This regular feature of the journal includes a discussion of recent trends in health care delivery, employment, and prices. The statistics presented in this article are valuable in their own right for understanding the relationship between the health care sector and the overall economy. In addition, they allow us to anticipate the direction and magnitude of health care cost changes prior to the availability of more comprehensive data. Beginning with this issue, the article will include statistics not presented before on hospital operations and on the change in health care prices, with particular attention to the Medicare population.

KEY FIRST-QUARTER 1995 TRENDS

- Hospital utilization increased sharply as admissions, surgical operations, and outpatient visits increased at the fastest rate in 10 years. Growth in each of these three measures accelerated in each of the past 3 quarters.
- Hospital admissions for the population 65 years of age or over increased 5.2 percent from the first quarter of 1994, one of the largest increases in the last 10 years.
- Employment in home health care services, the fastest-growing sector in the health care industry, continued to grow at a rate nearly four times faster than employment in the private non-farm business sector.
- The economy slowed, as gross domestic product (GDP) growth decelerated, and economywide price increases were moderate.
- Consumer prices for medical commodities increased less than overall consumer prices, the second time this occurred in the last 3 quarters.
- Prices for hospital services for Medicare and Medicaid patients, as measured by the producer price index (PPI), increased less than prices for hospital services for all other patients.

INTRODUCTION

This article presents statistics on health care utilization, prices, expenses, employment, and work hours, as well as on national economic activity. These statistics provide an early indication of changes occurring in the health care sector and within the general economy.

The text and tables presented in this article have been reformatted. Analysis of recent developments in the health care sector and the economy immediately follows this introduction. Tables have been revised and expanded to include a wider and more useful array of health care indicators. There are two new tables, one on medical sector prices and one on the Medicare Economic Index (MEI). Background material on the data sources and methodology is now in the section titled “Background.” The first eight of the accompanying tables report selected quarterly statistics and the calendar year aggregations of quarterly information for the past 4 years. In these tables, changes in quarterly statistics are shown from the same period 1 year earlier. For quarterly information, this calculation permits analysis of data to focus on the direction and magnitude of changes, without interference...
introduced by seasonal fluctuations. The last four tables in the report show base weights, quarterly index levels, and 4-quarter moving-average percent changes in the input price indexes maintained by HCFA.

In the national health accounts, indicators such as these play an important role in the estimation of the latest historical year of health care expenditures. Information that is more comprehensive tends to lag behind the close of a calendar year by 9 to 12 months or more. Therefore, we rely extensively on indicators such as these to anticipate and predict changes in health care sector expenditures for the most recent year. Other indicators help to identify specific reasons (e.g., increases in price inflation or declines in utilization) for health care expenditure change.

COMMUNITY HOSPITAL STATISTICS

The American Hospital Association's (AHA) statistics on community hospital operations (American Hospital Association, 1995) indicate that the rate of overall hospital utilization increased in the first quarter of 1995 (Tables 1 and 2). The growth in outpatient visits, surgical operations, and admissions all accelerated in the first quarter of 1995. The growth in outpatient visits, 13.0 percent over the same period in the previous year, was the fastest rate of increase recorded in more than 10 years. The growth in surgical operations also was the highest in more than 10 years and represented the fourth consecutive quarter of acceleration in growth (Figure 1). The 8.6 million admissions to community hospitals in the first quarter of 1995 is the highest number recorded since the first quarter of 1986.

Increased hospital utilization may be attributable in part to increased rates of hospitalization of the Medicare population. The AHA data on community hospital operations provide some evidence of this in the time series on hospital admissions of those 65 years of age or over. In the first quarter of 1995, hospital admissions for those 65 years of age or over increased 5.2 percent over the same period of the previous year, while admissions for those under 65 years of age increased 1.9 percent.

Presenting the age-group hospital admissions data as a function of population makes this comparison between those 65 years of age or over and those under 65 years of age even more compelling. Dividing the number of admissions by the population in the age group shows that those 65 years of age or over are being admitted to hospitals at an increasing rate. For most of the period shown in Figure 2, admissions per capita for those 65 years of age or over have been increasing, while admissions per capita for those under 65 years of age are decreasing.

The increase in hospital admissions was offset somewhat by decreases in the adult length of stay. Continuing the established trend toward shorter hospital stays, overall adult length of stay decreased 5.6 percent in the first quarter of 1995 from the same period a year earlier. The average length of stay decreased 7.8 percent for the under 65 years of age group and 4.0 percent for the 65 years or over group.

The increases in overall admissions and outpatient visits combined with similar percentage increases in inpatient and outpatient expense translates to very small increases in inpatient expenses per admission and outpatient expenses per visit. Both measures increased only 0.5 percent from the same period in the previous year, the smallest increases recorded in the last 10 years (Figure 3).

HEALTH CARE SECTOR EMPLOYMENT TRENDS

In 1994, employment in the private nonfarm business sector grew more rapidly than employment in the health services
industry, the first year this happened since 1985. Employment data for the first quarter of 1995 indicate that this trend may be short-lived. The growth rates for health services employment, average weekly hours, and average hourly earnings all accelerated in the first quarter of 1995, in contrast to the private non-farm sector where the growth rates for all three variables decelerated (Table 3). If these trends continue in the subsequent quarters of 1995, the historic relationship of slower employment growth in the non-farm business sector than in the health services industry will be re-established.

The trends in employment growth in both private hospitals and home health care services broke with recent historical patterns in the first quarter of 1995. In these two industries, established patterns of employment growth have been reversed, at least in the short term. Private hospitals, the slowest-growing segment of the health care industry in recent years, had employment growth of 0.8 percent in the first quarter of 1995. This is an acceleration from the 0.3-percent increase in the fourth quarter of 1994. These 2 consecutive quarters of growth, measured over the same period in the preceding year, follow 4 quarters of outright decreases in hospital employment and several years of decelerating growth. The trend in employment growth for private hospitals closely parallels the AHA statistics on community hospital operations and supports the contention that hospital utilization has accelerated. Conversely, home health care services, the fastest-growing industry in the health care sector in recent years, registered a 13.0-percent increase in employment in the first quarter of 1995, the slowest quarterly growth recorded since 1989. The slowdown in home health care employment growth in the first quarter of 1995 follows 2 quarters of deceleration in the third and fourth quarter of 1994 (Figure 4).

Home health care services has been the fastest growing component of the health care industry since data on home health care services as a separate industry started being collected in 1988 (see Background). This industry has experienced explosive rates of employment growth, particularly in 1991 and 1994, when the annual increases exceeded 18 percent (Table 4). Employment in home health care services has more than doubled in the last 5 years, increasing from 243,700 in 1989 to 555,000 in 1994.

The economywide slowdown in the growth of average weekly hours was evident in the health sector in the first quarter of 1995. With the exception of home health care and nursing homes, the health care industry had decreases or decelerating growth in average weekly hours for the quarter when measured over the same period in the previous year.

Implied non-supervisory payrolls for health services, the product of non-supervisory employment, average weekly hours, and average hourly earnings, increased 6.0 percent in the first quarter of 1995, an acceleration in growth from the 5.5 percent recorded in the fourth quarter of 1994 (Table 5). The increases in both quarters, measured over the same period in the previous year, were driven by increases in the number of employees and in average hourly earnings. In the private non-farm business sector as a whole, implied non-supervisory payrolls were up 6.6 percent in the first quarter of 1995, a deceleration in growth from the 7.4-percent increase in the fourth quarter of 1994. All three components of private non-farm payrolls decelerated, with the greatest slowdown in average weekly hours.

OUTPUT AND PRICES

Table 6 presents statistics on the output and price-level changes for the entire econo-
Economic growth slowed appreciably in the first quarter of 1995. When measured over the same period a year earlier, GDP increased 4.0 percent in the first quarter, compared with an increase of 4.1 percent in the fourth quarter of 1994 (Table 6). The quarter-to-quarter change at seasonally adjusted annual rates, a more common expression of GDP growth, was 2.7 percent in the first quarter of 1995, compared with 5.1 percent in the fourth quarter.

Economywide inflation for the first quarter of 1995 remained moderate by historic standards. The CPI for all items increased 2.8 percent from the same period of the previous year. The PPI for finished goods increased 1.6 percent in the first quarter of 1995, measured from the same period in the previous year, a slight uptick from the 1.2 rise recorded in the fourth quarter of 1994. This increase was concentrated in food and energy prices, since the PPI for finished goods less food and energy category increased 1.5 percent in the first quarter of 1995 after increasing 1.6 percent in the fourth quarter of 1994.

MEDICAL PRICES

Consumer prices for medical care, as measured by the CPI for all urban consumers, continued to grow faster than consumer prices for all other items in the first quarter of 1995. The CPI for medical care increased 4.9 percent in the first quarter of 1995 over the same period of the previous year, while the CPI for all items less medical care increased just 2.7 percent over this same period (Table 6). This continues a pattern in which growth rates for the CPI for medical care outpaced growth rates in the CPI for all items less medical care by roughly 2 percentage points.

The slight acceleration in the CPI for medical care in the first quarter of 1995 partially obscures the offsetting trends in its components—the price changes for medical services and medical commodities. The 0.1-percentage point acceleration in the CPI for medical care between the fourth quarter of 1994 and the first quarter of 1995 was the net result of an acceleration in the CPI for medical services and a continued deceleration in the CPI for medical commodities.

Measured over the same period in the previous year, the CPI for medical services increased 5.5 percent in the first quarter of 1995, compared with a 5.2-percent increase in the fourth quarter of 1994 (Table 8). In contrast, the CPI for medical commodities increased 2.5 percent from the same period in the previous year in the first quarter of 1995, after increasing 3.0 percent in the fourth quarter of 1994. The first-quarter 1995 change in the CPI for medical commodities was 0.2 percentage point below the percent change in the CPI for all items less medical care over the same period (Figure 5), a significant trend given that similar patterns have occurred in the PPI for medical commodities.

The change in the CPI for professional services was responsible for the acceleration in the CPI for medical services in the first quarter of 1995. During the same period, the growth in the CPI for hospital and related services, the other component of medical care services, actually decelerated. The percent change in the CPI for professional services from the same period a year ago rose from 4.5 percent in the fourth quarter of 1994 to 4.7 percent in the first quarter of 1995. The CPI for both physicians' services and dental services contributed to this acceleration in growth. The level of growth in the CPI for physicians' services in the first quarter is cor-
roborated by a similar acceleration in the growth in the PPI for offices and clinics of doctors of medicine. While the PPI differs from the CPI in that the PPI measures transaction prices and the CPI measures mainly list prices, both indexes showed approximately the same level of growth in the first quarter of 1995. The PPI for offices and clinics of doctors of medicine increased 4.2 percent between first quarter of 1994 and first quarter of 1995, similar to the 4.5-percent increase in the CPI for physicians’ services over the same period.

Medicare prices in offices and clinics of doctors of medicine increased slightly faster than non-Medicare prices in the first quarter of 1995. The PPI for Medicare treatments in offices and clinics of doctors of medicine increased 4.7 percent between first quarter 1994 and first quarter 1995, while non-Medicare treatments increased by 4.2 percent during this period. The PPI for Medicare treatments in offices and clinics of doctors of medicine is calculated using data gathered from a collected sample and from Medicare physician payment adjustments published annually in the Federal Register (see Background).

Growth in hospital consumer prices decelerated slightly in the first quarter of 1995, while hospital producer prices accelerated. The slowdown in the CPI for hospitals was caused by a deceleration in the CPI for other inpatient services and for outpatient services between fourth quarter 1994 and first quarter 1995. While not directly comparable to the CPI for hospital and related services, the growth rate in the PPI for hospitals accelerated from 3.5 percent to 4.0 percent between fourth and first quarters. Comparing the differing trends in rates of change in the CPI and PPI for hospitals is inappropriate, given the differences in survey scope and methodology of the two indexes. The PPI for hospitals measures transaction prices, which reflect mandated charges and discounts, while the CPI is primarily a measure of list prices, though in some cases it does measure net transaction prices (see Background).

Hospital input prices also accelerated slightly between the fourth quarter of 1994 and the first quarter of 1995 (Table 9). The 4-quarter moving-average percent change in the prospective payment system (PPS) hospital input price index increased from 2.5 percent to 2.6 percent between the 2 quarters. Much of the acceleration in this index was the result of acceleration in the price increases for chemicals, rubber and plastic products, and paper. In fact, medical commodity prices did not contribute materially to the acceleration of the PPS hospital input price index in the first quarter of 1995. In some cases, such as pharmaceuticals, the 4-quarter moving-average percent change for medical commodities in the hospital input price index actually decelerated between the fourth quarter of 1994 and the first quarter of 1995. This deceleration in medical commodity prices in the PPS hospital input price index is consistent with the deceleration in overall CPI and PPI medical commodities between the fourth and first quarters.

The PPI for hospitals can give added insight into price changes among three types of hospital patients: Medicare, Medicaid, and all others (Table 8). The hospital PPI for Medicare is calculated using data gathered from a sample of hospitals and from published Federal regulation (see Background). By using the base year weights supplied by the Bureau of Labor Statistics (BLS), the inpatient and outpatient index levels for each of type of patient can be added to produce totals for each type of patient. Comparing these three types of hospital patients, the PPI for all other patients has increased faster than the PPI for both Medicare and Medicaid since the first quarter of 1993 (Figure 6).
The 5.2-percent increase in the hospital PPI for all other patients from the first quarter of 1994 to the first quarter of 1995 was larger than that for Medicaid patients (4.2 percent) and Medicare patients (1.6 percent). The hospital PPI for all other patients had an accelerated rate of growth in the first quarter of 1995, mostly the result of faster growth rates in outpatient services. The hospital PPI for all other patient outpatient treatments accelerated from a 4.8-percent increase in the fourth quarter of 1994 to a 7.3-percent increase in the first quarter of 1995.

BACKGROUND

Community Hospital Statistics

Since 1963, the AHA, in cooperation with member hospitals, has been collecting data on the operation of community hospitals through its National Hospital Panel Survey. Community hospitals, which comprised more than 80 percent of all hospital facilities in the United States in 1994, include all non-Federal, short-term general, and other special hospitals open to the public. They exclude hospital units of institutions; psychiatric facilities; tuberculosis, other respiratory, and chronic disease hospitals; institutions for the mentally retarded; and alcohol and chemical dependency hospitals.

The survey samples approximately one-third of all U.S. community hospitals. The sample is designed to produce estimates of community hospital indicators by bed size and region (American Hospital Association, 1963-94). In Tables 1 and 2, statistics covering expenses, utilization, beds, and personnel depict trends in the operation of community hospitals annually for 1991-94 and quarterly for 1991 forward.

For purposes of national health expenditures (NHE), survey statistics on revenues (not shown on Table 1) are analyzed in estimating the growth in the largest component of health care costs—community hospital expenditures. This one segment of NHE accounted for 37 percent of all health spending in 1993 (Levit et al., 1994a). The survey also identifies important factors influencing expenditure growth patterns, such as changes in the number of beds in operation, number of admissions, length of stay, use of outpatient facilities, and number of surgeries.

Private Health Sector: Employment, Hours, and Earnings

The BLS collects monthly information on employment for all workers, and earnings and work hours for non-supervisory workers in a sample of 342,000 establishments. Data are collected through cooperative agreements with State agencies that also use this information to create State and local area statistics. The survey is designed to collect industry-specific information on wage and salary jobs in non-agricultural industries. It excludes statistics on self-employed persons and on those employed in the military (U.S. Department of Labor, 1995).

Employment in this survey is defined as number of jobs. Persons holding multiple jobs would be counted multiple times. Approximately 5 percent of the population hold more than one job at any one time. (Other surveys that are household-based, such as the Current Population Survey [CPS], also record employment. In the CPS, however, each person's employment status is counted only once, as either employed, unemployed, or not in the labor force.) Once each year, monthly establishment-based employment statistics are adjusted to benchmarks created from annual establishment census information, resulting in revisions to previously published employment estimates.
Tables 3, 4, and 5 have been reformatted in this article. The most significant change has been the addition of data on the home health care services industry. The 1987 revision of the Standard Industrial Code (SIC) established Home Health Care Services as a separate industry, SIC 808. Prior to the 1987 revision, home health care was included in SIC 809, Allied Health Services, not elsewhere classified. Data on home health care services have been collected on the revised SIC basis since 1988. The format and content of Table 5 have also been altered. Table 5 previously showed the percent change from the same period in the previous year of implied non-supervisory payrolls and work hours. The new table drops work hours in favor of the change in the three components of payrolls—employment, average weekly hours, and average hourly earnings. This format will facilitate a description of the composition of the change in payrolls, i.e., payrolls are increasing or decreasing because of changes in the number of workers, or the amount of hours worked, or amount workers are paid. Changes in total work hours are implicit in this new format and can be calculated from the data in Tables 3 and 4.

National Economic Indicators

National economic indicators provide a context for understanding health-specific indicators and how change in the health sector relates to change in the economy as a whole. Table 6 presents national indicators of output and inflation.

GDP measures the output of U.S. economy as the market value of goods and services produced within the geographic boundaries of the United States by U.S. or foreign citizens or companies. Constant dollar or “real” GDP removes the effects of price changes from the valuation of goods and services produced, so that the growth of real GDP reflects changes in the “physical quantity” of the output of the economy (U.S. Department of Commerce, 1995).

Prices

Consumer Price Indexes

BLS publishes monthly information on changes in prices paid by consumers for a fixed market basket of goods and services. Tables 6, 7, and 8 present information on the all urban CPI, which measures changes in prices faced by 80 percent of the non-institutionalized population in the United States. (The more restrictive wage-earner CPI gauges prices faced by wage earners and clerical workers. These workers account for 32 percent of the non-institutionalized population [U.S. Department of Labor, 1995].)

The index reflects changes in prices charged for the same quality and quantity of goods or services purchased in the base period. For most items, the base period of 1982-84 is used to define the share of consumer expenditures on specific services and products. Those shares or weights remain constant in all years, even though consumption patterns of the household may change over time. This type of index is called a fixed-weight or Laspeyres index.

CPIs for health care goods and services depict price changes for out-of-pocket expenditures and health insurance premium payments made directly by consumers. The composite CPI for medical care weights together product-specific or service-specific CPIs in proportion to household out-of-pocket expenditures for these items. For example, the composite medical care CPI measures inflation for the 3 percent of hospital expenditures that are made out-of-pocket by consumers; the remaining 97 percent of the costs of hospital care paid by private health insurers, Medicare, Medicaid,
and other payers are not weighted into the CPI for medical care. In addition, some medical care sector indexes measure changes in list or charged prices, rather than in prices actually received by providers after discounts are deducted. In several health care areas, received or transaction prices are difficult to capture, although BLS is making advances in this area.

In the NHE, a combination of CPIs for selected medical care items, input price indexes for nursing homes, and the PPI for hospitals are used as measures of inflation for the health industry. The indexes are used to develop a fixed-weight price index for personal health care to depict price changes affecting the entire health care industry more accurately than does the overall CPI medical care index (Levit et al., 1994b).

**Producer Price Indexes**

BLS produces monthly information on average changes in selling prices received by domestic producers for their output. These prices are presented in Tables 6, 7, and 8 as PPIs. The PPI is designed to measure transaction prices, and is different from the CPI, which in some cases measures list or full charge prices. The PPI is a fixed-weight or Laspeyres index, with base period weights determined by values of receipts. The base period varies among series.

The PPI consists of indexes in several major classification structures, including the industry and commodity classifications that are included in this article. The PPI by industry classification measures price changes received for the industry's output sold outside the industry. PPI changes for an industry are determined by price changes for products primarily made by establishments in that industry. The industry into which an establishment is classified is determined by those products accounting for the largest share of its total value of shipments. The PPI by commodity classification measures price changes by similarity of the end product (end use or material composition). The classification system for PPI commodity groups is unique to the PPI, and is divided into 15 major commodity groupings.

While PPIs for medical commodities have existed for numerous years, PPIs for health service industries are relatively new. Most index series began in 1994, and the index series for the composite health services industry does not begin until December 1994. However, the PPI for hospitals began in December 1992, providing enough data for a useful time series. The PPI for hospitals is a measure of transaction prices, or net prices received by the producer from out-of-pocket, Medicare, Medicaid, and private third-party payor sources. The PPI for hospitals should not be compared with the CPI for hospital and related services. While other PPI and CPI series are somewhat comparable (for example, the PPI—office and clinics of doctors of medicine, and the CPI—physicians' services), the PPI and CPI for hospitals have important differences in survey scope and methodology. The PPI for hospitals measures price changes for the entire treatment path, measures net transaction price, includes Medicare and Medicaid, samples both urban and rural hospitals, and reflects total hospital revenue from all sources in its index weights. On the other hand, the CPI for hospitals measures price changes for a discrete sample of hospital services singly, measures published charges, excludes Medicare and Medicaid, samples only urban hospitals, and reflects only consumer out-of-pocket expenses and household health insurance premium payments in its index weights. These differences make a direct comparison between the PPI and CPI hospital services indexes inappropriate.
The PPI for the health services industry is available by detailed industry groupings. For example, general medical and surgical hospitals consist of inpatient and outpatient treatments, which in turn consist of Medicare, Medicaid, and all other patients. These patient categories consist of more detail, such as diagnosis-related group (DRG) groupings for Medicare. While most of the data used to measure PPI price changes for health services are collected through a sample, there are specific instances in which data are collected from both a sample and from Federal regulation. This is the case for Medicare hospital inpatient services and Medicare offices and clinics of doctors of medicine. The producer price changes in Medicare hospital inpatient services are computed from a combination of a national sample of DRGs in hospitals, DRG relative weights from the September 1, 1994, Federal Register, and other adjustments. The producer price changes in Medicare offices of doctors of medicine are computed from a combination of a geographic area sample of payments under the HCFA Common Procedure Coding System (HCPCS), HCPCS updates from the December 8, 1994, Federal Register, and other adjustments. Because of different methodologies, these two PPIs are not comparable to the national updates computed by HCFA and published in the Federal Register.

Input Price Indexes

In 1979, HCFA developed the Medicare hospital input price index (hospital market basket), which was designed to measure the pure price changes associated with expenditure changes for hospital services. In the early 1980s, the skilled nursing facility (SNF) and home health agency (HHA) input price indexes, often referred to as market baskets, were developed to price a consistent set of goods and services over time. Also in the early 1980s, the original Medicare hospital input price index was revised for use in updating payment rates for the PPS. All of these indexes have played an important role in helping to set Medicare payment percent increases, and in understanding the contribution of input price increases to growing health expenditures. The input price indexes, or market baskets, are Laspeyres or fixed-weight indexes that are constructed in two steps. First, a base period is selected. For example, for the PPS hospital input price index, the base period is 1987. Cost categories, such as food, fuel, and labor, are identified and their 1987 expenditure amounts determined. The proportion or share of total expenditures included in specific spending categories is calculated. These proportions are called cost or expenditure weights. There are 28 expenditure categories in the 1987-based PPS hospital input price index.

Second, a price proxy is selected to match each expenditure category. Its purpose is to measure the rate of price increases of the goods or services in that category. The price proxy index for each spending category is multiplied by the expenditure weight for the category. The sum of these products (weights multiplied by the price index) over all cost categories yields the composite input price index for any given time period, usually a fiscal year or a calendar year. The percent change in the input price index is an estimate of price change over time for a fixed quantity of goods and services purchased by a provider.

The input price indexes are estimated on a historical basis and forecasted out several years. The HCFA-chosen price proxies are forecasted under contract with Data Resources, Inc./McGraw Hill (DRI). Following every calendar-year quarter, in March, June, September, and December, DRI updates its macroeconomic forecasts.
of wages and prices based on updated historical information and revised forecast assumptions. Some of the data in Tables 9 through 11 are forecasted and are expected to change as more recent historical data become available and subsequent quarterly forecasts are received.

The methodology and price proxy definitions used in the input price indexes are described in the Federal Register notices that accompany the revisions of the PPS, HHA, and SNF cost limits. A description of the current structure of the PPS input price index was published in the September 4, 1990, Federal Register. The most recent PPS update for payment rates was published in the September 1, 1994, Federal Register. The latest HHA regulatory input price index was published in the February 14, 1995, Federal Register, and the latest SNF input price index was published in the October 7, 1992, Federal Register (also see the January 6, 1994, Federal Register).

Periodically, the input price indexes are revised to a new base year so that cost weights will reflect changes in the mix of goods and services that are purchased. Each revision allows for new base weights, a new base year, and changes to certain price variables used for price proxies.

Each input price index is presented in a table with both an index level and a 4-quarter moving-average percent change. The hospital input price index for PPS is in Table 9, the SNF input price index is in Table 10, and the HHA input price index is in Table 11.

**Medicare Economic Index**

In 1972, Congress mandated the development of the MEI to measure the changes in costs of physicians' time and operating expenses. The input price change measured by the MEI is considered in connection with the update factor for the Medicare Part B physician fee schedule under the resource-based relative value scale (November 25, 1992, Federal Register and December 8, 1994, Federal Register), or is used in an advisory capacity by Congress in updating the fee schedule.

The MEI is a fixed-weighted sum of annual price changes for various inputs needed to produce physicians' services with an offset for productivity increases. Like a traditional Laspeyres index, the MEI is constructed in two steps. First, a base period is selected (1989 for the MEI), cost categories are identified, and the 1989 expenditure amounts by cost category are determined. Second, price proxies are selected to match each expenditure category. These proxies are weighted by the category weight determined from expenditure amounts, and summed to produce the composite MEI. Unlike a traditional Laspeyres index, the compensation portion of the MEI is adjusted for productivity so that economywide productivity and physician-practice productivity are not both included in the update, resulting in a double counting of productivity.

Forecasts of the MEI are made periodically throughout the fiscal year by Data Resources, Inc./McGraw-Hill (DRI) for HCFA using several different sets of economic assumptions. DRI produces four main forecasts of the MEI: (1) a presidential budget forecast in December, (2) the mid-session review in June based on assumptions for the Federal budget exercises, (3) the Medicare Trustees Report forecast in February based on assumptions by the Medicare Trustees, and (4) the Medicare premium promulgation forecast in August based on baseline assumptions by DRI. DRI also produces forecasts of the MEI using their own economic assumptions forecast. The forecasts based on DRI assumptions are presented in this article.
Much of the forecasted data change as more recent historical data become available and the assumptions change.

The methodology, weights, and price proxy definitions used in the MEI are described in the November 25, 1992, Federal Register. The MEI data are presented in Table 12 as index levels and 4-quarter moving-average percent changes.

| Amount per Outpatient Visit  | 175 | 190 | 197 | 203 | 167 | 173 | 178 | 181 | 182 |

\(^1\) Admissions per 1,000 population is calculated using age-group population estimates prepared by the Social Security Administration.

\(^2\) Adjusted patient days is an aggregate figure reflecting the number of days of inpatient care, plus an estimate of the volume of outpatient services, expressed in units equivalent to an inpatient day in terms of level of effort. It is derived by multiplying the number of outpatient visits by the ratio of outpatient revenue per outpatient visit to inpatient revenue per inpatient day, and adding the product to the number of inpatient days.

\(^3\) Adult occupancy rate is the ratio of average daily census to the average number of beds maintained during the reporting period.

NOTES: Q designates quarter of year. Quarterly data are not seasonally adjusted.

1 Unless otherwise noted, base year is 1982-84=100.
2 Includes the net cost of private health insurance, not shown separately.
3 Unless otherwise noted, base year is 1982=100. Producer price indexes are classified by industry (price changes received for the industry's output sold outside the industry) and commodity (price changes by similarity of end use or material composition).
4 Further detail for Producer Price Index industry groupings, such as types of physician practices, hospital diagnosis-related group groupings, etc., are available from the Bureau of Labor Statistics.

**NOTES:** Q designates quarter of year. Quarterly data are not seasonally adjusted.

| Personal Aid Equipment | | | | | | | | | |
| Medical Instruments and Equipment (6/82=100) | 1.5 | 2.2 | 2.1 | 0.5 | 1.7 | 1.4 | 1.5 | 1.2 | 2.2 |
| Surgical Appliances and Supplies (6/83=100) | 3.5 | 3.1 | 4.1 | 3.1 | 4.7 | 3.6 | 3.2 | 2.6 | 2.7 |
| Ophthalmic Goods (12/83=100) | 0.9 | 1.7 | 0.9 | 0.6 | 0.7 | 0.3 | 0.8 | 1.7 | 1.8 |
| Dental Equipment and Supplies (6/85=100) | 1.9 | 4.5 | 3.8 | 2.9 | 2.9 | 1.9 | 2.9 | 2.8 | 5.1 |

1 Unless otherwise noted, base year is 1982-84=100.
2 Includes the net cost of private health insurance, not shown separately.
3 Unless otherwise noted, base year is 1982=100. Producer price indexes are classified by industry (price changes received for the industry's output sold outside the industry) and commodity (price changes by similarity of end use or material composition).
4 Further detail for Producer Price Index industry groupings, such as types of physician practices, hospital diagnosis-related group groupings, etc., are available from the Bureau of Labor Statistics.

NOTES: Q designates quarter of year. Quarterly data are not seasonally adjusted.

1 For data sources used to estimate the input price index relative weights and choice of price proxies, see the September 4, 1990, Federal Register.

2 For the most recent PPS update for payment rates, see the June 2, 1995, Federal Register.

3 Category weights may not sum to total or subtotals because of detail not included.

4 The HCFA Occupational Wage and Occupational Benefits Indexes are computed as the weighted average of 10 ECI categories (ECI for hospital workers and 9 ECI occupational categories).

5 Represents a subtotal. Detailed categories not shown are listed below by subtotal, detailed category, and base year weight: Energy and Utilities: Fuel Oil, Coal, and Other Fuel (0.524), Electricity (1.135), Natural Gas (0.343), and Motor Gasoline (0.230). Other Products: Paper Products (1.399), Apparel (1.142), Machinery and Equipment (0.497), and Miscellaneous Products (0.533). Food: Direct Purchase (2.111) and Contract Service (1.188). Other Services: Transportation and Shipping (1.233), Telephone (0.957), Blood Services (0.595), Postage (0.372), Other—Labor Intensive (1.233), and Other—Non-Labor Intensive (0.600).

| 123.9   | 124.5   | 125.2   | 128.0   | 128.3   | 128.7   | 129.5   | 131.5   | 132.3   | 133.1   | 134.5   | 136.4   |         |
| 141.3   | 142.2   | 143.7   | 145.0   | 146.0   | 147.3   | 148.5   | 149.7   | 150.5   | 152.2   | 153.5   | 155.0   |         |

### Notes:
- A dash (—) in the Price/Wage Variable column denotes a total or subtotal produced by adding 2 or more categories.
- ECI represents Employment Cost Index, PPI represents Producer Price Index, and AHE represents average hourly earnings.
- HCFA is Health Care Financing Administration.
- W/S is wages and salaries. FY is fiscal year.
- Q designates quarter of year.
- The 4-quarter moving-average percent change for the quarter indicated by the column heading is the rate of change in the average index level for 4 quarters ending in that quarter over the same period of the previous year. The 4-quarter moving-average index level for the quarter indicated by the column heading is computed by summing the index level for that quarter and the prior 3 quarters and dividing by 4. The process is repeated to compute the 4-quarter moving-average index level for the same quarter a year ago. The average index level for the quarter indicated by the column heading is divided by the average index level of the same quarter a year ago, and the quotient is subtracted from 1 and multiplied by 100 to determine the 4-quarter moving-average percent change in the index.

NOTES: A dash (—) in the Price/Wage Variable column denotes a total or subtotal produced by adding 2 or more categories. AHE represents average hourly earnings, BIE represents Bureau of Economic Analysis, IPD represents implicit price deflator from the Department of Commerce, CPI(U) represents Consumer Price Index for all urban consumers, and PPI represents Producer Price Index. CY is calendar year, Q designates quarter of year. An example of how a percent change is calculated is shown in the Notes at end of Table 9.

SOURCES: Health Care Financing Administration, Office of the Actuary; Data from the Office of National Health Statistics, Division of Health Cost Analysis. Second quarter 1995 forecasts were produced under contract to HCFA by Data Resources, Inc./McGraw-Hill.

| Miscellaneous Costs       | CPI(U)—All Items            | 7.100             | 3.1  | 3.1  | 3.0  | 2.9  |
| Contract Services         | Composite—All Other Costs<sup>3</sup> | 5.870      | 3.9  | 3.7  | 3.4  | 3.1  |

<sup>1</sup> For data sources used to estimate the input price index relative weights and choice of price proxies, see the July 8, 1993, Federal Register.

<sup>2</sup> For the latest HHA regulation, see the February 14, 1995, Federal Register.

<sup>3</sup> Category weights may not sum to total because of rounding.

<sup>3</sup> The price/wage variable for Contract Services, Composite—All Other Costs, is the composite of all other HHA cost category weights and variables in the HHA input price index.

NOTES: AHE represents average hourly earnings, BEA represents Bureau of Economic Analysis, and CPI(U) represents Consumer Price Index for all urban consumers. A dash (—) in the Price/Wage Variable column denotes a total or subtotal produced by adding 2 or more categories.

Q designates quarter of year. An example of how a percent change is calculated is shown in the Notes at end of Table 9. CY is calendar year.

SOURCES: Health Care Financing Administration, Office of the Actuary: Data from the Office of National Health Statistics, Division of Health Cost Analysis. Second quarter 1995 forecasts were produced under contract to HCFA by Data Resources, Inc./McGraw-Hill.

1 For data sources used to estimate the index relative weights and choice of price proxies, see the November 25, 1992, Federal Register.
2 Category weights may not sum to total because of rounding.
3 Series are adjusted for productivity using 10-year moving average of output per hour for the non-farm business sector. All series in the compensation portion of the MEI are adjusted for productivity, so both economywide productivity and physician-practice productivity are not included in the update.
