) - \varphi^{-1}(0) \cap f_{X,0}(M_X^0,0)\]
\[\implies \pm|\varphi^{-1}(0) \cap f_{X,0}(M_X^0,0)| = \pm|\varphi^{-1}(0) \cap f_{X,1}(M_X^0,1)|.\]

Thus, the number in (1.9) is independent of the choice of pseudocycle representative $f_X$ for $X$ satisfying (\(\varphi X1\)) and (\(\varphi X2\)).

Similarly, if $\varphi_0$ and $\varphi_1$ are two multisections satisfying (V1) and (V2), let $\Phi$ be a homotopy between $\varphi_0$ and $\varphi_1$ satisfying (V1') and (V2'). We can then choose a pseudocycle representative
\[f_X: M_X \rightarrow \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d)\]
for $X$ such that
\[(\Phi X1) f_X(M_X) \cap \Phi^{-1}(0) \subset \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d), f_X^{-1}(\Phi^{-1}(0)) \subset M_X^0;\]
\[(\Phi X2) f_X|_{\tilde{M}_X^0} \text{ intersects } \Phi^{-1}(0) \text{ transversally in } \mathfrak{M}_{1,k}^0(\mathbb{P}^n,d),\]
and $f_X$ satisfies (\(\varphi X2\)) with $\varphi = \varphi_0$ and $\varphi = \varphi_1$. These assumptions imply that $\Phi^{-1}(0) \cap f_X(M_X^0)$ is a compact oriented one-dimensional suborbifold of $\mathfrak{M}_{1,k}^0(\mathbb{P}^n,d)$ and
\[\partial(\Phi^{-1}(0) \cap f_X(M_X^0)) = \varphi_1^{-1}(0) \cap f_X(M_X^0) - \varphi_0^{-1}(0) \cap f_X(M_X^0)\]
\[\implies \pm|\varphi_0^{-1}(0) \cap f_X(M_X^0)| = \pm|\varphi_1^{-1}(0) \cap f_X(M_X^0)|.\]

Thus, the number in (1.9) is independent of the choice of section $\varphi$ satisfying (V1) and (V2). We conclude that (1.9) defines an element of
\[\text{Hom}( H_{2da}(\mathfrak{M}_{1,k}^0(\mathbb{P}^n,d);\mathbb{Q}); \mathbb{Q}) = H^{2da}(\mathfrak{M}_{1,k}^0(\mathbb{P}^n,d);\mathbb{Q}).\]
We call this cohomology class the euler class of the cone \([1.8]\) and of the sheaf \([1.5]\).

We note that the existence of a continuous section \(\varphi\) of \([1.5]\) satisfying \((V1)\) and \((V2)\) implies that the euler class of every desingularization of \([1.8]\), or of \([1.5]\), is the same, in the appropriate sense, for the following reason. If

\[
\begin{array}{ccc}
\hat{\mathcal{V}}^d_{1,k} & \xrightarrow{\hat{\pi}_*} & \mathcal{V}^d_{1,k} \\
\xrightarrow{\tilde{\pi}} & & \xrightarrow{\tilde{\pi}} \\
\tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d) & & \tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)
\end{array}
\tag{1.10}
\]

is a desingularization of the cone \([1.8]\), or of the sheaf \([1.5]\), the section \(\varphi\) induces a section \(\tilde{\varphi}\) of the vector bundle

\[
\hat{\mathcal{V}}^d_{1,k} \rightarrow \tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)
\]

such that \(\tilde{\varphi} = \varphi\) on \(\mathcal{M}^0_{1,k}(\mathbb{P}^n, d)\) and \(\tilde{\varphi}^{-1}(0) - \mathcal{M}^0_{1,k}(\mathbb{P}^n, d)\) is a finite union of smooth orbifolds of real dimension of at most \(2(d(n+1-a)+k) - 2\). Suppose \(X \in H_{2da}(\tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d); \mathbb{Q})\) is represented by a pseudocycle

\[
f_X: M_X \rightarrow \tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d),
\]

and

\[
\psi_X \equiv \text{PD}_{\tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)} X \in H^{2(d(n+1-a)+k)}(\tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d); \mathbb{Q})
\]

\[
= \text{Hom}(H_{2(d(n+1-a)+k)}(\tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d); \mathbb{Q}); \mathbb{Q})
\]

is the Poincaré dual of \(X\), i.e. the element constructed by intersecting \(2(d(n+1-a)+k)\)-pseudocycles with \(f_X(M_X)\). The Poincaré dual of the cohomology class \(\tilde{\pi}_*\psi_X\) in \(\tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)\) can then be represented by a pseudocycle

\[
f_{\tilde{X}}: M_{\tilde{X}} \rightarrow \tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d) \quad \text{s.t.}
\]

\[
M_{\tilde{X}} \subset M_X, \quad f_{\tilde{X}}(M_{\tilde{X}} - M^0_X) \subset \tilde{\pi}^{-1}(f_X(M_X - M^0_X)),
\]

and

\[
f_X|_{M_{\tilde{X}}} = f_{\tilde{X}}|_{M_{\tilde{X}}}: M_0 = \tilde{M}_0 \rightarrow \tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d) \subset \tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d), \tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d).
\]

Our assumptions on \(\varphi\) and \(f_X\) then imply that all intersections of \(f_{\tilde{X}}(M_{\tilde{X}})\) with \(\tilde{\varphi}^{-1}(0)\) are contained in \(f_{\tilde{X}}(M^0_X) \cap \tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)\), are transverse, and correspond to the intersections of \(f_X(M_X)\) with \(\varphi^{-1}(0)\). Thus,

\[
(\tilde{\pi}^*\psi_X \cdot e(\hat{\mathcal{V}}^d_{1,k}), \tilde{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d)) = \pm |\tilde{\varphi}^{-1}(0) \cap f_{\tilde{X}}(M_{\tilde{X}})|
\]

\[
= \pm |\varphi^{-1}(0) \cap f_X(M_X)|.
\tag{1.11}
\]

In particular, the left-hand side of \((1.11)\) depends only on the homology class \(X\) used in constructing the cohomology class \(\psi_X\) and is independent of the desingularization \((1.10)\).
The above argument also shows that if the cone \( \mathcal{L} \) admits a multisection \( \varphi \) satisfying (V1) and (V2) and admits a desingularization as in \( \mathcal{L} \), then the number

\[
\langle e(V^d_{1,k}), X \rangle \equiv \langle \tilde{\pi}^*\psi_X \cdot e(V^d_{1,k}), [\mathcal{M}_{1,1}^0(\mathbb{P}^n, d)] \rangle
\]

is well-defined for every homology class \( X \) on \( \mathcal{M}_{1,1}^0(\mathbb{P}^n, d) \). Thus, the euler class \( e(V^d_{1,k}) \) of the cone \( \mathcal{L} \) and the sheaf \( \mathcal{L} \) is also well-defined. In particular, the existence of homotopies satisfying (V1') and (V2') is not absolutely necessary for showing that the euler class of \( \mathcal{L} \) is well-defined.

### 1.3 Main Result

While the standard complex structure \( J_0 \) on \( \mathbb{P}^n \) is ideal for many purposes, such as computing obstruction bundles in the Gromov-Witten theory and applying the localization theorems of [AB] and [GP], it is sometimes more convenient to work with an almost complex structure on \( X \) consisting of stable maps with smooth domains. The spaces \( \mathcal{X}_{g,k}(\mathbb{P}^n, d) \) are topologized using \( L^p \)-convergence on compact subsets of smooth points of the domain and certain convergence requirements near the nodes; see Section 3 in [LT] for more details. Here and throughout the rest of the paper, \( p \) denotes a real number greater than two. The spaces \( \mathcal{X}_{g,k}(\mathbb{P}^n, d) \) are stratified by the smooth infinite-dimensional orbifolds \( \mathcal{X}_T(\mathbb{P}^n) \) of stable maps from domains of the same geometric type and with the same degree distribution between the components. The closure of the main stratum, \( \mathcal{X}_{g,k}^0(\mathbb{P}^n, d) \), is \( \mathcal{X}_{g,k}(\mathbb{P}^n, d) \).

Using modified Sobolev norms, \( \mathcal{L} \) also defines a cone \( \Gamma_{g,k}(T\mathbb{P}^n, d) \rightarrow \mathcal{X}_{g,k}(\mathbb{P}^n, d) \) such that the fiber of \( \Gamma_{g,k}(T\mathbb{P}^n, d) \) over a point \( [b] = [\Sigma, j; u] \) in \( \mathcal{X}_{g,k}(\mathbb{P}^n, d) \) is the Banach space

\[
\Gamma_{g,k}(T\mathbb{P}^n, d)\big|_b = \Gamma(b; T\mathbb{P}^n)/\text{Aut}(b), \quad \text{where} \quad \Gamma(b; T\mathbb{P}^n) = L^p_1(\Sigma; u^*T\mathbb{P}^n).
\]

The topology on \( \Gamma_{g,k}(T\mathbb{P}^n, d) \) is defined similarly to the convergence topology on \( \mathcal{X}_{g,k}(\mathbb{P}^n, d) \). If \( \mathcal{L} \) is the line bundle \( \gamma^*\mathcal{O} \rightarrow \mathbb{P}^n \), let \( \Gamma_{g,k}(\mathcal{L}, d) \rightarrow \mathcal{X}_{g,k}(\mathbb{P}^n, d) \) be the cone such that the fiber of \( \Gamma_{g,k}(\mathcal{L}, d) \) over \( [b] = [\Sigma, j; u] \) in \( \mathcal{X}_{g,k}(\mathbb{P}^n, d) \) is the Banach space

\[
\Gamma_{g,k}(\mathcal{L}, d)\big|_b = \Gamma(b; \mathcal{L})/\text{Aut}(b), \quad \text{where} \quad \Gamma(b; \mathcal{L}) = L^p_1(\Sigma; u^*\mathcal{L}),
\]

and the topology on \( \Gamma_{g,k}(\mathcal{L}, d) \) is defined analogously to the topology on \( \Gamma_{g,k}(\mathbb{P}^n, d) \).

Let \( \nabla \) denote the hermitian connection in the line bundle \( \mathcal{L} \rightarrow \mathbb{P}^n \) induced from the standard connection on the tautological line bundle over \( \mathbb{P}^n \). If \( (\Sigma, j) \) is a Riemann surface and \( u: \Sigma \rightarrow \mathbb{P}^n \) is a smooth map, let

\[
\nabla^u: \Gamma(\Sigma; u^*\mathcal{L}) \rightarrow \Gamma(\Sigma; T^*\Sigma \otimes u^*\mathcal{L})
\]

be the pull-back of \( \nabla \) by \( u \). If \( b = (\Sigma, j; u) \), we define the corresponding \( \bar{\partial} \)-operator by

\[
\bar{\partial}_{\nabla,b}: \Gamma(\Sigma; u^*\mathcal{L}) \rightarrow \Gamma(\Sigma; \Lambda^0_{1,1} T^*\Sigma \otimes u^*\mathcal{L}), \quad \bar{\partial}_{\nabla,b} \xi = \frac{1}{2}(\nabla^u \xi + i \nabla^u \xi \circ j), \tag{1.12}
\]
where $i$ is the complex multiplication in the bundle $u^*L$ and

$$A_{i,j}^{0,1} T^* \Sigma \otimes u^* L = \{ \eta \in \Hom(T\Sigma, u^* L) : \eta \circ j = -i\eta \}.$$ 

The kernel of $\partial_{\Sigma, b}$ is necessarily a finite-dimensional complex vector space. If $u : \Sigma \to \mathbb{P}^n$ is a $(J_0, j)$-holomorphic map, then

$$\ker \partial_{\Sigma, b} = H^0((\Sigma, j); u^* L)$$

is the space of holomorphic sections of the line bundle $u^* L \to (\Sigma, j)$. Let

$$\mathcal{V}_{g,k}^d = \{ [b, \xi] \in \Gamma_{g,k}(\mathcal{L}, d) : [b] \in \mathcal{X}_{g,k}(\mathbb{P}^n, d), \xi \in \ker \partial_{\Sigma, b} \subset \Gamma_{g,k}(b; \mathcal{L}) \} \subset \Gamma_{g,k}(\mathcal{L}, d).$$

The cone $\mathcal{V}_{g,k}^d \to \mathcal{X}_{g,k}(\mathbb{P}^n, d)$ inherits its topology from $\Gamma_{g,k}(\mathcal{L}, d)$.

If $J$ is an almost complex structure on $\mathbb{P}^n$, let $\overline{\mathcal{M}}_{g,k}(\mathbb{P}^n, d; J)$ denote the moduli spaces of stable $J$-holomorphic degree-$d$ maps from genus-$g$ Riemann surfaces with $k$ marked points to $\mathbb{P}^n$. Let

$$\overline{\mathcal{M}}_{0, g,k}^0(\mathbb{P}^n, d; J) = \{ [\mathcal{C}, u] \in \overline{\mathcal{M}}_{g,k}(\mathbb{P}^n, d; J) : C \text{ is smooth} \}.$$

We denote by $\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J)$ the closed subset of $\overline{\mathcal{M}}_{1, k}(\mathbb{P}^n, d; J)$ containing $\overline{\mathcal{M}}_{0, g,k}^0(\mathbb{P}^n, d; J)$ defined in $[Z5]$. If $J$ is sufficiently close to $J_0$, $\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J)$ is the closure of $\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J)$ in $\overline{\mathcal{M}}_{1, k}(\mathbb{P}^n, d; J)$.

We describe the structure of $\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J)$ in this case in Lemma 2.3 below. Finally, let $\bar{\mathbb{Z}}^+$ denote the set of nonnegative integers.

**Theorem 1.2** If $n, d, a \in \mathbb{Z}^+$ and $k \in \bar{\mathbb{Z}}^+$, there exists $\delta_n(d, a) \in \mathbb{R}^+$ with the following property. If $J$ is an almost complex structure on $\mathbb{P}^n$ such that $\|J - J_0\|_{C^1} < \delta_n(d, a)$, the moduli space $\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J)$ carries a fundamental class

$$[\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J)] \in H_{2(d(n+1)+k)}(\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J); \mathbb{Q}).$$

Furthermore, the cone $\mathcal{V}_{1, k}^d \to \mathcal{X}_{1, k}(\mathbb{P}^n, d)$ corresponding to the line bundle $L = \gamma^* \mathcal{O} \to \mathbb{P}^n$ determines a homology class and a cohomology class on $\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J)$:

$$\text{PD}_{\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J)}(e(V_{1, k}^d)) \in H_{2(d(n+1)+k)}(\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J); \mathbb{Q})$$

and

$$e(V_{1, k}^d) \in H^{2da}(\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J); \mathbb{Q}).$$

Finally, if $\mathcal{W} \to \mathcal{X}_{1, k}(\mathbb{P}^n, d)$ is a vector orbi-bundle such that the restriction of $\mathcal{W}$ to each stratum $\mathcal{X}_\tau(\mathbb{P}^n)$ of $\mathcal{X}_{1, k}(\mathbb{P}^n)$ is smooth, then

$$\langle e(\mathcal{W}) \cdot e(V_{1, k}^d), [\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d; J)] \rangle = \langle e(\mathcal{W}) \cdot e(V_{1, k}^d), [\overline{\mathcal{M}}_{1, k}^0(\mathbb{P}^n, d)] \rangle. \quad (1.13)$$

**Remark:** This theorem remains valid if the compact Kähler manifold $(\mathbb{P}^n, \omega_0, J_0)$, positive integer $d$, the holomorphic line bundle $L = \gamma^* \mathcal{O} \to \mathbb{P}^n$, and the connection $\nabla$ in $L$ are replaced by a compact almost Kähler manifold $(X, \omega, J_0)$, a homology class $A \in H_2(X; \mathbb{Z})$, and a split positive
vector bundle with connection $(\mathcal{L}, \nabla) \to X$ such that the almost complex structure $J_0$ on $X$ is genus-one $A$-regular in the sense of Definition ?? in \([Z5]\).

It is well-known that the standard complex structure is genus-one $d\ell$-regular, where $\ell \in H_2(\mathbb{P}^n; \mathbb{Z})$ is the homology class of a line. Thus, if $J$ is an almost complex structure on $\mathbb{P}^n$ which is close to $J_0$, Corollary ?? and Theorem ?? in \([Z5]\) imply that $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J)$ is the closure of $\mathcal{M}_{1,k}(\mathbb{P}^n, d; J)$ in $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J)$ and is contained in a small neighborhood of $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d)$ in $\mathcal{X}_{1,k}(\mathbb{P}^n, d)$. In addition, the stratification structure of the moduli space $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J)$ is the same as that of $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d)$; see Lemmas 2.3 and 2.4 below. Thus, $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J)$ carries a rational fundamental class; see the paragraph at the end of Subsection ?? in \([Z5]\).

The two remaining claims of Theorem 1.2 are the subject of Proposition 3.1. The restriction of the cone $\mathcal{V}_{1,k}$ to $\mathcal{M}_{1,k}(\mathbb{P}^n, d; J)$ is a complex vector bundle of the expected rank, i.e. $da$. The cone $\mathcal{V}_{1,k}$ admits a multisection $\varphi$ that satisfies the analogues of (V1) and (V2) for $\mathcal{M}_{1,k}(\mathbb{P}^n, d; J)$. As in the previous subsection, the zero set of this section determines a homology class in real codimension $2da$ and a cohomology class of real dimension $2da$. On the other hand, if $J_0 = (J_t)_{t \in [0,1]}$ is a smooth family of almost complex structures on $\mathbb{P}^n$ such that $J_t$ is close to $J_0$ for all $t \in [0,1]$, the moduli space

$$\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J) = \bigcup_{t \in [0,1]} \overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J_t)$$

is compact, by Theorem ?? in \([Z5]\). We can construct a multisection $\Phi$ of the cone $\mathcal{V}_{1,k}$ over $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J)$ with properties analogous to (V1) and (V2). If $\mathcal{W} \to \mathcal{X}_{1,k}(\mathbb{P}^n, d)$ is a complex vector bundle of rank $d(n+1-a)+k$ as in Theorem 1.2 we can choose a section $F$ of $\mathcal{W}$ over $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J)$ such that $\Phi^{-1}(0) \cap F^{-1}(0)$ is a compact oriented one-dimensional suborbifold of $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, A; J)$ and

$$\partial(\Phi^{-1}(0) \cap F^{-1}(0)) = \Phi^{-1}(0) \cap F^{-1}(0) \cap \overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J_1) - \Phi^{-1}(0) \cap F^{-1}(0) \cap \mathcal{M}_{1,k}(\mathbb{P}^n, d; J_0)$$

$$\implies \pm |\Phi^{-1}(0) \cap F^{-1}(0) \cap \overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J_1)| = \pm |\Phi^{-1}(0) \cap F^{-1}(0) \cap \mathcal{M}_{1,k}(\mathbb{P}^n, d; J)|.$$

This equality implies (1.13).

In the next section we first summarize our detailed notation for stable maps and for related objects. We then describe the structure of the moduli space $\overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J)$. In Subsection 3.1 we deduce Proposition 3.1 from the descriptions of the local structure of the cone $\mathcal{V}_{1,k}$ that appear in Subsections 3.2 and 3.3. The key results of this paper, Proposition 3.3 and Lemma 3.4, are proved in Section 4 by extending the gluing construction of Section ?? in \([Z5]\) from stable $J$-holomorphic maps to holomorphic bundle sections.

## 2 Preliminaries

### 2.1 Notation: Genus-Zero Maps

We now summarize our notation for bubble maps from genus-zero Riemann surfaces with at least one marked point, for the spaces of such bubble maps that form the standard stratifications of
moduli spaces of stable maps, and for important vector bundles over them. For more details on the notation described below, the reader is referred to Subsections ?? and ?? in [Z5].

In general, moduli spaces of stable maps can be stratified by the dual graph. However, in the present situation, it is more convenient to make use of **linearly ordered sets**:

**Definition 2.1**  
(1) A finite nonempty partially ordered set $I$ is a linearly ordered set if for all $i_1, i_2, h \in I$ such that $i_1, i_2 < h$, either $i_1 \leq i_2$ or $i_2 \leq i_1$.

(2) A linearly ordered set $I$ is a rooted tree if $I$ has a unique minimal element, i.e. there exists $0 \in I$ such that $0 \leq i$ for all $i \in I$.

If $I$ is a linearly ordered set, let $\hat{I}$ be the subset of the non-minimal elements of $I$. For every $h \in \hat{I}$, denote by $\iota_h \in I$ the largest element of $I$ which is smaller than $h$, i.e. $\iota_h = \max \{i \in I : i < h\}$.

If $M$ is a finite set, a **genus-zero $\mathbb{P}^n$-valued bubble map with $M$-marked points** is a tuple

$$b = (M, I; x, (j, y), u),$$

where $I$ is a rooted tree, and

$$x: \hat{I} \to \mathbb{C} = S^2 - \{\infty\}, \quad j: M \to I, \quad y: M \to \mathbb{C}, \quad u: I \to C^\infty(S^2; \mathbb{P}^n)$$

are maps such that $u_b(\infty) = u_{\iota_h}(x_h)$ for all $h \in \hat{I}$. Such a tuple describes a Riemann surface $\Sigma_b$ and a continuous map $u_b: \Sigma_b \to \mathbb{P}^n$. The irreducible components $\Sigma_{b,i}$ of $\Sigma_b$ are indexed by the set $I$ and $u_b|_{\Sigma_{b,i}} = u_i$. The Riemann surface $\Sigma_b$ carries a special marked point, i.e. the point

$$y_0(b) = (0, \infty) \in \Sigma_{b,0}$$

if $0$ is the minimal element of $I$, and $|M|$ other marked points, $(j_l, y_l) \in \Sigma_{b,j_l}$ with $l \in M$.

The general structure of genus-zero bubble maps is described by tuples

$$\mathcal{T} = (M, I; j, d),$$

where $d: I \to \mathbb{Z}$ is a map specifying the degree of $u_b|_{\Sigma_{b,i}}$, if $b$ is a bubble map of type $\mathcal{T}$. We call such tuples **bubble types**. Let $\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J)$ denote the subset of $\overline{\mathcal{M}}_{0,\{0\} \sqcup M}(\mathbb{P}^n, d; J)$ consisting of stable maps $[C; u]$ such that

$$[C; u] = [(\Sigma_b, (0, \infty), (j_l, y_l))_{l \in M}; u_b],$$

for some bubble map $b$ of type $\mathcal{T}$. We recall that

$$\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J) = \mathcal{U}_\mathcal{T}^0(\mathbb{P}^n; J)/\text{Aut}(\mathcal{T}) \times (S^1)^I,$$

for a certain submanifold $\mathcal{U}_\mathcal{T}^0(\mathbb{P}^n; J)$ of the space $\mathcal{H}_\mathcal{T}(\mathbb{P}^n; J)$ of $J$-holomorphic maps into $\mathbb{P}^n$ of type $\mathcal{T}$, not of equivalence classes of such maps; see Subsection 2.5 in [Z3]. For $l \in \{0\} \sqcup M$, let

$$\text{ev}_l: \mathcal{U}_\mathcal{T}(\mathbb{P}^n; J), \mathcal{U}_\mathcal{T}^0(\mathbb{P}^n; J) \to \mathbb{P}^n$$

be the evaluation maps corresponding to the marked point $y_l$. 

2.2 Notation: Genus-One Maps

We next set up analogous notation for maps from genus-one Riemann surfaces. In this case, we also need to specify the structure of the principal component. Thus, we index the strata of the moduli space $\mathcal{M}_{1,0}(\mathbb{P}^n, d; J)$ by enhanced linearly ordered sets:

**Definition 2.2** An enhanced linearly ordered set is a pair $(I, \aleph)$, where $I$ is a linearly ordered set, $\aleph$ is a subset of $I_0 \times I_0$, and $I_0$ is the subset of minimal elements of $I$, such that if $|I_0| > 1$, $\aleph = \{(i_1, i_2), (i_2, i_3), \ldots, (i_{n-1}, i_n), (i_n, i_1)\}$ for some bijection $i: \{1, \ldots, n\} \rightarrow I_0$.

An enhanced linearly ordered set can be represented by an oriented connected graph. In Figure 1, the dots denote the elements of $I$. The arrows outside the loop, if there are any, specify the partial ordering of the linearly ordered set $I$. In fact, every directed edge outside of the loop connects a non-minimal element $h$ of $I$ with $i_h$. Inside of the loop, there is a directed edge from $i_1$ to $i_2$ if and only if $(i_1, i_2) \in \aleph$.

The subset $\aleph$ of $I_0 \times I_0$ will be used to describe the structure of the principal curve of the domain of stable maps in a stratum of the moduli space $\mathcal{M}_{1,0}(\mathbb{P}^n, d; J)$. If $\aleph = \emptyset$, and thus $|I_0| = 1$, the corresponding principal curve $\Sigma_{\aleph}$ is a smooth torus, with some complex structure. If $\aleph \neq \emptyset$, the principal components form a circle of spheres:

$$\Sigma_{\aleph} = \left( \bigsqcup_{i \in I_0} \{i\} \times S^2 \right) / \sim,$$

where $(i_1, \infty) \sim (i_2, 0)$ if $(i_1, i_2) \in \aleph$.

A genus-one $\mathbb{P}^n$-valued bubble map with $M$-marked points is a tuple

$$b = (M, I, \aleph; S, x, (j, y), u),$$

where $S$ is a smooth Riemann surface of genus one if $\aleph = \emptyset$ and the circle of spheres $\Sigma_{\aleph}$ otherwise. The objects $x, j, y, u,$ and $(\Sigma, u_0)$ are as in the genus-zero case above, except the sphere $\Sigma_{b,0}$ is replaced by the genus-one curve $\Sigma_{b,\aleph} \equiv S$. Furthermore, if $\aleph = \emptyset$, and thus $I_0 = \{0\}$ is a single-element set, $u_0 \in C^\infty(S; \mathbb{P}^n)$. In the genus-one case, the general structure of bubble maps is encoded by the tuples of the form

$$\mathcal{T} = (M, I, \aleph; j, \mathcal{J}).$$
Similarly to the genus-zero case, we denote by $U_T(P^n; J)$ the subset of $\mathcal{M}_{1, \infty}$ consisting of stable maps $[C; u]$ such that $[C; u] = \left(\Sigma_b, (j_l, y_l)_{l \in \mathcal{M}}; u_0\right)$ for some bubble map $b$ of type $T$ as above.

If $T = (M, I, \aleph; j, d)$ is a bubble type as above, let

$$I_0 = \{h \in \hat{I} : \iota_h \in I_0\}, \quad M_0 = \{l \in M : j_l \in I_0\}, \quad \text{and} \quad T_0 = (M_0 \sqcup I_0, I_0, \aleph; J_{M_0 \sqcup I_0} |_{I_1}, d |_{I_0}),$$

where $I_0$ is the subset of minimal elements of $I$. For each $h \in I_1$, we put $I_h = \{i \in I : h \leq i\}$, $M_h = \{l \in M : j_l \in I_h\}$, and $T_h = (M_h, I_h; j_{M_h}, d |_{I_h})$.

The tuple $T_0$ describes bubble maps from genus-one Riemann surfaces with the marked points indexed by the set $M_0 \sqcup I_1$. By definition, we have a natural isomorphism

$$U_T(P^n; J) \approx \left(\{ (b_0, (b_h)_{h \in I_1}) \in U_{T_0}(P^n; J) \times \prod_{h \in I_1} U_{T_h}(P^n; J) : \right. \left. ev_0(b_h) = ev_{i_h}(b_0) \quad \forall h \in I_1\} \right) / \text{Aut}^*(T), \quad (2.2)$$

where the group $\text{Aut}^*(T)$ is defined by

$$\text{Aut}^*(T) = \text{Aut}(T) / \{ g \in \text{Aut}(T) : g \cdot h = h \quad \forall h \in I_1\}.$$

This decomposition is illustrated in Figure 2. In this figure, we represent an entire stratum of bubble maps by the domain of the stable maps in that stratum. We shade the components of the domain on which every (or any) stable map in $U_T(P^n; J)$ is nonconstant. The right-hand side of Figure 2 represents the subset of the cartesian product of the three spaces of bubble maps, corresponding to the three drawings, on which the appropriate evaluation maps agree pairwise, as indicated by the dotted lines and defined in (2.2).

Let $\mathcal{F}T \rightarrow U_T(P^n; J)$ be the bundle of gluing parameters, or of smoothings at the nodes. This orbi-bundle has the form

$$\mathcal{F}T = \left( \bigoplus_{(h, i) \in \aleph} L_{h, 0} \otimes L_{i, 1} \oplus \bigoplus_{h \in \hat{I}} L_{h, 0} \otimes L_{h, 1} \right) / \text{Aut}(T),$$

Figure 2: An Example of the Decomposition (2.2)
for certain line orbi-bundles $L_{h,0}$ and $L_{h,1}$. Similarly to the genus-zero case,

$$\mathcal{U}_T(\mathbb{P}^n; J) = \mathcal{U}_T(\mathbb{P}^n; J)/\text{Aut}(\mathcal{T}) \times (S^1)^I, \quad \text{where}$$

$$\mathcal{U}_T(\mathbb{P}^n; J) = \{(b_h)_{h \in I_1} \in \mathcal{U}_{T_0}(\mathbb{P}^n; J) \times \prod_{h \in I_1} \mathcal{U}_{T_h}(\mathbb{P}^n; J) : \text{ev}_0(b_h) = \text{ev}_{i_h}(b_0) \ \forall h \in I_1\}. \quad (2.3)$$

The line bundles $L_{h,0}$ and $L_{h,1}$ arise from the quotient $\mathcal{U}_T(\mathbb{P}^n; J)$ and

$$\mathcal{F}_T = \tilde{\mathcal{F}}_T / \text{Aut}(\mathcal{T}) \times (S^1)^I, \quad \text{where} \quad \tilde{\mathcal{F}}_T = \tilde{\mathcal{F}}_{\mathbb{R}} T \oplus \bigoplus_{h \in I} \tilde{\mathcal{F}}_h T,$$

$$\tilde{\mathcal{F}}_{\mathbb{R}} T \rightarrow \mathcal{U}_T(\mathbb{P}^n; J)$$

is the bundle of smoothings for the $|\mathbb{R}|$ nodes of the circle of spheres $\Sigma_{\mathbb{R}}$ and

$$\tilde{\mathcal{F}}_h T \rightarrow \mathcal{U}_T(\mathbb{P}^n; J)$$

is the line bundle of smoothings of the attaching node of the bubble indexed by $h$. We denote by $\mathcal{F}_T^0$ and $\tilde{\mathcal{F}}_T^0$ the subsets of $\mathcal{F}_T$ and $\tilde{\mathcal{F}}_T$, respectively, consisting of the elements with all components nonzero.

Suppose $\mathcal{T} = (M, I, \mathbb{R}; j, d)$ is a bubble type such that $d_i = 0$ for all $i \in I_0$, i.e. every element in $\mathcal{U}_T(\mathbb{P}^n; J)$ is constant on the principal components. In this case, the decomposition $\mathcal{U}_T(\mathbb{P}^n; J)$ is equivalent to

$$\mathcal{U}_T(\mathbb{P}^n; J) \approx \left( \mathcal{U}_{T_0}(pt) \times \mathcal{U}_T(\mathbb{P}^n; J) \right)/\text{Aut}^*(\mathcal{T}) \subset \left( \mathcal{M}_{1,k_0} \times \mathcal{U}_T(\mathbb{P}^n; J) \right)/\text{Aut}^*(\mathcal{T}), \quad (2.5)$$

where $k_0 = |I_1| + |M_0|$, $\mathcal{M}_{1,k_0}$ is the moduli space of genus-one curves with $k_0$ marked points, and

$$\mathcal{U}_T(\mathbb{P}^n; J) = \{(b_h)_{h \in I_1} \in \prod_{h \in I_1} \mathcal{U}_{T_h}(\mathbb{P}^n; J) : \text{ev}_0(b_{h_1}) = \text{ev}_{i_1}(b_{h_2}) \ \forall h_1, h_2 \in I_1\}. \quad (2.6)$$

Similarly, $\mathcal{U}_T^0(\mathbb{P}^n; J)$ and $\mathcal{U}_T^0(\mathbb{P}^n; J)$ are equivalent to

$$\mathcal{U}_T^0(\mathbb{P}^n; J) \approx \mathcal{U}_{T_0}(pt) \times \mathcal{U}_T^0(\mathbb{P}^n; J) \subset \mathcal{M}_{1,k_0} \times \mathcal{U}_T^0(\mathbb{P}^n; J), \quad \text{where}$$

$$\mathcal{U}_T^0(\mathbb{P}^n; J) = \{(b_h)_{h \in I_1} \in \prod_{h \in I_1} \mathcal{U}_{T_h}^0(\mathbb{P}^n; J) : \text{ev}_0(b_{h_1}) = \text{ev}_{i_1}(b_{h_2}) \ \forall h_1, h_2 \in I_1\}. \quad (2.7)$$

We denote by

$$\pi_P : \mathcal{U}_T(\mathbb{P}^n; J), \mathcal{U}_T^0(\mathbb{P}^n; J) \longrightarrow \mathcal{M}_{1,k_0}$$

the projections onto the first component in the decompositions $\mathcal{U}_T(\mathbb{P}^n; J)$ and $\mathcal{U}_T^0(\mathbb{P}^n; J)$. Let

$$\text{ev}_P : \mathcal{U}_T(\mathbb{P}^n; J), \mathcal{U}_T^0(\mathbb{P}^n; J) \longrightarrow \mathbb{P}^n$$

be the maps sending every element $b = (\Sigma_b, u_b)$ of $\mathcal{U}_T(\mathbb{P}^n; J)$ and $\mathcal{U}_T^0(\mathbb{P}^n; J)$ to the image of the principal component $\Sigma_{b,P}$ of $\Sigma_b$ under $u_b$.

If $\mathcal{T} = (M, I, \mathbb{R}; j, d)$ is as in the previous paragraph, let

$$\chi(\mathcal{T}) = \{i \in \hat{I} : d_i \neq 0; \ d_h = 0 \ \forall h < i\}.$$
The subset $\chi(\mathcal{T})$ of $I$ indexes the first-level effective bubbles of every element of $\mathcal{U}^{(0)}_T(\mathbb{P}^n; J)$. For each element $b=(\Sigma_b, u_b)$ of $\mathcal{U}^{(0)}_T(\mathbb{P}^n; J)$ and $i \in \chi(\mathcal{T})$, let

$$D_i b = \left\{ du_b|_{\Sigma_{b,i}} \right\}_\infty e_\infty \in T_{ev\rho(p)}^* \mathbb{P}^n, \quad \text{where} \quad e_\infty = (1, 0, 0) \in T_\infty S^2.$$  

In geometric terms, the complex span of $D_i b$ in $T_{ev\rho(p)}^* \mathbb{P}^n$ is the line tangent to the rational component $\Sigma_{b,i}$ at the node of $\Sigma_{b,i}$ closest to a principal component of $\Sigma_b$. If the branch corresponding to $\Sigma_{b,i}$ has a cusp at this node, then $D_i b = 0$. Let

$$\tilde{T} = \bigoplus_{i \in \chi(\mathcal{T})} \tilde{\mathcal{F}}_{h(i)} \mathcal{T} \to \mathcal{U}^{(0)}_T(\mathbb{P}^n; J), \quad \text{where} \quad h(i) = \min \{ h \in \tilde{I} : h \leq i \} \in I_1.$$  

We define the bundle map

$$\rho: \tilde{T} \to \tilde{T}$$  

over $\mathcal{U}^{(0)}_T(\mathbb{P}^n; J)$ by

$$\rho(v) = (b; (\rho_i(v))_{i \in \chi(\mathcal{T})}) \in \tilde{T}, \quad \text{where} \quad \rho_i(v) = \prod_{h \in I, h \leq i} v_h \in \tilde{\mathcal{F}}_{h(i)} \mathcal{T}, \quad \text{if}$$  

$$v = (b; v_{\tilde{N}}, (v_h)_{h \in i}), \quad b \in \mathcal{U}^{(0)}_T(\mathbb{P}^n; J), \quad v_{\tilde{N}} \in \tilde{\mathcal{F}}_{h} \mathcal{T}|_{b}, \quad v_h \in \tilde{\mathcal{F}}_{h} \mathcal{T}|_{b} \approx \begin{cases} T_{x_h(b)} \Sigma_{h,P}, & \text{if} h \in I_1, \\ \mathbb{C}, & \text{if} h \in \tilde{I} - I_1, \end{cases}$$  

where $x_h(b) \in \Sigma_{h,P}$ is the node joining the bubble $\Sigma_{h,h}$ of $b$ to the principal component $\Sigma_{h,P}$ of $\Sigma_b$. This definition is illustrated in Figure 8 on page 19.

Let $E \to \mathcal{M}_{1,k_0}$ be the Hodge line bundle, i.e. the line bundle of holomorphic differentials. For each $i \in \chi(\mathcal{T})$, we define the bundle map

$$D_{h,i}: \tilde{T}_{h(i)} \mathcal{T} \to \pi_p^* E^* \otimes \text{ev}_p^* T_{\mathbb{P}^n}$$  

over $\mathcal{U}^{(0)}_T(\mathbb{P}^n; J)$ by

$$\left\{ D_{h,i}(b, w_i) \right\}(\psi) = \psi_{x_{h(i)}(b)(w_i)}(w_i) \cdot J D_i b \in T_{ev\rho(p)}^* \mathbb{P}^n \quad \text{if} \quad b \in \mathcal{U}^{(0)}_T(\mathbb{P}^n; J), \quad w_i \in \tilde{\mathcal{F}}_{h(i)} \mathcal{T}|_{b}, \quad \psi \in \pi_p^* E|_{b}.$$  

Let

$$D_T: \tilde{T} \to \pi_p^* E^* \otimes \text{ev}_p^* T_{\mathbb{P}^n}$$  

be the bundle map over $\mathcal{U}^{(0)}_T(\mathbb{P}^n; J)$ given by

$$D_T(b, (w_i)_{i \in \chi(\mathcal{T})}) = \sum_{i \in \chi(\mathcal{T})} D_{h,i}(b, w_i).$$  

It descends to a bundle map

$$D_T: \tilde{T} \to \pi_p^* E^* \otimes \text{ev}_p^* T_{\mathbb{P}^n}/\text{Aut}^*(\mathcal{T})$$  

over $\mathcal{U}_T(\mathbb{P}^n; J)$, for a bundle $\tilde{T} \to \mathcal{U}_T(\mathbb{P}^n; J)$.  

15
Let $\tilde{V}^d_{1,k} \longrightarrow \mathcal{U}^0_T(\mathbb{P}^n; J)$ be the cone such that the fiber of $\tilde{V}^d_{1,k}$ over a point $b = (\Sigma_b, u_b)$ in $\mathcal{U}^0_T(\mathbb{P}^n; J)$ is $\ker \bar{\partial}_{\mathcal{V}, b}$; see Subsection 1.3. If $b = (\Sigma_b, u_b) \in \mathcal{U}^0_T(\mathbb{P}^n; J)$, $\xi = (\xi_k)_{k \in I} \in \Gamma(b; \mathcal{L})$, and $i \in \chi(T)$, let

$$\mathcal{D}_{T,i}\xi = \nabla_{e_{\infty}}\xi_i \in \mathcal{L}_{e_{\infty}}(\mathcal{V}_{\mathcal{W}})$$

The element $\nabla_{e_{\infty}}\xi_i$ of $\mathcal{L}_{e_{\infty}}(\mathcal{W})$ is the covariant derivative of the section $\xi_i \in \Gamma(\Sigma_b; \mathcal{W})$ at $\infty \in \Sigma_{b,i}$ with respect to the connection $\nabla$ in $\mathcal{W}$ along $e_{\infty}$; see Subsection 1.3. Note that if $\xi \in \ker \bar{\partial}_{\mathcal{V}, b}$, then

$$\nabla_{e_{\infty}}\xi_i = c \cdot \mathcal{D}_{T,i}\xi \quad \forall c \in \mathbb{C}. \quad (2.8)$$

We next define the bundle map

$$\mathcal{D}_{T}: \mathcal{F}^T \longrightarrow \text{Hom}(\tilde{V}^d_{1,k}, \pi_p^*\mathcal{E}^* \otimes \text{ev}_p^*\mathcal{L})$$

over $\mathcal{U}^0_T(\mathbb{P}^n; J)$ by

$$\{ \mathcal{D}_{T}(b, \xi \otimes w) \}(\psi) = \sum_{i \in \chi(T)} \psi_{\chi(i)}(w_i) \cdot \mathcal{D}_{T,i}\xi \in \mathcal{L}_{e_{\infty}}(b) \quad \text{if} \quad \xi \in \tilde{V}^d_{1,k}|_b \subset \Gamma(b; \mathcal{L}), \quad w = (w_i)_{i \in \chi(T)} \in \mathcal{F}^T|_b, \quad \text{and} \quad \psi \in \mathcal{E}_{p,e_{\infty}}(b).$$

By $(2.8)$, the bundle map $\mathcal{D}_{T}$ induces a linear bundle map

$$\mathcal{F}^T \longrightarrow \text{Hom}(\varphi^d_{1,k}, \pi_p^*\mathcal{E}^* \otimes \text{ev}_p^*\mathcal{L}/\text{Aut}^*(T))$$

over $\mathcal{U}_T(\mathbb{P}^n; J)$.

Finally, all vector orbi-bundles we encounter will be assumed to be normed. Some will come with natural norms; for others, we implicitly choose a norm once and for all. If $\pi_\mathcal{F}: \mathcal{F} \longrightarrow \mathcal{X}$ is a normed vector bundle and $\delta: \mathcal{X} \longrightarrow \mathbb{R}$ is any function, possibly constant, let

$$\mathcal{F}_\delta = \{ v \in \mathcal{F}; |v| < \delta(\pi_\mathcal{F}(v)) \}.$$

If $\Omega$ is any subset of $\mathcal{F}$, we take $\Omega_\delta = \Omega \cap \mathcal{F}_\delta$.

### 2.3 The Structure of the Moduli Space $\mathcal{M}^0_{1,k}(\mathbb{P}^n, d; J)$

We now describe the structure of the moduli space $\mathcal{M}^0_{1,k}(\mathbb{P}^n, d; J)$ near each of its strata. The first part of Theorem 1.2 follows from the first claims of Lemmas 2.3 and 2.4 below. If $k \in \mathbb{Z}$, we denote by $[k]$ the set of positive integers that do not exceed $k$.

**Lemma 2.3** If $n$, $k$, and $d$ are as in Theorem 1.2 there exists $\delta_n(d) \in \mathbb{R}^+$ with the following property. If $J$ is an almost complex structure on $\mathbb{P}^n$, such that $\| J - J_0 \|_{C^1} < \delta_n(d)$, and

$$\mathcal{T} = ([k], I, \mathbb{N}; j, d)$$

is a bubble type such that $\sum_{i \in I} d_i = d$ and $d_i \neq 0$ for some minimal element $i$ of $I$, then $\mathcal{U}_T(\mathbb{P}^n; J)$ is a smooth orbifold,

$$\dim \mathcal{U}_T(\mathbb{P}^n; J) = 2(d(n+1) + k - |\mathbb{N}| - |I|), \quad \text{and} \quad \mathcal{U}_T(\mathbb{P}^n; J) \subset \mathcal{M}^0_{1,k}(\mathbb{P}^n, d; J).$$
Furthermore, there exist $\delta \in C(\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J); \mathbb{R}^+)\), an open neighborhood $U_\mathcal{T}$ of $\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J)$ in $\mathcal{X}_{1,k}(\mathbb{P}^n, d)$, and an orientation-preserving homeomorphism

$$\phi_\mathcal{T} : \mathcal{FT}_\delta \to \mathcal{M}_{1,k}^0(\mathbb{P}^n, d; J) \cap U_\mathcal{T},$$

which restricts to a diffeomorphism $\mathcal{FT}_\delta^0 \to \mathcal{M}_{1,k}^0(\mathbb{P}^n, d; J) \cap U_\mathcal{T}$.

By Theorem ?? in [Z5], there exists $\delta_n(d) \in \mathbb{R}^+$ with the following property. If $J$ is an almost complex structure on $\mathbb{P}^n$, such that $\|J - J_0\|_{C^1} < \delta_n(d)$, $\Sigma$ is a genus-one prestable Riemann surface, and $u : \Sigma \to \mathbb{P}^n$ is a $J$-holomorphic map, such that the restriction of $u$ to the principal component(s) of $\Sigma$ is not constant, then the linearization $D_{J,u}$ of the $\bar{\partial}_J$-operator at $u$ is surjective. From standard arguments, such as in Chapter 3 of [MS], it then follows that the stratum $\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J)$ of $\mathcal{M}_{1,k}^0(\mathbb{P}^n, d; J)$, where $\mathcal{T}$ is a bubble type as in Lemma [2.3] is a smooth orbifold of the expected dimension. Furthermore, there is no obstruction to gluing the maps in $\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J)$, in the sense of the following paragraph.

We fix a metric $g_n$ and a connection $\nabla^n$ on $(T\mathbb{P}^n, J)$. For each sufficiently small element $v = (b, \nu)$ of $\mathcal{FT}_\delta^0$ and $b = (\Sigma_b, u_b) \in U_\mathcal{T}(\mathbb{P}^n; J)$, let

$$q_v : \Sigma_v \to \Sigma_b$$

be the basic gluing map constructed in Subsection ?? of [Z5]. In this case, $\Sigma_v$ is a smooth elliptic curve. Let

$$b(v) = (\Sigma_v, j_v, u_v), \quad \text{where} \quad u_v = u_b \circ q_v,$$

be the corresponding approximately $J$-holomorphic stable map. By the previous paragraph, the linearization $D_{J,b}$ of the $\bar{\partial}_J$-operator at $b$ is surjective. Thus, if $v$ is sufficiently small, the linearization

$$D_{J,v} : \Gamma(v) \equiv \mathbb{L}^p(\Sigma_v, u_v^*T\mathbb{P}^n) \to \Gamma^{0,1}(v) \equiv L^p(\Sigma_v, \Lambda^{0,1}_J T^*\Sigma_v \otimes u_v^*T\mathbb{P}^n),$$

of the $\bar{\partial}_J$-operator at $b(v)$, defined via $\nabla^n$, is also surjective. In particular, we can obtain an orthogonal decomposition

$$\Gamma(v) = \Gamma_-(v) \oplus \Gamma_+(v) \quad (2.9)$$

such that the linear operator $D_{J,v} : \Gamma_+ (v) \to \Gamma^{0,1}(v)$ is an isomorphism, while $\Gamma_-(v)$ is close to ker $D_{J,b}$. The $L^2$-inner product on $\Gamma(v)$ used in the orthogonal decomposition is defined via the metric $g_n$ on $\mathbb{P}^n$ and the metric $g_v$ on $\Sigma_v$ induced by the pregluing construction. The Banach spaces $\Gamma(v)$ and $\Gamma^{0,1}(v)$ carry the norms $\| \cdot \|_{v,p,1}$ and $\| \cdot \|_{v,p}$, respectively, which are also defined by the pregluing construction. These norms are equivalent to the ones used in Section 3 of [LT]. In particular, the norms of $D_{J,v}$ and of the inverse of its restriction to $\Gamma_+(v)$ have fiberwise uniform upper bounds, i.e. dependent only on $|b| \in \mathcal{U}_\mathcal{T}(\mathbb{P}^n; J)$, and not on $v \in \mathcal{FT}_\delta^0$. It then follows that the equation

$$\bar{\partial}_J \exp_{u_v} \zeta = 0 \iff [\Sigma_v, \exp_{u_v} \zeta] \in \mathcal{M}_{1,k}^0(\mathbb{P}^n, d; J)$$

has a unique small solution $\zeta_v \in \Gamma_+(v)$. Furthermore,

$$\|\zeta_v\|_{v,p,1} \leq C(b)|v|^{1/p},$$

for some $C \in C(\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J); \mathbb{R}^+)$. The diffeomorphism on $\mathcal{FT}_\delta^0$ is given by

$$\phi_\mathcal{T} : \mathcal{FT}_\delta^0 \to \mathcal{M}_{1,k}^0(\mathbb{P}^n, d; J), \quad \phi_\mathcal{T}([v]) = [\tilde{b}(v)], \quad \text{where} \quad \tilde{b}(v) = (\Sigma_v, \exp_{u_v} \zeta_v);$$
see the paragraph following Lemma 2.3 in [Z5]. This map extends to a homeomorphism

\[ \phi_T : \mathcal{F}\mathcal{T}_\delta \longrightarrow \overline{\mathcal{M}}_{1,k}^0(\mathbb{P}^n, d; J), \]

as can be seen by an argument similar to Subsections 3.9 and 4.1 in [Z3].

We denote by \( \overline{\mathcal{M}}_{1,k}^{(0)}(\mathbb{P}^n, d; J) \) the union of the strata \( \mathcal{U}_T(\mathbb{P}^n; J) \) with \( T \) as in Lemma 2.3. In other words,

\[ \overline{\mathcal{M}}_{1,k}^{(0)}(\mathbb{P}^n, d; J) = \{ [C, u] \in \overline{\mathcal{M}}_{1,k}(\mathbb{P}^n, d; J) : u|_{C_P} \text{ is not constant} \}, \]

where \( C_P \) is the principal component of the domain \( C \) of \( u \).

**Lemma 2.4** If \( n, k, \) and \( d \) are as in Theorem 1.2, there exists \( \delta_n(d) \in \mathbb{R}^+ \) with the following property. If \( J \) is an almost complex structure on \( \mathbb{P}^n \), such that \( \| J - J_0 \|_{C^1} < \delta_n(d), \) and

\[ T = ([k], I, \mathcal{R}; j, d) \]

is a bubble type such that \( \sum_{i \in I} d_i = d \) and \( d_i = 0 \) for all minimal elements \( i \) of \( I \), then \( \mathcal{U}_T(\mathbb{P}^n; J) \) is a smooth orbifold,

\[ \dim \mathcal{U}_T(\mathbb{P}^n; J) = 2(d(n+1)+k-|\mathcal{N}| - |J| + n), \quad \text{and} \quad \overline{\mathcal{M}}_{1,k}^{(0)}(\mathbb{P}^n, d; J) \cap \mathcal{U}_T(\mathbb{P}^n; J) = \mathcal{U}_{T,1}(\mathbb{P}^n; J), \]

where

\[ \mathcal{U}_{T,1}(\mathbb{P}^n; J) = \{ [b] \in \mathcal{U}_T(\mathbb{P}^n; J) : \dim_{\mathcal{C}} \text{Span}_{(\mathcal{C}, I)} \{ \mathcal{D}_i b : i \in \chi(T) \} < |\chi(T)| \}. \]

The space \( \mathcal{U}_{T,1}(\mathbb{P}^n; J) \) admits a stratification by smooth suborbifolds of \( \mathcal{U}_T(\mathbb{P}^n; J) \):

\[ \mathcal{U}_{T,1}(\mathbb{P}^n; J) = \bigcup_{m=|\chi(T)|}^{m=\max(|\chi(T)|-n,1)} \mathcal{U}_{T,1}^m(\mathbb{P}^n; J) \quad \text{such that} \]

\[ \dim \mathcal{U}_{T,1}^m(\mathbb{P}^n; J) = 2(d(n+1)+k-|\mathcal{N}| - |J| + n + (|\chi(T)|-n-m)m) \]

\[ \leq \dim \overline{\mathcal{M}}_{1,k}^{(0)}(\mathbb{P}^n, d; J) - 2. \]

Furthermore, the space

\[ \mathcal{F}^1\mathcal{T}^0 \equiv \{ [b, v] \in \mathcal{F}\mathcal{T}^0 : \mathcal{D}_T(\rho(v)) = 0 \} \]

is a smooth oriented suborbifold of \( \mathcal{F}\mathcal{T} \). Finally, there exist \( \delta \in C(\mathcal{U}_T(\mathbb{P}^n; J); \mathbb{R}^+) \), an open neighborhood \( U_T \) of \( \mathcal{U}_T(\mathbb{P}^n; J) \) in \( \mathcal{X}_{1,k}(\mathbb{P}^n, d) \), and an orientation-preserving diffeomorphism

\[ \phi_T : \mathcal{F}^1\mathcal{T}^0 \longrightarrow \overline{\mathcal{M}}_{1,k}^{(0)}(\mathbb{P}^n, d; J) \cap U_T, \]

which extends to a homeomorphism

\[ \phi_T : \mathcal{F}^1\mathcal{T}_\delta \longrightarrow \overline{\mathcal{M}}_{1,k}^{(0)}(\mathbb{P}^n, d; J) \cap U_T, \]

where \( \mathcal{F}^1\mathcal{T} \) is the closure of \( \mathcal{F}^1\mathcal{T}^0 \) in \( \mathcal{F}\mathcal{T} \).

We now clarify the statement of Lemma 2.4 and illustrate it using Figure 31. As before, the shaded discs represent the components of the domain on which every stable map \([b]\) in \( \mathcal{U}_T(\mathbb{P}^n; J) \) is non-constant. The element \([\Sigma_b, u_b]\) of \( \mathcal{U}_T(\mathbb{P}^n; J) \) is in the stable-map closure of \( \overline{\mathcal{M}}_{1,k}^{(0)}(\mathbb{P}^n, d; J) \) if and only if the branches of \( u_b(\Sigma_b) \) corresponding to the attaching nodes of the first-level effective bubbles of
The last statement of Lemma 2.4 identifies a normal neighborhood of \( b \) the map sending each bubble map \((\Sigma, U)\). In order to show that the space of \( \Sigma_b \) is smooth, but the dimension of the span of the three lines tangent to these branches is less than three.

The last statement of Lemma 2.4 identifies a normal neighborhood of \( \mathcal{U}(\mathbb{P}^n; J) \) in \( \mathfrak{M}^0_{1,k}(\mathbb{P}^n, d; J) \) with a small neighborhood of \( \mathcal{U}(\mathbb{P}^n; J) \) in the bundle \( \mathcal{F}^1\mathcal{T} \) over \( \mathcal{U}(\mathbb{P}^n; J) \). Each fiber of the projection map \( \mathcal{F}^1\mathcal{T} \rightarrow \mathcal{U}(\mathbb{P}^n; J) \) is an algebraic variety. See Figure 3 for an example.

The first three claims of Lemma 2.4 follow immediately from Theorems 1 and 2 in [75] and the decomposition (2.2). The last two statements of Lemma 2.4 are a special case of the last two statements of the latter theorem.

If \( \mathcal{T} \) is a bubble type as in Lemma 2.3 and \( m \) is a positive integer, let

\[
\mathcal{U}_{\mathcal{T},1}^m(\mathbb{P}^n; J) = \{ [b] \in \mathcal{U}(\mathbb{P}^n; J): \dim \mathfrak{C} \mathcal{S}_{\chi(T),J} \{ D_i b : i \in \chi(T) \} = |\chi(T)| - m \} \subset \mathcal{U}(\mathbb{P}^n; J).
\]

By definition, the subspaces \( \mathcal{U}_{\mathcal{T},1}^m(\mathbb{P}^n; J) \) of \( \mathcal{U}(\mathbb{P}^n; J) \) partition \( \mathcal{U}(\mathbb{P}^n; J) \). On the other hand,

\[
\mathcal{U}_{\mathcal{T},1}^m(\mathbb{P}^n; J) \neq \emptyset \quad \Rightarrow \quad \max (|\chi(T)| - n, 1) \leq m \leq |\chi(T)|.
\]

In order to show that the space \( \mathcal{U}_{\mathcal{T},1}^m(\mathbb{P}^n; J) \) is a smooth suborbifold of \( \mathcal{U}(\mathbb{P}^n; J) \) of the claimed dimension, below we describe \( \mathcal{U}_{\mathcal{T},1}^m(\mathbb{P}^n; J) \) in a different way.

For each \( i \in \hat{I} \), let

\[
M_i = \{ j \in \hat{M} : j_i = i \} \cup \{ h \in \hat{I} : \nu_b = i \}.
\]

We denote by

\[
\pi_i : \mathcal{U}(\mathbb{P}^n; J) \rightarrow \mathfrak{M}_0^0(\mathbb{P}^n, d_i; J)
\]

the map sending each bubble map \((\Sigma_b, u_b)\) to its restriction to the component \( \Sigma_{b,i} \subset \Sigma \). Let

\[
L_0 \rightarrow \mathfrak{M}_0^0(\mathbb{P}^n, d_i; J) \subset \mathfrak{M}^0_{0,\{0\} \cup M_i}(\mathbb{P}^n, d_i; J)
\]

be the universal tangent line bundle for the special point labeled by 0, i.e. \((i, \infty)\) in the notation of Subsection 2.1. We put

\[
\mathcal{F} = \bigoplus_{i \in \chi(T)} \pi_i^* L_0 \rightarrow \mathcal{U}(\mathbb{P}^n; J).
\]
While each line bundle $\pi_i^* L_0$ may not be well-defined, the orbundle $\mathcal{F}$ is always well-defined. We denote by
\[
\pi_m : \text{Gr}_m \mathcal{F} \to \mathcal{U}_\mathcal{T}(\mathbb{P}^n; J) \quad \text{and} \quad \gamma_m \to \text{Gr}_m \mathcal{F}
\]
the Grassmannian bundle of $m$-dimensional linear subspaces and the tautological $m$-plane bundle, respectively. Let
\[
\mathcal{S}_m = \mathcal{D}_m^{-1}(0) \subset \text{Gr}_m \mathcal{F}, \quad \text{where}
\]
\[
\mathcal{D}_m \in \Gamma(\text{Gr}_m \mathcal{F}; \gamma_m \otimes \pi_m^* \text{ev}_p T \mathbb{P}^n), \quad \mathcal{D}_m([v]) = \sum_{i \in \chi(\mathcal{T})} \mathcal{D}_{i,v_i} \in \text{ev}_p T \mathbb{P}^n \quad \text{if} \quad [v] = [(v_i)_{i \in \chi(\mathcal{T})}].
\]

By Theorem 23 in [Z3], the section $\mathcal{D}_m$ is transverse to the zero set if $\delta_n(d)$ is sufficiently small. Thus, $\mathcal{S}_m$ is a smooth suborbifold of $\text{Gr}_m \mathcal{F}$ of dimension
\[
\dim \mathcal{S}_m = \dim \text{Gr}_m \mathcal{F} - 2 \text{rk} \gamma_m \otimes \pi_m^* \text{ev}_p T \mathbb{P}^n
\]
\[
= 2(d(n+1)+k-|\mathcal{S}|+|\mathcal{I}|+n) + 2m(|\chi(\mathcal{T})|-m) - 2\cdot n \cdot m
\]
\[
= 2(d(n+1)+k-|\mathcal{S}|+|\mathcal{I}|+n+m(|\chi(\mathcal{T})|-n-m)).
\]
The image of $\mathcal{S}_m$ under the bundle projection map $\pi_m$ is the union of the spaces $\mathcal{U}_{\mathcal{T},1}^m(\mathbb{P}^n; J)$ with $m' \geq m$. The map $\pi_m|_{\mathcal{S}_m}$ is an immersion at $[v] \in \mathcal{S}_m$ if $\pi_m^{-1}(\pi_m([v])) = [v]$. The latter is the case if and only $\pi_m([v]) \in \mathcal{U}_{\mathcal{T},1}^m(\mathbb{P}^n; J)$. Thus, the subspace $\mathcal{U}_{\mathcal{T},1}^m(\mathbb{P}^n; J)$ is a smooth suborbifold of $\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J)$ of dimension $\dim \mathcal{S}_m$.

3 Proof of Theorem 1.2

3.1 The Global Structure of the Cone $\mathcal{V}_{1,k}^d \longrightarrow \mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J)$

In this section, we prove Proposition 3.1 which contains the last two statements of Theorem 1.2. The key nontrivial ingredient in the proof of Proposition 3.1 is Proposition 3.3 which is proved in Section 4.

**Proposition 3.1** If $n$, $k$, $d$, $a$, $\mathcal{L}$, and $\mathcal{V}_{1,k}^d$ are as in Theorem 1.2, there exists $\delta_n(d,a) \in \mathbb{R}^+$ with the following property. If $J$ is an almost complex structure on $\mathbb{P}^n$, such that $\|J - J_0\|_{C^1} < \delta_n(d,a)$, the requirements of Lemmas [Z3] and [Z4] are satisfied. Furthermore, $\mathcal{V}_{1,k}^d \longrightarrow \mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J)$ is a smooth complex vector orbundle of rank $da$. In addition, there exists a continuous multisection $\varphi : \mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J) \to \mathcal{V}_{1,k}^d$ such that

(V1) $\varphi|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J)}$ is smooth and transverse to the zero set in $\mathcal{V}_{1,k}^d|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J)}$;

(V2) the intersection of $\varphi^{-1}(0)$ with each boundary stratum $\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J)$ and $\mathcal{U}_{\mathcal{T},1}^m(\mathbb{P}^n; J)$ of $\mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J)$ is a smooth suborbifold of the stratum of real dimension of at most $2(d(n+1) + k) - 2$.

If $\varphi_0$ and $\varphi_1$ are two such multisections, there exists a continuous homotopy $\Phi : [0,1] \times \mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J) \to [0,1] \times \mathcal{V}_{1,k}^d$ such that $\Phi|_{[t]} \times \mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J) = \varphi_t$ for $t = 0, 1$, and

(V1') $\Phi|_{[0,1]} \times \mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J)$ is smooth and transverse to the zero set in $[0,1] \times \mathcal{V}_{1,k}^d|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n; d; J)}$.
(\mathcal{V}^2') the intersection of $\Phi^{-1}(0)$ with each boundary stratum $[0,1] \times \mathcal{U}_T(\mathbb{P}^n; J)$ and $(0,1] \times \mathcal{U}_{T,1}^m(\mathbb{P}^n; J)$ of $[0,1] \times \mathcal{M}_1(\mathbb{P}^n, d; J)$ is a smooth orbibundle of the stratum of real dimension of at most $2(d(n+1-a)+k)-1$.

Thus, the cone $\mathcal{V}^d_{1,k}$ determines a homology class and a cohomology class on $\mathcal{M}_1^0(\mathbb{P}^n, d; J)$:

$$
PD_{\mathcal{M}_1^0(\mathbb{P}^n, d; J)}(\phi(V_{1,k})) \in H_2(d(n+1-a)+k)(\mathcal{M}_1^0(\mathbb{P}^n, d; J)) \otimes \mathbb{Q}
$$

$$
and \quad e(V_{1,k}) \in H^2da(\mathcal{M}_1^0(\mathbb{P}^n, d; J)) \otimes \mathbb{Q}.
$$

Finally, if $\mathcal{W} \rightarrow \mathcal{X}_{1,k}(\mathbb{P}^n, d)$ is a vector orbibundle such that the restriction of $\mathcal{W}$ to each stratum $\mathcal{X}_T(\mathbb{P}^n)$ of $\mathcal{X}_{1,k}(\mathbb{P}^n, d)$ is smooth, then

$$
\langle e(\mathcal{W}) \cdot e(V_{1,k}), [\mathcal{M}_1^0(\mathbb{P}^n, d; J)] \rangle = \langle e(\mathcal{W}), e(V_{1,k}) \cdot [\mathcal{M}_1^0(\mathbb{P}^n, d)] \rangle.
$$

The second statement of this proposition is a special case of Lemma 3.2. We use Lemma 3.2 and Proposition 3.3 to construct a multisection $\varphi$ satisfying (\mathcal{V}1) and (\mathcal{V}2), starting from the lowest-dimensional strata of $\mathcal{M}_1^0(\mathbb{P}^n, d; J)$. Suppose $\mathcal{T}$ and $m$ are as in Lemma 2.4 and we have constructed a neighborhood $U$ of

$$
\partial \mathcal{U}_T^m(\mathbb{P}^n; J) \equiv \mathcal{U}_T^m(\mathbb{P}^n; J) - \mathcal{U}_T^m(\mathbb{P}^n; J)
$$

in $\mathcal{M}_1^0(\mathbb{P}^n, d; J)$ and a continuous multisection $\varphi$ of the cone $\mathcal{V}^d_{1,k}$ over $U$ such that for all $\mathcal{T}'$ and $m'$ as in Lemma 2.4 the restriction of $\varphi$ to $\mathcal{U}_T^{m'}(\mathbb{P}^n; J) \cap U$ is a smooth multisection of the vector bundle $\mathcal{V}^{d,m'}_{1,k,T}$ of Proposition 3.3 which is transverse to the zero set in $\mathcal{V}^{d,m'}_{1,k,T}$. We then extend the restriction of $\varphi$ to $\mathcal{U}_T^{m}(\mathbb{P}^n; J) \cap U$ to a smooth section of $\mathcal{V}^{d,m}_{1,k,T}$ over $\mathcal{U}_T^{m}(\mathbb{P}^n; J)$ and to a continuous section $\varphi_{m,T}$ of $\mathcal{V}^{d,m}_{1,k,T}$ over $\mathcal{M}_1^0(\mathbb{P}^n, d; J) \cap \mathcal{U}_T^{m}$, using the bundle isomorphism $\tilde{\alpha}_{1,k,T}$ of Proposition 3.3. By the definition of the bundles $\mathcal{V}_{1,k,T}$ in Subsection 3.3 the restriction of $\varphi_{m,T}$ to each space $\mathcal{U}_T^{m'}(\mathbb{P}^n; J) \cap \mathcal{U}_T^{m}$ is a section of $\mathcal{V}^{d,m'}_{1,k,T}$ for all $\mathcal{T}'$ and $m'$ as in Lemma 2.4. We can also insure that the restriction of $\varphi_{m,T}$ to $\mathcal{U}_T^{m'}(\mathbb{P}^n; J) \cap \mathcal{U}_T^{m}$ is smooth and transverse to the zero set in $\mathcal{V}^{d,m'}_{1,k,T}$. Finally, by using a partition of unity and the newly constructed section $\varphi_{m,T}$, we can extend the section $\varphi$ to a neighborhood of $\mathcal{U}_T^{m}(\mathbb{P}^n; J)$ in $\mathcal{M}_1^0(\mathbb{P}^n, d; J)$, without changing it on $\mathcal{U}_T^{m}(\mathbb{P}^n; J)$ or on a neighborhood of $\partial \mathcal{U}_T^{m}(\mathbb{P}^n; J)$ in $\mathcal{M}_1^0(\mathbb{P}^n, d; J)$. After finitely many steps, we end up with a neighborhood $U$ of

$$
\mathcal{M}_1^0(\mathbb{P}^n, d; J) - \mathcal{M}_1^0(\mathbb{P}^n, d; J)
$$

in $\mathcal{M}_1^0(\mathbb{P}^n, d; J)$ and a continuous multisection $\varphi$ of the cone $\mathcal{V}^d_{1,k}$ over $U$ such that for all $\mathcal{T}'$ and $m'$ as in Lemma 2.4 the restriction of $\varphi$ to $\mathcal{U}_T^{m'}(\mathbb{P}^n; J)$ is a smooth multisection of the vector bundle $\mathcal{V}^{d,m'}_{1,k,T}$ which is transverse to the zero set in $\mathcal{V}^{d,m'}_{1,k,T}$. We then extend $\varphi$ in the same stratum-by-stratum way to a section over all of $\mathcal{M}_1^0(\mathbb{P}^n, d; J)$, using Lemma 3.2. Since the real dimension of
a boundary stratum \( \mathcal{U}_T(\mathbb{P}^n; J) \) of \( \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J) \), with \( T \) as in Lemma 2.3, is at least two less than the dimension of \( \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J) \), the transversality of \( \varphi_{|\mathcal{U}_T(\mathbb{P}^n; J)} \) to the zero set in \( \mathcal{V}^d_{1,k} \) implies \( (V2) \) for this stratum. Similarly, the transversality of \( \varphi_{|\mathcal{U}^m_{T,1}(\mathbb{P}^n; J)} \) to the zero set in \( \mathcal{V}^{d,m}_{1,k} \) and the rank statement of Proposition 3.3 imply \( (V2) \) for each stratum \( \mathcal{U}^m_{T,1}(\mathbb{P}^n; J) \) of \( \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J) \), with \( T \) and \( m \) as in Lemma 2.4. The homotopy statement of Proposition 3.1 is proved by a nearly identical construction.

The second-to-last statement of Proposition 3.1 follows from the preceding claims by the same argument as in Subsection 1.2. The final statement of Proposition 3.1 follows from the proof of the first part of Proposition 3.1 and from the last statement of Theorem ?? in [Z5]. The latter states that there exists \( \delta_n(d) \in \mathbb{R}^+ \) with the following property. If \( J = (J_t)_{t \in [0,1]} \) is a \( C^1 \)-smooth family of almost complex structures on \( \mathbb{P}^n \) such that \( \| J_t - J_0 \|_{C^1} \leq \delta_n(d) \) for all \( t \in [0,1] \), then the compact moduli space

\[
\mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J) \equiv \bigcup_{t \in [0,1]} \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J_t) \subset \mathcal{X}_{1,k}(\mathbb{P}^n, d)
\]

has the general topological structure of a unidimensional variety with boundary. It is stratified by the smooth orbifolds with boundary,

\[
\mathcal{U}_T(\mathbb{P}^n; J) \equiv \bigcup_{t \in [0,1]} \mathcal{U}_T(\mathbb{P}^n; J_t) \quad \text{and} \quad \mathcal{U}^m_{T,1}(\mathbb{P}^n; J) \equiv \bigcup_{t \in [0,1]} \mathcal{U}^m_{T,1}(\mathbb{P}^n; J_t),
\]

each of dimension one greater than the corresponding dimension given by Lemmas 2.3 or 2.4. By the same argument as above, we can construct a multisection \( \Phi \) of the cone \( \mathcal{V}^d_{1,k} \) over \( \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J) \) such that

\[
(V1') \quad \Phi|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J)} \text{ is smooth and transverse to the zero set in } \mathcal{V}^d_{1,k}|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J)};
\]

\[
(V2') \quad \text{the intersection of } \Phi^{-1}(0) \text{ with each boundary stratum } \mathcal{U}_T(\mathbb{P}^n; J) \text{ and } \mathcal{U}^m_{T,1}(\mathbb{P}^n; J)
\]

of \( \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J) \) is a smooth suborbifold of the stratum of real dimension of at most \( 2(d(n+1-a)+k) - 1 \), and the restrictions \( \varphi_0 \equiv \Phi|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J_0)} \) and \( \varphi_1 \equiv \Phi|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J_1)} \) satisfy conditions \( (V1) \) and \( (V2) \). If \( \mathcal{W} \longrightarrow \mathcal{X}_{1,k}(\mathbb{P}^n, d) \) is a complex vector bundle of rank \( d(n+1-a)+k \) as in Proposition 3.1 we can then choose a continuous section \( F \) of \( \mathcal{W} \) over \( \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J) \) such that

\[
(\Phi\mathcal{W}1) \quad \Phi^{-1}(0) \cap F^{-1}(0) \subset \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J);
\]

\[
(\Phi\mathcal{W}2) \quad F|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J)} \text{ is smooth and transverse to the zero set in } \mathcal{W}|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J)};
\]

\[
(\Phi\mathcal{W}3) \quad F^{-1}(0) \text{ intersects } \Phi^{-1}(0) \text{ transversely in } \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J),
\]

\[
(\Phi\mathcal{W}4) \quad f_t^{-1}(0) \text{ intersects } \varphi_t^{-1}(0) \text{ transversely in } \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J_t) \text{ for } t = 0, 1,
\]

where \( f_t \equiv F|_{\mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J_t)} \).

It follows that \( \Phi^{-1}(0) \cap F^{-1}(0) \) is a compact oriented one-dimensional suborbifold of \( \mathfrak{M}_{1,k}^0(\mathbb{P}^n, d; J) \) and

\[
\partial(\Phi^{-1}(0) \cap F^{-1}(0)) = \varphi_1^{-1}(0) \cap f_1^{-1}(0) - \varphi_0^{-1}(0) \cap f_0^{-1}(0)
\]

\[
\implies \quad \pm |\varphi_1^{-1}(0) \cap f_1^{-1}(0)| = \pm |\varphi_0^{-1}(0) \cap f_0^{-1}(0)|.
\]

This equality implies the last claim of Proposition 3.1.
3.2 The Local Structure of the Cone $\mathcal{V}_{i,k}^d \longrightarrow \mathcal{M}_{i,k}^0(\mathbb{P}^n, d; J)$, I

In this subsection, we describe the structure of the cone $\mathcal{V}_{i,k}^d \longrightarrow \mathcal{M}_{i,k}^0(\mathbb{P}^n, d; J)$ over a neighborhood of each stratum $\mathcal{T}(\mathbb{P}^n; J)$ of Lemma 2.3.

Lemma 3.2 If $n, k, d, a, \mathcal{L},$ and $\mathcal{V}_{i,k}^d$ are as in Theorem 1.2, there exists $\delta_n(d) \in \mathbb{R}^+$ with the following property. If $J$ is an almost complex structure on $\mathbb{P}^n$, such that $\|J - J_0\|_{C^1} < \delta_n(d)$, and

$$\mathcal{T} = ([k], I; R; j, d)$$

is a bubble type such that $\sum_{i \in I} d_i = d$ and $d_i \neq 0$ for some minimal element $i$ of $I$, then the requirements of Lemma 2.3 are satisfied. Furthermore, the restriction $\mathcal{V}_{i,k}^d \longrightarrow \mathcal{T}(\mathbb{P}^n; J)$ is a smooth complex vector orbibundle of rank $\text{da}$. Finally, there exists a continuous vector-bundle isomorphism

$$\tilde{\phi}|_{\mathcal{T}^0_{i,k}} : \mathcal{V}_{i,k}^d(\mathbb{P}^n, J) \longrightarrow \mathcal{V}_{i,k}^d(\mathbb{P}^n, d; J)$$

covering the homeomorphism $\phi|_{\mathcal{T}^0_{i,k}}$ of Lemma 2.3, such that $\tilde{\phi}$ is the identity over $\mathcal{T}(\mathbb{P}^n; J)$ and is smooth over $\mathcal{T}^0_{i,k}$.

The restriction $\mathcal{V}_{i,k}^d \longrightarrow \mathcal{T}(\mathbb{P}^n; J)$ is the quotient of the cone $\tilde{\mathcal{V}}_{i,k}^d \longrightarrow \mathcal{T}(\mathbb{P}^n; J)$ by the group $\text{Aut}(\mathcal{T}) \propto (S^1)^I$; see Subsection 2.2 for notation. The fiber of $\tilde{\mathcal{V}}_{i,k}^d$ at a point $b = (\Sigma_b, u_b)$ of $\mathcal{T}(\mathbb{P}^n; J)$ is the Dolbeault cohomology group $H^0(\Sigma_b; u^*_b \mathcal{L})$, for a holomorphic structure in the bundle $u^*_b \mathcal{L}$. Since $d_i \neq 0$ for some minimal element $i \in I$, the degree of the restriction of $u^*_b \mathcal{L}$ to the principal curve of $\Sigma_b$ is positive. Thus, by an argument similar to Subsections 6.2 and 6.3 in [Z2],

$$H^0(\Sigma_b; u^*_b \mathcal{L}) = \{0\} \implies \dim \tilde{\mathcal{V}}_{i,k}^d|_b = \dim H^0(\Sigma_b; u^*_b \mathcal{L}) = \text{ind} \tilde{\mathcal{V}}_{i,k} = \text{da}.$$

Since the holomorphic structure in the line bundles $u^*_b \mathcal{L}$ varies smoothly with $b \in \mathcal{T}(\mathbb{P}^n; J)$, it follows that $\tilde{\mathcal{V}}_{i,k}^d \longrightarrow \mathcal{T}(\mathbb{P}^n; J)$ is a smooth complex vector bundle of rank $\text{da}$ and $\mathcal{V}_{i,k}^d \longrightarrow \mathcal{T}(\mathbb{P}^n; J)$ is a smooth complex vector orbibundle of rank $\text{da}$.

We construct a lift $\tilde{\phi}$ of $\phi$ to the cone $\mathcal{V}_{i,k}^d \longrightarrow \mathcal{T}(\mathbb{P}^n; J)$ as follows. For each sufficiently small element $v = (b, v)$ of $\mathcal{T}^0_{i,k}$, we define the maps

$$R_v : \Gamma(b; \mathcal{L}) \equiv L^1(\Sigma_b; u^*_b \mathcal{L}) \longrightarrow \Gamma(v; \mathcal{L}) \equiv L^1(\Sigma_v; u^*_v \mathcal{L}) \quad \text{by} \quad \{R_v \xi\}(z) = \xi(q_v(z)) \quad \text{if} \quad z \in \Sigma_v,$$

$$\Pi_v : \Gamma(v; \mathcal{L}) \longrightarrow \Gamma(v; \mathcal{L}) \equiv L^1(\Sigma_v; u^*_v \mathcal{L}) \quad \text{by} \quad \{\Pi_v \xi\}(z) = \Pi_{\zeta_v(z)} \xi(z) \quad \text{if} \quad z \in \Sigma_v,$$

where $\Pi_{\zeta_v(z)} \xi(z)$ is the $\nabla$-parallel transport of $\xi(z)$ along the $g_n$-geodesic

$$\gamma_{\zeta_v(z)} : [0, 1] \longrightarrow \mathbb{P}^n, \quad \tau \longrightarrow \exp_{u_v(z)} \tau \zeta_v(z),$$

and $\zeta_v \in \Gamma(v)$ is as in Subsection 2.3. As in Subsection 1.3, we use the $[L^p]$-modified $L^p$- and $L^p-$ Sobolev norms, defined in the present setting as in Subsection 3.3 of [Z3]. By a direct computation, for some $C \in C(\mathcal{T}(\mathbb{P}^n; J); \mathbb{R}^+)$,

$$\|\tilde{\mathcal{V}}_{b, v} R_v \xi\|_{v,p} \leq C(b) v^{1/p} \|\xi\|_{b,p,1} \quad \forall \xi \in \Gamma_b(b; \mathcal{L}) \equiv \ker \tilde{\mathcal{V}}_{b, v} \quad \text{and} \quad (3.1)$$

$$\|\Pi_{b, v} \xi - \tilde{\mathcal{V}}_{b, v} \xi\|_{v,p} \leq C(b) \|\xi\|_{b,p,1} \|\xi\|_{v,p,1} \leq C(b) v^{2/p} \|\xi\|_{b,p,1} \quad \forall \xi \in \Gamma_b(b; \mathcal{L}); \quad (3.2)$$
see the proof of Corollary 2.3 in [Z1] for the first inequality in (3.2). We denote by $\Gamma_-(b; \mathcal{L})$ the image of $\Gamma_-(b; \mathcal{L})$ under the map $R_\nu$ and by $\Gamma_+(v; \mathcal{L})$ its $L^2$-orthogonal complement in $\Gamma(v; \mathcal{L})$. Since the operator
\[
\bar{\partial}_\nu b : \Gamma(b; \mathcal{L}) \longrightarrow \Gamma^{0,1}(b; \mathcal{L}) \equiv L^p(\Sigma b; \Lambda^{0,1}_{\nu b} T^* \Sigma b \otimes u_b^* \mathcal{L})
\]
is surjective for all $b \in \mathcal{U}^0_T(\mathbb{P}^n; J)$, similarly to Subsection 2.3, the operator
\[
\bar{\partial}_\nu b(v) : \Gamma_+(v; \mathcal{L}) \longrightarrow \Gamma^{0,1}(v; \mathcal{L}) \equiv L^p(\Sigma v; \Lambda^{0,1}_{\nu v} T^* \Sigma v \otimes u_v^* \mathcal{L})
\]
is an isomorphism if $v$ is sufficiently small. Its norm and the norm of its inverse depend only on $[b] \in \mathcal{U}_T(\mathbb{P}^n; J)$. Thus, by (3.1) and (3.2), for every $\xi \in \Gamma_-(b; \mathcal{L})$ there exists a unique $\xi_+(v) \in \Gamma_+(v; \mathcal{L})$ such that
\[
\Pi_v^{-1} \circ \bar{\partial}_\nu b(v) \circ \Pi_v(R_v \xi + \xi_+(v)) = 0 \quad \iff \quad \Pi_v(R_v \xi + \xi_+(v)) \in \ker \bar{\partial}_\nu b(v).
\]
Furthermore,
\[
||\xi_+(v)||_{v,p,1} \leq C(b)||v||^{2/p}||\xi||_{b,p,1},
\]
for some $C \in C(\mathcal{U}_T(\mathbb{P}^n; J); \mathbb{R}^+)$. We can thus define a smooth lift $\tilde{\phi}_T$ of the diffeomorphism on $\phi_T|_{\mathcal{F}_T^0}$ by
\[
\tilde{\phi}_T : \pi^*_{\mathcal{F}_T^0}(\mathcal{V}^d_{1,k}|_{\mathcal{U}_T(\mathbb{P}^n; J)}) \longrightarrow \mathcal{V}^d_{1,k}|_{\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d; J) \cap \mathcal{U}_T}, \quad \tilde{\phi}_T([v; \xi]) = [\check{R}_v \xi],
\]
where $\check{R}_v \xi = \Pi_v(R_v \xi + \xi_+(v))$.

This map extends to a continuous bundle homomorphism
\[
\tilde{\phi}_T : \pi^*_{\mathcal{F}_T^0}(\mathcal{V}^d_{1,k}|_{\mathcal{U}_T(\mathbb{P}^n; J)}) \longrightarrow \mathcal{V}^d_{1,k}|_{\overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d; J) \cap \mathcal{U}_T},
\]
as can be seen by an argument similar to Subsections 3.9 and 4.1 in [Z3].

### 3.3 The Local Structure of the Cone $\mathcal{V}^d_{1,k} \longrightarrow \overline{\mathcal{M}}^0_{1,k}(\mathbb{P}^n, d; J)$, II

In this subsection, we state the central results of the paper: Proposition 3.3 and Lemma 3.4. The former is the analogue of Lemma 2.4 for the cone $\mathcal{V}^d_{1,k}$. The latter can be viewed as a condensed version of Proposition 3.3. The proof of these two results takes up the next two subsections.

**Proposition 3.3** If $n$, $k$, $d$, $a$, $\mathcal{L}$, and $\mathcal{V}^d_{1,k}$ are as in Theorem 1.2, there exists $\delta_n(d) \in \mathbb{R}^+$ with the following property. If $J$ is an almost complex structure on $\mathbb{P}^n$ such that $||J - J_0||_{C^1} < \delta_n(d)$, then the requirements of Lemma 2.4 and of Lemma 2.2 are satisfied for all appropriate bubble types. Furthermore, if
\[
\mathcal{T} = ([k], I, \mathcal{K}; j, d)
\]
is a bubble type such that $\sum_{i \in I} d_i = d$ and $d_i = 0$ for all minimal elements $i$ of $I$, then the restriction $\mathcal{V}^d_{1,k} \longrightarrow \mathcal{U}_T(\mathbb{P}^n; J)$ is a smooth complex vector orbibundle of rank $da + 1$. In addition, for every integer
\[
m \in \{ \max(|\chi(\mathcal{T})| - n, 1), |\chi(\mathcal{T})|, \}
\]

there exist a neighborhood $U^m_T$ of $\mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$ in $X_{1,k}(\mathbb{P}^n, d)$ and a topological vector orbundle

$$\mathcal{V}^d_{1,k; T} \longrightarrow \mathcal{M}^0_{1,k}(\mathbb{P}^n, d; J) \cap U^m_T$$

such that $\mathcal{V}^d_{1,k; T} \rightarrow \mathcal{M}^0_{1,k}(\mathbb{P}^n, d; J) \cap U^m_T$ is a smooth vector orbundle,

$$\mathcal{V}^d_{1,k; T} \subset \mathcal{V}^d_{1, k}, \quad \text{and} \quad \text{rk } \mathcal{V}^d_{1,k; T} = da + 1 - m > \frac{1}{2} \dim \mathcal{U}^m_{T;1}(\mathbb{P}^n; J) - (d(n+1-a)+k).$$

There also exists a continuous vector-bundle isomorphism

$$\tilde{\phi}_T : \pi_{F^1 T}^{-1}(\mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J)) \longrightarrow \mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J) \cap U^m_T,$$

covering the homeomorphism $\phi_T$ of Lemma 2.4, such that $\tilde{\phi}_T^m$ is the identity over $\mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$. Finally,

$$\mathcal{U}^m_{T;1}(\mathbb{P}^n; J) \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J) \neq \emptyset \quad \Longrightarrow \quad \mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J) \subset \mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J) \cap U^m_T.$$

The restriction of every element of $\mathcal{V}^d_{1,k} | b$ to the domain of the image of $b$ under the projection onto the first component in the decomposition (2.5) is a constant function. Thus, every element of $\mathcal{V}^d_{1,k} | b$ is determined by its restriction to the domain of the image of $b$ under the projection onto the second component in (2.5). The statement concerning the restriction $\mathcal{V}^d_{1,k} \rightarrow \mathcal{U}^m_T(\mathbb{P}^n; J)$ in Proposition 3.3 now follows by the same argument as for the corresponding statement in Lemma 3.2, but applied to the second component in the decomposition (2.5). The index in this case is $da + 1$.

The bundle $\mathcal{V}^d_{1,k; T} \rightarrow \mathcal{M}^0_{1,k}(\mathbb{P}^n, d; J) \cap U^m_T$ is not unique. However, its restriction to $\mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$ is:

$$\mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J) \equiv \{ \xi \in \mathcal{V}^d_{1,k} | b; b \in \mathcal{U}^m_{T;1}(\mathbb{P}^n; J); \text{if } b_r \in \mathcal{M}^0_{1,k}(\mathbb{P}^n, d; J) \text{ and } \lim_{r \to \infty} b_r = b \in \mathcal{U}^m_{T;1}(\mathbb{P}^n; J), \text{ then } \exists \xi_r \in \mathcal{V}^d_{1,k} | b_r \text{ s.t. } \lim_{r \to \infty} \xi_r = \xi \}.$$

In other words, $\mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$ is the largest subspace of $\mathcal{V}^d_{1,k} | \mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$ with the property that a continuous lift

$$\tilde{\phi}_T : \pi_{\tilde{F}^1 T}^{-1}(\mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J)) \longrightarrow \mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J) \cap U^m_T$$

of $\phi_T$ that restricts to the identity over $\mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$ can possibly exist for a vector-bundle extension for the subspace $\mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$ to a neighborhood of $\mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$ in $\mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$. The next lemma describes the subspace $\mathcal{V}^d_{1,k; T} \cap \mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$ of $\mathcal{V}^d_{1,k} | \mathcal{U}^m_{T;1}(\mathbb{P}^n; J)$ explicitly. Let

$$\tilde{F}^1 T = \{ v \in \tilde{F}^1 T: [v] \in \tilde{F}^1 T \}.$$

**Lemma 3.4** Suppose $n, k, d, a, \mathcal{U}^d_{1,k}, J,$ and $\mathcal{T}$ are as in the first and second sentences of Proposition 3.3. If $b \in \mathcal{U}^d_{T;0}(\mathbb{P}^n; J)$, $\xi \in \mathcal{V}^d_{1,k} | b$, and $v_r \in \tilde{F}^1 T \emptyset$ is a sequence of gluing parameters such that

$$\lim_{r \to \infty} v_r = b \quad \text{and} \quad \lim_{r \to \infty} \left( [\rho_i(v_r)]_{i \in \chi(\mathcal{T})} \right) = [w] \in \mathbb{P}^\mathcal{F} \mathcal{F} \mathcal{T} | b$$

25
then

\[ \exists \{ \xi_r \} \in \mathcal{V}_{1,k}^{r} \phi_T([u,v]) \text{ s.t. } \lim_{r \to \infty} \{ \xi_r \} = \{ \xi \} \quad \implies \quad \mathcal{D}_T(\xi \otimes w) = 0. \]

Therefore,

\[ \mathcal{V}_{1,k,T}^{d,m} \mathcal{U}_T^{m+1}(\mathbb{P}^n; J) = \left\{ \{ \xi \} \in \mathcal{V}_{1,k}^{r} \mid \{ \xi \} \in \mathcal{V}_{1,k}^{r} \mid [b] \in \mathcal{U}_T^{m+1}(\mathbb{P}^n; J); \quad \mathcal{D}_T(\xi \otimes w) = 0 \forall w \in \tilde{\mathcal{S}}^1 \right\}, \tag{3.3} \]

where

\[ \tilde{\mathcal{S}}^1 = \{ w \in \tilde{\mathcal{S}}_T \mid \mathcal{D}_T w = 0 \}. \]

Thus, \( \mathcal{V}_{1,k,T}^{d,m} \mathcal{U}_T^{m+1}(\mathbb{P}^n; J) \) is a smooth complex vector orbibundle of rank \( da+1-m \).

The bundle map \( \mathcal{D}_T \) constructed at the end of Subsection 2.2 depends on the choice of connection in the bundle \( \mathfrak{L} \to \mathbb{P}^n \). It may appear that so do the first two statements of Lemma 3.4. This is however not the case for the following reason. Suppose

\[ b \equiv (\Sigma_b, u_b) \in \mathcal{U}_T^{0}(\mathbb{P}^n; J), \quad \xi \equiv \mathcal{V}_{1,k,b}, \quad v_r \in \mathcal{F}^1 \mathcal{T}^0, \quad \text{and} \quad w \equiv (w_i)_{i \in \chi(T)} \in \tilde{\mathcal{S}}^1 \]

are as in Lemma 3.4. Then, by the definition of \( \tilde{\mathcal{F}}^1 \mathcal{T}^0 \) in Lemma 2.4,

\[ \mathcal{D}_T(b, w) \equiv \sum_{i \in \chi(T)} \psi_{x_{h(i)}(b)}(w_i) \cdot J dw_{b,i}|\infty|e_\infty = 0 \in \mathcal{T} \mathbb{P}^n \quad \forall \psi \in \mathbb{E}_{\mathbb{P}^{n}}(b). \tag{3.4} \]

On the other hand, since the map \( u_b \) is constant on every component \( \Sigma_{b,h} \) of the domain \( \Sigma_b \) of \( b \) with \( h < i \) for some \( i \in \chi(T) \), \( \xi \) is a holomorphic function on \( \Sigma_{b,h} \) and thus must be a constant \( \xi_P \in \mathfrak{L}_{\mathbb{P}^n}(b) \). It follows that

\[ \xi_{i_1}(\infty) = \xi_{i_2}(\infty) = \xi_P \quad \forall i_1, i_2 \in \chi(T). \tag{3.5} \]

Suppose that \( \nabla' \) is a connection in the line bundle \( \mathfrak{L} \to \mathbb{P}^n \) that induces the same \( \bar{\partial} \)-operator in the line bundle \( u_b^* \mathfrak{L} \to \Sigma_b \) as the connection \( \nabla \); see Subsection 1.3. Then, there exists a complex-valued one-form \( \theta \) on \( \mathbb{P}^n \) such that

\[ \nabla_v \zeta - \nabla'_{v'} \zeta = (\theta_v \cdot \zeta)(z) \quad \forall q \in \mathbb{P}^n, \quad v \in T_q \mathbb{P}^n, \quad \zeta \in \Gamma(\mathbb{P}^n; \mathfrak{L}), \quad \text{and} \quad u_b \theta \circ j_b = i \cdot u_b \theta. \tag{3.6} \]

Thus, if \( \mathcal{D}_T \) and \( \mathcal{D}'_T \) are the bundle maps corresponding to the connections \( \nabla \) and \( \nabla' \) as at the end of Subsection 2.2,

\[ \{ \mathcal{D}_T(\xi \otimes w) - \mathcal{D}'_T(\xi \otimes w) \}(\psi) = \sum_{i \in \chi(T)} \psi_{x_{h(i)}(b)}(w_i) \cdot (\theta_{e_{\mathbb{P}^{n}}}(b)(dw_{b,i}|\infty|e_\infty) \cdot \xi_i(\infty) \]

\[ = \theta_{e_{\mathbb{P}^{n}}}(b) \left( \sum_{i \in \chi(T)} \psi_{x_{h(i)}(b)}(w_i) \cdot J \left( dw_{b,i}|\infty|e_\infty \right) \right) \cdot \xi_P = 0. \tag{3.7} \]

The middle equality above follows from (3.3), the second condition in (3.5), and the assumption that \( u_b \) is a \( J \)-holomorphic map. The last equality above is an immediate consequence of (3.4). More generally, the middle equality in (3.7) implies that the expression \( \mathcal{D}_T(\xi \otimes w) \) is intrinsically defined whenever \( w \in \tilde{\mathcal{S}}^1 \).

The second statement of Lemma 3.4 follows immediately from the definition of \( \mathcal{V}_{1,k,T}^{d,m} \mathcal{U}_T^{m+1}(\mathbb{P}^n; J) \), the first statement of Lemma 3.4, and the last statement of Lemma 2.4. For the final statement of Lemma 3.4 let

\[ \hat{\mathcal{U}}_{T}^{m}(\mathbb{P}^n; J) = \{ b \in \mathcal{U}_T^{m}(\mathbb{P}^n; J) \mid [b] \in \mathcal{U}_T^{m+1}(\mathbb{P}^n; J) \}. \]
By the proof of Lemma 2.4, \( \hat{\mathcal{T}} \) is a vector bundle of rank \( m \). On the other hand, by the same argument as in Subsection 6.2 of [Z5], for every \( b \in \mathcal{U}_T^0(\mathbb{P}^n; J) \) and \( i \in \chi(\mathcal{T}) \), the linear map
\[
\{ \xi = (\xi_h)_{h \in I} \mid b : \xi_i(\infty) = 0 \} \rightarrow \mathcal{L}_{ev_P(b)}, \quad \xi \mapsto \nabla_{e_\infty} \xi_i,
\]
is surjective. It follows that the linear bundle map
\[
\hat{\mathcal{V}}_{1,k}^d \rightarrow \text{Hom}(\hat{\mathcal{T}}, \pi_P^* \mathcal{E}^* \otimes ev_P^* \mathcal{L})
\]
over \( \tilde{\mathcal{U}}_{T,1}^m(\mathbb{P}^n; J) \) induced by \( \mathcal{D}_T \) is surjective on every fiber. Thus, its kernel is a smooth vector bundle of rank
\[
\text{rk } \mathcal{V}_{1,k,T}^{d,m} = \text{rk } \mathcal{V}_{1,k}^d - \text{rk } \text{Hom}(\hat{\mathcal{T}}, \pi_P^* \mathcal{E}^* \otimes ev_P^* \mathcal{L}) = da + 1 - m,
\]
as claimed in the last statement of Lemma 3.4.

We prove the remaining claims of Proposition 3.3 and Lemma 3.4 at the end of Section 4, after reviewing the multi-step genus-one gluing construction used in [Z5] and extending it to the cone \( \mathcal{V}_{1,k}^d \).

4 A Gluing Construction

4.1 Smoothing Stable Maps

We begin by reviewing the gluing construction of Section ?? in [Z5]. If \( b = (\Sigma_b, u_b) \) is any genus-one bubble map such that \( u_b|_{\Sigma^0_b} \) is constant, let \( \Sigma^0_b \subset \Sigma_b \) be the maximum connected union of the irreducible components of \( \Sigma_b \) such that \( \Sigma_{b,P} \subset \Sigma^0_b \) and \( u_b|_{\Sigma^0_b} \) is constant. If \( u_b|_{\Sigma^-_{b,P}} \) is not constant, let \( \Sigma^0_b = \emptyset \). We put
\[
\Gamma_B(b) = \{ \zeta \in \Gamma(\Sigma_b; u_b^* T\mathbb{P}^n) : \zeta|_{\Sigma^0_b} = 0 \},
\]
\[
\Gamma_B(b; \mathcal{L}) = \{ \xi \in \Gamma(\Sigma_b; u_b^* \mathcal{L}) : \xi|_{\Sigma^0_b} = 0 \}, \quad \text{and}
\]
\[
\Gamma_B^0(b; \mathcal{L}) = \{ \eta \in \Gamma(\Sigma_b; u^* \Lambda_{U,I}^0 T^* \Sigma_b \otimes u_b^* \mathcal{L}) : \eta|_{\Sigma^0_b} = 0 \}.
\]

Suppose \( \mathcal{T} = ([k], I, \&; j, \mathcal{D}) \) is a bubble type as in Proposition 3.3, i.e. \( d_i = 0 \) for all \( i \in I_0 \), where \( I_0 \subset I \) is the subset of minimal elements. We put
\[
\chi^0(\mathcal{T}) = \{ h \in I : d_i = 0 \; \forall \; i \leq h \}, \quad \chi^0(\mathcal{T}) = \bigcup_{i \in \chi(\mathcal{T})} \{ h \in \hat{I} : h < i \} \subset \chi^0(\mathcal{T}),
\]
\[
\langle \mathcal{T} \rangle = \max \{ \{ h \in \hat{I} : h \leq i \} : i \in \chi(\mathcal{T}) \} \geq 1, \quad \mathcal{I}^0_\mathcal{T} = \chi(\mathcal{T}), \quad \mathcal{I}_\mathcal{T} = \hat{I} - \chi(\mathcal{T}) - \chi^0(\mathcal{T}) - I_1,
\]
where \( I_1 \subset I \) is as in Subsection 2.2. For each \( s \in \{ 0 \} \cup \langle \mathcal{T} \rangle - 1 \), let
\[
\mathcal{I}_s = \{ i \in \chi(\mathcal{T}) \cup \chi^0(\mathcal{T}) : |\{ h \in \hat{I} : h < i \}| = s \}, \quad \mathcal{I}_s^* = \mathcal{I}_s \cup \bigcup_{t=0}^{s-1} (\mathcal{I}_t \cap \chi(\mathcal{T))).
\]
In the case of Figure 8 on page 19

\[ \langle T \rangle = 2, \quad \mathcal{I}_0 = \{ h_1, h_3 \}, \quad \mathcal{I}_1 = \{ h_4, h_5 \}, \quad \mathcal{I}_2 = \{ h_2 \}. \]

In general, the set \( \mathcal{I}_{\langle T \rangle} \) could be empty, but the sets \( \mathcal{I}_s \) with \( s < \langle T \rangle \) never are.

If \( b \) is a bubble map of type \( T \) as in Subsection 2.2 and \( s \in [\langle T \rangle] \), we put

\[ \Sigma_b^{(s)} = \bigcup_{i \in \chi^0(\langle T \rangle) - \chi^+(\langle T \rangle)} \bigcup_{h \in I_{s-1}^i \cap h} \Sigma_{b,i} \subset \Sigma_b. \]

If \( h \in I_{s-1}^i \), let

\[ \Sigma_b^h = \bigcup_{h \leq i} \Sigma_{b,i} \subset \Sigma_b, \quad \chi_h(\langle T \rangle) = \{ i \in \chi(\langle T \rangle) : h \leq i \}, \quad \tilde{\delta}_h \langle T \rangle = \mathcal{U}_T^0(X; J) \times C^{\chi_h(\langle T \rangle)}. \]

If in addition \( v = (b, v) \in \tilde{F} \langle T \rangle \), we put

\[ \rho_{s,h}(v) = (b, (\rho_{h,i}(v))_{i \in \chi_h(\langle T \rangle)}) \in \tilde{\delta}_h \langle T \rangle, \quad \text{where} \quad \rho_{h,i}(v) = \prod_{h < h' \leq i} v_{h'} \in \mathbb{C}; \]

\[ I_{s-1}^h(v) = \{ h \in I_{s-1}^i : \rho_{s,h}(v) = 0 \}; \]

see Subsection 2.2 for notation.

If \( v = (b, v) \in \tilde{F} \langle T \rangle \), let

\[ v_0 = (b, v, (v_h)_{h \in I_1^i}) \quad \text{if} \quad v = (b, v, (v_h)_{h \in I_1^i}). \]

Let \( v_{\langle 0 \rangle} = v \) and \( v_{\langle \langle T \rangle + 1 \rangle} = b \). If \( s \in [\langle T \rangle] \), we put

\[ v_s = (b, (v_h)_{h \in I_s}) \quad \text{and} \quad v_{\langle s \rangle} = (b, (v_h)_{h \in I_s, t \geq s}). \]

The component \( v_{\langle T \rangle} \) of \( v \) consists of smoothings at the nodes of \( \Sigma_b \) that do not lie on the principal component \( \Sigma_{b,P} \) of \( \Sigma_b \) and do not lie between \( \Sigma_{b,P} \) and the bubble components indexed by the set \( \chi(\langle T \rangle) \). In Section ?? of [Z3], these nodes are smoothed out at the first step of the gluing construction, as specified by \( v_{\langle T \rangle} \). After that, the nodes indexed by the set \( I_{\langle T \rangle - 1} \) are smoothed out, and so on. At the last step, the nodes that lie on the principle component are smoothed according to \( v_0 \), provided \( v \in \tilde{F}^1 \langle T \rangle^0 \) is sufficiently small.

If \( v \in \tilde{F}^1 \langle T \rangle^0 \) is sufficiently small and \( s \in \{ 0 \} \cup [\langle T \rangle] \), let

\[ q_{v_{\langle s \rangle}} : \Sigma_{v_{\langle s \rangle}} \longrightarrow \Sigma_b \]

be the basic gluing map constructed in Subsection 2.2 of [Z3]. Via the construction of Subsection 3.3 in [Z3], the map \( q_{v_{\langle s \rangle}} \) induces a metric \( g_{v_{\langle s \rangle}} \) and a weight function \( \rho_{v_{\langle s \rangle}} \) that define weighted \( L^p \)-Sobolev norms \( \| - \|_{v_{\langle s \rangle}, p} \) on the spaces \( \Gamma_B(\langle b' \rangle) \) and \( \Gamma_B(\langle b'; J \rangle) \) and weighted \( L^p \)-Sobolev norms \( \| - \|_{v_{\langle s \rangle}, p} \) on the corresponding spaces of differentials, for any bubble map \( \langle b' = (\Sigma_{v_{\langle s \rangle}}, u) \rangle \) such that \( u \) is constant on \( q_{v_{\langle s \rangle}}^{-1}(\Sigma_b^{(s)}) \) if \( s > 0 \). In this case, \( (\Sigma_{v_{\langle s \rangle}}, g_{v_{\langle s \rangle}}) \) is obtained from \( \Sigma_b \) with its metric \( g_b \) by replacing
the nodes of $\Sigma_b$ indexed by the sets $\mathcal{I}_t$ with $t \geq s$ by thin necks. The norms $\| \cdot \|_{v,p,1}$ and $\| \cdot \|_{v,p}$ are analogous to the ones used in Section 3 of [LT]. Let

$$q_{v,(\mathcal{T})+1-s}: \Sigma_{v,(s)} \to \Sigma_{v,(s+1)}$$

be the basic gluing map of Subsection 2.2 in [Z5] corresponding to the gluing parameter $v_s$. We recall that

$$q_{v(s)} = q_{v,(s+1)} \circ q_{v,(\mathcal{T})+1-s}$$

for all $s \in \{0\} \cup [\langle \mathcal{T} \rangle - 1]$. If $s \in [\langle \mathcal{T} \rangle]$ and $h \in \mathcal{I}_{s-1}$, let

$$\Sigma^h_{v,(s)} = q_{v,(s)}^{-1}(\Sigma^h_{b,v}) \subset \Sigma_{v,(s)}.$$  

We note that $\Sigma^h_{v,(s)}$ is a union of components of $\Sigma_{v,(s)}$.

For any $v = (b,v) \in \mathcal{F}\mathcal{T}$, we put

$$b_{\langle \mathcal{T} \rangle+1}(v) \equiv (\Sigma_b, \tilde{u}_{v,(\mathcal{T})+1}) = (\Sigma_b, u_b).$$

In Section 3 of [Z5], for $J$ sufficiently close to $J_0$, $\delta \in C(\mathcal{U}_J([\mathbb{P}^m]; \mathbb{R}^+))$ sufficiently small and all $v \in \mathcal{F}^1\mathcal{T}_\delta$, we construct $J$-holomorphic bubble maps

$$\tilde{b}_s(v) = (\Sigma_{v(s)}, \tilde{u}_{v(s)}) \quad \forall \ s = 0, \ldots, \langle \mathcal{T} \rangle$$

such that the following properties are satisfied. First, for all $s \in [\langle \mathcal{T} \rangle],$

$$\Sigma^0_{b_s(v)} = q_{v(s)}^{-1}(\Sigma^0_b) \quad \text{and} \quad \tilde{u}_{v(s)}(\Sigma^0_{b_s(v)}) = u_b(\Sigma^0_b) \equiv \text{ev}_b(b). \quad (4.1)$$

Second, for all $s \in [\langle \mathcal{T} \rangle],$

$$\tilde{u}_{v(s)} = \exp_{u_{v(s)}} \zeta_{v,s} \quad \text{for some} \quad \zeta_{v,s} \in \Gamma_B(b_s(v)) \quad \text{s.t.} \quad \|\zeta_{v,s}\|_{v,s,p,1} \leq C(b)|v|^{1/p}, \quad (4.2)$$

where

$$b_s(v) = (\Sigma_{v(s)}, u_{v(s)}), \quad u_{v,s} = \tilde{u}_{s+1} \circ q_{v,(\mathcal{T})+1-s}.$$

Third,

$$\tilde{u}_{v,0} = \exp_{u_{v,0}} \zeta_{v,0} \quad \text{for some} \quad \zeta_{v,0} \in \Gamma_B(b_0(v)) \quad \text{s.t.} \quad \|\zeta_{v,0}\|_{v,0,p,1} \leq C(b)|v|,$$

where

$$b_0(v) = (\Sigma_v, u_{v,0}), \quad u_{v,0} = \tilde{u}_1 \circ \tilde{q}_{v,(\mathcal{T})+1},$$

and

$$\tilde{q}_{v,(\mathcal{T})+1}: \Sigma_v \to \Sigma_{v,(1)}$$

is the modified gluing map corresponding to the parameter of $\delta(b)^{1/2}$ constructed in Subsection 2 of [Z5]. Finally, the maps $v \to \zeta_{v,s}$ are smooth over $\mathcal{F}^1\mathcal{T}_\delta$ and extend continuously over $\mathcal{F}^1\mathcal{T}_\delta$.

These extensions satisfy

$$\zeta_{b,s} = 0 \quad \forall \ b \in \mathcal{U}_J^0(X;J), \ s \in \{0\} \cup [\langle \mathcal{T} \rangle] \quad \text{and} \quad (4.4)$$

$$\zeta_{v,s}|_{\Sigma^b_{v,(s)}} = 0 \quad \forall \ v \in \mathcal{F}\mathcal{T}, \ s \in [\langle \mathcal{T} \rangle], \ h \in \mathcal{I}_{s-1}^0(v). \quad (4.5)$$

29
The homeomorphism of Lemma 2.4 is given by

\[ \phi_T : F^1 \mathcal{T}_\delta \to \mathfrak{M}_{1,k}^0 (\mathbb{P}^n, d; J) \cap U_T, \quad \phi_T ([v]) = [\tilde{b}_0(v)]. \]

Remark: The bubble maps \( b_s(v) \) and \( \tilde{b}_s(v) \) above correspond to the bubble maps \( b_s(\tilde{\mu}_0(v, \zeta_{v,0})) \) and \( \tilde{b}_s(\tilde{\mu}_0(v, \zeta_{v,0})) \) in Section 2.5 of [Z5], where \( \tilde{\mu}_0(v, \zeta_{v,0}) \) is the perturbation of \( v \) constructed in Subsection 2.5 in [Z5].

4.2 Smoothing Bundle Sections, I

In this subsection we extend all but the last step of the gluing construction summarized above to the cone \( \mathcal{V}^d_{1,k} \) over \( \mathfrak{M}_{1,k}^0 (\mathbb{P}^n, d; J) \).

In order to do this, we will use a convenient family of connections in the line bundles \( u^* \mathcal{L} \to \Sigma \), which is chosen in Lemma 4.1 below. First, if \( b = (\Sigma_b, u_b) \) is a stable genus-one bubble map such that \( u_b|_{\Sigma_{b,v}} \) is constant, \( g_b \) is a Hermitian metric in the line bundle \( u_b^* \mathcal{L} \to \Sigma_b \), and \( \nabla^b \) is an admissible connection in \( u_b^* \mathcal{L} \), we will call the pair \((g, \nabla)\)-admissible if

\[ (g \nabla 1) \nabla^b \text{ is } g_b\text{-compatible and } \partial_{\nabla, b}\text{-compatible;} \]

\[ (g \nabla 2) \quad g_b = g_{u_b} \text{ and } \nabla^b = \nabla^{u_b} \text{ on } \Sigma^0_b, \]

where \( g_{u_b} \) is the Hermitian metric in \( u_b^* \mathcal{L} \) induced from the standard metric in \( \mathcal{L} \). The second condition in \((g \nabla 1)\) means that

\[ \partial_{\nabla, b} \equiv \frac{1}{2} (\nabla^{u_b} + i \nabla^{u_b} \circ j) = \frac{1}{2} (\nabla^b + i \nabla^b \circ j), \]

with notation as in [1.12]. If the pair \((g, \nabla)\) satisfies \((g \nabla 1)\), the connection \( \nabla^b \) is uniquely determined by the metric \( g_b \). The second conditions in \((g \nabla 1)\) and in \((g \nabla 2)\) imply that the bundle map \( \mathcal{D}_T \) does not change if it is defined using the connection \( \nabla^b \) instead of \( \nabla^{u_b} \); see Subsection 2.2.

If \( b \in U^0_T (\mathbb{P}^n; J), \delta \in \mathbb{R}^+, i \in \hat{I}, \) let

\[ A^{b,0}_b(i, \delta) = \{ (i, z) \in \Sigma_{b,i} = \{ i \} \times S^2 : |z| \geq \delta^{-1/2} / 2 \} \subset \Sigma_b; \]

\[ \partial^{-1} A^{b,0}_b(i, \delta) = \{ (i, z) \in \Sigma_{b,i} = \{ i \} \times S^2 : |z| = \delta^{-1/2} / 2 \} \subset \Sigma_b; \]

\[ \Sigma^0_b(\delta) = \bigcup_{i \in \chi(T)} A^{b,0}_b(i, \delta) \cup \bigcup_{h \in \chi(0)} \Sigma_{b,h}. \]

If \( v \in \tilde{F}T \) is sufficiently small, we put

\[ A^{b,0}_b(i, \delta) = q_v^{-1}(A^{b,0}_b(i, \delta)) \subset \Sigma_v, \quad \partial^{-1} A^{b,0}_b(i, \delta) = q_v^{-1}(\partial^{-1} A^{b,0}_b(i, \delta)), \quad \Sigma^0_v(\delta) = q_v^{-1}(\Sigma^0_b(\delta)). \]

If \( s \in (\mathcal{T} + 1) \) and \( h \in I^*_{s-1} \), let

\[ \Sigma^0_{v(s)}(\delta) = \Sigma^0_{v(s)}(\delta) \cap \Sigma^0_{v(s)}. \]

Lemma 4.1 If \( n, d, k, a, \) and \( \mathcal{L} \) are as in Proposition 3.6, there exists \( \delta_n(d) \in \mathbb{R}^+ \) such that for every almost complex structure \( J \) on \( \mathbb{P}^n \), such that \( \| J - J_0 \|_{C^1} \leq \delta_n(d) \), and a bubble type \( \mathcal{T} \) as above, there exist \( \delta, C \in C(\mathcal{U}_T (\mathbb{P}^n; J); \mathbb{R}^+) \) with the following property. For every \( v \equiv (b, v) \in \tilde{F}^1 \mathcal{T}_\delta^b \) and \( s \in [\mathcal{T} + 1] \),
there exist a metric \(g_{\upsilon,s}\) and a connection \(\nabla^{\upsilon,s}\) in the line bundle \(\tilde{u}_{\upsilon,s}^*\mathcal{L} \to \Sigma_v\) such that

1. all pairs \((g_{\upsilon,s}, \nabla^{\upsilon,s})\) are admissible;
2. the curvature of \(\nabla^{\upsilon,s}\) vanishes on \(\Sigma^0_{\upsilon(s)}(2\delta(b))\).

Furthermore, the maps \(\upsilon \to (g_{\upsilon,s}, \nabla^{\upsilon,s})\) are \(\text{Aut}(\mathcal{T}) \times (S^1)^I\)-invariant and smooth over \(\tilde{F}^1\mathcal{T}_b^0\). They extend continuously over \(\tilde{F}^1\mathcal{T}_b\). The extension satisfies (1) and (2). In addition,

\[
(g_{b,s}, \nabla^{b,s}) = (g_{b,\langle T \rangle+1}, \nabla^{b,\langle T \rangle+1}) \quad \forall b \in \mathcal{U}^{(0)}(\mathbb{P}^n; J), \ s \in [\langle T \rangle];
\]

\[
(g_{\upsilon,s}, \nabla^{\upsilon,s})|_{\Sigma^0_{\upsilon(s)}(\upsilon,b)} = q_{\upsilon,s,\langle T \rangle+1-s}^*(g_{\upsilon,s+1,\upsilon,s+1})|_{\Sigma^0_{\upsilon(s)}(\upsilon,b)} \quad \forall s \in [\langle T \rangle], \ h \in \mathcal{I}^0_{\upsilon(s)}(\upsilon,b).
\]

This lemma is an analogue of Lemma 3.5 in [Z5] for the bundle \(\mathcal{L}\) and is proved in a similar way. Let \(\beta : \mathbb{R}^+ \to [0,1]\) be a smooth function such that

\[
\beta(t) = \begin{cases} 
0, & \text{if } t \leq 1; \\
1, & \text{if } t \geq 2.
\end{cases}
\]

If \(r \in \mathbb{R}^+\), let \(\beta_r(t) = \beta(t)/\sqrt{T}\). We define \(\beta_b \in C^\infty(\Sigma^0; \mathbb{R})\) by

\[
\beta_b(z) = \begin{cases} 
1, & \text{if } z \in \Sigma_{b,i}, \ i \in \chi^0(\mathcal{T}); \\
1 - \beta_{q_S}(r(z)/2), & \text{if } z \in \Sigma_{b,i}, \ i \in \chi(\mathcal{T}); \\
0, & \text{otherwise},
\end{cases}
\]

where \(r(z) = |q_S^{-1}(z)|\) if \(q_S : \mathbb{C} \to S^2\) is the stereographic projection mapping the origin to the south pole of \(S^2\). In other words, \(\beta_b = 1\) on \(\Sigma^0(2\delta(b))\) and vanishes outside of \(\Sigma^0(8\delta(b)) \subset \Sigma_b\). Let \(\beta_\upsilon = \beta_b \circ q_\upsilon\).

For \(s \in [\langle T \rangle+1], \ h \in \mathcal{I}^*_s, \) and \(\upsilon \in \tilde{F}^1\mathcal{T}_b^0\), we use parallel transport with respect to the connection \(\nabla^{\tilde{u}_{\upsilon,s}}\) along the meridians to the south pole of the sphere \(\Sigma^0_{\upsilon(s)}\) to identify \(\tilde{u}_{\upsilon,s}^*\mathcal{L}\) over \(\Sigma^0_{\upsilon(s)}(8\delta(b))\) with the trivial holomorphic line bundle

\[
\Sigma^0_{\upsilon(s)}(8\delta(b)) \times \mathcal{L}_{ev}(b).
\]

A connection \(\nabla^{\upsilon,s}\) with the desired properties can then be found by solving an equation of the form

\[
\bar{\partial}\theta = \beta_\upsilon\Omega_{\upsilon,h}, \quad \theta(\infty) = 0, \quad \theta \in C^\infty(\Sigma^0_{\upsilon(s)}(8\delta(b)); \mathbb{C}),
\]

where \(\Omega_{\upsilon,h} \in C^\infty(\Sigma^0_{\upsilon(s)}(8\delta(b)); \mathbb{C})\) is determined by \(\upsilon\) and satisfies

\[
\|\Omega_{\upsilon,h}\|_{\upsilon(s),p} \leq C(b)\delta(b)^{1/p}.
\]

This bound follows immediately from the definition of the set \(\chi(\mathcal{T})\) and (4.2). The equation (4.9) can be viewed as an equation on \(\Sigma_{\upsilon(s)}^0\), which is a two-sphere with the metric \(g_{\upsilon(s)}\) arising in the pregluing construction. If \(\delta(b) \in \mathbb{R}^+\) is sufficiently small, (4.9) has a unique solution \(\theta_{\upsilon,h} \in C^\infty(\Sigma^0_{\upsilon(s)}; \mathbb{C})\). The curvature of the connection

\[
\tilde{\nabla}^{\upsilon,h} = \nabla^{\tilde{u}_{\upsilon,s}} + \beta_\upsilon\theta_{\upsilon,h}
\]
then vanishes on $\Sigma_{\upsilon(v)}^{h,0}(2\delta(b))$.

Let $g_{\upsilon,h}$ be the metric in $\tilde{u}_{\upsilon,s}^*\mathfrak{L}|_{\Sigma_{\upsilon(h)}^h}$ obtained by patching the flat metric in $\tilde{u}_{\upsilon,s}^*\mathfrak{L}|_{\Sigma_{\upsilon(h)}^{h,0}(8\delta(b))}$ induced via parallel transport from $\infty \in \Sigma_{\upsilon(h)}^h$ with respect to $\tilde{\nabla}^{\upsilon,h}$ with the metric $g_{\tilde{u}_{\upsilon}}$ over

$$\Sigma_{\upsilon(h)}^{h,0}(8\delta(b)) - \Sigma_{\upsilon(h)}^{h,0}(4\delta(b)).$$

We put

$$g_{\upsilon,s}|_z = \begin{cases} g_{\upsilon,h}|_z, & \text{if } z \in \Sigma_{\upsilon(h)}^h, \ h \in \mathcal{I}_{s-1}^s; \\ g_{\tilde{u}_{\upsilon,s}}|_z, & \text{if } z \in \Sigma_{\upsilon(s)}^0. \end{cases}$$

Since $\Sigma_{\upsilon(s)}^0$ is the union of the components of $\Sigma_{\upsilon(s)}$ that are not in $\Sigma_{\upsilon(h)}^h$ for any $h \in \mathcal{I}_{s-1}$ by (4.1), the metric $g_{\upsilon,s}$ on $\tilde{u}_{\upsilon,s}^*\mathfrak{L}$ is well-defined. In particular, the two definitions agree at the node of $\Sigma_{\upsilon(h)}^h$.

Let $\nabla^{\upsilon,s}$ be the $\tilde{\nabla}_{\upsilon,s}$-compatible and $g_{\upsilon,s}$-compatible connection. By construction, $\nabla^{\upsilon,s} = \tilde{\nabla}^{\upsilon,h}$ on $\Sigma_{\upsilon(h)}^{h,0}(2\delta(b))$. Thus, the pair $(g_{\upsilon,s}, \nabla^{\upsilon,s})$ satisfies the requirements (1) and (2) of Lemma 4.1. By construction, the map $v \mapsto (g_{\upsilon,s}, \nabla^{\upsilon,s})$ is $\text{Aut}(\mathcal{T}) \times (S^1)^{1-s}$-invariant and smooth. Since the maps $v \mapsto \zeta_{\upsilon,s}$ extend continuously over $\tilde{\mathcal{T}}_T$, so does the map $v \mapsto (g_{\upsilon,s}, \nabla^{\upsilon,s})$, as can be seen by an argument analogous to Subsections 3.9 and 4.1 in [Z3]. It is immediate from the construction that (4.6) is satisfied, while (4.7) follows from (4.5).

For each $s \in \langle \mathcal{T} \rangle$, we will next choose a family of identifications

$$\Pi_{\upsilon,s}|_z: u_{\upsilon,s}^*\mathfrak{L}|_z \rightarrow \tilde{u}_{\upsilon,s}^*\mathfrak{L}|_z, \quad z \in \Sigma_{\upsilon(s)},$$

which is smooth in $v$ on $\tilde{\mathcal{T}}^0_\upsilon$ and in $z$. If $z \in \Sigma_{\upsilon(h)}^{h,0}(2\delta(b))$ for some $h \in \mathcal{I}_{s-1}$, let $\Pi_{\upsilon,s}^\upsilon$ and $\Pi_{\upsilon,s}^\upsilon$ be the parallel transports in the line bundles $u_{\upsilon,s}^*\mathfrak{L}$ and $\tilde{u}_{\upsilon,s}^*\mathfrak{L}$, respectively, along a path from $\infty$ to $z$ in $\Sigma_{\upsilon(h)}^{h,0}(2\delta(b))$ with respect to the connections $q_{\upsilon(h)}^{*\upsilon,s}, \nabla^{\upsilon,s+1}$ and $\nabla^{\upsilon,s}$. Due to the requirement (2) of Lemma 4.1 these parallel transports are path-independent. If $z \in \Sigma_{\upsilon(s)}$ and $\xi \in u_{\upsilon,s}^*\mathfrak{L}|_z$, we require that

$$\Pi_{\upsilon,s}|_z\xi = \begin{cases} \xi, & \text{if } z \in \Sigma_{\upsilon}^0; \\ \Pi_{\upsilon,s}^\upsilon \{ \Pi_{\upsilon,s}^\upsilon \}^{-1}\xi, & \text{if } z \in \Sigma_{\upsilon(h)}^{h,0}(\delta(b)), \ h \in \mathcal{I}_{s-1}; \\ \Pi_{\zeta_{\upsilon,s}(z)}\xi, & \text{if } z \notin \Sigma_{\upsilon(h)}^{h,0}(2\delta(b)) \forall h \in \mathcal{I}_{s-1}. \end{cases} \quad (4.10)$$

We patch the last two identifications in (4.10) over $\Sigma_{\upsilon(h)}^{h,0}(2\delta(b)) - \Sigma_{\upsilon(h)}^{h,0}(\delta(b))$, using a cutoff function constructed from $\beta$. Let

$$\Pi_{\upsilon,s}: \Gamma(\Sigma_{\upsilon(s)}; u_{\upsilon,s}^*\mathfrak{L}) \rightarrow \Gamma(\Sigma_{\upsilon(s)}; \tilde{u}_{\upsilon,s}^*\mathfrak{L})$$

be the operator induced by the maps $\Pi_{\upsilon,s}|_z$. We note that if

$$\xi \in \Gamma(-\upsilon(s); \mathfrak{L}) \equiv \ker \tilde{\nabla}_{\tilde{\mathcal{T}}_\upsilon},$$

then $\{\Pi_{\upsilon,s}\}^{-1}\xi$ is a holomorphic function on $\Sigma_{\upsilon(h)}^{h,0}(2\delta(b))$, since covariant differentiation commutes with parallel transport due to (2) of Lemma 4.1.
For \( b \in \mathcal{U}_T^{(0)}(X; J) \), \( s \in [\langle T \rangle] \), and \( h \in \mathcal{I}_{s-1} \), let
\[
\Gamma_h(b; \mathcal{L}) = \{ \xi \in \Gamma_B(b; \mathcal{L}) : \xi|_{\Sigma_b - \Sigma_b^h} = 0 \}, \quad \Gamma_{h; -}(b; \mathcal{L}) = \Gamma_h(b; \mathcal{L}) \cap \Gamma_{-}(b; \mathcal{L}),
\]
\[
\Gamma_h^{0,1}(b; \mathcal{L}) = \{ \eta \in \Gamma_B^{0,1}(b; \mathcal{L}) : \eta|_{\Sigma_b - \Sigma_b^h} = 0 \}.
\]
If \( v \in \tilde{T}^1_T, s \in [\langle T \rangle + 1] \), and \( h \in \mathcal{I}_{s-1} \), we put
\[
\tilde{\Gamma}_{h; -}(v(s); \mathcal{L}) = \{ \xi \in \tilde{\Gamma}_{-}(v(s); \mathcal{L}) : \xi|_{\Sigma_{v(s)} - \Sigma_{v(s)}^h} = 0 \}.
\]
For each \( m \in \mathbb{Z}^+ \), we define
\[
\mathcal{D}_{s,h}^{(m)} : \tilde{\Gamma}_{-}(v(s); \mathcal{L}) \rightarrow \mathfrak{L}_{ev\rho(b)} \quad \text{by} \quad \mathcal{D}_{s,h}^{(m)} \xi = \frac{d}{dw_h} \{ \Pi^v_s \}^{-1} \xi \bigg|_{w_h=0} = \{ \nabla^s \}^m \xi|_{\Sigma_{v(s)}^h},
\]
where \( w_h \) is the standard holomorphic coordinate around \( \infty \) in \( \Sigma_{v(s)}^h \). We will construct isomorphisms
\[
\tilde{R}_{v,s} : \Gamma_{-}(b; \mathcal{L}) \rightarrow \tilde{\Gamma}_{-}(v(s); \mathcal{L}) \quad \forall s \in [\langle T \rangle]
\]
such that the following properties are satisfied. First, for all \( h \in \mathcal{I}_{s-1} \),
\[
\tilde{R}_{v,s} \xi \in \tilde{\Gamma}_{h; -}(v(s); \mathcal{L}) \quad \forall \xi \in \Gamma_{h; -}(b; \mathcal{L}). \quad (4.11)
\]
Second, for all \( h \in \mathcal{I}_{s-1} \),
\[
\mathcal{D}_{s,h}^{(1)} \tilde{R}_{v,s} \xi = \alpha_{s,h} (\rho_{s,h}(v); \xi) \equiv \sum_{i \in \chi(T)} \rho_{s,i}(v) \mathcal{D}_{i,h} \xi \quad \forall \xi \in \Gamma_{-}(b; \mathcal{L}). \quad (4.12)
\]
Finally, the maps \( v \rightarrow \tilde{R}_{v,s} \) are smooth over \( \tilde{T}^1_T \) and extend continuously over \( \tilde{T}^1_T \). These extensions satisfy
\[
\tilde{R}_{v,s}|_b = \text{id} : \Gamma_{-}(b; \mathcal{L}) \rightarrow \Gamma_{-}(b; \mathcal{L}). \quad (4.13)
\]
In order to construct isomorphisms \( \tilde{R}_{v,s} \), we observe that certain operators are surjective. If \( b \in \mathcal{U}_T^{(0)}(X; J), s \in [\langle T \rangle], h \in \mathcal{I}_{s-1} \), and \( [w_h] \in \mathbb{F}_{\tilde{T}^1_T} \), let
\[
\Gamma_{h; -}(b; \mathcal{L}; [w_h]) = \{ \xi \in \Gamma_{h; -}(b; \mathcal{L}) : \alpha_{s,h}(w_h; \xi) = 0 \}.
\]
We denote the \( L^2 \)-orthogonal complement of \( \Gamma_{h; -}(b; \mathcal{L}; [w_h]) \) in \( \Gamma_{h; -}(b; \mathcal{L}) \) by \( \Gamma_{h; +}(b; \mathcal{L}; [w_h]) \). Since \( \Sigma_b^h \) is a genus-zero Riemann surface and the degree of \( u_b^* \mathcal{L} \) over every component of \( \Sigma_b^h \) is nonnegative,
\[
H^1(\Sigma_b^h; \{ u_b|_{\Sigma_b^h} \}^* \mathcal{L} \otimes \mathcal{O}(-z)) = \{ 0 \} \quad \forall z \in \Sigma_b^{h*},
\]
where \( \Sigma_b^{h*} \subset \Sigma_b^h \) is the subset of smooth points. Thus, the operator
\[
\bar{\partial}_{\bar{\partial}} : \Gamma_h(b; \mathcal{L}) \rightarrow \Gamma_h^{0,1}(b; \mathcal{L})
\]
induced by \( \bar{\partial}_{\bar{\partial}} \) is surjective. Similarly, since the degree of \( u_b^* \mathcal{L}|_{\Sigma_b,i} \) is positive for all \( i \in \chi(T) \),
\[
H^1(\Sigma_b^h; \{ u_b|_{\Sigma_b^h} \}^* \mathcal{L} \otimes \mathcal{O}(-2z)) = \{ 0 \} \quad \forall z \in \Sigma_b^{i*} \cap \Sigma_b^h.
\]

33
Thus, for every element \( w_h \in \tilde{\mathcal{F}}_h T|_b \), the linear map

\[
\alpha_{s,h}(w_h; \cdot) : \Gamma_{h;-}(b; \mathcal{L}) \rightarrow \mathcal{L}_{\nu \nu P}(b)
\]

is surjective. In particular,

\[
\alpha_{s,h}(w_h; \cdot) : \Gamma_{h;-}^1(b; \mathcal{L}) \rightarrow \mathcal{L}_{\nu \nu P}(b)
\]

is an isomorphism and

\[
C(b)^{-1}|w_h||\xi| \leq |\alpha_{s,h}(w_h; \xi)| \leq C(b)|w_h||\xi| \quad \forall \xi \in \Gamma_{h;-}^1(b; \mathcal{L}; [w_h]),
\]

for some \( C \in C(\mathcal{T}_s(\mathbb{P}^n; J); \mathbb{R}^+). \)

If \( v \in \tilde{\mathcal{F}}^1 \mathcal{T}_s^0, s \in [\langle T \rangle], \) and \( h \in T^*_{s-1} \), we denote by \( \Gamma_h(v_s); \mathcal{L} \) and \( \Gamma_h^{0,1}(v_s); \mathcal{L} \) the completions of the spaces

\[
\left\{ \xi \in \Gamma_B(b_s(v); \mathcal{L}) : \xi|_{\Sigma_{v_s}^0 - \Sigma_{v_s}^h} = 0 \right\} \quad \text{and} \quad \left\{ \eta \in \Gamma_B^{0,1}(b_s(v); \mathcal{L}) : \eta|_{\Sigma_{v_s}^0 - \Sigma_{v_s}^h} = 0 \right\}
\]

with respect to the norms \( \| \cdot \|_{v_s;P,1} \) and \( \| \cdot \|_{v_s;P} \), respectively. Let

\[
\Gamma_{h;-}(v_s); \mathcal{L} = \Gamma_{-}(v_s); \mathcal{L} \cap \Gamma_h(v_s); \mathcal{L}, \quad \text{where}
\]

\[
\Gamma_{-}(v_s); \mathcal{L} = \left\{ \xi \in \tilde{\Gamma}_{-}(v_{s+1}; \mathcal{L}) : \xi \in \Gamma_{h;+}(v_{s+1}; \mathcal{L}) \right\}.
\]

We denote the \( L^2 \)-orthogonal complement of \( \Gamma_{h;-}(v_s); \mathcal{L} \) in \( \Gamma_h(v_s); \mathcal{L} \) by \( \Gamma_{h;+}(v_s); \mathcal{L} \). By \( \mathbb{B} \) and the same argument as in Subsection 3.5 in \( \mathbb{Z}^3 \),

\[
C(b)^{-1}\|\xi\|_{v_s;P,1} \leq \|\tilde{\partial}_{v, b_s(v)} \xi\|_{v_s;P} \leq C(b)\|\xi\|_{v_s;P,1} \quad \forall \xi \in \Gamma_{h;+}(v_s); \mathcal{L} \quad (4.15)
\]

for some \( C \in C(\mathcal{T}_s(\mathbb{P}^n; J); \mathbb{R}^+), \) provided \( \delta \in C(\mathcal{T}_s(\mathbb{P}^n; J); \mathbb{R}^+) \) is sufficiently small. In particular, the operator

\[
\tilde{\partial}_{v, b_s(v)} : \Gamma_{h;+}(v_s); \mathcal{L} \rightarrow \Gamma_h^{0,1}(v_s); \mathcal{L}
\]

is an isomorphism. On the other hand, by the construction of the map \( q_{v_s;\langle T \rangle + 1-s} \) in Subsection 2.2 of \( \mathbb{Z}^3 \),

\[
\|\tilde{\partial}_{v, b_s(v)} (\xi \circ q_{v_s;\langle T \rangle + 1-s})\|_{v_s;P} \leq C(b)\|v_s\|_{v_{s+1},P,1} \quad \forall \xi \in \tilde{\Gamma}_{-}(v_{s+1}; \mathcal{L})
\]

and

\[
\tilde{\partial}_{v, b_s(v)} (\xi \circ q_{v_s;\langle T \rangle + 1-s})|_{\Sigma_{b_s(v)}} = 0 \quad \forall \xi \in \tilde{\Gamma}_{-}(v_{s+1}; \mathcal{L}).
\]

Thus, by the analogue of \( \mathbb{B} \) for \( \zeta_{v,s} \), there exist unique linear maps

\[
\varepsilon_{v,s,h} : \tilde{\Gamma}_{-}(v_{s+1}; \mathcal{L}) \rightarrow \Gamma_{h;+}(v_s); \mathcal{L}, \quad h \in T^*_{s-1},
\]

such that

\[
\tilde{R}'_{v,s} \xi \equiv \Pi_{v,s} \left( \xi \circ q_{v_s;\langle T \rangle + 1-s} + \sum_{h \in T^*_{s-1}} \varepsilon_{v,s,h}(\xi) \right) \in \tilde{\Gamma}_{-}(v_s); \mathcal{L} \quad \forall \xi \in \tilde{\Gamma}_{-}(v_{s+1}; \mathcal{L}).
\]
Furthermore, for all $\xi \in \tilde{\Gamma}_-(v(s+1); \mathfrak{L})$ and $h \in \mathcal{I}_{s-1}^*$,
\[
\|\varepsilon_{v,s,h}(\xi)\|_{v(s),p,1} \leq C(b)(\|\xi_{v,s}\|^2_{\mathfrak{L}_0^{(s)}} \|\xi\|_{v(s+1),p,1}^2 + \|\partial \psi_{v,s}\frac{1}{2}\|\xi\|_{v(s+1),p,1}^2).
\] (4.17)

In addition, for all $h, h' \in \mathcal{I}_{s-1}^*$ such that $h' \neq h$,
\[
\varepsilon_{v,s,h}(\xi) = 0 \quad \forall \xi \in \tilde{\Gamma}_{h',-(v(s+1); \mathfrak{L})}.
\]

The expansion in Lemma 4.2 below is a key step in constructing the homomorphisms $\tilde{R}_{v,s}$ with the desired properties. For every $h \in \mathcal{I}_{s-1}^* \setminus \chi(\mathcal{T})$, let
\[
\chi_h'(\mathcal{T}) = \{ h' \in \tilde{I} : \iota_{h'} = \iota_h \}.
\]

If $b \in \mathcal{U}^{(0)}_\mathcal{T}(\mathbb{P}^n; J)$ and $h' \in \chi_h'(\mathcal{T})$, we denote by
\[
x_{h'}(b) \in \mathbb{C} = \Sigma_{b,h} - \{\infty\}
\]
the node shared by $\Sigma_{b,h}$ and $\Sigma_{b,h'}$.

**Lemma 4.2** If $n, d, k, a$, and $\mathfrak{L}$ are as in Proposition 2.1, there exists $\delta_n(d) \in \mathbb{R}^+$ such that for every almost complex structure $J$ on $\mathbb{P}^n$, such that $\|J - J_0\|_{C^1} \leq \delta_n(d)$, and a bubble type $\mathcal{T}$ as above, there exist $\delta, C \in C(\mathcal{U}_\mathcal{T}(\mathbb{P}^n; J); \mathbb{R}^+)$ such that the requirement of Lemma 4.1 is satisfied. Furthermore, for every $v = (b, v) \in \tilde{F}^1_\mathcal{T}_s^0$ and $s \in \left[1, \mathcal{T}\right]$, there exists an isomorphism
\[
\tilde{R}_{v,s} : \tilde{\Gamma}_-(v(s+1); \mathfrak{L}) \to \tilde{\Gamma}_-(v(s); \mathfrak{L})
\]
such that
\[
\|\tilde{R}_{v,s}^\delta \xi - \Pi_{\tilde{\chi}_{v,s}}(\xi \circ q_{(\mathcal{T})+1-s})\|_{v(s),p,1} \leq C(b)v^{1/p}\|\xi\|_{v(s+1),p,1} \quad \forall \xi \in \tilde{\Gamma}_-(v(s+1); \mathfrak{L});
\] (4.18)
\[
\tilde{R}_{v,s}^\delta \xi \in \tilde{\Gamma}_{h,-(v(s); \mathfrak{L})} \quad \forall \xi \in \tilde{\Gamma}_{h,-(v(s+1); \mathfrak{L})}.
\] (4.19)

In addition, there exist homomorphisms
\[
\varepsilon_{v,h;i} : \tilde{\Gamma}_-(v(s+1); \mathfrak{L}) \to \mathfrak{L}_{ev,b}(b), \quad h \in \mathcal{I}_{s-1}^* \setminus \chi_h(\mathcal{T}), \ i \in \chi_h(\mathcal{T}),
\]
such that for all $\xi \in \tilde{\Gamma}_-(v(s+1); \mathfrak{L})$, $h \in \mathcal{I}_{s-1}^* \cap \chi_h(\mathcal{T})$, and $i \in \chi_h(\mathcal{T})$,
\[
|\varepsilon_{v,h;i}(\xi)| \leq C(b)v^{1/p}\|\xi\|_{v(s+1),p,1}
\]
and
\[
\mathfrak{L}_{s,h_i}(\tilde{R}_{v,s}^\delta \xi) = \sum_{h' \in \chi_h(\mathcal{T})} v_{h'}\mathfrak{L}_{s+1,h'}^\delta + \sum_{i \in \chi_h(\mathcal{T})} \rho_{h;i}(v)\varepsilon_{v,h;i}(\xi).
\] (4.20)

Furthermore, the maps $v \to \tilde{R}_{v,s}^\delta$ and $v \to \varepsilon_{v,h;i}$ are $\text{Aut}(\mathcal{T}) \times (S^1)^{d}$-invariant and smooth over $\tilde{F}^1_\mathcal{T}_s^0$. They extend continuously over $\tilde{F}^1_\mathcal{T}_s^0$. These extensions satisfy
\[
\tilde{R}_{b,s}^\delta = \text{id} \quad \forall b \in \mathcal{U}^{(0)}_\mathcal{T}(\mathbb{P}^n; J) \quad \text{and} \quad \varepsilon_{v,h;i} = 0 \quad \forall h \in \mathcal{I}_{s-1}^*(v), \ i \in \chi_h(\mathcal{T}).
\] (4.21)
Isomorphisms \( \tilde{R}_{v,s} \) satisfying (4.13) and (4.19) have already been constructed. The estimate (4.20) is obtained by applying the integration-by-parts argument in the proof of Theorem 2.8 in [Z2] to the holomorphic functions

\[
\{ \tilde{\Pi}_{\infty,0} \}^{-1} \tilde{R}_{v,s} : \mathcal{S} \longrightarrow \mathcal{S}_{evp}(b) \quad \text{and} \quad \{ \tilde{\Pi}_{\infty,0} \}^{-1} \tilde{\pi} \cdot : \mathcal{S} \longrightarrow \mathcal{S}_{evp}(b).
\]

The homomorphism \( \tilde{\varepsilon}_{v,h;i} \) is given by

\[
\tilde{\varepsilon}_{v,h;i}(\xi) = \frac{1}{2\pi i} \int_{\partial^{-A_{v^{-1}}(s)}} \{ \tilde{\Pi}_{\infty,0} \}^{-1} \tilde{\varepsilon}_{v,h;i}(\xi) (w_i) \frac{d\xi}{\xi}, \quad (4.22)
\]

where \( w_i \) is the coordinate on a neighborhood of the circle \( \partial^{-A_{v^{-1}}(s)}(\delta(b)) \) induced from the standard holomorphic coordinate centered at \( \infty \) in \( \Sigma_{b,i} = S^2 \); see the proof of Lemma ?? in [Z5] for details. By the continuity of the maps

\[
v \longrightarrow \zeta_{v,s}, \quad \nabla^{v,s}
\]

over \( \tilde{\mathcal{F}}^0 T_\delta \) and the same argument as in Subsection 4.1 of [Z3], the homomorphisms \( \tilde{\varepsilon}_{v,s,h} \) extend continuously over \( \tilde{\mathcal{F}}^0 T_\delta \). Thus, by (4.22), the homomorphisms \( \tilde{\varepsilon}_{v,h;i} \) also extend continuously over \( \tilde{\mathcal{F}}^0 T_\delta \). By (4.5), (4.6), and (4.17),

\[
\tilde{\varepsilon}_{v,s,h} = 0 \quad \forall h \in \mathcal{I}_{s-1}(v).
\]

This observation, along with (4.22), implies the second claim in (4.21). The first claim in (4.21) follows from (4.22), (4.23), and the construction of \( \tilde{R}_{v,s} \).

Suppose \( v = (b, v) \in \tilde{\mathcal{F}}^0 T_\delta, s \in \langle \mathcal{T} \rangle \), and we have constructed an isomorphism

\[
\tilde{R}_{v,s+1} : \Gamma_-(b; \mathcal{L}) \longrightarrow \tilde{\Gamma}_-(v(s+1); \mathcal{L})
\]

that satisfies (4.11)–(4.13). We note that for every \( s \in \langle \mathcal{T} \rangle \) and \( h \in \mathcal{I}_{s-1} \cap \mathcal{X}^-(\mathcal{T}) \),

\[
\rho_{s,h}(v) = (v_{h'} \rho_{s+1,h'}(v))_{h'=h} \quad \forall v \equiv (b, (v_i)_{i \in R}) \in \tilde{\mathcal{F}} T.
\]

Thus, by (4.11) and (4.12) with \( s \) replaced by \( s+1 \), (4.19), and (4.20), there exists a homomorphism

\[
\tilde{\varepsilon}_{v,s,h} : \tilde{\mathcal{F}} T \longrightarrow \text{Hom}(\Gamma_-(b; \mathcal{L}), \mathcal{S}_{evp}(b))
\]

such that

\[
|\tilde{\varepsilon}_{v,s,h}| \leq C(b)|v|^{1/p}, \quad \tilde{\varepsilon}_{v,s,h}(w_h; \xi) = 0 \quad \forall w_h \in \tilde{\mathcal{F}} T, \xi \in \Gamma_{h';-}(b; \mathcal{L}), h' \in \mathcal{I}_{s-1} \setminus \{h\}, \quad (4.23)
\]

\[
\mathcal{D}^{(1)}_{s,h} \{ \tilde{R}_{v,s} \} = \alpha_{s,h}(\rho_{s,h}(v); \xi) + \tilde{\varepsilon}_{v,s,h}(\rho_{s,h}(v); \xi) \quad \forall \xi \in \Gamma_-(b; \mathcal{L}). \quad (4.24)
\]

We note that for \( h \in \mathcal{I}_{s-1} \cap \mathcal{X}^-(\mathcal{T}) \), the existence of such \( \tilde{\varepsilon}_{v,s,h} \) is immediate from (4.12) with \( s \) replaced by \( s+1 \), (4.18), and (4.19). Let \( \rho_{s,h}(v) \) denote the image of \( \rho_{s,h}(v) \) under the projection map \( \tilde{\mathcal{F}} T \setminus \{0\} \longrightarrow \mathbb{P} \tilde{\mathcal{F}} T \). Since

\[
\alpha_{s,h}(w_h; \cdot) : \Gamma_{h';-}(b; \mathcal{L}, \rho_{s,h}(v)) \longrightarrow \mathcal{S}_{evp}(b)
\]

36
is an isomorphism for each $h \in \mathcal{I}^*_s-1$, by the first bound in (4.23), (4.24), and (4.14) there exists a unique homomorphism

$$\mu_{v,s;h}: \Gamma_-(b; \mathcal{L}) \longrightarrow \Gamma^1_{h;1-}(b; \mathcal{L}; [\rho_{s;h}(v)]),$$

such that

$$\mathcal{D}^{(1)}_{s;h} \{ \bar{\bar{R}}_{v,s} \bar{R}_{v,s+1} (\xi + \mu_{v,s;h}(\xi)) \} = \alpha_{s;h}(\rho_{s;h}(v); \xi). \quad (4.25)$$

Furthermore, by (4.14) and (4.23),

$$|\mu_{v,s;h}| \leq C(b)|v|^{1/p}, \quad \mu_{v,s;h}(\xi) = 0 \quad \forall \xi \in \Gamma_{h;1-}(b; \mathcal{L}), \quad h' \in \mathcal{I}^*_s-1-\{h\}. \quad (4.26)$$

We define

$$\bar{R}_{v,s}: \Gamma_-(b; \mathcal{L}) \longrightarrow \bar{T}_{v}(s; \mathcal{L}) \quad \text{by} \quad \bar{R}_{v,s}(\xi) = \bar{R}'_{v,s} \bar{R}_{v,s+1}(\xi + \sum_{h \in \mathcal{I}^*_s-1} \mu_{v,s;h}(\xi)).$$

By (4.14) with $s$ replaced by $s+1$, (4.19), and the second statement in (4.26), $\bar{R}_{v,s}$ satisfies (4.11). Since

$$\mathcal{D}^{(1)}_{s;h} \xi = 0 \quad \forall \xi \in \bar{T}_{v}(s)(\mathcal{L}), \quad h' \in \mathcal{I}^*_s-1-\{h\},$$

$\bar{R}_{v,s}$ satisfies (4.12) by (4.25), along with (4.11) with $s$ replaced by $s+1$, (4.19), and the second statement in (4.26).

It remains to show that for every $h \in \mathcal{I}^*_s-1$ the family of homomorphisms

$$\mu_{v,s;h}: \Gamma_-(b; \mathcal{L}) \longrightarrow \Gamma^1_{h;1-}(b; \mathcal{L}; [\rho_{s;h}(v)]), \quad v \in \bar{T}_s^1 \mathcal{T}^0_\delta,$$

extends continuously over $\bar{T}_s^1 \mathcal{T}^0_\delta$. Each homomorphism $\tilde{\varepsilon}_{v,s;h}$ of the previous paragraph extends continuously over $\bar{T}_s^1 \mathcal{T}^0_\delta$, as this is case for the homomorphisms $\varepsilon_{v,h;i}$ by Lemma 4.2. Furthermore,

$$\tilde{\varepsilon}_{b,1;h} = 0 \quad \forall b \in \mathcal{U}_T^{(0)}(\mathbb{P}^n; J), \quad h \in \mathcal{I}_s-1, \quad \text{and} \quad \varepsilon_{v,s;h} = 0 \quad \forall \nu \in \bar{T}_s^1 \mathcal{T}^0_\delta, \quad h \in \mathcal{I}_s-1(v). \quad (4.27)$$

The first claim above follows from (4.13) with $s$ replaced by $s+1$ and first statement in (4.24). The second claim in (4.27) follows from the second statement in (4.21). If $v \in \bar{T}_s^1 \mathcal{T}^0_\delta$ and $h \in \mathcal{I}_s-1-\mathcal{I}_s^0-1(v)$, we define $\mu_{v,s;h}$ as in the previous paragraph. This extension is continuous at $v$ since $\tilde{\varepsilon}_{v,s;h}$ is. If $h \in \mathcal{I}_s^0-1(v)$, we take $\mu_{v,s;h} = 0$. This extension is continuous by the continuity of $\tilde{\varepsilon}_{v,s;h}$ and the second statement in (4.27). Finally, $\tilde{R}_{v,s}$ satisfies (4.13) by the first statement in (4.27), along with (4.13) with $s$ replaced by $s+1$ and the first statement in (4.21).

Remark: The key point in the previous paragraph is the second statement in (4.27), because the lines $\Gamma^1_{h;1-}(b; \mathcal{L}; [\rho_{s;h}(v)])$ may not extend continuously over $\bar{T}_s^1 \mathcal{T}^0_\delta$.

Corollary 4.3 If $n$, $d$, $k$, $a$, and $\mathcal{L}$ are as in Proposition 3.3 there exists $\delta(d) \in \mathbb{R}^+$ such that for every almost complex structure $J$ on $\mathbb{P}^n$, such that $\|J - J_0\|_{C^1} \leq \delta_0(d)$, and a bubble type $\mathcal{T}$ as above, there exist $\delta, C \in C(\mathcal{U}_T(\mathbb{P}^n; J); \mathbb{R}^+)$ such that the requirement of Lemma 4.7 is satisfied. In addition, for every $v = (b, v) \in \bar{T}_s^1 \mathcal{T}^0_\delta$ there exists an isomorphism

$$\tilde{R}_{v,1}: \Gamma_-(b; \mathcal{L}) \longrightarrow \tilde{T}_-(v(1); \mathcal{L})$$
such that for every \( \xi \in \Gamma_-(b; \Lambda) \), \( h \in \mathcal{I}_0 \), and \( e \in (0, 2\delta(b)) \),
\[
\| \nabla^{v,1} \tilde{R}_{v,1} \xi \|_{C^0(A_{v,1}^-(\delta(b)))} \leq C(b) |\rho_{1;h}(v)| \cdot \| \xi \|_{b,p,1}, \quad \text{and} \quad (4.28)
\]
\[
\int_{\partial A_{v,1}^-(\delta(e))} \{ (\tilde{\Pi}^{v,1}_\infty)^{-1} \tilde{R}_{v,1} \xi \}(w_h) \frac{\text{d}w_h}{w_h^2} = 2\pi i \sum_{i \in \chi_h(\mathcal{T})} \rho_{h;i}(v) \mathcal{D}_{\mathcal{T},i} \xi, \quad (4.29)
\]
where \( w_h \) is the standard holomorphic on the neighborhood of \( \infty \) in \( \Sigma_{v,1}^-(h) = S^2 \). Finally, the map \( v \mapsto \tilde{R}_{v,1} \) is Aut(\( \mathcal{T} \)) \( (S^1)^l \)-invariant and smooth on \( \tilde{\mathcal{T}}^1 \mathcal{T}_\delta \). It extends continuously over \( \tilde{\mathcal{T}}^1 \mathcal{T}_\delta \).

This extension satisfies
\[
\tilde{R}_{b,1} = \text{id} \quad \forall b \in \mathcal{U}_T(0) (\mathbb{P}^n; J). \quad (4.30)
\]

The homomorphism \( \tilde{R}_{v,1} \) constructed above satisfies the extension requirements of the corollary. Since \( (\tilde{\Pi}^{v,1}_\infty)^{-1} \tilde{R}_{v,1} \xi \) is holomorphic on \( A_{v,1}^-(\delta(e)) \), \( (4.29) \) is equivalent to the \( s=1 \) case of \( (4.12) \).

It remains to verify \( (4.28) \). Let
\[
u_{v(1)} = u_b \circ q_{v(1)}.
\]
For each \( h \in \mathcal{I}_0 \) and \( z \in \Sigma_{v,0}^h(\delta(b)) \), we denote by \( \Pi_{\infty,2}^{v(1)} \) the parallel transport in the line bundle \( u_{v(1)}^* \Lambda \) along a path from \( \infty \) to \( z \) in \( \Sigma_{v,0}^h(\delta(b)) \) with respect to the connection \( q_{v(1)}^* \nabla_v(\mathcal{T}) + 1 \). By the construction of the homomorphism \( \tilde{R}_{v,1} \) above,
\[
(\tilde{\Pi}^{v,1}_\infty)^{-1} \tilde{R}_{v,1} \xi|_{\Sigma_{v,0}^h(\delta(b))} = (\Pi_{\infty,2}^{v(1)})^{-1}(\xi \circ q_{v(1)})|_{\Sigma_{v,0}^h(\delta(b))} + \varepsilon_v(\xi) \quad \forall \xi \in \Gamma_-(b; \Lambda),
\]
for some homomorphism
\[
\varepsilon_v : \Gamma_-(b; \Lambda) \longrightarrow C^\infty(\Sigma_{v,0}^h(\delta(b)); \mathcal{L}_{\text{ev}_p}(b)) \quad \text{s.t.}
\]
\[
\| \varepsilon_v(\xi) \|_{C^0(\Sigma_{v,0}^h(\delta(b)))} \leq C(b) |v|^{1/p} \| \xi \|_{b,p,1} \quad \forall \xi \in \Gamma_-(b; \Lambda).
\]
Thus, by the same integration-by-parts argument as in the proof of Theorem 2.2 in \( [Z2] \), there exist homomorphisms
\[
\varepsilon_v^{(l)} : \Gamma_-(b; \Lambda) \longrightarrow \mathcal{L}_{\text{ev}_p}(b), \quad \forall \ h \in \mathcal{I}_0^*, \ i \in \chi_h(\mathcal{T}), \ l \in \mathbb{Z}^+, \]
such that for all \( h \in \mathcal{I}_0^*, \ i \in \chi_h(\mathcal{T}), \ l \in \mathbb{Z}^+, \) and \( \xi \in \Gamma_-(b; \Lambda) \)
\[
|\varepsilon_v^{(l)}(\xi)| \leq C(b) \delta(b)^{-l/2} \| \xi \|_{b,p,1}, \quad (4.31)
\]
\[
\mathcal{D}_{s,h}^{(m)} \{ \tilde{R}_{v,1} \xi \} = \sum_{i=1}^{l=m} \binom{m-1}{l-1} \sum_{i \in \chi_h(\mathcal{T})} x_i^{m-l-1} \rho_{h;i}(v)(\mathcal{D}_{\mathcal{T},i}^{(l)} \xi + \varepsilon_v^{(l)}(\xi)).
\]

The number \( x_i(v) \in \mathbb{C} \) is given explicitly in the paragraph preceding Lemma 4.2 in \( [Z3] \). It is close to
\[
x_{h'}(b) \in \mathbb{C} = \Sigma_{b,h} - \{ \infty \}, \quad \text{where} \quad h' = \nu_{v,1} \xi \in \mathbb{C}.
\]
The estimate \( (4.28) \) is obtained by summing up the derivatives of \( \tilde{R}_{v,1} \xi|_{\Sigma_{v,1}^h(b)} \) at \( \infty \) with the appropriate coefficients, using \( (4.31) \); see the proof of Lemma 4.2 in \( [Z4] \) for a similar argument.
4.3 Smoothing Bundle Sections, II

In this subsection, we take the inductive construction of the previous subsection one step further to define a homomorphism $\tilde{\mathcal{R}}_v \equiv \tilde{\mathcal{R}}_{v;0}$. However, in this case we will encounter an obstruction bundle. The homomorphism $\tilde{\mathcal{R}}_v$ will not extend continuously over $\tilde{\mathcal{T}^1_\delta}$, but its restriction to a cone contained in $\mathcal{V}_{1,d}^i$ will.

We first recall certain facts concerning the modified gluing map

$$\tilde{q}_{v;0;(T)+1}: \Sigma_v \to \Sigma_{v;1}$$

corresponding to the parameter $\delta(b)^{1/2}$, as constructed in Subsection ?? of [25]. Suppose

$$v \equiv (b, v_N, (v_h)_{h \in \mathbb{N}}) \in \tilde{\mathcal{T}^1_\delta}.$$  

The map $\tilde{q}_{v;0;(T)+1}$ is biholomorphic outside $|N|$ thin necks $A_{v,h}$, with $h \in \mathbb{N}$, of $(\Sigma_v, g_v)$ and the $|I_1|$ annuli

$$\tilde{A}_{b,h} \equiv \tilde{A}_{b,h}^{-} \cup \tilde{A}_{b,h}^{+},$$

with $h \in I_1$, where

$$\tilde{A}_{b,h}^\pm \equiv \tilde{A}_{b,h}^\pm(\delta(b)) \subset \Sigma_{b,P} \approx \Sigma_v$$

are annuli independent of $v$. In addition,

$$\tilde{u}_{v,1}|_{\tilde{q}_{v;0;(T)+1}(A_{v,h})} = \text{const} \quad \forall h \in \mathbb{N},$$  

$$\tilde{u}_{v,1}|_{\tilde{q}_{v;0;(T)+1}(\tilde{A}_{b,h})} = \text{const} \quad \forall h \in I_1-I_0, \quad \tilde{u}_{v,1}|_{\tilde{q}_{v;0;(T)+1}(\tilde{A}_{b,h}^+)} = \text{const} \quad \forall h \in I_0;$$

$$\tilde{q}_{v;0;(T)+1}(\tilde{A}_{b,h}^-) \subset A_{v,1,h}^{-1/3}(v_h^2/\delta(b)) \quad \text{and} \quad \|\tilde{d}_{v;0;(T)+1}\|_{C^0(\tilde{A}_{b,h}^-)} \leq C(b)|v_h| \quad \forall h \in I_0, \quad (4.33)$$

if the $C^0$-norm of $\tilde{d}_{v;0;(T)+1}$ is computed with respect to the metrics $g_v$ on $\Sigma_v$ and $g_{v;1}$ on $\Sigma_{v;1}$. Furthermore,

$$\|\tilde{d}_{v;0;(T)+1}\|_{C^0} \leq C(b). \quad (4.34)$$

We now proceed similarly to the previous subsection. If $v \in \tilde{\mathcal{T}^1_\delta}$, we denote the completions of the spaces

$$\Gamma(\Sigma_v; u^*_v, \Omega) \quad \text{and} \quad \Gamma(\Sigma_v; A_{L^1}^{0,1} T^* \Sigma_v \otimes u^*_v, \Omega)$$

with respect to the Sobolev norms $\|\cdot\|_{v;1}$ and $\|\cdot\|_{v;1}$ by $\Gamma(v; \Omega)$ and $\Gamma^0(\Sigma_v; \Omega)$. Let

$$\Gamma^-(v; \Omega) = \{ R'_{v,0} \xi : \xi \in \tilde{\Gamma}^-(v;1; \Omega) \}, \quad \text{where} \quad R'_{v,0} \xi = \xi \circ \tilde{q}_{v;0;(T)+1}.$$  

Let $R_{v,0} = R'_{v,0} \tilde{R}_{v,1}$. By ??, ??, and ??,

$$\|\tilde{\nabla}_v b_0(v) R'_{v,0} \xi\|_{v;1} \leq C(b)\rho(v)\|\xi\|_{v;1,p,1} \leq C'(b)\rho(v)\|R'_{v,0} \xi\|_{v;1,p,1} \quad \forall \xi \in \Gamma^-(v;1; \Omega). \quad (4.35)$$

Let $\Gamma^+(v; \Omega)$ denote the $L^2$-orthogonal complement of $\Gamma^-(v; \Omega)$ in $\Gamma(v; \Omega)$. Similarly to ??,

$$C(b)^{-1} \|\xi\|_{v;1} \leq \|\tilde{\nabla}_v b_0(v) \xi\|_{v;1} \leq C(b)\|\xi\|_{v;1} \quad \forall \xi \in \Gamma^+(v; \Omega). \quad (4.36)$$
for some $C \in C(U_T(\mathbb{P}^n; J); \mathbb{R}^+)$, provided $\delta \in C(U_T(\mathbb{P}^n; J); \mathbb{R}^+)$ is sufficiently small. Let $\Gamma^{0,1}_+(v; \mathfrak{L})$ be the image of $\Gamma_+(v; \mathfrak{L})$ under $\partial_{\mathfrak{L}, b_0(v)}$.

In contrast to the previous subsection, the operator $\partial_{\mathfrak{L}, b_0(v)}$ is not surjective. We next describe a complement of $\Gamma^{0,1}_+(v; \mathfrak{L})$ in $\Gamma^{0,1}(v; \mathfrak{L})$. Since the operator $\partial_{\mathfrak{L}, b}$ is surjective, the cokernel of $\partial_{\mathfrak{L}, b}$ can be identified with the vector space

$$\Gamma^{0,1}_-(b; \mathfrak{L}) \equiv \mathcal{H}_{b; \mathfrak{L}} \otimes \mathcal{L}_{ev_{\mathfrak{L}}(b)} \approx \mathbb{E}^*_{\pi_{b; \mathfrak{L}}} \otimes \mathcal{L}_{ev_{\mathfrak{L}}(b)},$$

where $\mathcal{H}_{b; \mathfrak{L}}$ is the space of harmonic antilinear differentials on the main component $\Sigma_{b; \mathfrak{L}}$ of $\Sigma_b$. If $\mathfrak{L} \neq 0$, i.e. $\Sigma_{b; \mathfrak{L}}$ is a circle of spheres, the elements of $\mathcal{H}_{b; \mathfrak{L}}$ have simple poles at the nodes of $\Sigma_{b; \mathfrak{L}}$ with the residues adding up to zero at each node. Since the Riemann surfaces $\Sigma_v$, with $v \in F^1 T_\delta$, are deformations of $\Sigma_b$, with $b \in \mathcal{U}_T^{(0)}(\mathbb{P}^n; J)$, there exists a family of isomorphisms

$$R^{0,1}_{v; \mathfrak{L}}: \mathcal{H}_{b; \mathfrak{L}} \rightarrow \mathcal{H}_{v; \mathfrak{L}} \equiv \mathcal{H}_{b_0(v); \mathfrak{L}}, \quad v = (b, v) \in F^1 T_\delta,$$

such that the family of induced homomorphisms

$$\mathcal{H}_{b; \mathfrak{L}} \rightarrow \Gamma^{0,1}(v; \mathbb{C})^*, \quad \{R^{0,1}_{v; \mathfrak{L}}\eta\}(\eta') = \langle R^{0,1}_{v; \mathfrak{L}}\eta, \eta' \rangle_2 \quad \forall \eta \in \mathcal{H}_{b; \mathfrak{L}}, \eta' \in \Gamma^{0,1}(v; \mathbb{C}),$$

is $\text{Aut}(\mathcal{T}) \times (S^1)^1$-invariant and smooth on $F^1 T_\delta^0$, continuous on $\tilde{F}^1 T_\delta$, and

$$R^{0,1}_{v; \mathfrak{L}}|_b = \text{id} \quad \forall b \in \mathcal{U}_T^{(0)}(\mathbb{P}^n; J). \quad (4.37)$$

With notation as in (3.4), we define $\tilde{\beta}_b \in C^\infty(\Sigma_b; \mathbb{R})$ by

$$\tilde{\beta}_b(z) = \begin{cases} 1, & \text{if } z \in \Sigma_{b, i}, \ i \in \chi^0(\mathcal{T}); \\ 1 - \beta_{\delta(b)}(r(z)), & \text{if } z \in \Sigma_{b, i}, \ i \in \chi(\mathcal{T}); \\ 0, & \text{otherwise}. \end{cases}$$

In other words, $\tilde{\beta}_b = 1$ on $\Sigma_0(\delta(b)/2)$ and vanishes outside of $\Sigma_0(2\delta(b)) \subset \Sigma_b$. Let $\tilde{\beta}_v = \tilde{\beta}_b \circ q_{uv}$. If $z \in \Sigma_v^0(2\delta(b))$, we denote by $\Pi^0_{\tilde{\beta}}$ the parallel transport in the line bundle $u^*_{v; 0} \mathfrak{L}$ along a path from $x \in q_{v; 0}^{-1}(\Sigma_{v; (i); P})$ to $z$ in $\Sigma_v^0(2\delta(b))$ with respect to the connection $\tilde{q}_{v; 0}^{-1}(\mathcal{T}) + 1 \nabla^{u,1}$. For each

$$v = (b, v) \in \tilde{F}^1 T_\delta^0 \quad \text{and} \quad \eta \in \Gamma^{0,1}_-(b; \mathfrak{L}), \quad (4.38)$$

let $R^{0,1}_v \eta \in \Gamma^{0,1}(v; \mathfrak{L})$ be given by

$$\{R^{0,1}_v \eta\} z w = \tilde{\beta}_v(z) \Pi^0_{\tilde{\beta}} \eta_z(w) \in \mathcal{L}_{u_{v; 0}(z)}, \quad z \in \Sigma_v, w \in T_z \Sigma_v.$$

The image of $\Gamma^{0,1}_-(b; \mathfrak{L})$ in $\Gamma^{0,1}(v; \mathfrak{L})$ is a complement of $\Gamma^{0,1}_+(v; \mathfrak{L})$ in $\Gamma^{0,1}(v; \mathfrak{L})$, as can be seen from Lemma (4.4) below.

If $\eta \in \Gamma^{0,1}_-(b; \mathfrak{L})$, we put

$$\|\eta\| = \sum_{h \in \mathcal{Z}_0} |\eta|_{\partial_{\mathfrak{L}, b}(h)},$$

40
where \(|\eta|_{X_k(b)}\) is the norm of \(\eta|_{X_k(b)}\) with respect to the metric \(g_{\pi P(b)}\) on \(\Sigma_{b,P}\). If \(v\) and \(\eta\) are as in (4.38) and \(\|\eta\|_1 = 1\), we define by

\[
\pi_{v;-1}^0 : \Gamma^0,1(v; \mathcal{L}) \longrightarrow \Gamma^0,1(-b; \mathcal{L}) \quad \text{by} \quad \pi_{v;-1}^0(\eta') = \langle \eta', R_v^0,1 \eta \rangle_2 \eta' \quad \forall \eta' \in \Gamma^0,1(v; \mathcal{L}).
\]

Since the space \(\Gamma^0,1(b; \mathcal{L})\) is one-dimensional, \(\pi_{v;-1}^0\) is independent of the choice of \(\eta\). We note that since \(p > 2\), by Holder’s inequality

\[
\|\pi_{v;-1}^0 \| \leq C(b) \|\eta\|_{v,p} \quad \forall \eta' \in \Gamma^0,1(v; \mathcal{L}). \tag{4.39}
\]

**Lemma 4.4** If \(n, d, k, a,\) and \(\mathcal{L}\) are as in Proposition 4.4 there exists \(\delta_n(d) \in \mathbb{R}^+\) such that for every almost complex structure \(J\) on \(\mathbb{P}^n\), such that \(\|J - J_0\|_{C^1} \leq \delta_n(d)\), and a bubble type \(\mathcal{T}\) as above, there exist \(\delta, C \in C(\mathcal{U}_T(\mathbb{P}^n; J); \mathbb{R}^+)\) such that the requirements of of Corollary 4.3 are satisfied. Furthermore, with notation as above, for all \(v = (b, v) \in \hat{F}^1\mathcal{T}_\delta^0\),

\[
\pi_{v;-1}^0 \partial_{\nabla^0, \hat{b}_0(\eta)} R_{v,0} \xi = -2\pi i \mathcal{D}_\mathcal{T} (\xi \otimes \rho(v)) \quad \forall \xi \in \Gamma^0(-b; \mathcal{L}); \tag{4.40}
\]

\[
\|\pi_{v;-1}^0 \partial_{\nabla^0, \hat{b}_0(\eta)} \xi\| \leq C(b) \|\rho(v)\| \|\xi\|_{v,p,1} \quad \forall \xi \in \Gamma(v; \mathcal{L}). \tag{4.41}
\]

Finally, the map \(v \rightarrow \pi_{v;-1}^0 \) is \(\text{Aut}(\mathcal{T}) \propto (S^1)^I\)-invariant and smooth on \(\hat{F}^1\mathcal{T}_\delta^0\). It extends continuously over \(\hat{F}^1\mathcal{T}_\delta\).

The identity (4.40) requires the restriction on the homomorphisms \(R_{v;-1}^0\) and identification of gluing parameters described in Subsection 7.3 of [33]. It follows from (4.29) by the same integration-by-parts argument as used in the proof of Proposition 4.4 in [32]. The estimate (4.41) is obtained by computing \(\partial_{\nabla^0, \hat{b}_0(\eta)} R_{v,0}^0,1 \eta\); see the proof of Lemma 2.2 in [32].

With notation as in the two previous subsections, let

\[
\Pi_{v,0} : u_{v,0}^* \mathcal{L} \longrightarrow \tilde{u}_{v,0}^* \mathcal{L}
\]

be the \(\nabla\)-parallel transport along the geodesics \(\tau \longrightarrow \exp_{u_{v,0}(z)} \zeta_{v,0}(z)\), with \(\tau \in [0, 1]\). We put

\[
L_{v,0} = \Pi_{v,0}^{-1} \circ \partial_{\nabla^0, \hat{b}_0(\eta)} \circ \Pi_{v,0} = \partial_{\nabla^0, \hat{b}_0(\eta)} : \Gamma(v; \mathcal{L}) \longrightarrow \Gamma^0,1(v; \mathcal{L});
\]

\[
\hat{\Gamma}^1_-(v; \mathcal{L}) = \{ \Pi_{v,0}^\perp \xi : \xi \in \hat{\Gamma}^1_-(v; \mathcal{L}) \} \subset \Gamma(v; \mathcal{L}).
\]

We denote by

\[
\pi_{v;-1} : \Gamma(v; \mathcal{L}) \longrightarrow \Gamma^0(-v; \mathcal{L}) \quad \text{and} \quad \tilde{\pi}_{v;-1} : \Gamma(v; \mathcal{L}) \longrightarrow \tilde{\Gamma}^1_-(v; \mathcal{L})
\]

the \(L^2\)-projection maps. Let \(\Gamma^0_-(v; \mathcal{L})\) be the image of \(\hat{\Gamma}^1_-(v; \mathcal{L})\) under \(\pi_{v;-1}\). By the analogue of (3.2) for \(\zeta_{v,0}\) and (4.3),

\[
\|L_{v,0} \xi\|_{v,p} \leq C(b) \|\rho(v)\|^2 \|\xi\|_{v,p,1} \quad \forall \xi \in \Gamma(v; \mathcal{L}). \tag{4.42}
\]

By (4.35), (4.36), and (4.42),

\[
\|\xi - \pi_{v;-1} \xi\|_{v,p,1} \leq C(b) \|\rho(v)\| \|\xi\|_{v,p,1} \quad \forall \xi \in \tilde{\Gamma}^1_-(v; \mathcal{L}). \tag{4.43}
\]

41
By (4.39)-(4.43),
\[|\mathcal{D}_T(\xi \otimes \rho(v))| \leq C(b)|\rho(v)|^2\|R_{v,0}\xi\|_{v,p,1} \quad \forall R_{v,0}\xi \in \Gamma'_-(v; \mathcal{L}). \quad (4.44)\]

For each \(b \in \mathcal{U}^{(0)}(\mathbb{P}^n; J)\) and \([w] \in \mathbb{P}^n \mathcal{T}_L\), let
\[
\Gamma_-(b; \mathcal{L}; [w]) = \{ \xi \in \Gamma_-(b; \mathcal{L}); \mathcal{D}_T(\xi \otimes w) = 0 \}.
\]

Similarly to the previous subsection, the map \(\mathcal{D}_T\) is surjective. Thus, the \(L^2\)-orthogonal complement \(\Gamma_+\) of \(\Gamma_-(b; \mathcal{L}; [w])\) in \(\Gamma_-(b; \mathcal{L})\) is one-dimensional. Furthermore, there exists \(C \in C(\mathcal{U}(\mathbb{P}^n; J; \mathbb{R}^+))\) such that
\[
C(b)^{-1}|w| \cdot \|\xi\|_{b,p,1} \leq |\mathcal{D}_T(\xi \otimes w)| \leq C(b)|w| \cdot \|\xi\|_{b,p,1} \quad \forall \xi \in \Gamma_+(b; \mathcal{L}; [w]). \quad (4.45)
\]

If \(v \in \tilde{T}^1_{\delta} F\), let
\[
\Gamma_-(v; \mathcal{L}; [w]) = \{ R_{v,0}\xi : \xi \in \Gamma_-(b; \mathcal{L}; [w]) \} \subset \Gamma_-(v; \mathcal{L}).
\]

We denote by \(\Gamma_+(v; \mathcal{L}; [w])\) the \(L^2\)-orthogonal complement of \(\Gamma_-(v; \mathcal{L}; [w])\) in \(\Gamma_-(v; \mathcal{L})\). Since \(R_{v,0}\) is close to an isometry on \(\Gamma_-(b; \mathcal{L})\) with respect to the \(L^2\) and \(L^p\)-norms,
\[
|\mathcal{D}_T(\xi \otimes w)| \geq C(b)^{-1}|w|\|R_{v,0}\xi\|_{v,p,1} \quad \forall R_{v,0}\xi \in \Gamma_+(v; \mathcal{L}; [\rho(v)]), \quad (4.46)
\]

by (4.45). We note that
\[
\dim \Gamma_-(v; \mathcal{L}; [\rho(v)]) = \dim \tilde{T}_+(v; \mathcal{L}) = \dim \Gamma'_-(v; \mathcal{L}).
\]

Thus, by (4.43), (4.44), and (4.46) applied with \(w = \rho(v)\), the map
\[
\tilde{\pi}_{v,-} : \Gamma_-(v; \mathcal{L}; [\rho(v)]) \rightarrow \Gamma'_-(v; \mathcal{L})
\]

is an isomorphism. Furthermore,
\[
\|\xi - \tilde{\pi}_{v,-}\xi\|_{v,p,1} \leq C(b)|\rho(v)|\|\xi\|_{v,p,1} \quad \forall \xi \in \Gamma_-(v; \mathcal{L}; [\rho(v)]). \quad (4.47)
\]

If \(b \in \mathcal{U}^{(0)}(\mathbb{P}^n; J)\), let
\[
\tilde{\Gamma}_-(b; \mathcal{L}) = \{ \xi \in \Gamma_-(b; \mathcal{L}); \mathcal{D}_T(\xi \otimes w) = 0 \forall w \in \tilde{T}^1_{\delta} F|_b \}.
\]

**Corollary 4.5** If \(n, d, k, a, \) and \(\mathcal{L}\) are as in Proposition 3.3, there exists \(\delta_0(d) \in \mathbb{R}^+\) such that for every almost complex structure \(J\) on \(\mathbb{P}^n\), such that \(\|J - J_0\|_{C^1} \leq \delta_0(d)\), and a bubble type \(\mathcal{L}\) as above, there exist \(\delta, C \in C(\mathcal{U}(\mathbb{P}^n; J; \mathbb{R}^+))\) with the following property. For every \(v = (b, v) \in \tilde{T}^1_{\delta} F\) there exists a homomorphism
\[
\tilde{R}_v : \Gamma_-(b; \mathcal{L}) \rightarrow \tilde{\Gamma}_-(v; \mathcal{L})
\]
such that the map \(v \mapsto \tilde{R}_v\) is \(\text{Aut}(\mathcal{L}) \times (S^1)^f\)-invariant and smooth on \(\tilde{T}^1_{\delta} F\). Furthermore, the map \(v \mapsto \tilde{R}_v|_{\tilde{\Gamma}_-(b; \mathcal{L})}\) is continuous on \(\tilde{T}^1_{\delta} F\) and
\[
\tilde{R}_b = \text{id} \quad \forall b \in \mathcal{U}^{(0)}(\mathbb{P}^n; J). \quad (4.48)
\]
If \( v \in \tilde{F}^1T^\theta_\delta \), the homomorphism \( \tilde{R}_v \) is defined by
\[
\tilde{R}_v \xi = \Pi_{\zeta_v,0} R_v \xi \quad \forall \xi \in \Gamma_-(b; \mathcal{L}).
\]
Since the maps
\[
v \mapsto b_0(v), \zeta_v,0, R_v,0, \Gamma_-(v; \mathcal{L}; \rho(v))
\]
are continuous over \( \tilde{F}^1T^\theta_\delta - \rho^{-1}(0) \), this family of homomorphisms extends continuously over \( \tilde{F}^1T^\theta_\delta - \rho^{-1}(0) \), as can be seen by an argument similar to Subsection 3.9 and 4.1 in \[Z3\]. This extension is formally described in the same way as the homomorphisms \( \tilde{R}_v \) for \( v \in \tilde{F}^1T^\theta_\delta \). On the other hand, if \( \rho(v) = 0 \), we put
\[
\tilde{R}_v \xi = \Pi_{\zeta_v,0} R_v \xi = R_v \xi \quad \forall \xi \in \Gamma_-(b; \mathcal{L}).
\]
The second equality above holds by (4.47). By (4.30), the requirement (4.48) is satisfied.

It remains to check that the extension described above is continuous at every
\[
v^* \equiv (b^*, v^*) \in \tilde{F}^1T^\theta_\delta - \rho^{-1}(0)
\]
We note that by (4.47),
\[
\tilde{R}_v \xi = \Pi_{\zeta_v,0} \left( R_v \xi + \varepsilon_{v,0}(\xi) \right) \quad \forall \xi \in \Gamma_-(b; \mathcal{L}), v \in \tilde{F}^1T^\theta_\delta,
\]
for some homomorphism
\[
\varepsilon_{v,0}: \Gamma_-(b; \mathcal{L}) \longrightarrow \Gamma(v; \mathcal{L})
\]
such that
\[
\|\varepsilon_{v,0}(\xi)\|_{v,0,1} \leq C(b) \|\rho(v)\| \|\xi\|_{b,0,1} \quad \forall \xi \in \Gamma_-(b; \mathcal{L}; \rho(v)).
\]
(4.50)
Suppose \( v_r \equiv (b_r, v_r) \in \tilde{F}^1T^\theta_\delta \) and \( \xi_r \in \Gamma(b_r; \mathcal{L}) \) are sequence such that
\[
\lim_{r \to -\infty} v_r = b^* \quad \text{and} \quad \lim_{r \to -\infty} \xi_r = \xi^* \in \Gamma_-(b^*; \mathcal{L}).
\]
Since \( \Gamma(b_r; \mathcal{L}) \subset \Gamma_-(b_r; \mathcal{L}; \rho(v_r)) \) and the maps
\[
v \mapsto b_0(v), \zeta_v,0, R_v,0
\]
are continuous over \( \tilde{F}^1T^\theta_\delta \),
\[
\lim_{r \to -\infty} \tilde{R}_v \xi_r = \lim_{r \to -\infty} \Pi_{\zeta_v,0} \left( R_v \xi + \varepsilon_{v,0}(\xi) \right) = \tilde{R}_v \xi^*,
\]
by (4.49) and (4.50), as needed.

Corollary 4.5 concludes the proof of Lemma 3.3. It remains to finish the proof of Proposition 3.3. By Corollary 4.5, \( \tilde{R}_v \) induces an injective homomorphism
\[
R_\{v\}: \mathcal{V}^d_{1,k;T}\{v\} \longrightarrow \mathcal{V}^d_{1,k}|_{\phi_T([v])}
\]
for \( b \in \mathcal{U}_T^{n_1}(\mathbb{P}^n; J) \) and \( [v] = [b, v] \in \mathcal{F}^1T_\delta \). If \( U \) is an open subset of \( \mathcal{U}_T(\mathbb{P}^n; J) \) and \( \mathcal{W} \longrightarrow U \) is a smooth subbundle of \( \mathcal{V}^d_{1,k}|_U \) such that
\[
\forall b \in U \triangle \mathcal{U}_T^{n_1}(\mathbb{P}^n; J), m \in \left( \max(|\chi(T)| - n, 1), |\chi(T)| \right),
\]
\[
\mathcal{W}_b \subset \mathcal{V}^d_{1,k;T}|_b \quad \forall b \in U \triangle \mathcal{U}_T^{n_1}(\mathbb{P}^n; J), m \in \left( \max(|\chi(T)| - n, 1), |\chi(T)| \right),
\]
then the map \( [v] \longrightarrow R_{[v]} \) induces a continuous injective bundle homomorphism

\[
\tilde{\phi} : \pi^T_{\mathcal{F}^1 | U} | \mathcal{W} \longrightarrow \mathcal{V}^d_{1,k}
\]

that restricts to the identity over \( U \) and is smooth over \( \mathcal{F}^1 T_0^U \).

Finally, for each \( m \in (\max(|\chi(T)| - n, 1), |\chi(T)|) \), let \( U_m^{r} \subseteq U_T \) be a small neighborhood of \( U_T^{m} \) in \( U_{1,k}(\mathbb{P}^n, d) \) and let

\[
\mathcal{W}_m^{d,m} \longrightarrow U_T(\mathbb{P}^n; J) \cap U_T^{m}
\]

be a subbundle of \( \mathcal{V}^d_{1,k} \) such that

\[
\mathcal{W}_m^{d,m} |_{U_T^{m}} \subset \mathcal{V}_m^{d,m^{'}} |_{U_T^{m}} \quad \forall \ b \in U_T^{m^{'}}(\mathbb{P}^n; J) \cap U_T^{m}, \ m^{'} \in \left( \max(|\chi(T)| - n, 1), |\chi(T)| \right).
\]

By the next paragraph, such an extension of \( \mathcal{W}_m^{d,m} |_{U_T^{m}} \) to \( U_T(\mathbb{P}^n; J) \cap U_T^{m} \) exists if \( U_T^{m} \) is sufficiently small. By the previous paragraph, the bundle homomorphism

\[
\tilde{\phi}_m^m \equiv \tilde{\phi} : \mathcal{W}_m^{d,m} \longrightarrow \mathcal{V}_m^{d,m} \]

is continuous and injective, restricts to the identity over \( U_T(\mathbb{P}^n; J) \cap U_T \), and is smooth over \( \mathcal{F}^1 T_0^U \). We define the bundle

\[
\mathcal{V}_m^{d,m} : \longrightarrow \mathcal{W}_m^{d,m} |_{U_T^{m}} \cap U_T^{m}
\]

to be the image of \( \tilde{\phi}_m^m \). This bundle has the claimed rank by the last statement of Lemma \( \ref{lem:vector_bundle_rank} \).

The last condition of Proposition \( \ref{prop:bundle_extension} \) is satisfied by the definition of the bundles \( \mathcal{W}_m^{d,m} |_{U_T^{m}} \) following Proposition \( \ref{prop:bundle_extension} \). The proof of Proposition \( \ref{prop:bundle_extension} \) is now complete.

We now prove the extension claim used in the previous paragraph. By definition,

\[
\tilde{\mathcal{S}}^1 T = \{ w \in \tilde{\mathcal{S}} T : \mathcal{D}_T w = 0 \}.
\]

Since \( \mathcal{D}_T \) is a continuous bundle section, if \( \tilde{U} \) is a sufficiently small neighborhood of \( \tilde{U}_T^{m} \) in \( U_T^{0}(\mathbb{P}^n; J) \), there exists a vector bundle \( \tilde{\mathcal{S}}^1 T^m \longrightarrow \tilde{U} \) such that

\[
\tilde{\mathcal{S}}^1 T^m |_{U_T^{m}(\mathbb{P}^n; J)} = \tilde{\mathcal{S}}^1 T |_{U_T^{m}(\mathbb{P}^n; J)} \quad \text{and} \quad \tilde{\mathcal{S}}^1 T |_{\tilde{U}} \subset \tilde{\mathcal{S}}^1 T^m \subset \tilde{\mathcal{S}} T.
\]

The neighborhood \( \tilde{U} \) and the bundle \( \tilde{\mathcal{S}}^1 T^m \) can be chosen so that they are preserved by the actions of \( \text{Aut}(T) \times (S^1)^f \). We then define the vector bundle \( \mathcal{W}_m^{d,m} \longrightarrow U \) by

\[
U = \{ [b] \in U_T(\mathbb{P}^n; J) : b \in \tilde{U} \} \quad \text{and} \quad \mathcal{W}_m^{d,m} = \{ [b] | \mathcal{W}_m^{d,m} | b \} : b \in U. \quad \mathcal{D}_T(\xi \otimes w) = 0 \ \forall \ w \in \tilde{\mathcal{S}}^1 T^m | b\}.
\]

By the same argument as at the end of Subsection \( \ref{subsec:bundle_extension} \), \( \mathcal{W}_m^{d,m} \longrightarrow U \) is a vector bundle of rank \( da + 1 - m \). By the middle statement of Lemma \( \ref{lem:vector_bundle_rank} \) and \( \ref{prop:bundle_extension} \), this vector bundle satisfies the requirements \( \ref{eq:vector_bundle_rank} \) and \( \ref{eq:bundle_embedding} \), as needed.
