Abstract. The evolution equations of the gauge and Yukawa couplings are derived for the
two-loop renormalisation group equations in a five-dimensional SM compactified on a $S^1/Z_2$
to yield standard four space-time dimensions. Different possibilities can be discussed, however, we
shall consider the limiting case in which all matter fields are localised on the brane. We will
compare our two-loop results to the results found at one-loop level, and investigate the evolution
of $\sin^2 \theta_W$ in this scenario also.

1. Introduction

The renormalisation group evolution of gauge and Yukawa couplings is important in many
contexts, and in some cases one needs to know this evolution quite precisely. Furthermore, in
order to take full advantage of future experimental observations, it will be necessary to provide
theoretical predictions for measured observables which are as accurate as possible, where one
can hope that the values of these couplings will be deduced directly from experimental data.

Note that in order to obtain very precise predictions for the running of Yukawa couplings,
one usually uses known masses of quarks and leptons [1], since it is the Yukawa interactions
that give the fundamental fermions their masses after spontaneous symmetry breaking. Due
to the observed hierarchy of the fermion masses, the corresponding values are usually defined
at different scales. Therefore, one inevitably makes use of Renormalisation Group Equations
(RGEs) to connect these scales. It should also be mentioned that contrary to leptons, quarks
are not observed as free particles, so the pole mass which is usually associated with the physical
mass of a particle, although being a gauge invariant and finite quantity, suffers from ambiguity
[2]. As a consequence, theoretical uncertainty in the determination of the top Yukawa coupling,
for example, is reduced, thus requiring more precise determinations of the corresponding RGEs.

So by computing couplings to two-loop accuracy we are able to set limits, such as on the
prediction of the masses of heavy fermions [3]. But this is exasperated further when considering
models with extra-dimensions, where we can have a range of heavy fermions and bosons,
arising as Kaluza-Klein states, leading to runnings for our couplings now exhibiting a power
law running, see Refs. [4] for example. Furthermore, this observed power law running can mean
contributions from higher-order loops could be very significant when compared to our earlier
one-loop calculations [4, 5]. Note that in this proceedings we shall restrict ourselves to a minimal
Universal Extra-Dimensional (UED) model, where all matter fields are constrained to the brane,
as a simpler testing ground for two-loop calculations. This shall be extended in an upcoming
work to bulk cases also [6]. However, two-loop precision remains desirable here because fermions
can be heavy, and this means that their Yukawa couplings, and other couplings, can be large.
As such, the precise value of the corresponding coupling is required to test whether the Standard Model (SM), or UED models, correctly describe nature. The paper is organised as follows: In section 2 we shall recall the one- and two-loop SM beta functions. In section 3, the one- and two-loop UED beta functions shall be presented. Section 4 concludes with some preliminary results.

2. The beta functions in the SM Model
The one- and two-loop beta functions in the SM have been known for decades now in various mass limits, see Refs. [7] for example, and are presented here in the form we shall use for completeness.

2.1. Gauge sector
The one-loop beta functions for the gauge couplings in SM model are given by:

\[(4\pi)^2 g_1^{-3} \beta_{g_1}^{(1)} = \frac{41}{10}, \quad (4\pi)^2 g_2^{-3} \beta_{g_2}^{(1)} = -\frac{19}{6}, \quad (4\pi)^2 g_3^{-3} \beta_{g_3}^{(1)} = -7.\]

The two-loop contribution to the SM gauge couplings are given by:

\[(4\pi)^4 g_1^{-3} \beta_{g_1}^{(2)} = \frac{199}{50} g_1^2 + \frac{27}{10} g_2^2 + \frac{4}{5} g_3^2 - \text{Tr} \left( \frac{17}{5} Y_u^\dagger Y_u + Y_d^\dagger Y_d + 3 Y_e^\dagger Y_e \right),\]
\[(4\pi)^4 g_2^{-3} \beta_{g_2}^{(2)} = \frac{9}{10} g_1^2 + \frac{35}{6} g_2^2 + 12 g_3^2 - \text{Tr} \left( 3 Y_u^\dagger Y_u + 3 Y_d^\dagger Y_d + Y_e^\dagger Y_e \right),\]
\[(4\pi)^4 g_3^{-3} \beta_{g_3}^{(2)} = \frac{11}{10} g_1^2 + \frac{9}{2} g_2^2 - 26 g_3^2 - 4 \text{Tr} \left( Y_u^\dagger Y_u + Y_d^\dagger Y_d \right).\]

2.2. Yukawa sector
The one-loop beta functions for the Yukawa couplings in SM model are given by:

\[(4\pi)^2 Y_u^{-1} \beta_{Y_u}^{(1)} = \text{Tr} \left( 3 Y_u^\dagger Y_u + 3 Y_d^\dagger Y_d + Y_e^\dagger Y_e \right) - \left( \frac{17}{20} g_1^2 + \frac{9}{4} g_2^2 + 8 g_3^2 \right) + \frac{1}{2} \left( Y_u^\dagger Y_u - Y_d^\dagger Y_d \right),\]
\[(4\pi)^2 Y_d^{-1} \beta_{Y_d}^{(1)} = \text{Tr} \left( 3 Y_u^\dagger Y_u + 3 Y_d^\dagger Y_d + Y_e^\dagger Y_e \right) - \left( \frac{1}{4} g_1^2 + \frac{9}{4} g_2^2 + 8 g_3^2 \right) + \frac{1}{2} \left( Y_d^\dagger Y_d - Y_u^\dagger Y_u \right),\]
\[(4\pi)^2 Y_e^{-1} \beta_{Y_e}^{(1)} = \text{Tr} \left( 3 Y_u^\dagger Y_u + 3 Y_d^\dagger Y_d + Y_e^\dagger Y_e \right) - \left( \frac{9}{4} g_1^2 + \frac{9}{4} g_2^2 \right) + \frac{3}{2} Y_e^\dagger Y_e.\]

The two-loop contribution to the SM Yukawa couplings are given by:

\[(4\pi)^4 Y_u^{-1} \beta_{Y_u}^{(2)} = 11 (Y_u^\dagger Y_d)^2 - 5 (Y_u^\dagger Y_d) (Y_u^\dagger Y_u) + (5 Y_d^\dagger Y_d - 9 Y_u^\dagger Y_u) \text{Tr} \left( 3 Y_u^\dagger Y_u + 3 Y_d^\dagger Y_d + Y_e^\dagger Y_e \right)
\left[ 6 (Y_u^\dagger Y_u)^2 - 9 \text{Tr} \left( 3 (Y_u^\dagger Y_u)^2 + 3 (Y_d^\dagger Y_d)^2 - \frac{2}{3} (Y_d^\dagger Y_d) (Y_u^\dagger Y_u) + (Y_e^\dagger Y_e)^2 \right) \right]
+ Y_u^\dagger Y_u \left[ \frac{223}{40} g_1^2 + \frac{135}{8} g_2^2 + 32 g_3^2 \right] - Y_d^\dagger Y_d \left[ \frac{43}{40} g_1^2 - \frac{9}{2} g_2^2 + 32 g_3^2 \right]
+ \frac{1187}{600} g_1^4 - \frac{23}{4} g_2^4 - 108 g_3^4 - \frac{9}{20} g_1^2 g_2^2 - \frac{19}{15} g_1^2 g_3^2 + 9 g_2^2 g_3^2 + \frac{15}{4} \text{Tr} (Y_e^\dagger Y_e) \left( g_1^2 + g_2^2 \right)
+ 5 \text{Tr} (Y_u^\dagger Y_u) \left( \frac{17}{20} g_1^2 + \frac{9}{4} g_2^2 + 8 g_3^2 \right) + 5 \text{Tr} (Y_d^\dagger Y_d) \left( \frac{1}{4} g_1^2 + \frac{9}{4} g_2^2 + 8 g_3^2 \right),\]
\[(4\pi)^4 Y_d^{-1} \beta_{Y_d}^{(2)} = 11(Y_d Y_u)^2 - 5(Y_d Y_d)(Y_d Y_u) + 9(Y_d Y_d) \left(3Y_u Y_u + 3Y_d Y_d + Y_e Y_e\right) \]
\[6(Y_d Y_d)^2 - 9 \text{Tr} \left(3(Y_d Y_u)^2 + 3(Y_d Y_d)^2 - \frac{2}{3}(Y_d Y_d)(Y_d Y_u) + (Y_e Y_e)^2\right) + 79\frac{(187 g_1^2 + 135 g_2^2 + 32 g_3^2)}{92}\]
\[-12\frac{g_1^4}{60} - 108g_1^4 + 27\frac{g_1^2 g_2^2 + 13\frac{g_1^2 g_3^2 + 9g_2^2 g_3^2 + 15\frac{4}{4} \text{Tr}(Y_e Y_e)}{79}\]
\[+5 \text{Tr}(Y_d Y_u) \left(17\frac{g_1^2 + 9\frac{g_2^2 + 8g_3^2}{92}\right) + 5 \text{Tr}(Y_d Y_d) \left(\frac{1}{4} g_1^2 + \frac{9}{4} g_2^2 + 8g_3^2\right)\],
\[(11)\]

\[(4\pi)^4 Y_e^{-1} \beta_{Y_e}^{(2)} = 6(Y_e Y_u)^2 - 9 \text{Tr} \left(3(Y_e Y_u)^2 + 3(Y_e Y_d)^2 - \frac{2}{3}(Y_d Y_d)(Y_d Y_u) + (Y_e Y_e)^2\right) - Y_e Y_e \text{Tr} \left(3Y_u Y_u + 3Y_d Y_d + Y_e Y_e\right) + Y_e Y_e \left(387\frac{g_1^2 + 135}{92}\right) + 15\frac{4}{4} \text{Tr}(Y_e Y_e) \left(g_1^2 + g_2^2\right) + 137\frac{1}{200} g_1^2 - 23\frac{4}{92} + 27\frac{20\frac{g_1^2 g_2^2 + 8g_3^2}{g_2^2 + 8g_3^2}\right).\]
\[(12)\]

3. The beta functions in a brane-localised UED model

In this scenario the SM $SU(3)_c \times SU(2)_L \times U(1)_Y$ gauge fields and the Higgs ($H$) propagate into the fifth dimension, $y$. As a consequence these fields will have Kaluza-Klein modes which contribute to the RGEs at energies $E > 1/R$. Different possibilities for the matter fields can be studied, however we shall study the limiting case with SM matter fields restricted to the $y = 0$ brane. As such there will be no additional Kaluza-Klein contributions of these matter fields to the RGEs.

3.1. Gauge sector

The one-loop beta functions for the gauge couplings in this five dimensional model are given by:

\[(4\pi)^2 g_1^{-3} \beta_{g_1}^{(1)} = (S(t) - 1) \left(\frac{1}{10} + \frac{8}{3} \eta\right),\]
\[(13)\]
\[(4\pi)^2 g_2^{-3} \beta_{g_2}^{(1)} = (S(t) - 1) \left(-\frac{41}{6} + \frac{8}{3} \eta\right),\]
\[(14)\]
\[(4\pi)^2 g_3^{-3} \beta_{g_3}^{(1)} = (S(t) - 1) \left(-\frac{21}{2} + \frac{8}{3} \eta\right).\]
\[(15)\]

where $\eta$ is the number of fermion generations.

The two-loop contribution to the gauge couplings in this five dimensional model are given by:

\[(4\pi)^4 g_1^{-3} \beta_{g_1}^{(2)} = (S(t)^2 - 1) \left(\frac{199}{50} g_1^2 + 27\frac{g_2^2 + 44}{10} g_3^2\right),\]
\[(16)\]
\[(4\pi)^4 g_2^{-3} \beta_{g_2}^{(2)} = (S(t)^2 - 1) \left(\frac{9}{10} g_1^2 + 35\frac{g_2^2 + 12g_3^2}{6} g_2^2\right),\]
\[(17)\]
\[(4\pi)^4 g_3^{-3} \beta_{g_3}^{(2)} = (S(t)^2 - 1) \left(\frac{11}{10} g_1^2 + 9\frac{g_2^2 + 26g_3^2}{2} g_2^2\right).\]
\[(18)\]
3.2. Yukawa sector

The one-loop beta functions for the Yukawa couplings in this five dimensional model are given by:

\[
(4\pi)^2 Y_u^{-1} \beta_{Y_u}^{(1)} = 2(S(t) - 1) \left( -\frac{17}{20} g_1^2 + \frac{9}{4} g_2^2 + 8 g_3^2 \right) + \frac{3}{2} \left( Y_d^\dagger Y_u - Y_u^\dagger Y_d \right),
\]

(19)

\[
(4\pi)^2 Y_d^{-1} \beta_{Y_d}^{(1)} = 2(S(t) - 1) \left( -\frac{1}{4} g_1^2 + \frac{9}{4} g_2^2 + 8 g_3^2 \right) + \frac{3}{2} \left( Y_d^\dagger Y_d - Y_u^\dagger Y_u \right),
\]

(20)

\[
(4\pi)^2 Y_e^{-1} \beta_{Y_e}^{(1)} = 2(S(t) - 1) \left( -\frac{9}{4} g_1^2 + \frac{9}{4} g_2^2 \right) + \frac{3}{2} Y_e^\dagger Y_e.
\]

(21)

The two-loop contribution to the Yukawa couplings in this five dimensional are given by:

\[
(4\pi)^4 Y_u^{-1} \beta_{Y_u}^{(2)} = 2(S(t)^2 - 1) \left( 6(Y_u^\dagger Y_u)^2 - 5(Y_d^\dagger Y_d)(Y_u^\dagger Y_u) + 11(Y_d^\dagger Y_d)^2 \right.
\]

\[
+ Y_u^\dagger Y_u \left( \frac{223}{40} g_1^4 + \frac{135}{8} g_2^2 + 32 g_3^2 \right) - Y_d^\dagger Y_d \left( \frac{43}{40} g_1^2 - \frac{9}{8} g_2^2 + 32 g_3^2 \right)
\]

\[
+ \frac{1187}{600} g_1^4 - \frac{23}{4} g_2^4 - 108 g_3^4 - \frac{9}{20} g_1^2 g_2^2 - \frac{19}{15} g_1^2 g_3^2 + 9 g_2^2 g_3^2 \right)
\]

(22)

\[
(4\pi)^4 Y_d^{-1} \beta_{Y_d}^{(2)} = 2(S(t)^2 - 1) \left( 6(Y_d^\dagger Y_d)^2 - 5(Y_d^\dagger Y_d)(Y_u^\dagger Y_u) + 11(Y_u^\dagger Y_u)^2 \right.
\]

\[
+ Y_d^\dagger Y_d \left( \frac{187}{40} g_1^4 + \frac{135}{8} g_2^2 + 32 g_3^2 \right) - Y_u^\dagger Y_u \left( \frac{79}{40} g_1^2 - \frac{9}{8} g_2^2 + 32 g_3^2 \right)
\]

\[
- \frac{127}{600} g_1^4 - \frac{23}{4} g_2^4 - 108 g_3^4 - \frac{27}{20} g_1^2 g_2^2 + \frac{13}{15} g_1^2 g_3^2 + 9 g_2^2 g_3^2 \right)
\]

(23)

\[
(4\pi)^4 Y_e^{-1} \beta_{Y_e}^{(2)} = 2(S(t)^2 - 1) \left( 6(Y_e^\dagger Y_e)^2 + Y_e^\dagger Y_e \left( \frac{387}{40} g_1^4 + \frac{135}{8} g_2^2 \right)
\]

\[
+ \frac{1371}{200} g_1^4 - \frac{23}{4} g_2^4 + \frac{27}{20} g_1^2 g_2^2 \right).
\]

(24)

That is, when the energy scale parameter \( t = \ln(E/M_Z) > \ln(1/RM_Z) \) or \( E > 1/R \), these equations shall be used. When the energy \( 0 < t < \ln(1/RM_Z) \) (that is \( M_Z < E < 1/R \)) the evolution of the gauge and Yukawa couplings at low energy are given by the usual four dimensional SM expressions, as was presented in section 2.

4. Result and Discussion

As expected the extra-dimension brings down the unification scale to a lower scale, see Fig. 1. At one-loop level the gauge and Yukawa coupling RGEs are disentangled, however, at the two-loop level the RGEs for the gauge and Yukawa couplings are entangled. As such, only a few percent change in the evolution of gauge couplings, due to the appearance of Yukawa couplings over the one-loop running, is observed. This also may change the running of \( g_3 \), due to the large size of \( Y_t \).

In Fig. 2 we present the evolution of \( \sin^2 \theta_W \) in this brane constrained UED model. Once the new contributions from the extra-dimensions arise, the behaviour is changed until we reach the cut-off scale. One can see for \( R^{-1} = 1 \) TeV \( \sin^2 \theta_W \) can rise to ~ 0.4. This result may be useful, at least from a model building perspective, where there is no discernible difference from the one- and two-loop trajectories in this plot.

As such, for models with an extra-dimension the one-loop running of Yukawa couplings is clearly insufficient, since higher order corrections can be just as important at scales a few times above \( 1/R \). Although this type of large correction, which we require to claim unification, see Fig. 3, needs to be tested further to ensure that \( Y_t \) remains perturbative up to the unification...
Figure 1. (Colour online) Gauge couplings \( g_1 \) (red), \( g_2 \) (blue), \( g_3 \) (green) with all matter fields in the brane; for the compactification scales \( R^{-1} = 2 \, \text{TeV} \) as a function of the scale parameter \( t \). Solid lines are the one-loop level runnings, dashed lines are two-loop level runnings.

Figure 2. \( \sin^2 \theta_W \) with all matter fields in the brane; for three different values of the compactification scales \( R^{-1} = 1 \, \text{TeV} \) (red), 2 TeV (blue), 10 TeV (green) as a function of the scale parameter \( t \).

scale. This shall be more fully explored in an upcoming work, where the case of bulk propagating matter fields shall also be investigated [6].
