Abstract
We provide the conditions for the boundedness of the Bochner–Riesz operator acting between two different Grand Lebesgue Spaces. Moreover we obtain a lower estimate for the constant appearing in the Lebesgue–Riesz norm estimation of the Bochner–Riesz operator and we investigate the convergence of the Bochner–Riesz approximation in Lebesgue–Riesz spaces.

1 Introduction

The well-known (pseudo-differential) Bochner-Riesz linear operator $B_R^\alpha[f]$, acting on measurable functions $f : \mathbb{R}^n \rightarrow \mathbb{R}$ ($n > 1$), is defined as follows

$$B_R^\alpha[f](t) \overset{def}{=} \int_{\mathbb{R}^n} e^{-i(t,y)} \left( 1 - \frac{|y|^2}{R^2} \right)^\alpha_+ \tilde{f}(y) \, dy,$$  \hspace{1cm} (1.1)
where
\[ R = \text{const} > 0, \quad \alpha = \text{const}, \quad z_+ = \max(z, 0), \quad z \in \mathbb{R}, \quad (1.2) \]

\((x, y)\) stands for the scalar (inner) product of two vectors \(x, y \in \mathbb{R}^n, |y|^2 := (y, y)\) and \(\hat{f}\) denotes, as ordinary, the Fourier transform
\[
\hat{f}(y) = \int_{\mathbb{R}^n} e^{i(x,y)} f(x) \, dx. \quad (1.3)
\]

The applications of these operators are described in particular in Functional Analysis (see [10,23]) and in statistics of random processes and field (see [5,41]).

The classical Lebesgue-Riesz norm \(||f||_p, \quad p \in [1, \infty]\), for the function \(f\), is denoted by
\[
||f||_p := \left( \int_{\mathbb{R}^n} |f(x)|^p \, dx \right)^{1/p}, \quad 1 \leq p < \infty,
\]
\[
||f||_\infty := \text{ess sup}_{x \in \mathbb{R}^n} |f(x)|, \quad p = \infty
\]
and the corresponding Banach space is, as usually,
\[
L_p = L_p(\mathbb{R}^n) = \{ f : ||f||_p < \infty \}.
\]

Denote, for an arbitrary linear or quasi linear operator \(U\), acting from \(L_p\) to \(L_q, \quad p, q \geq 1\), its norm
\[
||U||_{p,q} = ||U||_{p \to q} := \sup_{0 \neq f \in L_p} \left[ \frac{||Uf||_q}{||f||_p} \right].
\]

Of course, the operator \(U\) is bounded as the operator acting from the space \(L_p\) into the space \(L_q\) iff \(||U||_{p,q} < \infty\).

More generally, for the operator \(U\) acting from some Banach space \(F\) equipped with the norm \(|| \cdot ||_F\) into another (in the general case) Banach space \(D\), having the norm \(|| \cdot ||_D\), we denote as usually
\[
||U||_{F \to D} := \sup_{0 \neq f \in F} \left[ \frac{||Uf||_D}{||f||_F} \right].
\]

There exists a huge numbers of works devoted to the \(p, q\) estimates for Bochner-Riesz operators \(B^\alpha_R\), as a rule for the case \(q = p\), see e.g. [23, chapter5], [9,10,13,29,35,42,43], etc. The boundedness of these operators in Morrey–Lorentz spaces and in \(L^p\) spaces with variable exponent has been investigated in [25] and [8], respectively.

Our aim, in this paper, is to extend some results contained in the above mentioned works concerning upper estimates for the norm of the Bochner-Riesz operator, in the case of different Lebesgue–Riesz spaces (Sect. 2) and to extend these estimates to the so-called Grand Lebesgue Spaces (GLS), see Sect. 3.
We deduce also a non trivial quantitative lower estimate for the coefficient in the Lebesgue–Riesz norm estimation for the Bochner-Riesz operator (Sect. 4) and we study the convergence of the Bochner–Riesz approximation in Lebesgue–Riesz spaces (Sect. 5).

2 Norm estimates for the Bochner–Riesz operator acting between different Lebesgue-Riesz spaces

We clarify slightly the known results about the Lebesgue–Riesz $p, r$ norms for the operators $B^\alpha_R$ defined in (1.1), see e.g. [10,12,23,29,43], ecc.

It is important to observe that the Bochner–Riesz operator $B^\alpha_R$ may be rewritten as a convolution, namely

$$B^\alpha_R[f](t) = f * K^R_\alpha(t) = \int_{\mathbb{R}^n} f(t-s) K^R_\lambda(s) \, ds,$$

where $R = \text{const} > 0$,

$$K^R_\lambda(z) = C(\alpha) \frac{R^n J_\lambda(R|z|)}{|Rz|^\lambda}, \quad \lambda = \alpha + \frac{n}{2},$$

$$C(\alpha) := \frac{1}{\Gamma(\alpha + 1)}, \quad \alpha > -1,$$

$\Gamma(\cdot)$ is the Gamma-function, $J_\lambda(\cdot)$ is the Bessel function of order $\lambda$ and $|z| = \sqrt{(z, z)}$.

Notice that, under our restriction on $\alpha$,

$$\int_{\mathbb{R}^n} K^R_\lambda(t) \, dt = 1.$$  

(2.2)

Evidently,

$$K^R_\lambda(z) = R^n K_\lambda(Rz),$$

(2.3)

where in turn

$$K_\lambda(z) \overset{\text{def}}{=} K^1_\lambda(z) = C(\alpha) \frac{J_\lambda(|z|)}{|z|^\lambda},$$

(2.4)

see, e.g., [10, pp. 171–172].

Note that, from the identity (2.3), it follows

$$||K^R_\lambda(z)||_q = R^{n-n/q} ||K_\lambda||_q, \quad q \geq 1,$$

(2.5)

as long as $R > 0$.

Assume here and in the sequel

$$-1 < \alpha \leq \alpha_0, \quad \alpha_0 := \frac{n-1}{2},$$

(2.6)
and introduce the value

\[ q_0 := \frac{n}{(n + 1)/2 + \alpha}, \tag{2.7} \]

so that

\[ q_0 \geq 1 \iff \frac{-(n + 1)}{2} < \alpha \leq \alpha_0, \]

where the inequality on the left hand side is true due to the restriction \( \alpha > -1 \).

Moreover, using the well-known results about the behavior of the Bessel functions (see, e.g., [10, p. 172]),

\[ K_{\lambda}(z) \asymp |z|^{-(\frac{n+1}{2}+\alpha)}, \text{ as } |z| \to \infty, \]

it is easy to estimate

\[ ||K_{\lambda}||_q \asymp (q - q_0)^{-1/q}, \quad q > q_0, \tag{2.8} \]

and \( ||K_{\lambda}||_q = \infty \) otherwise (see also, e.g., [23, pp. 339-341]).

Correspondingly,

\[ ||K_{\lambda}^R||_q \asymp R^{n-n/q} (q - q_0)^{-1/q}, \quad q > q_0. \tag{2.9} \]

Furthermore, we recall the Beckner–Brascamp–Lieb–Young inequality for the convolution (see [3,4])

\[ ||f * g||_r \leq \left( \frac{C_p C_q}{C_r} \right)^n ||f||_p ||g||_q, \quad 1 + 1/r = 1/p + 1/q, \tag{2.10} \]

where \( p, q, r \geq 1 \) and

\[ C_m = \left( \frac{m^{1/m}}{(m')^{1/m'}} \right)^{1/2}, \quad m' = m/(m - 1). \]

We point out that the constant \( C_m \) defined above, and considered in (2.10) for \( m = p, q, r, \) does not blow up when \( m \to 1 \) (which implies \( m' \to \infty \)), in fact \( C_m \to 1 \) in this case. Therefore \( p, q, r \) are allowed to be 1. Note that

\[ \frac{C_p C_q}{C_r} \leq 1. \]

Recently in [22] has been given a generalization of the convolution inequality in the context of the Grand Lebesgue Spaces (see Sect. 3 for the definition), built on a unimodular locally compact topological group.

The estimate (2.10) is essentially non-improbable. Indeed, the equality in (2.10) is attained iff both functions \( f, g \) are proportional to Gaussian densities, namely there exists positive constants \( c_1, c_2, c_3, c_4 \) such that

\[ f(x) = c_1 \exp(-c_2|x|^2), \quad g(x) = c_3 \exp(-c_4|x|^2), \quad x \in \mathbb{R}^n, \tag{2.11} \]
where $|x| = \sqrt{(x, x)}$ is the euclidean norm. Then the convolution $f * g$ is also Gaussian and

$$||f * g||_r = \left(\frac{C_pC_q}{C_r}\right)^n ||f||_p ||g||_q, \quad 1/p + 1/q = 1 + 1/r, \quad p, q, r > 1.$$  \hfill (2.12)

The following result about the boundedness of the Bochner–Riesz operator, acting between different Lebesgue–Riesz spaces, holds.

**Theorem 2.1** Let $p > 1$ and $f \in L_p(\mathbb{R}^n)$. Let $\alpha$ be a constant such that

$$-1 < \alpha \leq \alpha_0 := \frac{n - 1}{2}$$  \hfill (2.13)

and

$$q_0 = \frac{n}{(n + 1)/2 + \alpha}.$$  \hfill (2.14)

Let $q, r \geq 1$ such that $1 + 1/r = 1/q + 1/p$ and assume $q > q_0$, $r > r_0$, $p \leq p_0$, where

$$r_0 = r_0(\alpha, n; p) := \frac{pq_0}{p + q_0 - pq_0},$$  \hfill (2.15)

$$p_0 = q'_0 = (1 - 1/q_0)^{-1}.$$  \hfill (2.16)

Define, for $R = \text{const} > 0$,

$$W(\alpha, n, R; p, r) \overset{\text{def}}{=} R^{n(1/p - 1/r)} \cdot [q(p, r) - q_0(\alpha, n)]^{1/p - 1/r}.$$  \hfill (2.17)

Then the Bochner–Riesz operator satisfies

$$||B_\alpha^R[f]||_r \leq C(\alpha, R) \cdot W(\alpha, n, R; p, r) \cdot ||f||_p.$$  \hfill (2.18)

**Proof** If $f \in L_p$ for some value $p > 1$, then by (2.10) it follows

$$||B_\alpha^R[f]||_r \leq ||K_\lambda^R||_q ||f||_p,$$  \hfill (2.19)

where $1 + 1/r = 1/q + 1/p$ and $p, q, r \geq 1$, $q > q_0$. On the other words,

$$q = q(p, r) \overset{\text{def}}{=} \frac{pr}{pr + p - r}, \quad q > q_0, \quad r > p.$$  

Moreover it is easy to verify that $r_0$, defined in (2.15), is such that $r_0 > p$.

Under our restrictions $W(\alpha, n, R; p, r)$ is finite and positive.

So we conclude that estimate (2.18) holds.  \hfill $\Box$
3 Main result: boundedness of Bochner–Riesz operators in Grand Lebesgue Spaces (GLS)

We recall here, for reader convenience, some known definitions and facts from the theory of Grand Lebesgue Spaces (GLS).

**Definition 3.1** Let \( \psi = \psi(p) \), \( p \in (a, b) \), \( a, b = \text{const} \), \( 1 \leq a < b \leq \infty \), be a positive measurable numerical valued function, such that

\[
\inf_{p \in (a,b)} \psi(p) > 0. \tag{3.1}
\]

The (Banach) Grand Lebesgue Space \( G\psi = G\psi(a, b) \) consists of all the real (or complex) numerical valued measurable functions \( f : \mathbb{R}^n \to \mathbb{R} \) having finite norm, defined by

\[
\|f\|_{G\psi} := \sup_{p \in (a, b)} \left[ \frac{\|f\|_p}{\psi(p)} \right]. \tag{3.2}
\]

We agree to write \( G\psi \) in the case when \( a = 1 \) and \( b = \infty \).

The function \( \psi \) is named *generating function* for the space \( G\psi \) and we denote by \( \{\psi(\cdot)\} \) the set of all such functions.

For instance

\[
\psi(p) := p^{1/m}, \quad p \in [1, \infty), \quad m > 0, \tag{3.3}
\]

or

\[
\psi(p) := (p - a)^{-\alpha} (b - p)^{-\beta}, \quad p \in (a, b), \quad 1 \leq a < b < \infty, \quad \alpha, \beta \geq 0, \tag{3.4}
\]

are generating functions.

If

\[
\psi(p) = 1, \quad p = r; \quad \psi(p) = +\infty, \quad p \neq r, \quad r \in [1, \infty),
\]

where \( C/\infty := 0 \), \( C \in \mathbb{R} \) (extremal case), then the corresponding \( G\psi \) space coincides with the classical Lebesgue-Riesz space \( L_r = L_r(\mathbb{R}^d) \).

The Grand Lebesgue Spaces and several generalizations of them have been widely investigated, mainly in the case of GLS on sets of finite measure, (see, e.g., [6,11,14,20,26,27,34,36], etc). They play an important role in the theory of Partial Differential Equations (PDEs) (see, e.g., [2,15,17,24], etc.), in interpolation theory (see, e.g., [16,19]), in the theory of Probability ([21,38,40]), in Statistics [36, chapter 5], in theory of random fields [30,39], in Functional Analysis [36,37,39] and so one.

These spaces are rearrangement invariant (r.i.) Banach functional (complete) spaces; their fundamental functions have been considered in [39]. They do not coincide, in the general case, with the classical Banach rearrangement functional spaces: Orlicz, Lorentz, Marcinkiewicz etc., see [34,37]. The belonging of a function \( f : \mathbb{R}^n \to \mathbb{R} \) to some \( G\psi \) space is closely related with its tail function behavior as \( t \to 0^+ \) as well as when \( t \to \infty \), see [30,32].
The Grand Lebesgue Spaces can be considered not only on the Euclidean space $\mathbb{R}^n$ equipped with the Lebesgue measure, but also on an arbitrary measurable space with sigma-finite non-trivial measure.

In the following Theorem we investigate the boundedness of the Bochner-Riesz operator acting from some Grand Lebesgue Space $G\psi = G\psi(a, b)$ into another one $G\nu$. We will consider the same restrictions and quantities defined in Theorem 2.1.

**Theorem 3.1** Let $1 \leq a < b \leq \infty$ and $f \in G\psi(a, b)$. Let $\alpha$ be a constant such that

$$-1 < \alpha \leq \alpha_0 := \frac{n - 1}{2}, \quad n > 1.$$ 

Let $p > 1, q, r \geq 1$, $p_0, q_0, r_0$ and $W(\alpha, n, R; p, r)$ defined as in Theorem 2.1. Denote

$$s = s(\alpha, n; r) := \min \left\{ b, \frac{rq_0}{rq_0 + q_0 - r} \right\},$$

and

$$d := r_0(\alpha, n; b) = \frac{bq_0}{q_0 + b - bq_0}.$$ 

For $r \in (d, \infty)$ let $\nu(r)$ be the following generating function

$$\nu(r) = \nu[\psi](r) = \nu[\psi](\alpha, n, R; r) := \inf_{p \in (a, s)} W(\alpha, n, R; p, r) \psi(p). \quad (3.5)$$

Then

$$\|B^\alpha_R[f]\|_{G\nu} \leq C(\alpha, n, R) \|f\|_{G\psi}. \quad (3.6)$$

**Proof** The proof is simple and alike as the one in [40]. First we observe that $\nu(r)$ is finite. One can assume, without loss of generality, $\|f\|_{G\psi} = 1$, then $\|f\|_p \leq \psi(p), \quad p \in (a, b)$. Applying the inequality (2.18) we have

$$\|B^\alpha_R[f]\|_r \leq C(\alpha, n, R) \cdot W(\alpha, n, R; p, r) \cdot \psi(p). \quad (3.7)$$

Taking the minimum over $p$ subject to our limitations, we get

$$\|B^\alpha_R[f]\|_r \leq C(\alpha, n, R) \cdot \inf_{p \in (a, s)} W(\alpha, R; p, r) \cdot \psi(p) \right] = C(\alpha, n, R) \nu(r) = C(\alpha, n, R) \nu(r)\|f\|_{G\psi}. \quad (3.8)$$

which is quite equivalent to our claim in (3.6). □

**Remark 3.1** Let us give the following generalization of Theorem 3.1 Let $\zeta = \zeta(r), \quad r \in (d, \infty)$, be some another generating function from the set $G\Psi[d, \infty]$, such that a
new function
\[ \kappa(r) \overset{\text{def}}{=} \sup_{p \in (a,s)} \left\{ \frac{W(\alpha, R; p, r) \psi(p)}{\kappa(r)} \right\} \]
also belongs to this set. We deduce from (3.7)
\[ \frac{||B^r_R[f]||_r}{\kappa(r)} \leq C(\alpha, n, R) \cdot \frac{W(\alpha, n, R; p, r) \cdot \psi(p)}{\kappa(r)} \cdot ||f||_G\psi, \quad (3.9) \]
hence
\[ \frac{||B^r_R[f]||_r}{\kappa(r)} \leq C(\alpha, n, R) \kappa(r) ||f||_G\psi. \]

Dividing on \( \kappa(r) \) and taking the supremum over \( r \), if we denote \( \theta(r) = \kappa(r) \kappa(r) \), we have
\[ ||B^r_R[f]||_{G\theta} \leq C(\alpha, n, R) ||f||_{G\psi}. \quad (3.10) \]

4 Lower bound for the coefficient in the Lebesgue–Riesz norm estimate for the Bochner–Riesz operator

Let \( p, r > 1, n > 1 \) and let us introduce the following variable
\[ Q_n(p, r) \overset{\text{def}}{=} \sup_{\alpha > 0} \sup_{R > 0} W(\alpha, n, R; p, r), \]
where \( W(\alpha, n, R; p, r) \) is defined in Sect. 2. Our target in this Section is a lower bound for the above variable.

**Theorem 4.1** Let \( p, r > 1, n > 1 \) and
\[ \Theta(n, p) := (2\pi)^{(1-p)/2p} p^{-n/2p}. \]
Then
\[ Q_n(p, r) \geq \Theta \left( n, \frac{pr}{pr + p - r} \right), \quad r > p. \quad (4.1) \]

**Remark 4.1** The possible case when \( Q_n(p, r) = +\infty \) can not be excluded.

**Proof** We will apply equality (2.12), in which we choose the ordinary Gaussian density
\[ f_0(x) := (2\pi)^{-n/2} \exp(-|x|^2/2), \quad x \in \mathbb{R}^n, \]
and take \( \alpha = R^2/2 \). Obviously
\[ Q_n(p, r) \geq \lim_{R \to \infty} W(R^2/2, n, R; p, r). \]
We have
\[
B^2_R[f](t) = \int_{\mathbb{R}^n} e^{-i(t,y)} \left( 1 - \frac{|y|^2}{R^2} \right)^{R^2/2} I(|y| < R) \tilde{f}(y) \, dy,
\]
where \( I(A) \) denotes the indicator function of the (measurable) set \( A, \ A \subset \mathbb{R}^n \).
Therefore, as \( R \to \infty \),
\[
B^2_R[f](t) \to \int_{\mathbb{R}^n} e^{-i(t,y)} \exp\{-|y|^2/2 \} \tilde{f}(y) \, dy = [\sqrt{2\pi}]^n [f \ast f_0](t), \tag{4.2}
\]
by virtue of dominated convergence theorem.
If we take \( f = f_0 \), then in (4.2) the convolution of two Gaussian densities appears.
It remains to apply the relation (2.12); we omit some simple calculations. \( \Box \)

5 Convergence of Bochner–Riesz operators

We investigate here the convergence, as \( R \to \infty \), of the family of Bochner-Riesz approximations \( B^\alpha_R[f] \) to the source function \( f \) in the Lebesgue-Riesz norm \( L^p(\mathbb{R}^n), \ p \in (1, \infty) \), in addition to the similar results in [13,23,29], etc.

For any function \( f \in L^p(\mathbb{R}^n) \), its modulus of \( L^p \) continuity is defined alike as in approximation theory [1, chapter V] :

\[
\omega_p[f](\delta) \overset{\text{def}}{=} \sup_{h : |h| \leq \delta} ||T_h[f] - f||_p, \ \delta \geq 0,
\]

where \( T_h[f] \) denotes the shift operator

\[
T_h[f](t) = f(t - h), \ t, h \in \mathbb{R}^n.
\]

Obviously, \( \omega_p[f](\delta) \leq 2||f||_p \) and

\[
\lim_{\delta \to 0^+} \omega_p[f](\delta) = 0, \ f \in L^p. \tag{5.1}
\]

Theorem 5.1 Let \( p \in (1, \infty) \), \( \alpha \leq \alpha_0 = (n - 1)/2 \) and \( f \in L^p(\mathbb{R}^n) \). Then

\[
\lim_{R \to \infty} ||B^\alpha_R[f] - f||_p = 0. \tag{5.2}
\]

Proof The difference \( \Delta_R[f](t) = B^\alpha_R[f] - f \) has the form

\[
\Delta_R[f](t) = \int_{\mathbb{R}^n} \left\{ f \left( t - \frac{v}{R} \right) - f(t) \right\} K_\lambda(|v|) \, dv.
\]
We apply now the triangle inequality for the $L_p$ norm in the integral form

$$||\Delta_R[f]||_p \leq \int_{\mathbb{R}^n} ||T_{|v|/R}[f] - f||_p |K_\lambda(|v|)| \, dv$$

$$\leq \int_{\mathbb{R}^n} \omega_p[f](|v|/R) |K_\lambda(|v|)| \, dv.$$ 

Note that, under the above conditions,

$$\int_{\mathbb{R}^n} |K_\lambda(|v|)| \, dv < \infty,$$

so that (5.2) follows again from the dominated convergence theorem. \[\square\]

**Remark 5.1** As a slight consequence, under the above conditions, if $f \in L_p(\mathbb{R}^n)$, then

$$||B^\alpha_R[f]||_p \leq ||f||_p + \int_{\mathbb{R}^n} \omega_p[f](|v|/R) |K_\lambda(|v|)| \, dv$$

and, consequently,

$$\forall f \in L_p(\mathbb{R}^n) \quad \Rightarrow \quad \sup_{R \geq 1} ||B^\alpha_R[f]||_p \leq 3||f||_p.$$

The case $p = \infty$ requires a separate consideration. Introduce the Banach space $C_0(\mathbb{R}^n)$ as a collection of all bounded and uniformly continuous functions $f : \mathbb{R}^n \to \mathbb{R}$, equipped with the ordinary norm,

$$||f||_\infty \overset{def}{=} \sup_{t \in \mathbb{R}^n} |f(t)|.$$

As above

$$\omega_\infty[f](\delta) \overset{def}{=} \sup_{h : |h| \leq \delta} ||T_h[f] - f||_\infty, \quad \delta \geq 0.$$ 

Evidently, $\omega_\infty[f](\delta) \leq 2||f||_\infty$ and

$$\lim_{\delta \to 0^+} \omega_\infty[f](\delta) = 0, \quad f \in L_p. \quad (5.3)$$

The assertion of Theorem 5.1 under the same conditions remains true in the case $p = \infty$.

**Theorem 5.2** Under the same conditions of Theorem 5.1, for any function $f : \mathbb{R}^n \to \mathbb{R}$ from the space $C_0(\mathbb{R}^n)$, its Bochner-Riesz approximation $B^\alpha_R$ converges uniformly to the source function $f$, that is

$$\lim_{R \to \infty} ||B^\alpha_R[f] - f||_\infty = 0. \quad (5.4)$$
Proof The proof is the same as in Theorem 5.1 and may be omitted. □

Remark 5.2 As before, if \( f \in C_0(\mathbb{R}^n) \),
then
\[
||B^\alpha_R[f]||_\infty \leq ||f||_\infty + \int_{\mathbb{R}^n} \omega_\infty[f](|v|/R) |K_\lambda(|v|)| \, dv
\]
and moreover
\[
\forall f \in C_0(\mathbb{R}^n) \Rightarrow \sup_{R \geq 1} ||B^\alpha_R[f]||_\infty \leq 3||f||_\infty.
\]

6 Concluding remarks

A. In our opinion, the method described in this paper may be essentially generalized

to more operators of convolutions type, linear or not. See some preliminary results

[34].

B. The study of the maximal Bochner-Riesz operator \( B^\alpha_* \), defined by

\[
B^\alpha_*[f](t) = \sup_{R > 0} |B^\alpha_R[f](t)|,
\]

is closely related to the pointwise convergence of the associated Bochner–Riesz
operator \( B^\alpha_R[f] \) as \( R \to \infty \), for any \( f \in L_p(\mathbb{R}^n), \ p \in (1, \infty) \), see e.g. [7,33,44].

It is interesting to generalize the estimates obtained in the previous Sections to
the maximal operator associated to the Bochner–Riesz one considered here, in the
spirit of the works [18,28], and so one:

\[
|| \sup_{R \geq 1} B^\alpha_R[f] ||_p \leq M(\alpha, n; \ p; \ ||f||_p), \ p \geq p_0,
\]

or

\[
|| \sup_{R \geq 1} B^\alpha_R[f] ||_r \leq M(\alpha, n; \ p, \ r; \ ||f||_p), \ p \geq p_0, \ r = r(p),
\]

in order to obtain the GLS estimate for the Bochner-Riesz maximal operator of
the form

\[
|| \sup_{R \geq 1} B^\alpha_R[f] ||_{G^\gamma} \leq L(\alpha, n; \ \gamma, \ \psi \cdot ||f||_{G^\psi}
\]

for some generating functions \( \psi, \ \gamma \).
C. It is not hard to generalize the estimates obtained here in the case when the kernels are of the form

\[ \phi(t) := \prod_{s=1}^{k} (1 - t^{\alpha(s)})_{+}^{m(s)}, \]

instead of the kernel \((1 - t^2)^{\alpha}_{+}\), considered here. Necessary estimates for this purpose for the Fourier transform \(F[\phi](y)\) of these functions may be found in \([45,46]\).
