(Dated: April 22, 2010)

Abstract

One loop expressions for fermion self energy, vacuum polarization and vertex correction in light-front time ordered perturbation theory (LFTOPT) can be obtained from respective covariant expressions by performing $k^-$ integration. In an earlier work, we have shown that the third term in the doubly transverse gauge propagator is necessary to generate the diagrams involving instantaneous photon exchange both in case of fermion self energy as well as vertex correction. In this work, we show that instantaneous photon exchange diagrams in fermion self-energy as well as the IR singular terms in the propagating diagrams can be generated by taking the asymptotic limit of the covariant expression, if one uses the commonly used two term photon propagator. We also show that this method reproduces the IR singular terms in propagating diagrams of vacuum polarization.

I. INTRODUCTION

The issue of equivalence of covariant perturbation theory and light front Hamiltonian perturbation theory has attracted a lot of attention in recent years [1–4]. It is important to establish equivalence between the two approaches as light front field theory has "spurious" divergences not present in covariant perturbation theory and it is necessary to understand how these are generated in order to establish a correspondence between light front expressions and the covariant expressions. One of the approaches consists of establishing equivalence at the Feynman diagram level wherein the covariant expression for a Feynman diagram is integrated over the light cone energy, $k^-$, to generate all the diagrams of light front perturbation theory [1]. Bakker et al [1] have given a general algorithm for proving equivalence in theories involving scalars as well spin $\frac{1}{2}$ particles. Equivalence at Feynman diagram level in Yukawa theory has been discussed in detail in [2]. Correspondence between light-front Hamiltonian approach and the Lorentz-covariant approach has been discussed for QED $1+1$ and also for QCD by bosonization of the model [3].

As far as $3+1$ dimensional theories are concerned, equivalence of LFQED and covariant QED in Coulomb gauge has been proved within the framework of Feynman-Dyson-Schwinger theory [5]. However, not much work has been done on proving equivalence for QED at the Feynman diagram level. In a previous work [6] we had addressed the issue of equivalence of light-front QED, [7] and covariant QED at the Feynman diagram level. In [6], we have shown how one can obtain all the propagating as well as instantaneous diagrams by performing the $k^-$-integration carefully. The feature that sets QED apart from other cases considered in literature is the presence of diagrams involving instantaneous photon exchange. Our previous study was aimed at generating these expressions in the diagram based approach. It was shown that the equivalence cannot be established by performing $k^-$ integration if one uses the commonly used two term photon propagator in light cone gauge, [7, 8]:

$$d_{\mu\nu} = \frac{1}{k^2 + i\epsilon} \left[ -g_{\mu\nu} + \frac{\delta_{\mu+}k_{\nu} + \delta_{\nu+}k_{\mu}}{k^+} \right]$$

(1)

However, if one uses the three term photon propagator term [5, 8–12] given by

$$d_{\mu\nu} = \frac{1}{k^2 + i\epsilon} \left[ -g_{\mu\nu} + \frac{\delta_{\mu+}k_{\nu} + \delta_{\nu+}k_{\mu} - k^2\delta_{\mu+}\delta_{\nu+}}{(k^+)^2} \right]$$

(2)

then one can generate the diagrams involving instantaneous photon exchange also which
completes the proof of equivalence. In present work, we give an alternative proof of equivalence of covariant and LFQED at the Feynman diagram level using the two term photon propagator. We will show that one can use the asymptotic method proposed by Bakker et al. \[4\] to generate the instantaneous photon exchange diagrams for one loop self energy correction. This method does not require the third term in the photon propagator. There has been some debate in literature over the relevance of the third term in the gauge boson propagator. It is usually dropped on the grounds that it does not propagate any information. In our previous work, we emphasized the importance of this term in proving equivalence at one loop level. The present work gives an alternative proof i.e. one without the need of the third term. However, it should not be considered as undermining the importance of this term. On the contrary, the present method, being an alternative to the three term propagator method, may be able to throw some light on the physical significance of this term.

The plan of the paper is as follows: In Section II we summarize the one loop renormalization of LFQED \[7\] and briefly review the work of \[6\] for completeness. Here, we present only those results of \[7\] and \[6\] which are needed for our discussion. In Section III we consider self energy diagram and use the asymptotic method to generate graph involving instantaneous photon exchange. We will show that in a certain asymptotic limit, the covariant expression for fermion self energy reduces to a sum of expression for the instantaneous photon exchange graph and the IR singular terms of the propagating graph. We also carry out a similar analysis for vacuum polarization. Since vacuum polarization does not have any contribution from instantaneous photon exchange vertex at one loop level, in this case the above mentioned limit reproduces only the IR singular terms in the propagating part. In Section IV we summarize and discuss our results. Appendix A contains the notations and basics. Appendix B contains some useful formulae.

II. PROOF OF EQUIVALENCE OF COVARIANT AND LIGHT FRONT QED USING THE THREE TERM PHOTON PROPAGATOR

In this section, we summarize the results of \[7\] on one loop renormalization of light front QED in Hamiltonian formalism and recall how these results were obtained by performing \(k^-\) integration in \[6\].
A. ELECTRON MASS RENORMALIZATION

In light cone time ordered perturbation theory (LCTOPT), fermion self energy at $O(e^2)$ has three contributions given by

\[ \bar{u}(p, s') \Sigma_1(p) u(p, s) = \langle p, s'| V_1 \frac{1}{p^- - H_0} V_1 | p, s \rangle \] (3)

corresponding to the diagram in Fig. 1(a),

\[ \bar{u}(p, s') \Sigma_2(p) u(p, s) = \langle p, s'| V_2 | p, s \rangle \] (4)

corresponding to diagram in Fig. 1(b) and

\[ \bar{u}(p, s') \Sigma_3(p) u(p, s) = \langle p, s'| V_3 | p, s \rangle \] (5)

corresponding to sum of diagrams in Fig. 1(c) and Fig. 1(d), $V_1$ is the standard three point QED vertex and $V_2$ and $V_3$ are $O(e^2)$ non local four point vertices corresponding to exchange of instantaneous fermion and photon respectively. Expressions for $V_1$, $V_2$ and $V_3$ are given in Appendix A.

The contribution of Fig. 1(a) to $\delta m$ is given by Eq. (3) and leads to the light cone expression for propagating part given by

\[ \delta m_a \delta_{ss'} = \frac{e^2}{m} \int \frac{d^2 k_\perp}{(4\pi)^3} \int_0^{p^+} \frac{dk^+}{k^+(p^+ - k^+)} \bar{u}(p, \sigma) \gamma^\mu \left( \frac{1}{2} k^\mu + m \right) \gamma^\nu u(p, s') d_{\mu\nu}(k) \] (6)

where all the momenta are on shell:

\[ p = \left( p^+, \frac{p^2 + m^2}{2p^+}, p_\perp \right) \] (7)

\[ k = \left( k^+, \frac{k_\perp^2}{2k^+}, k_\perp \right) \] (8)

and

\[ k' = \left( p^+ - k^+, \frac{(p_\perp - k_\perp)^2 + m^2}{2(p^+ - k^+)}, p_\perp - k_\perp \right) \] (9)

The contributions of Fig. 1(b) is

\[ \delta m_b \delta_{ss'} = \frac{e^2 p^+}{2m} \int \frac{d^2 k_\perp}{(2\pi)^3} \int_0^{+\infty} \frac{dk^+}{k^+(p^+ - k^+)} \] (10)

and the sum of contributions of Fig. 1(c) and Fig. 1(d) is

\[ \delta m_c \delta_{ss'} = \frac{e^2 p^+}{2m} \int \frac{d^2 k_\perp}{(2\pi)^3} \left[ \int_0^{+\infty} \frac{dk^+}{(p^+ - k^+)^2} - \int_0^{+\infty} \frac{dk^+}{(p^+ + k^+)^2} \right] \] (11)
FIG. 1: Diagrams for electron mass shift in LFQED
These integrals have potential singularities at $k^+ = 0$ and $k^+ = p^+$. To regularize them one introduces small cutoffs $\alpha$ $\beta$

\[ \alpha \leq k^+ \leq p^+ - \beta \]  

and removes the pole at $k^+ = p^+$ in $\delta m_b$ and $\delta m_c$ by principal value prescription. Using this procedure one obtains

\[ \delta m_a = \frac{e^2}{2m} \int \frac{d^2 k_\perp}{(2\pi)^2} \left[ \int_0^{p^+} \frac{dk^+ m^2}{k^+ p \cdot k} - 2 \left[ \frac{p^+}{\alpha} - 1 \right] - \ln \left( \frac{p^+}{\beta} \right) \right] \]  

\[ \delta m_b = \frac{e^2}{2m} \int \frac{d^2 k_\perp}{(2\pi)^2} \ln \left( \frac{p^+}{\alpha} \right) \]  

and

\[ \delta m_c = \frac{e^2}{m} \int \frac{d^2 k_\perp}{(2\pi)^2} \left[ \frac{p^+}{\alpha} - 1 \right] \]  

To establish equivalence, one starts with covariant expression for electron self energy in the light-front gauge,

\[ \sum(p) = (ie)^2 \int \frac{d^4 k}{(2\pi)^4} \frac{\gamma^\mu (p - k + m) \gamma^\nu d_{\mu\nu}(k)}{(p - k)^2 - m^2 + i\epsilon} \]  

where $\frac{d_{\mu\nu}}{k^+}$ is the photon propagator in light-cone gauge in covariant perturbation theory with $d_{\mu\nu}(k)$ given by Eq. (2): Substituting

\[ p - k + m = \gamma^+ \left( \frac{(p_\perp - k_\perp)^2 + m^2}{2(p^+ - k^+)} \right) + \gamma^- (p^+ - k^+) - \gamma_\perp (p_\perp - k_\perp) + \gamma^+ \left[ p^- - k^- - \frac{(p_\perp - k_\perp)^2 + m^2}{2(p^+ - k^+)} \right] \]

and integrating over light cone energy $k^-$, one obtains

\[ \sum(p) = \sum_1^{(a)}(p) + \sum_1^{(b)}(p) + \sum_2(p) \]  

where

\[ \sum_1^{(a)}(p) = \frac{e^2}{m} \int \frac{d^2 k_\perp}{(4\pi)^2} \int_0^{p^+} \frac{dk^+ m^2}{k^+ (p^+ - k^+)} \frac{\gamma^\mu (k' + m) \gamma^\nu d_{\mu\nu}(k)}{p^- - k^- - k'^-} \]  

is the propagating part leading to $\delta m_a$. $\sum_2(p)$ is given by

\[ \sum_2(p) = \frac{e^2}{2m} \int_0^\infty \frac{dk^+}{2k^+} \int \frac{d^2 k_\perp}{(2\pi)^2} \frac{\gamma^\mu \gamma^+ \gamma^\nu d_{\mu\nu}(k)}{2(p^+ - k^+)} \]
and leads to $\delta m_b$, whereas $\sum_1^{(b)}$ arises from the third term in photon propagator and yields $\delta m_c$.

$\sum_1^{(a)}(p)$ differs from the covariant expression in that the fermion momentum in the loop is on-shell in the light front expression, i.e.

$$k' = \left( p^+ - k^+, \frac{(p_\perp - k_\perp)^2 + m^2}{2(p^+ - k^+)} , p_\perp - k_\perp \right)$$  \hspace{1cm} (21)

whereas in covariant expression it is off shell.

One should recall that $\delta m_b$ arises when off shell momentum in covariant expression is replaced by on shell momentum. In fact in LFPT all diagrams involving instantaneous fermion exchange are obtained by the replacement

$$k^- \rightarrow k_{on}^- + (k^- - k_{on}^-)$$ \hspace{1cm} (22)

The first term here generates the LF propagating diagram and the second term generates the instantaneous fermion exchange diagram. Note that the resulting expression for $\delta m_a$ still has IR singular terms. We will show in section III that these IR singular terms and $\delta m_c$ can be obtained by taking the limit $k^+ \rightarrow p^+, k^- \rightarrow \infty$ in the covariant expression.

**B. PHOTON MASS RENORMALIZATION**

In exactly the same manner as for electron self energy, the covariant expression for photon self energy can also be shown to be equivalent to the sum of the propagating and instantaneous diagrams of light front field theory by changing the off shell momenta to on shell momenta.

One defines a tensor $\Pi^{\mu\nu}(p)$ through

$$\delta\mu^2\delta_{\lambda\lambda'} = \epsilon^\lambda_\mu(p)\Pi^{\mu\nu}(p)\epsilon^{\lambda'}_\nu(p)$$ \hspace{1cm} (23)

The corresponding diagrams are displayed in Fig. $\boxplus$ $\delta\mu_a^2$ is given by

$$\delta\mu_a^2\delta_{\lambda\lambda'} = \langle p, \lambda \mid V_1 \frac{1}{p^- - H_0} V_1 \mid p, \lambda \rangle$$ \hspace{1cm} (24)

whereas the segulls are given by

$$\delta\mu_{b+c}^2 = \langle p, \lambda \mid V_2 \mid p, \lambda \rangle$$ \hspace{1cm} (25)
Inserting appropriate sets of intermediate states and following the standard procedure, one obtains

\[ \delta \mu_a^2 = 2e^2 \int \frac{d^2k_\perp}{(4\pi)^3} \int_{p^+ - \beta}^{p^+ - \beta} \frac{dk^+}{k^+(p^+ - k^+)} \frac{tr[\gamma^\lambda(p)(k + m)\gamma^\lambda(p')(k' - m)]}{p^- - k^- - k'^-} \]  \hspace{1cm} (26)

where,

\[ k = \left[ k^+, \frac{k_\perp^2 + m^2}{2k^+}, k_\perp \right] \] \hspace{1cm} (27)
and
\[ k' = \left[ p^+ - k^+, \frac{(p_\perp - k_\perp)^2 + m^2}{2(p^+ - k^+)} , p_\perp - k_\perp \right] \] (28)

\( \delta \mu^2 \) is the sum of \( \delta \mu_a^2 \) and \( \delta \mu_{b+c}^2 \) where
\[ \delta \mu_a^2 = e^2 \int \frac{d^2 k_\perp}{(2\pi)^2} \left[ \ln \left[ \frac{\alpha \beta}{(p^+)^2} \right] + \frac{2k_\perp^2}{k_\perp^2 + m^2} \right] \] (29)
corresponds to the propagating diagram and
\[ \delta \mu_{b+c}^2 = e^2 \int \frac{d^2 k_\perp}{(2\pi)^2} \int_0^\infty dk^+ \left[ \frac{1}{p^+ - k^+} - \frac{1}{p^+ - k^+} \right] \] (30)
corresponds to the instantaneous fermion exchange.

One can obtain this result from covariant expression also by performing the \( k^- \) integration
in a manner similar to the one sketched above for fermion self-energy diagram.

III. ASYMPTOTIC METHOD AND LIGHT FRONT QED

In this section, we will show that the diagrams involving instantaneous photon exchange
in fermion self energy can be generated by the asymptotic method discussed by Bakker et al
in the context of 1 + 1-dimensional theories\[4\].

In general, the number of light cone energy denominators is one less than the number of
denominators in the covariant expression. This may give the impression that one can obtain
the propagating part of light cone expression from the covariant expression by integrating
over light cone energy \( k^- \) using the method of residues. However, this apparently straight-
forward manner of proving equivalence does not reproduce all the instantaneous diagrams
unless one takes into account the contribution of arc at infinity and end point contributions\[4, 6\]. The diagrams involving instantaneous fermion exchange arise in a straightforward
manner when the fermion momenta in covariant expression are replaced by on shell mo-
menta, as discussed in the previous section. We will not discuss this contribution here. In
Ref.\[6\], we have shown that the diagrams involving instantaneous photon exchange arise
from the third term in the photon propagator of Eq. (2). We will now show that these
instantaneous diagrams can also be generated by taking the asymptotic limit of leading \( k^- \)
term in the covariant expression of one loop diagrams with conventional two term photon
propagator of Eq. (1). In addition, the IR divergent term in propagating part can also be
generated by this method. The asymptotic method\[4\] consists of isolating the divergent
parts by identifying the behaviour of the integrand at asymptotic values of $k^-$ and then regularizing these divergent parts in an appropriate manner. In Ref. [4], Bakker *et al* regularize the divergent part by shifting the integration variables to light-front cylindrical coordinates $k^+ = R \cos \phi$ and $k^- = R \sin \phi$. The regularized integrals are then evaluated over a finite region first (keeping $R$ finite) and finally the limit $R \to \infty$ is taken.

In the following, we will use the asymptotic method to isolate the divergent parts of one loop expressions for self energy and vacuum polarization in QED. We will then use the $u$-coordinate regularization[1] to evaluate these integrals. We will show that this method reproduces the instantaneous photon exchange diagram as well as the divergent part of the propagating diagram even if one uses the two term photon propagator. We will consider the covariant expression in the limit when $k^- \to \infty$ and the light cone momentum of internal fermion line approaches zero since we are interested in generating diagrams involving instantaneous photon exchange,i.e.Figs.1(c) and (d).

The covariant expression for electron self energy in the light-front gauge with the two term photon propagator is given by,

$$
\sum(p) = \frac{(ie)^2}{2mi} \int \frac{d^4k}{(2\pi)^4} \frac{N}{D_1D_2} \tag{31}
$$

where ,

$$
N = \gamma^\mu(\not{p} - \not{k} + m)\gamma^\nu d_{\mu\nu}(k) \tag{32}
$$

$$
D_1 = k^2 - \mu^2 + i\epsilon \tag{33}
$$

$$
D_2 = (p - k)^2 - m^2 + i\epsilon \tag{34}
$$

and $\frac{d_{\mu\nu}(k)}{k^2}$ is the photon propagator in light-cone gauge commonly used in light front QED[4] given by

$$
d_{\mu\nu} = -g_{\mu\nu}(k) + \frac{\delta_{\mu+k}\nu + \delta_{\nu+k}\mu}{k^+} \tag{35}
$$

Using Eq.(A.8) -(A.12), the numerator reduces to

$$
N = (p^+ - k^+) \left[2\gamma^- + 4\gamma^+ k^- k^+ + 2\gamma_1 \cdot k_1 \right] + (p^- - k^-)2\gamma^+ - \frac{2\gamma^+}{k^+} k^i (p^i - k^i) - 2m \tag{36}
$$
Numerator in \( \bar{u} \sum (p) u \) is obtained from this by using Eq(A.14) and Eq(A.15). In the limit \( k^- \to \infty \), numerator in \( \bar{u} \sum (p) u \) is reduced to
\[
N' = \frac{8 p^+(p^+ - k^+)k^-}{k^+} - 4p^+ k^- + \frac{4p^+}{k^+} k_\perp^2
\]  
(37)

In the limit \( k^- \to \infty, k^+ \to p^+ \),
\( D_1 \to 2k^+k^- \)
and \( \delta m \) reduces to
\[
\delta m_{asy} = \delta m_1 + \delta m_2 + \delta m_3
\]  
(38)
where
\[
\delta m_1 = \frac{ie^2 p^+}{m} \int \frac{d^2k_\perp}{(2\pi)^4} \int \frac{dk^+}{k^+} \int \frac{dk^-}{p^- - k^- - \frac{(p^+ - k^-)^2 + m^2 - i\epsilon}{2(p^+ - k^-)}}
\]  
(39)
\[
\delta m_2 = -\frac{ie^2 p^+}{m} \int \frac{d^2k_\perp}{(2\pi)^4} \int \frac{dk^+}{2k^+(p^+ - k^-)} \int \frac{dk^-}{p^- - k^- - \frac{(p^+ - k^-)^2 + m^2 - i\epsilon}{2(p^+ - k^-)}}
\]  
(40)
\[
\delta m_3 = \frac{ie^2 p^+}{2m} \int \frac{d^2k_\perp}{(2\pi)^4} \int \frac{dk^+}{k^+ + 2(p^+ - k^-)} \int \frac{dk^-}{k^- \left[\frac{(p^- - k^-)^2 + m^2 - i\epsilon}{2(p^- - k^-)}\right]} \]  
(41)

Using Eq. [B.5]-[B.9], \( \delta m_1 \) reduces to
\[
\delta m_1 = -\frac{e^2 p^+}{2m} \int \frac{d^2k_\perp}{(2\pi)^3} \int \frac{dk^+}{k^+} \left[\theta(k^+ - p^+) - \theta(p^+ - k^-)\right]
\]  
(42)
which is the same as \( \delta m_c \),
\[
\delta m_2 = \frac{e^2 p^+}{2m} \int \frac{d^2k_\perp}{(2\pi)^3} \left[\int_{p^+}^{\infty} \frac{dk^+}{2k^+(p^+ - k^-)} - \int_{-\infty}^{p^+} \frac{dk^+}{2k^+(p^+ - k^-)}\right]
\]  
(43)
and
\[
\delta m_3 = \frac{e^2 p^+}{2m} \int \frac{d^2k_\perp}{(2\pi)^3} \left[\int_{p^+}^{\infty} \frac{dk^+}{k^+} - \int_{-\infty}^{p^+} \frac{dk^+}{k^+}\right]
\]  
(44)
The sum of \( \delta m_2 \) and \( \delta m_3 \), on performing \( k^+ \) integration reduces to
\[
\delta m_2 + \delta m_3 = -\frac{e^2}{2m} \int \frac{d^2k_\perp}{(2\pi)^3} \left[2 \left(\frac{p^+}{\alpha} - 1\right) + \ln\left(\frac{p^+}{\beta}\right)\right]
\]  
(45)
which is the same as the IR divergent part of \( \delta m_o \). Thus, the covariant expression, in the limit \( k^- \to \infty, k^+ \to p^+ \), reproduces the sum of instantaneous photon exchange graph and the IR singular terms in the propagating graph.
A. VACUUM POLARIZATION

Photon self energy is given by

\[ \delta \mu^2 \delta \lambda^\nu = \epsilon_\mu^\lambda(p) \Pi^{\mu\nu}(p) \epsilon_\nu^\lambda(p) \]  

(46)

where

\[ i \Pi^{\mu\nu} = -e^2 \int \frac{d^2 k_\perp}{(2\pi)^2} \int \frac{dk^+}{2\pi} \int \frac{dk^-}{2\pi} \frac{Tr[\gamma^\mu(\not k + m)\gamma^\nu(\not p - \not k + m)]}{D_1 D_2} \]  

(47)

One can rewrite Eq. (47) as

\[ i \Pi^{\mu\nu}(p) = -e^2 \int \frac{d^3 k}{(2\pi)^3} \int \frac{dk^-}{2\pi} \frac{Tr[\gamma^\mu(\not k + m)\gamma^\nu(\not p - \not k - m)]}{2k^+2(p^+ - k^+)} \left[ p^- - k^- - \frac{(p_\perp - k_\perp)^2 + m^2 - i\epsilon}{2(p^+ - k^+)} \right] \]  

(48)

Taking \( k^- \to \infty \) limit in the numerator, we obtain

\[ \delta \mu^2_{\text{asy}} = ie^2 \int \frac{d^2 k_\perp}{(2\pi)^2} \int \frac{dk^+}{(2\pi)^2} \int \frac{dk^-}{(2\pi)^2} \frac{[-4k^+k^- + 4(p^+ - k^+)k^- + 4k_\perp^2]}{D_1 D_2} \]  

(49)

In the limit \( k^+ \to 0 \) and \( k^- \to \infty \) this reduces to

\[ \delta \mu^2_{\text{asy1}} = ie^2 \int \frac{d^2 k_\perp}{(2\pi)^2} \int \frac{dk^+}{(2\pi)^2} \int \frac{dk^-}{(2\pi)^2} \frac{[-4k^+k^- + 4(p^+ - k^+)k^- + 4k_\perp^2]}{2k^+ \left( k^- - \frac{k^2 + m^2 - i\epsilon}{2k^+} \right) (-2)(p^+ - k^+)k^-} \]  

(50)

which, on using the Eqs. (B.5)- (B.9), reduces to

\[ \delta \mu^2_{\text{asy1}} = \frac{e^2}{2} \int \frac{d^2 k_\perp}{(2\pi)^3} \left[ \int_0^\infty \frac{dk^+}{(p^+ - k^+)} - \int_0^\infty \frac{dk^+}{(p^+ - k^+)} \right] \]  

(51)

Similarly, in the limit \( k^+ \to p^+ \), \( k^- \to \infty \), one obtains

\[ \delta \mu^2_{\text{asy2}} = ie^2 \int \frac{d^2 k_\perp}{(2\pi)^2} \int \frac{dk^+}{(2\pi)^2} \int \frac{dk^-}{(2\pi)^2} \frac{[-4k^+k^- + 4(p^+ - k^+)k^- + 4k_\perp^2]}{2k^+2(p^+ - k^+)} \left[ p^- - k^- - \frac{(p_\perp - k_\perp)^2 + m^2 + i\epsilon}{2(p^+ - k^+)} \right] \]  

(52)
Thus $\delta \mu^2_{asy2}$ becomes

$$
\delta \mu^2_{asy2} = -\frac{e^2}{2} \int \frac{d^2 k_\perp}{(2\pi)^3} \left[ \int_{p+}^{\infty} \frac{d k^+}{p^+ - k^+} - \int_{-\infty}^{p+} \frac{d k^+}{p^+ - k^+} \right]
$$

$$
\delta \mu^2_{asy1} = \frac{e^2}{2} \int \frac{d^2 k_\perp}{(2\pi)^3} \left[ \int_{p+}^{\infty} \frac{d k^+}{k^+ - k^+} - \int_{-\infty}^{p+} \frac{d k^+}{k^+ - k^+} \right]
$$

$$
\delta \mu^2_{asy} = e^2 \int \frac{d^2 k_\perp}{(2\pi)^3} \left[ \ln \left( \frac{\alpha \beta}{(p^+)^2} \right) \right]
$$

(53)

Adding $\delta \mu^2_{asy1}$ and $\delta \mu^2_{asy2}$ we finally obtain

$$
\delta \mu^2_{asy} = e^2 \int \frac{d^2 k_\perp}{(2\pi)^3} \left[ \ln \left( \frac{\alpha \beta}{(p^+)^2} \right) \right]
$$

(54)

which is the IR singular part of the propagating diagram of one loop vacuum polarization in Eq (29).

IV. SUMMARY AND CONCLUSION

We have shown that the instantaneous photon exchange diagrams present in one loop fermion self energy calculation within LFTOPT can be generated by taking the asymptotic limit $k^+ \to p^+, k^- \to \infty$ of the covariant expression. In our earlier work [6], we had shown that the third term in the doubly transverse photon propagator is necessary to generate this diagram. Here, in this alternative method of generating this diagram, we have used the two term photon propagator only. Thus the asymptotic method provides an alternative way to generate photon exchange diagrams. In addition, this limit also reproduces the IR divergent terms in propagating diagrams. This method does not generate instantaneous fermion exchange diagrams. It is well established that these diagrams arise when one takes the limit $k^- \to k^-_{on}$ of covariant expression to obtain propagating diagram of the light front perturbation theory. Thus, subtracting the two limits $k^- \to (k^- - k^-_{on})$ and $k^- \to \infty, k^+ \to p^+$ will render the covariant expression completely free of IR singularities.

In case of vacuum polarization, there are no instantaneous photon exchange diagrams, but the propagating diagram does have an IR divergent contribution. In this case, both the internal line are fermions and therefore, we consider both the limits $k^- \to \infty, k^+ \to 0$ as well as $k^- \to \infty, k^+ \to p^+$ to obtain the IR divergent contribution. We verify that the IR singular part of propagating term can indeed be generated by this method. Similar to the self
energy case, one can use this method to subtract the IR singular part from the propagating diagrams. It is worth mentioning that the IR divergences we have discussed here are not the "true" IR divergences of LFFTs \cite{13,14}, but are the "spurious" IR divergences arising due to the form of LF energy momentum relation. True IR divergences shall remain after the above procedure has been applied and have to be dealt with separately.

The procedure sketched here can also be applied to vertex correction graphs. We shall address this issue in a future communication.

Appendix: A

1. Basics

We define the light front co-ordinates by

\[ x^+ = \frac{x^0 + x^3}{\sqrt{2}} \]  \hspace{1cm} (A.1)

\[ x^- = \frac{x^0 - x^3}{\sqrt{2}} \]  \hspace{1cm} (A.2)

\[ x_\perp = (x^1, x^2) \]  \hspace{1cm} (A.3)

The metric tensor is given by,

\[ g^{\mu\nu} = \begin{pmatrix} 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & -1 & 0 \\ 0 & 0 & 0 & -1 \end{pmatrix} \]

Dirac matrices satisfy the following properties:

\[ (\gamma^+)^2 = (\gamma^-)^2 = 0 \]  \hspace{1cm} (A.4)
\{\gamma^\mu, \gamma^\nu\} = 2g^{\mu\nu} \quad (A.5)

(\gamma^0)^+ = \gamma^0 \quad (A.6)

(\gamma^k)^\dagger = -\gamma^k (k = 1, 2, 3) \quad (A.7)

\gamma^+\gamma^-\gamma^+ = 2\gamma^+ \quad (A.8)

\gamma^-\gamma^+\gamma^- = 2\gamma^- \quad (A.9)

d_{\mu\nu}(p) = -g_{\mu\nu} + \frac{\delta_{\mu+p\nu} + \delta_{\nu+p\mu}}{p^+} \quad (A.10)

also,

\gamma^\alpha\gamma^\beta d_{\alpha\beta}(p) = -2 \quad (A.11)

\gamma^\alpha\gamma^\nu\gamma^\beta d_{\alpha\beta}(p) = \frac{2}{p^+}(\gamma^+\gamma^\nu + g^{\nu\mu}\gamma^\mu) \quad (A.12)

\gamma^\alpha\gamma^\nu\gamma^\beta d_{\alpha\beta}(p) = -4g^{\mu\nu} + \frac{2p_\alpha}{p^+}(g^{\mu\alpha}\gamma^\nu\gamma^+ - g^{\nu\alpha}\gamma^\mu\gamma^+ - g^{\mu\nu}\gamma^\alpha + g^{\nu\mu}\gamma^\alpha) \quad (A.13)

Dirac spinors satisfy:

\bar{u}(p, s)u(p, s') = -\bar{v}(p, s)v(p, s) = 2m\delta_{s,s'} \quad (A.14)

\bar{u}(p, s)\gamma^\mu u(p, s') = \bar{v}(p, s)\gamma^\mu v(p, s) = 2p^\mu\delta_{s,s'} \quad (A.15)

2. Light Front Hamiltonian

\(P^-,\) the Light front Hamiltonian is the operator conjugate to the “time” evolution variable \(x^+\) and is given by,

\[ P^- = H_0 + V_1 + V_2 + V_3 \quad (A.16) \]

where \(H_0\) is the free hamiltonian, \(V_1\) is the standard, order-\(e\) three-point interaction,

\[ V_1 = e \int d^2x_\perp dx^- \bar{\xi}\gamma^\mu\xi a_\mu \quad (A.17) \]

\(V_2\) is an order-\(e^2\) non-local effective four-point vertex corresponding to an instantaneous fermion exchange,

\[ V_2 = -\frac{i}{4}e^2 \int d^2x_\perp dx^- dy^- \epsilon(x^- - y^-)(\bar{\xi}a_k\gamma^k)(x)\gamma^+(a_j\gamma^j\xi)(y) \quad (A.18) \]

and \(V_3\) is an order-\(e^2\) non-local effective four-point vertex corresponding to an instantaneous photon exchange,

\[ V_3 = -\frac{e^2}{4} \int d^2x_\perp dx^- dy^- (\bar{\xi}\gamma^+\xi)(x)|x^- - y^-|(\bar{\xi}\gamma^+\xi)(y) \quad (A.19) \]
3. Instantaneous diagrams in Self Energy correction

Here, we briefly review the calculation of $\delta m_b$ and $\delta m_c$ in Eqs. (14) and (15). The details can be found in Appendix B of Ref. [7]. To prove the expression for $\delta m_b$ in Eq. (14) starting from Eq. (10), one writes

$$
\int_0^\infty dk^+ \frac{p^+}{k^+(p^+ - k^+)} = \int_0^\infty \frac{dk^+}{k^+} + \int_0^{p^+ - \eta} \frac{dk^+}{p^+ - k^+} = \ln \left[ \frac{p^+}{\alpha} \right]
$$

(A.20)

where we have identified $\alpha$ with $\eta$.

To prove Eq. (15), we start with Eq. (11) and write

$$
\int_0^\infty \frac{dk^+}{(p^+ - k^+)^2} = \int_0^\infty \frac{dk^+}{(p^+ + k^+)^2} = \int_0^{p^+ - \eta} \frac{dk^+}{(p^+ - k^+)^2} + \int_{p^+ + \eta}^\infty \frac{dk^+}{(p^+ + k^+)^2}
$$

(A.21)

where again we have identified $\eta$ with $\alpha$.

Appendix: B

In this appendix, we will give expressions for the integrals used in Section III. Consider the integral

$$
I_1 = \int_0^\infty \frac{dk^-}{k^- - \frac{k^2 + \mu^2 - i\epsilon}{2k^+}}
$$

(B.1)

which has a pole at $k^- = \frac{k^2 + \mu^2 - i\epsilon}{2k^+}$ that tends to infinity in the limit $k^+ \to 0$. To evaluate the integral, we change the variable to $u = \frac{1}{k^-}$ and obtain

$$
I_1 = \int \frac{du}{u \left[ 1 - \frac{k^2 + \mu^2 - i\epsilon}{2k^+}u \right]}
$$

(B.2)

Regularizing the integral by the replacement

$$
\frac{1}{u} = \frac{1}{2} \left( \frac{1}{u + i\delta} + \frac{1}{u - i\delta} \right)
$$

(B.3)
we obtain

\[
I_1 = \frac{1}{2} \int \frac{du}{(u + i\delta) \left[ 1 - \frac{k^2 + \mu^2 - i\epsilon}{2k^+} u \right]} + \frac{1}{2} \int \frac{du}{(u - i\delta) \left[ 1 - \frac{k^2 + \mu^2 - i\epsilon}{2k^+} u \right]}
\]  

(B.4)

Closing the contour in the lower half plane for the first integral and in the upper half plane for the second integral, we finally obtain

\[
I_1 = -\pi i \left[ \theta(k^+) - \theta(-k^+) \right]
\]  

(B.5)

Similarly the integral

\[
I_2 = \int \frac{dk^-}{p^- - k^- - \frac{(p_+ - k_+)^2 + m^2 - i\epsilon}{2(p^+ - k^+)} - k^+}
\]  

(B.6)

has a pole at \( k^- = p^- - \frac{(p_+ - k_+)^2 + m^2 - i\epsilon}{2(p^+ - k^+)} \) which tends to infinity as \( k^+ \rightarrow p^+ \). Again changing the variable to \( u = \frac{1}{k^-} \) and using the same procedure as above we finally obtain

\[
\int \frac{dk^-}{p^- - k^- - \frac{(p_+ - k_+)^2 + m^2 - i\epsilon}{2(p^+ - k^+)} - k^+} = \pi i \left[ \theta(k^+ - p^+) - \theta(p^+ - k^+) \right]
\]  

(B.7)

Also the integral

\[
\int \frac{dk^-}{k^- \left[ k^- - \frac{k^2 + \mu^2 - i\epsilon}{2k^+} \right]} = -\pi i \left[ \frac{2k^+ \theta(k^+) - \theta(-k^+)}{k^2 + \mu^2 - i\epsilon} \right]
\]  

(B.8)

and

\[
\int \frac{dk^-}{k^- \left[ p^- - k^- - \frac{(p_+ - k_+)^2 + m^2 - i\epsilon}{2(p^+ - k^+)} \right]} = \pi i \left[ \frac{2(p^+ - k^+) \theta(k^+ - p^+) - \theta(p^+ - k^+)}{2(p^+ - k^+)(p^- - (p_+ - k_+)^2 - m^2 + i\epsilon)} \right]
\]
