Fungi are a source of natural products that are useful to human-kind. A variety of bioactive compounds produced by fungi are used in pharmaceutical and food industries, agriculture, and beyond. However, some fungi are plant, animal, and human pathogens. Fungal pathogens could cause serious health complications in immunocompromised populations. Pathogenic fungi can produce a range of secondary metabolites (SMs) that influence their virulence (melanins, siderophores, species-specific toxins) and immunologic potential.

Aspergillus fumigatus is a saprophytic, filamentous fungus that is ubiquitous outdoors (soil, decaying vegetation) and indoors (hospitals, simulated closed habitats, etc.). Aspergillus fumigatus can adapt to various environmental conditions and form airborne conidia that are the inoculum for a variety of diseases (e.g., non-invasive and invasive pulmonary infections, allergic bronchopulmonary aspergillosis, etc.) in immunocompromised hosts.

In on-going microbial observational experiments on the International Space Station (ISS), molecular phylogeny and radiation resistance of several fungal isolates were characterized. Two Aspergillus fumigatus strains, ISSFT-021 and IF1SW-F4, were isolated from a HEPA filter (1) and cupola wall (unpublished) of the ISS. Because A. fumigatus is an opportunistic pathogen causing pathologies ranging from allergic asthma to invasive aspergillosis, we assessed several pathogenic characteristics of the ISS isolates in comparison to two experimentally established clinical isolates, AF293 (2) and CEA10 (3). Virulence assessment in a larval zebrafish model of invasive aspergillosis revealed both ISSFT-021 and IF1SW-F4 as significantly more lethal compared to both clinical isolates (AF293 and CEA10) (4). In addition, the ISS strains ISSFT-021 and IF1SW-F4 exhibited significantly greater resistance to UV254 doses when compared to clinical isolates (4, 5).

The genomes of these ISS isolates might reveal the molecular mechanisms of the increased virulence. Subsequently, if the enhanced virulence is attributed to the microgravity, NASA potentially should consider developing countermeasures to protect the health of astronauts, whose immune systems are reported to be compromised under microgravity (6).

In this study, we determined the draft genome sequences of A. fumigatus strains ISSFT-021 and IF1SW-F4. Whole-genome shotgun sequencing was performed on an Illumina HiSeq2500 instrument with a paired-end module. A total of 27,987,752 and 10,752,032 paired-end reads of 101-nucleotides were collected for ISSFT-021 and IF1SW-F4. The NGS QC Toolkit v2.3 (7) was used to filter the data for high-quality (HQ) vector- and adapter-free reads for genome assembly (cutoff read length for HQ, 80%; cutoff quality score, 20). A total of 25,515,334 (~230x coverage) for ISSFT-021 and 8,466,430 (~75x coverage) for IF1SW-F4 high-quality vector-filtered reads were used for assembly with MaSuRCA (8) genome assembler (k-mer size = 70). The final assembly of the strain ISSFT-021 contains 301 scaffolds with a total size of 28,526,023 bp and an N50 contig length of 275,468 kb; the largest contigs assembled measures 813,103 kb and the G+C% was 49.41. Similarly, the final assembly of the IF1SW-F4 strain contains 208 scaffolds with a total size of 28,240,437 bp and an N50 contig length of 367,421 kb; the largest contig assembled measures 900,278 kb and the G+C content was 49.45%.

Nucleotide sequence accession numbers. The whole-genome sequences of both the strains were deposited at DDBL/EMBL/GenBank under the accession numbers LWRT00000000 and LWRU00000000. The versions described in this paper are LWRT01000000 and LWRU01000000. These A. fumigatus strains were also deposited in the USDA Agricultural Research Station and DSMZ public culture collections.

ACKNOWLEDGMENTS
Part of the research described in this publication was carried out at the Jet Propulsion Laboratory, California Institute of Technology, under a contract with NASA. This research was funded by 2012 Space Biology NNN12ZT001N grant 19-12829-26 under task order NNN13D111T awarded to K.V., which also funded post-doctoral fellowships for N.K.S.
We thank Jay Perry, Marshall Space Flight Center, for providing the HEPA filter and the implementation team of the Microbial Observatory (Microbial Tracking) project at NASA Ames Research Center.

FUNDING INFORMATION
This work, including the efforts of Kasthuri Venkateswaran, was funded by National Aeronautics and Space Administration (NASA) (19-12829-26).
