In this paper, we study the boundary value problem of a fractional $q$-difference equation with nonlocal integral boundary conditions on the half-line. Using the properties of the Green function and monotone iterative method, the extremal solutions are obtained. Finally, an example is presented to illustrate our main results.

1. Introduction

In this paper, we are concerned with the following fractional $q$-differential equation with integral boundary value problem on the half-line:

\[
\begin{cases}
D_q^\alpha u(t) + f(t,u(t),D_q^{\alpha-1} u(t),D_q^{\alpha-2} u(t),\ldots,D_q^{\alpha-(n-1)} u(t)) = 0, & n-1 < \alpha \leq n, \\
u(0) = D_q^j u(0) = 0, & j = 1, \ldots, n-2, \\
D_q^{\alpha-1} u(+\infty) = \int_0^{\infty} g(t)u(t)d_qt,
\end{cases}
\]  

(1)

where $t \in J = [0, +\infty)$, $D_q^\alpha$ and $D_q^{\alpha-j}$ are the fractional $q$-derivative of Riemann–Liouville type of order $\alpha$ and $\alpha - j$, $D_q^\alpha u$ is the $q$-derivative of order $j$, $0 < q < 1$, $n \in \mathbb{N}, n \geq 3$, $f \in C(J \times \mathbb{R}^n, J)$, and $g$ is a given function and satisfies some conditions which will be given later.

The $q$-difference calculus was initially developed by Jackson [1, 2] and had proved to have important applications in many subjects, such as quantum mechanics, complex analysis, and hypergeometric series. The fractional $q$-difference calculus had its origin in the works by Al-Salam [3] and Agarwal [4]. Due to the development of the fractional differential equations, fractional $q$-differential equations, regarded as fractional analogue of $q$-difference equations, have been studied by several researchers, especially, about the existence of the solutions for the boundary value problems (see [5–22] and the references therein).
In [21], Yang studied the coupled integral boundary value problem for systems of nonlinear fractional q-difference equations as follows:
\[
\begin{align*}
D_q^\mu u(t) + \lambda f(t, u(t), v(t)) &= 0, \\
D_q^\nu v(t) + \lambda g(t, u(t), v(t)) &= 0, \quad t \in (0, 1), \\
D_q^\alpha u(0) &= D_q^\alpha v(0) = 0, \quad 0 \leq j \leq n - 2, \\
u(1) &= \mu \int_0^1 v(s)d_q s, \\
v(1) &= v \int_0^1 u(s)d_q s,
\end{align*}
\]
where \( \lambda, \mu, \) and \( \nu \) are three parameters with \( 0 < \mu < [\beta]_q \) and \( 0 < \nu < [\alpha]_q \), \( \alpha, \beta \in (n - 1, n] \) are two real numbers and \( n \geq 3 \), and \( D_q^\alpha \) and \( D_q^\nu \) are the fractional q-derivative of Riemann–Liouville type. By applying the non-linear alternative of Leray–Schauder type and Krasnoselskii’s fixed point theorems, the authors obtain some sufficient conditions for the existence of positive solutions to the considered problem.

In [14], Wang et al. investigated the following nonlinear fractional q-difference equation with q-integral boundary condition:
\[
\begin{align*}
D_q^\beta u(t) + f(t, u(t), (I_q^\beta u)(t)) &= 0, \quad t \in (0, 1), \\
D_q^\alpha u(0) &= 0, \quad 0 \leq j \leq n - 2, \\
u(1) &= \mu \int_0^1 u(s)d_q s,
\end{align*}
\]
where \( \alpha \in (n - 1, n) \), \( n \geq 3 \), \( \mu \) is a parameter with \( 0 < \mu < [\alpha]_q \), \( \beta > 0 \), and \( D_q^\alpha \) is the fractional q-derivative of Riemann–Liouville type. By applying the hybrid monotone method, the existence and uniqueness of the positive solution of the q-integral boundary problem are obtained.

In [17], the authors investigate the existence of solutions for the following boundary value problem of nonlinear fractional q-difference equations on the half-line
\[
\begin{align*}
D_q^\beta u(t) + f(t, u(t), v(t)) &= 0, \\
D_q^\alpha u(0) &= 0, \\
D_q^{\alpha - 1} u(\infty) &= \sum_{i=1}^{m} a_i u(\xi_i),
\end{align*}
\]
where \( 1 < \alpha < 2 \), \( 0 \leq \sum_{i=1}^{m} a_i < \Gamma_q(a) \). \( D_q^\alpha \) is the q-derivative of Riemann–Liouville type of order \( \alpha \). By means of Schauder fixed point theorem and Leggett–Williams fixed point theorem, some results on existence and multiplicity of solutions to the above boundary value problem are obtained.

To the best of our knowledge, there are few papers that consider the boundary value of nonlinear fractional q-difference equations with nonlocal conditions on the half-line, although the study of such problems is very important. In [17], the authors only proved the existence and multiplicity of solutions, for the uniqueness of positive solutions without being given. Moreover, how to seek the solutions? It is very important and helpful for computational purpose. This thought motivates the research of iterative schemes of positive solutions for problem (1). We should mention that the paper has some new features. Firstly, we consider the infinite interval problem for higher-order nonlinear fractional q-difference equation with integral boundary conditions. Secondly, the nonlinearity relies on the lower-order fractional q-derivative of unknown function. Our main purpose of this paper is by constructing a suitable Banach space, defining appropriate operators, and using the monotone iterative method, which is different from the method in [17] to obtain the existence and uniqueness of positive solutions.

2. Preliminaries on q-Calculus and Lemmas

Here we recall some definitions and fundamental results on fractional q-integral and fractional q-derivative. For more information regarding fractional q-calculus, see [23].

Let \( q \in (0, 1) \) and define
\[
[a]_q = \frac{1 - q^a}{1 - q}, \quad a \in \mathbb{R}.
\]

The q-analogue of the power function \((a - b)^{(n)}\) with \( n \in \mathbb{N}_q \) is
\[
(a - b)^{(0)} = 1,
\]
\[
(a - b)^{(n)} = \prod_{k=0}^{n-1} (a - bq^k), \quad n \in \mathbb{N}, a, b \in \mathbb{R}.
\]

More generally, if \( a \in \mathbb{R} \), then
\[
(a - b)^{(a)} = a^\infty \prod_{n=0}^{\infty} (a - bq^n).
\]

If \( b = 0 \), then \( a^{(a)} = a^a \). The q-gamma function is defined by
\[
\Gamma_q(s) = \frac{(1 - q)^{(s-1)}}{(1 - q^s)^{1+}}, \quad s \in \mathbb{R}, [0, -1, -2, \ldots],
\]
and satisfies \( \Gamma_q(s + 1) = [s]_q \Gamma_q(s) \). The q-derivative of a function \( u \) is defined by
\[
(D_q u)(s) = \frac{u(s) - u(qs)}{(1 - q)s},
\]
and q-derivative of higher order by
\[
(D_q^m u)(s) = \frac{u(s) - u(q^n s)}{(1 - q^n s)}.
\]

The q-integral of a function \( f \) defined in the interval \([0, b]\) is given by
\[
(I_q f)(s) = \int_0^s f(t) d_q t = s(1 - q) \sum_{n=0}^{\infty} f(sq^n) q^n, \quad s \in [0, b].
\]

If \( a \in [0, b] \) and \( u \) is defined in the interval \([0, b]\), its integral from \( a \) to \( b \) is defined by
\[
\int_a^b u(t)d_q t = \int_0^1 (t) d_q t - \int_0^a u(t) d_q t. \tag{12}
\]

Similar to that for derivatives, an operator \(I_q^\alpha\) can be defined, namely,
\[
\left(I_q^\alpha u\right)(s) = u(s) \quad \text{and} \quad \left(I_q^n u\right)(s) = I_q^\alpha \left(I_q^{n-1} u\right)(s), \quad n \in N.
\]

(13)

The fundamental theorem of calculus applies to these operators \(I_q\) and \(D_q\), i.e.,
\[
\left(D_qI_q u\right)(s) = u(s), \tag{14}
\]
and if \(u\) is continuous at \(s = 0\), then
\[
\left(I_qD_q u\right)(s) = u(s) - u(0). \tag{15}
\]

The basic properties of the two operators can be found in the book [23].

The following definition was considered first in [4].

\textbf{Definition 1} (see [4]). Let \(\alpha \geq 0\) and \(u\) be a function defined on \([0, 1]\). The fractional \(q\)-integral of the Riemann–Liouville type is \((I_q^\alpha u)(s) = u(s)\) and
\[
\left(I_q^\alpha u\right)(s) = \frac{1}{\Gamma_q(\alpha)} \int_0^s (s - qt)^{(\alpha-1)} u(t)d_q t, \quad \alpha > 0, s \in [0, 1].
\]

(16)

\textbf{Definition 2} (see [24]). The fractional \(q\)-derivative of the Riemann-Liouville type of order \(\alpha \geq 0\) is defined by \((D_q^\alpha u)(s) = u(s)\) and
\[
\left(D_q^\alpha u\right)(s) = \left(D_q^{m-\alpha} I_q^m u\right)(s), \quad \alpha > 0, \tag{17}
\]
where \(m\) is the smallest integer greater than or equal to \(\alpha\).

\textbf{Lemma 1} (see [4, 24]). Let \(\alpha, \beta \geq 0\) and \(u\) be a function defined on \([0, 1]\). Then, the following formulas hold:
\[
\begin{align*}
(1) & \quad (I_q^\beta I_q^\alpha u)(s) = (I_q^{\alpha+\beta} u)(s) \\
(2) & \quad (D_q^\alpha I_q^\beta u)(s) = u(s)
\end{align*}
\]

(18)

\textbf{Lemma 2} (see [25]). Let \(\alpha > 0\) and \(n\) be a positive integer. Then, the following equality holds:
\[
\left(I_q^n D_q^\alpha u\right)(s) = \left(D_q^n I_q^\alpha u\right)(s) - \sum_{k=0}^{n-1} \frac{s^{\alpha-n+k}}{\Gamma_q(a + k - n + 1)} \left(D_q^k u\right)(0).
\]

(19)

\textbf{Lemma 3} (see [24]). For \(\beta \in \mathbb{R}^+, \lambda \in (-\infty, 0)\), the following is valid:
\[
I_q^\beta \left((s-a)^{(\lambda)}\right) = \frac{\Gamma_q(\lambda + 1)}{\Gamma_q(\beta + \lambda + 1)} (s-a)^{(\beta+\lambda)}, \quad 0 < a < x < b.
\]

(20)

In the following, we introduce the hypotheses that will be used in subsequent proof:

\((H_1)\): \(g(t)\) satisfies \(\int_0^\infty t^{-\alpha-1} g(t)d_q t = \Lambda < \Gamma_q(\alpha)\) and \(f(t, 0, \ldots, 0) \equiv 0, \forall t \in J = [0, +\infty)\).

\((H_2)\): there exist nonnegative functions \(a_0(t), a_i(t) \in L_q[0, +\infty)\) and constants \(\lambda_i \geq 0\) satisfying
\[
\begin{align*}
\left|f(t, u_1, u_2, \ldots, u_n)\right| & \leq a_0(t) + \sum_{i=1}^n a_i(t) |u_i|^{\lambda_i}, \quad \forall t \in J, u \in \mathbb{R}, i = 1, 2, \ldots, n \\
\int_0^{\infty} a_0(t)d_q t & = a_0 < +\infty \\
\int_0^{\infty} (1 + t^{\alpha-1})^{\lambda_1} a_1(t)d_q t & = a_1 < +\infty \\
\int_0^{\infty} a_2(t)d_q t & < +\infty \\
\int_0^{\infty} (1 + t^{\alpha-1})^{\lambda_i} a_i(t)d_q t & = a_i < +\infty, \quad i = 3, \ldots, n.
\end{align*}
\]
Lemma 4. Assume that $g(t)$ satisfies condition (H$_3$), then fractional $q$-differential equation

$$
\begin{cases}
D_q^\alpha u(t) + h(t) = 0, & n - 1 < \alpha \leq n, \\
u(0) = D_q^1u(0) = 0, & j = 1, \ldots, n - 2,
\end{cases}
$$

has a unique integral representation

$$
u(t) = \int_0^\infty G(t, qs)h(s)d_qs,
$$

where

$$
G(t, qs) = G_1(t, qs) + G_2(t, qs),
$$

\begin{align*}
G_1(t, qs) &= \frac{1}{\Gamma_q(\alpha)} \left\{ \begin{array}{ll}
t^{\alpha-1} - (t - qs)^{(\alpha-1)}, & 0 \leq s \leq t + \infty, \\
t^{\alpha-1}, & 0 \leq t \leq s + \infty,
\end{array} \right. \\
G_2(t, qs) &= \frac{t^{\alpha-1}}{\Gamma_q(\alpha) - \Lambda} \int_0^\infty g(t)G_1(t, qs)d_qt.
\end{align*}

Proof. In view of Definition 2 and Lemma 1, we see that

$$
u(t) = \frac{1}{\Gamma_q(\alpha)} \int_0^t (t - qs)^{(\alpha-1)}h(s)d_qs + \frac{t^{\alpha-1}}{\Gamma_q(\alpha)} \left( \int_0^\infty h(s)d_qs + \int_0^\infty g(t)u(t)d_qt \right)
$$

$$
= \frac{1}{\Gamma_q(\alpha)} \int_0^\infty t^{\alpha-1}h(s)d_qs - \frac{1}{\Gamma_q(\alpha)} \int_0^t (t - qs)^{(\alpha-1)}h(s)d_qs + \frac{t^{\alpha-1}}{\Gamma_q(\alpha)} \int_0^\infty g(t)u(t)d_qt
$$

$$
= \int_0^\infty G_1(t, qs)h(s)d_qs + \frac{t^{\alpha-1}}{\Gamma_q(\alpha)} \int_0^\infty g(t)u(t)d_qt.
$$
Equation (33) is multiplied by \( g(t) \) and \( q \)-integrating from 0 to \(+\infty\), and we obtain

\[
\int_{0}^{\infty} g(t)u(t)\,dt = \int_{0}^{\infty} g(t)\left( \int_{0}^{\infty} G_1(t,qs)h(s)\,ds \right)\,dt + \frac{\Lambda}{\Gamma_q(\alpha)} \int_{0}^{\infty} g(t)u(t)\,dt. \tag{34}
\]

From (34), we get

\[
\int_{0}^{\infty} g(t)u(t)\,dt = \frac{\Gamma_q(\alpha)}{\Gamma_q(\alpha) - \Lambda} \int_{0}^{\infty} g(t)\left( \int_{0}^{\infty} G_1(t,qs)h(s)\,ds \right)\,dt. \tag{35}
\]

Combining (33) and (35), we have

\[
u(t) = \int_{0}^{\infty} G_1(t,qs)h(s)\,ds + \int_{0}^{\infty} G_2(t,qs)h(s)\,ds = \int_{0}^{\infty} G(t,qs)h(s)\,ds. \tag{36}
\]

The proof is completed.  

Lemma 5. From Lemma 4, by direct calculation, we have

\[
D_q^{a-1}u(t) = \int_{0}^{\infty} \frac{t^{i-1}}{\Gamma_q(t)} \left[ t^{i-1} - (t - qs)^{(i-1)} \right] G_i(t,qs)h(s)\,ds, \quad i = 1, 2, \ldots, n-1, \tag{37}
\]

where

\[
G_i(t,qs) = G_{i1}(t,qs) + G_{i2}(t,qs),
\]

\[
G_{i1}(t,qs) = \frac{1}{\Gamma_q(t)} \left\{ t^{i-1} - (t - qs)^{(i-1)} \right\}, \quad 0 \leq s \leq t \leq +\infty,
\]

\[
G_{i1}(t,qs) = \frac{\Gamma_q(\alpha)}{\Gamma_q(t)(\Gamma_q(\alpha) - \Lambda)} \int_{0}^{\infty} g(t)G_1(t,qs)\,dt.
\]

\[
0 \leq G_1(t,qs) \leq \frac{t^{a-1}}{\Gamma_q(\alpha)}, \tag{39}
\]

\[
0 \leq G_2(t,qs) \leq \frac{t^{a-1}}{\Gamma_q(\alpha) - \Lambda} \int_{0}^{\infty} g(t)\frac{t^{a-1}}{\Gamma_q(\alpha)}\,ds = \frac{\Lambda t^{a-1}}{\Gamma_q(\alpha)(\Gamma_q(\alpha) - \Lambda)}. \tag{39}
\]

The above two inequalities imply that
$0 \leq G(t,qs) = G_1(t,qs) + G_2(t,qs) \leq \frac{t^{n-1}}{\Gamma_q(\alpha)} \frac{\Lambda t^{n-1}}{\Gamma_q(\alpha)(\Gamma_q(\alpha) - \Lambda)} = \frac{t^{n-1}}{\Gamma_q(\alpha)}$ \hspace{1cm} (40)

The proof is completed. \hspace{1cm} \square

**Lemma 7.** Function $G_i^*(t,qs)$ defined in Lemma 5 satisfies the following conditions:

\[0 \leq G_i^*(t,qs) \leq \frac{\Gamma_q(\alpha) t^{i-1}}{\Gamma_q(i)(\Gamma_q(\alpha) - \Lambda)}, \quad i = 1, 2, \ldots, n - 1,
\]

\[0 \leq G_i^*(t,qs) \leq \frac{\Gamma_q(\alpha) t^{i-1}}{1 + t^{i-1}} \leq \frac{1}{\Gamma_q(i)(\Gamma_q(\alpha) - \Lambda)} \quad \text{for all} \quad 0 \leq t, s \leq + \infty.
\]

**Proof.** For $0 \leq t, s \leq + \infty$ and $i = 1, 2, \ldots, n - 1$, by Remark 2 and Lemma 5, it is easy to get

\[0 \leq G_i^*(t,qs) \leq \frac{t^{i-1}}{\Gamma_q(i)},
\]

\[0 \leq G_i^*(t,qs) \leq \frac{\Gamma_q(\alpha) t^{i-1}}{\Gamma_q(i)(\Gamma_q(\alpha) - \Lambda)} \int_0^{+\infty} g(t) \frac{t^{n-1}}{\Gamma_q(\alpha)} \text{d}_q s = \frac{t^{i-1} \Lambda}{\Gamma_q(i) \Gamma_q(\alpha) - \Lambda},
\]

This gives for, $i = 2, \ldots, n - 1$,

\[0 \leq G_i^*(t,qs) \leq \frac{t^{i-1}}{\Gamma_q(i)} + \frac{t^{i-1} \Lambda}{\Gamma_q(i)(\Gamma_q(\alpha) - \Lambda)} = \frac{\Gamma_q(\alpha) t^{i-1}}{\Gamma_q(i)(\Gamma_q(\alpha) - \Lambda)},
\]

\[0 \leq G_i^*(t,qs) \leq \frac{\Gamma_q(\alpha) t^{i-1}}{1 + t^{i-1}} \leq \frac{1}{\Gamma_q(i)(\Gamma_q(\alpha) - \Lambda)} \quad \text{for all} \quad 0 \leq t, s \leq + \infty.
\]

In the following, we will construct a suitable Banach space. Let

\[X = \left\{ u | u, D_q^{n-1}u, D_q^{n-i}u \in C[0, +\infty), \left\| \frac{u}{1 + t^{\alpha-1}} \right\|_{\infty} < \infty, \left\| D_q^{n-1}u \right\|_{\infty} < \infty, \left\| \frac{D_q^{n-i}u}{1 + t^{i-1}} \right\|_{\infty} < \infty, \quad i = 2, \ldots, n - 1 \right\}, \quad (44)
\]

with the norm

\[\|u\| = \max \left\{ \left\| \frac{u}{1 + t^{\alpha-1}} \right\|_{\infty}, \left\| D_q^{n-i}u \right\|_{\infty}, \left\| D_q^{n-1}u \right\|_{\infty}, \quad i = 2, \ldots, n - 1 \right\}, \quad (45)
\]

where $\|u\|_{\infty} = \sup_{t \in \mathbb{J}} |u(t)|$, $J = [0, +\infty)$. 
Let $B \subset X$ be a bounded set. Then, $B$ is relatively compact in $X$ if the following conditions hold:

(i) $(u/1 + t^{a-1})u \in B$,
\[ (D^q_{a-1}u/1 + t^{i-1})u \in B, \quad D^q_{a-1}u \in B, \quad i = 2, \ldots, n-1 \]
are equicontinuous on $[0, T]$ for any $T \in [0, \infty)$

(ii) For $\forall \epsilon > 0$, $\exists T(\epsilon) > 0$ such that for any $t_1, t_2 \geq T(\epsilon), u \in B$, the following inequalities hold:
\[ \left| \frac{u(t_2)}{1 + t_2^{a-1}} - \frac{u(t_1)}{1 + t_1^{a-1}} \right| < \epsilon, \]
\[ \left| D^q_{a-1}u(t_2) - D^q_{a-1}u(t_1) \right| < \epsilon, \quad i = 2, \ldots, n-1. \]

Proof. The method is similar to the proof of Lemma 2.3 in [26], so we omit the details.

Lemma 9. If condition $(H_2)$ holds, then for $u \in X$, we have
\[ \int_0^{\infty} \left| f(t, u(t), D^q_{a-1}u(t), \ldots, D^q_{a-(n-1)}u(t)) \right| \, dt \leq a_0 + \sum_{i=1}^{n} a_i \|u\|^h. \] (47)

Proof. For $u \in X$, by condition $(H_2)$, we have

\[ \int_0^{\infty} \left| f(t, u(t), D^q_{a-1}u(t), \ldots, D^q_{a-(n-1)}u(t)) \right| \, dt \leq a_0 + \sum_{i=1}^{n} a_i \|u\|^h. \] (48)

Lemma 10. If condition $(H_3)$ holds, then for $u \in X$, we have
\[ \int_0^{\infty} \left| f(t, u(t), D^q_{a-1}u(t), \ldots, D^q_{a-(n-1)}u(t)) \right| \, dt \leq \kappa + \sum_{i=1}^{n} b_i \|u\|. \] (49)

Proof. For $u \in X$, by condition $(H_3)$, we have

\[ \int_0^{\infty} \left| f(t, u(t), D^q_{a-1}u(t), \ldots, D^q_{a-(n-1)}u(t)) \right| \, dt \leq \kappa + \sum_{i=1}^{n} b_i \|u\|. \] (50)
Define the cone $P \subset X$ by
\[ P = \left\{ u \in X | u(t) \geq 0, \quad D_0 t^{-i} u(t) \geq 0, \quad t \in J, \ i = 1, 2, \ldots, n - 1 \right\}, \tag{51} \]
and define the operator $\mathcal{T} : P \to P$ as follows:
\[ \mathcal{T} u(t) = \int_0^t G(t,qs) f(s, u(s), D_0 t^{-i} u(s), \ldots, D_0^{i-1} u(s)) ds. \tag{52} \]

We also define
\[ D_q^{a_i} \mathcal{T} u(t) = \int_0^t G_q^* (t,qs) f(s, u(s), D_0 t^{-i} u(s), \ldots, D_0^{i-1} u(s)) ds. \tag{53} \]

It is easy to see problem (1) has a solution, if and only if the operator $\mathcal{T}$ has a fixed point. \hfill \Box

**Lemma 11.** If conditions $(H_1)$ and $(H_2)$ hold, then the operator $\mathcal{T} : P \to P$ is completely continuous.

**Proof.** It is easy to see $\mathcal{T} : P \to P$. Since $G(t,qs) \geq 0$ and $f \geq 0$, we know $\mathcal{T}(u)(t) \geq 0$, for $u \in P$, $t \in J$. In the following, we divide the proof into four steps:

Step 1: We show that $\mathcal{T}$ is uniformly bounded. Let $\Omega$ be any bounded subset of $P$, i.e., there exists $M > 0$ such that $\|u\| \leq M$ for each $u \in \Omega$. We only need to show that $\mathcal{T} u$ is bounded in $P$. For $u \in \Omega$, by Lemmas 5 and 8, we have

\[ \mathcal{T} u \|_\infty = \sup_{t \in J} \mathcal{T} u = \sup_{t \in J} \left| \int_0^t G(t,qs) f(s, u(s), D_0 t^{-i} u(s), \ldots, D_0^{i-1} u(s)) ds \right| \]

\[ \leq \frac{1}{\Gamma_q (\alpha) - \Lambda} \left( a_0 + \sum_{k=1}^{n} a_k \|u\|^{k} \right) \leq \frac{1}{\Gamma_q (\alpha) - \Lambda} \left( a_0 + \sum_{k=1}^{n} a_k M^{k} \right). \tag{54} \]

By Lemmas 5, 7, and 9, we have

\[ \left\| D_q^{a_i} \mathcal{T} u \right\|_\infty = \sup_{t \in J} \left| D_q^{a_i} \mathcal{T} u \right| = \sup_{t \in J} \left| \int_0^t G_q^* (t,qs) f(s, u(s), D_0 t^{-i} u(s), \ldots, D_0^{i-1} u(s)) ds \right| \]

\[ \leq \frac{\Gamma_q (\alpha)}{\Gamma_q (\alpha) - \Lambda} \left( a_0 + \sum_{k=1}^{n} a_k \|u\|^{k} \right), \quad i = 2, 3, \ldots, n - 1 \tag{55} \]

\[ \leq \frac{\Gamma_q (\alpha)}{\Gamma_q (\alpha) - \Lambda} \left( a_0 + \sum_{k=1}^{n} a_k M^{k} \right), \quad i = 2, 3, \ldots, n - 1, \]

\[ \left\| D_q^{a_i} \mathcal{T} u \right\|_\infty = \sup_{t \in J} \left| \int_0^t G_q^* (t,qs) f(s, u(s), D_0 t^{-i} u(s), \ldots, D_0^{i-1} u(s)) ds \right| \]

\[ \leq \frac{\Gamma_q (\alpha)}{\Gamma_q (\alpha) - \Lambda} \left( a_0 + \sum_{k=1}^{n} a_k \|u\|^{k} \right) \leq \frac{\Gamma_q (\alpha)}{\Gamma_q (\alpha) - \Lambda} \left( a_0 + \sum_{k=1}^{n} a_k M^{k} \right). \tag{56} \]

From (54)–(56), we obtain

\[ \| \mathcal{T} u \| \leq \left( a_0 + \sum_{k=1}^{n} a_k M^{k} \right) \max \left\{ \frac{1}{\Gamma_q (\alpha) - \Lambda} \frac{\Gamma_q (\alpha)}{\Gamma_q (\alpha) - \Lambda} \frac{\Gamma_q (\alpha)}{\Gamma_q (\alpha) - \Lambda}, \quad i = 2, 3, \ldots, n - 1 \right\}, \tag{57} \]
which means that $T u$ is uniformly bounded.

Step 2: we show that the operator $T$ is equicontinuous for all $u \in \Omega$ on any compact interval $I$ of $J$. For any given $T > 0$, $t_1, t_2 \in [0, T]$ and $t_2 > t_1, u \in \Omega$, we have

$$\begin{align*}
\frac{|T u(t_2) - T u(t_1)|}{1 + t_2^{\alpha - 1} - t_1^{\alpha - 1}} &= \left| \int_0^{+\infty} \left( \frac{G(t_2, qs)}{1 + t_2^{\alpha - 1}} - \frac{G(t_1, qs)}{1 + t_1^{\alpha - 1}} \right) f(s, u(s), D_q^{a-1} u(s), \ldots, D_q^{a-(n-1)} u(s)) ds \right| \\
&\leq \int_0^{+\infty} \left| \frac{G_1(t_2, qs)}{1 + t_2^{\alpha - 1}} - \frac{G_1(t_1, qs)}{1 + t_1^{\alpha - 1}} \right| f(s, u(s), D_q^{a-1} u(s), \ldots, D_q^{a-(n-1)} u(s)) ds \\
&\quad + \int_0^{+\infty} \left| \frac{G_2(t_2, qs)}{1 + t_2^{\alpha - 1}} - \frac{G_2(t_1, qs)}{1 + t_1^{\alpha - 1}} \right| f(s, u(s), D_q^{a-1} u(s), \ldots, D_q^{a-(n-1)} u(s)) ds. \\
\end{align*}$$

By Lemmas 5 and 6, we have

$$\begin{align*}
\int_0^{+\infty} &\left| \frac{G_2(t_2, qs)}{1 + t_2^{\alpha - 1}} - \frac{G_2(t_1, qs)}{1 + t_1^{\alpha - 1}} \right| f(s, u(s), D_q^{a-1} u(s), \ldots, D_q^{a-(n-1)} u(s)) ds \\
&\leq \int_0^{+\infty} \frac{1}{\Gamma(q(\alpha) - A)} \left| \frac{t_2^{\alpha - 1} - t_1^{\alpha - 1}}{(1 + t_2^{\alpha - 1})(1 + t_1^{\alpha - 1})} \right| f(s, u(s), D_q^{a-1} u(s), \ldots, D_q^{a-(n-1)} u(s)) ds \longrightarrow 0. \\
\end{align*}$$

On the other hand, for all $u \in \Omega$, $t_1 \rightarrow t_2$, we have

$$\begin{align*}
\int_0^{+\infty} &\left| \frac{G_1(t_2, qs)}{1 + t_2^{\alpha - 1}} - \frac{G_1(t_1, qs)}{1 + t_1^{\alpha - 1}} \right| f(s, u(s), D_q^{a-1} u(s), \ldots, D_q^{a-(n-1)} u(s)) ds \\
&\leq \int_0^{t_2} \left| \frac{t_2^{\alpha - 1} - t_1^{\alpha - 1} - (t_2 - q s)^{a-1} + (t_1 - q s)^{a-1}}{\Gamma(q(\alpha) - 1 + t_2^{\alpha - 1})} \right| f(s, u(s), D_q^{a-1} u(s), \ldots, D_q^{a-(n-1)} u(s)) ds \\
&\quad + \int_{t_1}^{t_2} \left| \frac{t_2^{\alpha - 1} - t_1^{\alpha - 1} - (t_2 - q s)^{a-1}}{\Gamma(q(\alpha) - 1 + t_2^{\alpha - 1})} \right| f(s, u(s), D_q^{a-1} u(s), \ldots, D_q^{a-(n-1)} u(s)) ds \\
&\quad + \int_0^{+\infty} \frac{t_2^{\alpha - 1} - t_1^{\alpha - 1}}{\Gamma(q(\alpha) - 1 + t_2^{\alpha - 1})} f(s, u(s), D_q^{a-1} u(s), \ldots, D_q^{a-(n-1)} u(s)) ds \longrightarrow 0. \\
\end{align*}$$
Similar to (60), for all \( u \in \Omega, t_1 \rightarrow t_2 \), we have

\[
\int_0^{\infty} \left| \frac{G_1(t_1, qs) - G_1(t_2, qs)}{1 + t_2^{-1}} \right| |f(s, u(s), D_q^{a-1}u(s), \ldots, D_q^{a-(n-1)}u(s))| ds.
\]

\[
\leq \int_0^{t_1} \int_0^{t_2} \left| \frac{q_1 - q_2}{t_1^{a-1} - t_2^{a-1}} \right| |f(s, u(s), D_q^{a-1}u(s), \ldots, D_q^{a-(n-1)}u(s))| ds.
\]

Together with (59)--(61), which implies that \((\mathcal{T} u(t))/1 + t^{a-1}\) is equicontinuous on any compact intervals of \([0, \infty)\).

Note that, from (53) and Lemma 5, we have

\[
D_q^{a-1} \mathcal{T} u(t) = \int_0^{\infty} G_1(t, qs) f(s, u(s), D_q^{a-1}u(s), \ldots, D_q^{a-(n-1)}u(s)) ds,
\]

where

\[
G_{t_1}(t, qs) = \begin{cases} 
0, & 0 \leq s \leq t \leq + \infty, \\
1, & 0 \leq t \leq s \leq + \infty,
\end{cases}
\]

\[
G_{t_2}^*(t, qs) = \frac{\Gamma_q(a)}{\Gamma_q(a) - \Lambda} \int_0^{\infty} g(t) G_1(t, qs) dt.
\]

which means \(G_1(t, qs)\) does not rely on \( t \). Hence, \( D_q^{a-1} \mathcal{T} u\) is equicontinuous on any compact intervals of \( I \).

In the following, we show that \( D_q^{a-i} \mathcal{T} u, i = 2, 3, \ldots, n-1 \), is equicontinuous on any compact intervals of \( I \). In fact, for any given \( T > 0, t_1, t_2 \in [0, T] \) and \( t_2 > t_1, u \in \Omega \), we have

\[
\left| \frac{D_q^{a-i} \mathcal{T} u(t_2)}{1 + t_2^{-1}} - \frac{D_q^{a-i} \mathcal{T} u(t_1)}{1 + t_1^{-1}} \right| = \left| \int_0^{\infty} \left( \frac{G_{t_2}^*(t, qs) - G_{t_1}^*(t, qs)}{1 + t_2^{-1} - t_1^{-1}} \right) f(s, u(s), D_q^{a-1}u(s), \ldots, D_q^{a-(n-1)}u(s)) ds \right|
\]

Inequalities (59)--(64) imply that the operator \( \mathcal{T} \) is equicontinuous on any compact intervals of \( I \).

Step 3: we show that \( \mathcal{T} \) is equiconvergent at \( \infty \). We need to prove that, for all \( \epsilon > 0 \), \( \exists T(\epsilon) > 0 \), such that, for any \( t_1, t_2 > T(\epsilon) \), the following inequalities hold:

\[
D_q^{a-i} \mathcal{T} u(t_1) - D_q^{a-i} \mathcal{T} u(t_2) \rightarrow 0, \quad as \ t_1 \rightarrow t_2.
\]
\[
\left| \mathcal{T} u(t_2) - \mathcal{T} u(t_1) \right| \leq \varepsilon, \\
\left| D_q^{\alpha} \mathcal{T} u(t_2) - D_q^{\alpha} \mathcal{T} u(t_1) \right| < \varepsilon, \\
\left| D_q^{\alpha} \mathcal{T} u(t_2) - D_q^{\alpha} \mathcal{T} u(t_1) \right| < \varepsilon, \quad i = 2, 3, \ldots, n - 1. 
\]
(66)

Note that, since the function \( G_i(t, s) \) does not rely on \( t \), it is easy to infer that
\[
\left| D_q^{\alpha} \mathcal{T} u(t_2) - D_q^{\alpha} \mathcal{T} u(t_1) \right| < \varepsilon, 
\]
i.e., \( D_q^{\alpha} \mathcal{T} u(t) \) is equiconvergent at \( +\infty \).

By \((H_i)\) and Lemma 9, for any \( \varepsilon > 0 \), there exists \( a > 0 \) such that
\[
\int_a^{\infty} f(s, u(s), D_q^{\alpha-1} u(s), \ldots, D_q^{\alpha-(n-1)} u(s)) \, ds < \varepsilon. 
\]
(68)

On the other hand, since
\[
\lim_{t \to \infty} \frac{t^\gamma}{1 + t^\gamma} = 1, 
\]
\[ y \in \{\alpha - 1, i - 1\}, \quad i = 2, \ldots, n - 1. \]
(69)

There exists sufficiently large \( T_1 > 0 \) such that for any \( t_1, t_2 > T_1 \), we have
Also because \( \lim_{t \to +\infty} \left( (t - q) (\alpha - 1)/1 + t^{\alpha - 1} \right) = 1 \), \( \theta \in \{\alpha, i\} \), \( i = 2, \ldots, n - 1 \), there exists sufficiently large \( T_2 > a \) such that, for any \( t_1, t_2 > T_3 \) and \( 0 \leq qs < s \leq a \), we have
\[
\left| \frac{(t_2 - qs)^{\alpha - 1}}{1 + t_2^{\alpha - 1}} - \frac{(t_1 - qs)^{\alpha - 1}}{1 + t_1^{\alpha - 1}} \right| < \varepsilon \quad \text{and} \quad \left| \frac{(t_2 - qs)^{(i - 1)}}{1 + t_2^{\alpha - 1}} - \frac{(t_1 - qs)^{(i - 1)}}{1 + t_1^{\alpha - 1}} \right| < \varepsilon, \quad i = 2, \ldots, n - 1. 
\]
(71)

Choose \( T > \max\{T_1, T_2\} \), for any \( t_1, t_2 > T \), and let \( t_1 \to t_2 \). For convenience, we denote \( F(s) = f(s, u(s), D_q^{\alpha-1} u(s), \ldots, D_q^{\alpha-(n-1)} u(s)) \), and we obtain

\[
\left| \mathcal{T} u(t_2) - \mathcal{T} u(t_1) \right| \leq \int_0^{\infty} \left| G_1(t_2, s) - G_1(t_1, s) \right| F(s) \, ds \leq \int_0^{\infty} \left| G_1(t_2, s) - G_1(t_1, s) \right| F(s) \, ds \leq \frac{1}{\Gamma_q(\alpha)} \int_0^{t_2} \left( \frac{t_2^{\alpha - 1}}{1 + t_2^{\alpha - 1}} - \frac{t_1^{\alpha - 1}}{1 + t_1^{\alpha - 1}} \right) F(s) \, ds + \frac{1}{\Gamma_q(\alpha)} \int_{t_2}^{\infty} \left| G_1(t_2, s) - G_1(t_1, s) \right| F(s) \, ds 
\]
(72)

\[
+ \frac{1}{\Gamma_q(\alpha)} \int_0^{t_1} \left( \frac{t_1^{\alpha - 1}}{1 + t_1^{\alpha - 1}} - \frac{t_2^{\alpha - 1}}{1 + t_2^{\alpha - 1}} \right) F(s) \, ds + \frac{1}{\Gamma_q(\alpha)} \int_{t_1}^{\infty} \left| G_1(t_2, s) - G_1(t_1, s) \right| F(s) \, ds 
\]

\[
+ \frac{1}{\Gamma_q(\alpha)} \int_0^{t_2} \left( \frac{t_2^{\alpha - 1}}{1 + t_2^{\alpha - 1}} - \frac{t_1^{\alpha - 1}}{1 + t_1^{\alpha - 1}} \right) F(s) \, ds + \frac{1}{\Gamma_q(\alpha)} \int_{t_1}^{\infty} \left| G_1(t_2, s) - G_1(t_1, s) \right| F(s) \, ds 
\]

\[
+ \frac{1}{\Gamma_q(\alpha)} \int_0^{t_1} \left( \frac{t_1^{\alpha - 1}}{1 + t_1^{\alpha - 1}} - \frac{t_2^{\alpha - 1}}{1 + t_2^{\alpha - 1}} \right) F(s) \, ds. 
\]
By (68) and (72), we obtain

\[
\left| \frac{\mathcal{T} u (t_2)}{1 + t_2^{\alpha - 1}} - \frac{\mathcal{T} u (t_1)}{1 + t_1^{\alpha - 1}} \right| \leq \frac{1}{\Gamma_q (\alpha)} \int_0^\infty \left( \left| \frac{t_2^{\alpha - 1} - t_1^{\alpha - 1}}{1 + t_2^{\alpha - 1}} + \left( \frac{t_2 - q s}{1 + t_2^{\alpha - 1}} - \frac{(t_1 - q s)^{\alpha - 1}}{1 + t_1^{\alpha - 1}} \right) \right| F (s) d_q s + \frac{1}{\Gamma_q (\alpha) - \Lambda} \int_0^\infty \left| \frac{t_2^{\alpha - 1} - t_1^{\alpha - 1}}{1 + t_2^{\alpha - 1}} + \left( \frac{t_2 - q s}{1 + t_2^{\alpha - 1}} - \frac{(t_1 - q s)^{\alpha - 1}}{1 + t_1^{\alpha - 1}} \right) \right| F (s) d_q s \right)
\]

\[
\leq \frac{1}{\Gamma_q (\alpha)} \max_{s \in [0, a], \alpha \in \Omega} F (s) + \frac{9}{\Gamma_q (\alpha)} \int_0^\infty F (s) d_q s + \frac{9 a^2 + \sum_{k=1}^n a_k M_k}{\Gamma_q (\alpha) - \Lambda} \varepsilon.
\]

Similar to (72) and (73), we obtain

\[
\left| \frac{D_q^{\alpha - i} \mathcal{T} u (t_2)}{1 + t_2^{\alpha - 1}} - \frac{D_q^{\alpha - i} \mathcal{T} u (t_1)}{1 + t_1^{\alpha - 1}} \right| \leq \left( 2 a \max_{s \in [0, a], \alpha \in \Omega} F (s) + \frac{9 a^2 + \sum_{k=1}^n a_k M_k}{\Gamma_q (\alpha) - \Lambda} \right) \varepsilon.
\]

From (67), (73), and (74), we obtain \( \mathcal{T} \) is equi-convergent at \( \infty \).

The above three steps and Lemma 8 imply that the operator \( \mathcal{T} : P \rightarrow P \) is relatively compact.

Step 4: we show that the operator \( \mathcal{T} : P \rightarrow P \) is continuous. For \( u_m \in P \), such that \( u_m \rightarrow u \) as \( m \rightarrow \infty \), and we need to show that \( \| \mathcal{T} u_m - \mathcal{T} u \| \rightarrow 0 \) as \( m \rightarrow \infty \).

By Lemma 6, the continuity of function \( f \), and the Lebesgue dominated convergence theorem, we obtain

\[
\left\| \mathcal{T} u_m - \mathcal{T} u \right\| \rightarrow 0 \quad \text{as} \quad m \rightarrow \infty.
\]
Similar to (75), by Lemmas 7 and 9, we get

$$
\left\| D_q^{a_i-1} \mathcal{T} u_m - D_q^{a_i-1} \mathcal{T} u \right\| \leq \frac{\Gamma_q(\alpha)}{\Gamma_q(\alpha) - \lambda} \int_0^{\infty} \left| \frac{f(s, u_m(s), D_q^{a_i-1} u_m(s), \ldots, D_q^{a_i-(n-1)} u_m(s))}{d_q s} - \frac{f(s, u(s), D_q^{a_i-1} u(s), \ldots, D_q^{a_i-(n-1)} u(s))}{d_q s} \right| \, d_q s \rightarrow 0, \text{ as } m \rightarrow \infty,
$$

(76)

$$
\left\| D_q^{a_i-1} \mathcal{T} u_m - D_q^{a_i-1} \mathcal{T} u \right\| \leq \frac{\Gamma_q(\alpha)}{\Gamma_q(\alpha) - \lambda} \int_0^{\infty} \left| \frac{f(s, u_m(s), D_q^{a_i-1} u_m(s), \ldots, D_q^{a_i-(n-1)} u_m(s))}{d_q s} - \frac{f(s, u(s), D_q^{a_i-1} u(s), \ldots, D_q^{a_i-(n-1)} u(s))}{d_q s} \right| \, d_q s \rightarrow 0, \text{ as } m \rightarrow \infty,
$$

(77)

for all $i = 2, 3, \ldots, n - 1$.

From (75)–(77), we have

$$
\left\| \mathcal{T} u_m - \mathcal{T} u \right\| \rightarrow 0, \text{ as } m \rightarrow \infty,
$$

(78)

which means that the operator $\mathcal{T}$ is continuous.

In view of all the above arguments, we deduce that the operator $\mathcal{T} : P \rightarrow P$ is completely continuous. This completes the proof.

3. Main Results

In this section, we give the main results of this paper. For convenience, we denote

$$
\rho_i = \frac{1}{\Gamma_q(i)(\Gamma_q(\alpha) - \lambda)} \quad i = 1, 2, \ldots, n - 1.
$$

(79)

Let

$$
L = \max\{\rho_1, \rho_1 \Gamma_q(\alpha), \rho_2 \Gamma_q(\alpha), \ldots, \rho_{n-1} \Gamma_q(\alpha)\}.
$$

(80)

We have the following two theorems.

Theorem 1. Assume that (H1), (H2), and (H4) hold. There exists a positive $R > 0$ such that problem (1) has two positive solutions $u^*$ and $v^*$ satisfying $0 \leq \|u^*\| \leq R$ and $0 \leq \|v^*\| \leq R$. Moreover, $\lim_{m \to \infty} u_m = u^*$ and $\lim_{m \to \infty} v_m = v^*$, $u_m$ and $v_m$ can be obtained by the following monotone iterative schemes:

$$
u_m = \mathcal{T} u_{m-1}, \text{ with } u_0(t) = R t^{a_i-1}, \quad m = 1, 2, \ldots,
$$

(81)

$$
v_m = \mathcal{T} v_{m-1}, \text{ with } v_0(t) = 0, \quad m = 1, 2, \ldots.
$$

(82)

In addition, we have

$$
v_0(t) \leq v_1(t) \leq \cdots \leq v_m(t) \leq \cdots \leq u^*(t) \leq \cdots \leq u_m(t) \leq \cdots \leq u_2(t) \leq u_1(t),
$$

(83)

$$
D_q^{a_i-1} v_0(t) \leq D_q^{a_i-1} v_1(t) \leq \cdots \leq D_q^{a_i-1} v_m(t) \leq \cdots \leq D_q^{a_i-1} u^*(t) \leq \cdots \leq D_q^{a_i-1} u_2(t) \leq D_q^{a_i-1} u_1(t), \quad i = 2, 3, \ldots, n - 1.
$$

(84)

Proof. First, Lemma 11 implies that $\mathcal{T} P \subset P$ for any $u \in P$ and $t \in J$. Next, let $0 \leq \lambda_k < 1$, $k = 1, 2, \ldots, n$. For the case $\lambda_k \geq 1$, the proof is similar to that of $0 \leq \lambda_k < 1$. Define $P_R = \{u \in P : \|u\| \leq R\}$, where $R$ satisfies

$$
R \geq \max \left\{(n+1)L \alpha_0, (n+1)L \alpha_1 \left(\frac{1}{1-\lambda_1}\right), \ldots, (n+1)L \alpha_n \left(\frac{1}{1-\lambda_n}\right)\right\}.
$$

(85)
For any $u \in P_R$, similar to (54)–(56), we obtain

$$\left\| T u \right\|_{\infty} \leq \frac{1}{\Gamma_q(\alpha) - \Lambda} \left( a_0 + \sum_{k=1}^{n} a_k R^k \right) = \rho_1 \left( a_0 + \sum_{k=1}^{n} a_k R^k \right) \leq L \left( a_0 + \sum_{k=1}^{n} a_k R^k \right) \leq R,$$

$$\left\| D^{\alpha - i} T u \right\|_{\infty} \leq \rho \Gamma_q(\alpha) \left( a_0 + \sum_{k=1}^{n} a_k R^k \right), \hspace{1em} i = 2, 3, \ldots, n - 1$$

$$\leq L \left( a_0 + \sum_{k=1}^{n} a_k R^k \right) \leq R, \hspace{1em} i = 2, 3, \ldots, n - 1,$$

$$\left\| D^{\alpha - 1} T u \right\|_{\infty} \leq \frac{\Gamma_q(\alpha)}{\Gamma_q(\alpha) - \Lambda} \left( a_0 + \sum_{k=1}^{n} a_k R^k \right) = \rho_1 \Gamma_q(\alpha) \left( a_0 + \sum_{k=1}^{n} a_k R^k \right) \leq L \left( a_0 + \sum_{k=1}^{n} a_k R^k \right) \leq R.$$

Thus,

$$\| T u \| = \max \left\{ \left\| T u \right\|_{\infty}, \left\| D^{\alpha - 1} T u \right\|_{\infty}, \left\| D^{\alpha - 2} T u \right\|_{\infty}, \ldots, \left\| D^{\alpha - n} T u \right\|_{\infty} \right\} \leq R.$$ (86)

That is $T P_R \subset P_R$. Denote that $u_0(t) = R t^{\alpha - 1}$, then $u_0(t) \in P_R$, and $u_1(t) = T u_0(t)$, i.e.,

$$u_1(t) = T u_0(t) = \int_{0}^{\infty} G(t, qs) f(s, u_0(s), D^{\alpha - 1} u_0(s), \ldots, D^{\alpha - (n-1)} u_0(s)) ds,$$

$$\leq \frac{t^{\alpha - 1}}{\Gamma_q(\alpha) - \Lambda} \left( a_0 + \sum_{k=1}^{n} a_k \| u \|_k \right) \leq t^{\alpha - 1} L \left( a_0 + \sum_{k=1}^{n} a_k R^k \right) \leq R t^{\alpha - 1} = u_0(t).$$ (87)

On the other hand, $(H_3)$ implies that the operator $T$ is increasing, and then we have

$$u_2(t) = T u_1(t) \leq T u_0(t) = u_1(t), \hspace{1em} \forall t \in J.$$ (88)

By the induction, we have $u_m(t) = T u_m(t), m = 0, 1, 2, \ldots$. Then, the sequence $\{ u_m \}_{m=0}^{\infty} \subset \mathcal{F} (\Omega_R) \subset P_R$ and satisfies the following relation:

$$u_m(t) = \left\{ u_m \right\} \subset \mathcal{F} (\Omega_R) \subset P_R.$$
By Lemmas 5 and 7, we have

\[ D_q^{a_i} u_1(t) = D_q^{a_i} \mathcal{T} u_0(t) = \int_0^{\infty} G_t^i(t, qs) f(s, u_0(s), D_q^{a_1} u_0(s), \ldots, D_q^{a_{n-1}} u_0(s)) \, ds \]

By induction, we have

\[ D_q^{a_i} u_1(t) \leq D_q^{a_i} u_m(t) \quad \forall t \in J, \quad i = 1, 2, \ldots, n-1, \quad m = 0, 1, 2, \ldots \]

By the induction, we have

In view of the complete continuity of the operator \( \mathcal{T} \) and \( u_{m+1}(t) = \mathcal{T} u_m(t) \), \( \{u_m(t)\}_{m=0}^{\infty} \) is relatively compact. That is, \( \{u_m(t)\}_{m=0}^{\infty} \) has a convergent subsequence \( \{u_m(t)\}_{m=1}^{\infty} \) and there exists a \( u^* \in P_k \) such that \( u_m \to u^* \) as \( k \to \infty \). This together with (90) implies \( \lim_{m \to \infty} u_m = u^* \). Since \( \mathcal{T} \) is continuous and \( u_{m+1}(t) = \mathcal{T} u_m(t) \), then we have \( u^* = \mathcal{T} u^* \), that is, \( u^* \) is a fixed point of operator \( \mathcal{T} \).

For the scheme \( \{v_m\}_{m=0}^{\infty} \), we use a similar discussion. For \( t \in J \), by Lemma 5 and \( f \in C(J \times \mathbb{R}^n, J) \), we have

\[ v_1(t) = \mathcal{T} v_0(t) = \int_0^{\infty} G(t, qs) f(s, v_0(s), D_q^{a_1} v_0(s), \ldots, D_q^{a_{n-1}} v_0(s)) \, ds \geq v_0(t) \]

Applying the monotonicity of function \( f \), we have

\[ v_2(t) = \mathcal{T} v_1(t) \geq \mathcal{T} v_0(t) = v_1(t), \quad \forall t \in J. \]

By the induction, we have

\[ D_q^{a_i} v_1(t) = D_q^{a_i} \mathcal{T} v_0(t) = \int_0^{\infty} G_t^i(t, qs) f(s, v_0(s), D_q^{a_1} v_0(s), \ldots, D_q^{a_{n-1}} v_0(s)) \, ds \geq v_0(t), \quad i = 1, 2, \ldots, n-1. \]

By the induction, we have

\[ D_q^{a_i} v_m(t) \leq D_q^{a_i} v_{m+1}(t), \quad i = 1, 2, \ldots, n-1, \quad m = 0, 1, 2, \ldots \]

Using the complete continuity of the operator \( \mathcal{T} \) and the iterative scheme, it is easy to get

\[ v_m \to v^* \quad \text{and} \quad \mathcal{T} v^* = v^*. \]
\( v_i(t) = T v_i(t) < T w(t) = w(t) \leq T u_i(t) = u_i(t), \quad \text{for all } t \in J. \) 
\( (100) \)

Similarly, for \( t \in J \) and \( i = 1, 2, \ldots, n - 1 \), we can get
\[
\begin{align*}
v_m(t) &\leq w(t) \leq u_m(t), \\
D_q^{a_i} v_m(t) &\leq D_q^{a_i} w(t) \leq D_q^{a_i} u_m(t).
\end{align*}
\( (101) \)

This implies that \( v^*(t) \) and \( u^*(t) \) are the minimal and maximal solutions of problem (1), and (53) and (54) hold.

On the other hand, we infer that \( v^*(t) \) and \( u^*(t) \) are two positive solutions of (1). In fact, by the condition \((H_3)\), we get
\[
0 \text{ function is not the solution of problem (1), which means } v^*(t) > 0, \ u^*(t) > 0, \text{ and they can be constructed by means of two monotone iterative schemes in (81) and (82).} \]

\textbf{Theorem 2.} Suppose conditions \((H_1)\) and \((H_2)\) are satisfied. If
\[
A = L \sum_{k=1}^{n} b_k < 1,
\]
\( (103) \)
then problem (1) has a unique positive solution \( \bar{u}(t) \) in \( P \). Moreover, there is an iterative scheme \( \{ u_m \}_{m=0}^{\infty} \) such that

\[
\begin{align*}
\| T u \|_{1 + t^{-\alpha}} \leq L \left( \sum_{k=1}^{n} b_k r + \kappa \right) < Ar + Lk, & \quad \forall u \in P_r, \\
\| D_q^{a_i} T u \|_{1 + t^{-\alpha}} \leq L \left( \sum_{k=1}^{n} b_k r + \kappa \right) < Ar + Lk, & \quad \forall u \in P_r, i = 2, 3, \ldots, \\
\| D_q^{a_i} T u \|_{\infty} \leq L \left( \sum_{k=1}^{n} b_k r + \kappa \right) < Ar + Lk, & \quad \forall u \in P_r.
\end{align*}
\( (106) \)

Thus, we have
\[
\| T u \| \leq Ar + Lk < Ar + (1 - A)r = r, \quad \forall u \in P_r,
\]
\( (107) \)
i.e., \( TP_r \subset P_r \).

In the following, we show that \( T \) is a contraction. For any \( u_1, u_2 \in P_r \), by condition \((H_3)\) and Lemma 10, we obtain

\[
\begin{align*}
\| u_m - \bar{u} \|_{\infty} = \frac{A^{m-1}}{1-A} \| u_1 - u_0 \|, & \quad m = 1, 2, \ldots \\
\| u_m \|_{\infty} &\leq \frac{A}{1-A} \| u_1 \|, & \quad m = 1, 2, \ldots
\end{align*}
\]
In the same way, we have

\[
\left\| D_q^{\alpha-i} \mathcal{T} u_2 - D_q^{\alpha-i} \mathcal{T} u_1 \right\|_{\infty} \leq L \sum_{k=1}^{n} b_k \left\| u_2 - u_1 \right\|_{\infty}, \quad i = 2, 3, \ldots, n - 1,
\]

\[
\left\| D_q^{\alpha-i} u_2 - D_q^{\alpha-i} u_1 \right\|_{\infty} \leq L \sum_{k=1}^{n} b_k \left\| u_2 - u_1 \right\|_{\infty}.
\]

From (108)–(110), we have

\[
\left\| \mathcal{T} u_2 - \mathcal{T} u_1 \right\| \leq L \sum_{k=1}^{n} b_k \left\| u_2 - u_1 \right\|_{\infty}, \quad \forall u_i, u_j \in P.
\]

Since \( A < 1 \), then \( \mathcal{T} \) is a contraction. The Banach fixed point theorem ensures that \( \mathcal{T} \) has a unique fixed point \( \bar{u} \in P \). Hence, problem (1) has a unique positive solution \( \bar{u} \).

Moreover, for any \( u_0 \in P, \| u_m - \bar{u} \| \rightarrow 0 \) as \( m \rightarrow 0 \), where \( u_m = \mathcal{T} u_{m-1} \). By (111), we have

\[
\left\| u_m - u_{m-1} \right\| \leq A \left\| u_{m-1} - u_{m-2} \right\| \leq \cdots \leq A^{m-1} \left\| u_1 - u_0 \right\|,
\]

\[
\left\| u_m - u_0 \right\| \leq \left\| u_m - u_{m-1} \right\| + \left\| u_{m-1} - u_{m-2} \right\| + \cdots + \left\| u_1 - u_0 \right\| \leq A^{m-1} \left\| u_1 - u_0 \right\| + A^{m-2} \left\| u_1 - u_0 \right\| + \cdots + A^0 \left\| u_1 - u_0 \right\| = \frac{A^{m-1} - 1}{1 - A} \left\| u_1 - u_0 \right\|.
\]

Let \( l \rightarrow \infty \) on both sides of (113), we obtain

\[
\left\| u_m - \bar{u} \right\| \leq \frac{A^{m-1}}{1 - A} \left\| u_1 - u_0 \right\|.
\]

\[\square\]

Remark 1. The function \( f \) in problem (1) relies on lower-order fractional \( q \)-derivative of unknown function which is different from [17].

Remark 2. The results in Theorems 1 and 2 extend the fractional \( q \)-derivative from the low-order to the high-order fractional derivative.

Remark 3. The two iterative sequences in Theorem 1 begin with some simple functions which are helpful for computational purpose.
4. Example

Consider the following equation:
\[
\begin{align*}
D_q^{(3/2)} u(t) + f\left(t, u(t), D_q^{(3/2)} u(t), D_q^{(1/2)} u(t)\right) &= 0, \\
u(0) &= D_q u(0) = 0, \\
D_q^{(3/2)} u(+\infty) &= \int_0^{+\infty} e^{-t} D_q^{(3/2)} u(t) d_q t,
\end{align*}
\]

(115)

By computation, we deduce that
\[
\begin{align*}
|f\left(t, u(t), D_q^{(3/2)} u(t), D_q^{(1/2)} u(t)\right)| &\leq \frac{4}{(5 + t)^2} + \frac{e^{-t}|u(t)|^{0.1}}{(1 + t^{(3/2)})^{0.1}} + \frac{2|D_q^{(3/2)} u|^{0.2}}{(5 + t)^2} + \frac{e^{-2t}|D_q^{(1/2)} u(t)|^{0.4}}{(1 + t)^{0.4}} \\
&= a_0(t) + a_1(t) u(t)^{0.1} + a_2(t) D_q^{(3/2)} u(t)^{0.2} + a_3(t) D_q^{(1/2)} u(t)^{0.4},
\end{align*}
\]

(116)

which means that hypothesis (H2) is satisfied.

On the other hand, \( \Lambda = \int_0^{+\infty} t^{(3/2)} g(t) d_q t = \int_0^{+\infty} e^{-t} d_q t < (1/e) < (1/\Gamma(5/2)) \), and \( f(t, 0, 0, 0) \equiv 0 \). So condition (H1) is satisfied. Moreover, from the expression of the function \( f \), it is obvious that \( f \) is increasing with respect to the variables \( u_1, u_2, u_3, \forall t \in J \). Hence, condition (H4) is satisfied. By Theorem 1, it follows that problem (1) has two positive solutions, which can be given by the limits of two explicit monotone iterative schemes in (81) and (82).

5. Conclusions

In this paper, we study the boundary value problem of a fractional \( q \)-difference equation with nonlocal integral boundary conditions on the half-line. We obtain some new results as follows: (1) the existence and uniqueness of positive solutions for a higher-order nonlinear fractional \( q \)-difference equation with integral boundary conditions on the half-line are obtained, and (2) the monotone iterative schemes of positive solutions for the problem which considered in our paper are obtained.
