EXISTENCE AND MULTIPLICITY OF SOLUTIONS TO EQUATIONS OF \( N \)-LAPLACIAN TYPE WITH CRITICAL EXPONENTIAL GROWTH IN \( \mathbb{R}^N \)

NGUYEN LAM AND GUOZHEN LU

Abstract. In this paper, we deal with the existence of solutions to the nonuniformly elliptic equation of the form

\[
- \text{div} (a(x, \nabla u)) + V(x)|u|^{N-2}u = \frac{f(x, u)}{|x|^\beta} + \varepsilon h(x)
\]

in \( \mathbb{R}^N \) where \( 0 \leq \beta < N \), \( V: \mathbb{R}^N \to \mathbb{R} \) is a continuous potential satisfying \( V(x) \geq V_0 > 0 \) in \( \mathbb{R}^N \) and \( V^{-1} \in L^1(\mathbb{R}^N) \) or \( |\{ x \in \mathbb{R}^N : V(x) \leq M \}| < \infty \) for every \( M > 0 \), \( f: \mathbb{R}^N \times \mathbb{R} \to \mathbb{R} \) behaves like \( \exp \left( \frac{\alpha |u|^{N/(N-1)}}{|x|^{N-1}} \right) \) when \( |u| \to \infty \) and satisfies the Ambrosetti-Rabinowitz condition, \( h \in (W^{1,N}(\mathbb{R}^N))^* \), \( h \neq 0 \) and \( \varepsilon \) is a positive parameter. In particular, in the case of \( N \)-Laplacian, i.e,

\[
- \Delta_N u + V(x)|u|^{N-2}u = \frac{f(x, u)}{|x|^\beta} + \varepsilon h(x)
\]

using the minimization and the Ekeland variational principle, we obtain multiplicity of weak solutions of (0.2).

Moreover, we prove that it is not necessary to have the small nonzero perturbation \( \varepsilon h(x) \) to get the nontriviality of the solution to the \( N \)-Laplacian equation

\[
- \Delta_N u + V(x)|u|^{N-2}u = \frac{f(x, u)}{|x|^\beta}
\]

Finally, we will prove the above results when our nonlinearity \( f \) doesn’t satisfy the well-known Ambrosetti-Rabinowitz condition and thus derive the existence and multiplicity of solutions for a wider class of nonlinear terms \( f \).

1. Introduction

In this paper, we consider the existence and multiplicity of nontrivial weak solution \( u \in W^{1,N}(\mathbb{R}^N) \) (\( u \geq 0 \)) for the nonuniformly elliptic equations of \( N \)-Laplacian type of the form:

\[
- \text{div} (a(x, \nabla u)) + V(x)|u|^{N-2}u = \frac{f(x, u)}{|x|^\beta} + \varepsilon h(x) \quad \text{in} \quad \mathbb{R}^N
\]

where, in addition to some more assumptions on \( a(x, \tau) \) and \( f \) which will be specified later in Section 2, we have

\[
|a(x, \tau)| \leq c_0 \left( h_0(x) + h_1(x) |\tau|^{N-1} \right)
\]

Key words and phrases. Ekeland variational principle, Mountain-pass Theorem, Variational methods, Critical growth, Moser-Trudinger inequality, \( N \)-Laplacian, Ambrosetti-Rabinowitz condition.

for any $\tau$ in $\mathbb{R}^N$ and a.e. $x$ in $\mathbb{R}^N$, $h_0 \in L^{N/(N-1)}(\mathbb{R}^N)$ and $h_1 \in L^\infty_{loc}(\mathbb{R}^N)$ and $f$ satisfies critical growth of exponential type such as $f : \mathbb{R}^N \times \mathbb{R} \to \mathbb{R}$ behaves like $\exp\left(\alpha |u|^{N/(N-1)}\right)$ when $|u| \to \infty$ and when $f$ either satisfies or does not satisfy the Ambrosetti-Rabinowitz condition.

A special case of our equation in the whole Euclidean space when $a(x, \nabla u) = |\nabla u|^{N-2} \nabla u$ has been studied extensively, both in the case $N = 2$ (the prototype equation is the Laplacian in $\mathbb{R}^2$) and in the case $N > 3$ in $\mathbb{R}^N$ for the $N-$Laplacian, see for example [11], [2], [3], [29], [19], [15], [16], [17], [5], etc. We should mention that problems involving Laplacian in bounded domains in $\mathbb{R}^2$ with critical exponential growth have been studied in [4], [19], [7], [8], [12], [32], etc. and for $N-$Laplacian in bounded domains in $\mathbb{R}^N (N > 2)$ by the authors of [2], [15], [29].

The problems of this type are important in many fields of sciences, notably the fields of electromagnetism, astronomy, and fluid dynamics, because they can be used to accurately describe the behavior of electric, gravitational, and fluid potentials. They have been extensively studied by many authors in many different cases: bounded domains and unbounded domains, different behaves of the nonlinearity, different types of boundary conditions, etc. In particular, many works focus on the subcritical and critical growth of the nonlinearity which allows to treat the problem variationally using general critical point theory.

In the case $p < N$, by the Sobolev embedding, the subcritical and critical growth for the $p-$Laplacian mean that the nonlinearity $f$ cannot exceed the polynomial of degree $p^* = \frac{Np}{N-p}$. The case $p = N$ is special, since the corresponding Sobolev space $W^{1,N}_0(\Omega)$ is a borderline case for Sobolev embeddings: one has $W^{1,N}_0(\Omega) \subset L^q(\Omega)$ for all $q \geq 1$, but $W^{1,N}_0(\Omega) \not\subset L^\infty(\Omega)$. So, one is led to ask if there is another kind of maximal growth in this situation. Indeed, this is the result of Pohozaev [30], Trudinger [34] and Moser [28], and is by now called the Moser-Trudinger inequality: it says that if $\Omega \subset \mathbb{R}^N$ is a bounded domain, then

$$\sup_{u \in W^{1,N}_0(\Omega), \|\nabla u\|_{L^N} \leq 1} \frac{1}{|\Omega|} \int_{\Omega} e^{\alpha_N |u|^N} \, dx < \infty$$

where $\alpha_N = Nw_{N-1}^{1-1/N}$ and $w_{N-1}$ is the surface area of the unit sphere in $\mathbb{R}^N$. Moreover, the constant $\alpha_N$ is sharp in the sense that if we replace $\alpha_N$ by some $\beta > \alpha_N$, the above supremum is infinite.

This well-known Moser-Trudinger inequality has been generalized in many ways. For instance, in the case of bounded domains, Adimurthi and Sandeep proved in [3] that the following inequality

$$\sup_{u \in W^{1,N}_0(\Omega), \|\nabla u\|_{L^N} \leq 1} \int_{\Omega} e^{\alpha_N |u|^N} \, dx < \infty$$

holds if and only if $\frac{\alpha}{2N} + \frac{\beta}{N} \leq 1$ where $\alpha > 0$ and $0 \leq \beta < N$.

On the other hand, in the case of unbounded domains, B. Ruf when $N = 2$ in [31] and Y. X. Li and B. Ruf when $N > 2$ in [25] proved that if we replace the $L^N$-norm of $\nabla u$ in the supremum by the standard Sobolev norm, then this supremum can still be finite.
under a certain condition for $\alpha$. More precisely, they have proved the following:

\[
\sup_{u \in W^{1,N}_0(\mathbb{R}^N), \|u\|_L^N + \|\nabla u\|_{L^N} \leq 1} \int_{\mathbb{R}^N} \left( \exp \left( \alpha |u|^{N/(N-1)} \right) - S_{N-2}(\alpha, u) \right) dx \leq \infty \text{ if } \alpha \leq \alpha_N, \\
= +\infty \text{ if } \alpha > \alpha_N,
\]

where

\[
S_{N-2}(\alpha, u) = \sum_{k=0}^{N-2} \frac{\alpha^k |u|^{kN/(N-1)}}{k!}.
\]

We should mention that for $\alpha < \alpha_N$ when $N = 2$, the above inequality was first proved by D. Cao in \([11]\), and proved for $N > 2$ by Panda \([29]\) and J.M. do O \([15, 16]\) and Adachi and Tanaka \([1]\).

Recently, Adimurthi and Yang generalized the above result of Li and Ruf \([25]\) to get the following version of the singular Trudinger-Moser inequality (see \([5]\)):

**Lemma 1.1.** For all $0 \leq \beta < N$, $0 < \alpha$ and $u \in W^{1,N}(\mathbb{R}^N)$, there holds

\[
\int_{\mathbb{R}^N} \frac{1}{|x|^\beta} \left\{ \exp \left( \alpha |u|^{N/(N-1)} \right) - S_{N-2}(\alpha, u) \right\} < \infty
\]

Furthermore, we have for all $\alpha \leq \left(1 - \frac{\beta}{N}\right) \alpha_N$ and $\tau > 0$,

\[
\sup_{\|u\|_{1,\tau} \leq 1} \int_{\mathbb{R}^N} \frac{1}{|x|^\beta} \left\{ \exp \left( \alpha |u|^{N/(N-1)} \right) - S_{N-2}(\alpha, u) \right\} < \infty
\]

where $\|u\|_{1,\tau} = \left( \int_{\mathbb{R}^N} \left( |\nabla u|^N + \tau |u|^N \right) dx \right)^{1/N}$. The inequality is sharp: for any $\alpha > \left(1 - \frac{\beta}{N}\right) \alpha_N$, the supremum is infinity.

Motivated by this Trudinger-Moser inequality, do Ó \([15, 16]\) and do Ó, Medeiros and Severo \([17]\) studied the quasilinear elliptic equations when $\beta = 0$ and Adimurthi and Yang \([5]\) studied the singular quasilinear elliptic equations for $0 \leq \beta < N$, both with the maximal growth on the singular nonlinear term $\frac{f(x,u)}{|x|^\beta}$ which allows them to treat the equations variationally in a subspace of $W^{1,N}(\mathbb{R}^N)$. More precisely, they can find a nontrivial weak solution of mountain-pass type to the equation with the perturbation

\[
- \text{div} \left( |\nabla u|^{N-2} \nabla u \right) + V(x) |u|^{N-2} u = \frac{f(x,u)}{|x|^\beta} + \varepsilon h(x)
\]

Moreover, they proved that when the positive parameter $\varepsilon$ is small enough, the above equation has a weak solution with negative energy. However, it was not proved in \([5]\) if those solutions are different or not. We also should stress that they need a small nonzero perturbation $\varepsilon h(x)$ in their equation to get the nontriviality of the solutions.

In this paper, we will study further about the equation considered in the whole space \([2, 15, 16, 17, 5]\). More precisely, we consider the existence and multiplicity of nontrivial weak solution for the nonuniformly elliptic equations of $N$-Laplacian type of the form:

\[
(1.2) \quad - \text{div} \left( a(x, \nabla u) \right) + V(x) |u|^{N-2} u = \frac{f(x,u)}{|x|^\beta} + \varepsilon h(x)
\]

where

\[
|a(x, \tau)| \leq c_0 \left( h_0(x) + h_1(x) |\tau|^{N-1} \right)
\]
for any $\tau$ in $\mathbb{R}^N$ and a.e. $x$ in $\mathbb{R}^N$, $h_0 \in L^{N/(N-1)}(\mathbb{R}^N)$ and $h_1 \in L^\infty_{\text{loc}}(\mathbb{R}^N)$. Note that the equation in [5] is a special case of our equation when $a(x, \nabla u) = |\nabla u|^{N-2} \nabla u$. In fact, the elliptic equations of nonuniform type is a natural generalization of the $p-$Laplacian equation and were studied by many authors, see [18, 20, 21, 22, 33]. As mentioned earlier, the main features of this class of equations are that they are defined in the whole $\mathbb{R}^N$ and with the critical growth of the singular nonlinear term $f(x,u)/|x|^\beta$ and the nonuniform nonlinear operator of $p-$Laplacian type. In spite of a possible failure of the Palais-Smale compactness condition, in this paper, we still use the Mountain-pass approach for the critical growth as in [15, 5, 16, 17] to derive a weak solution and get the nontriviality of this solution thanks to the small nonzero perturbation $\varepsilon h(x)$.

In the case of $N-$Laplacian, i.e.,

$$a(x, \nabla u) = |\nabla u|^{N-2} \nabla u,$$

our equation is exactly the equation studied in [5]:

$$-\text{div} \left(|\nabla u|^{N-2} \nabla u\right) + V(x) |u|^{N-2} u = \frac{f(x,u)}{|x|^\beta} + \varepsilon h(x) \tag{1.3}$$

Using the Radial lemma, Schwarz symmetrization and a modified result of Lions [27] about the singular Moser-Trudinger inequality, we will prove that two solutions derived in [5] are actually different. Thus as our second main result, we get the multiplicity of solutions to the equation (1.3). This result extends the result in [5] and also the multiplicity result in [17] ($\beta = 0$) to the singular case ($0 \leq \beta < N$).

Our next concern is about the existence of solution of the equation without the perturbation

$$-\text{div} \left(|\nabla u|^{N-2} \nabla u\right) + V(x) |u|^{N-2} u = \frac{f(x,u)}{|x|^\beta}. \tag{1.4}$$

Using an approach as in [15, 16, 17], we prove that we don’t even require the nonzero perturbation as in [5] to get the nontriviality of the mountain-pass type weak solution.

Our main tool in this paper is critical point theory. More precisely, we will use the Mountain-pass Theorem that is proposed by Ambrosetti and Rabinowitz in the celebrated paper [6]. Critical point theory has become one of the main tools for finding solutions to elliptic equations of variational type. We stress that to use the Mountain-pass Theorem, we need to verify some types of compactness for the associated Lagrange-Euler functional, namely the Palais-Smale condition and the Cerami condition. Or at least, we must prove the boundedness of the Palais-Smale or Cerami sequence [13, 14]. In almost all of works, we can easily establish this condition thanks to the Ambrosetti-Rabinowitz (AR) condition, see (f2) or (f3) in Section 2. However, there are many interesting examples of nonlinear terms $f$ which do not satisfy the Ambrosetti-Rabinowitz condition, but based on our theorem we can still conclude the existence and multiplicity of solutions. Thus our next result is that we will establish again the above results when the nonlinearity does not satisfy this famous (AR) condition. For the $N-$Laplacian equation in a bounded domain in $\mathbb{R}^N$, such a result of existence has been established by the authors in [23].

We mention in passing that the study of the existence and multiplicity results of nonuniformly elliptic equations of $N-$Laplacian type are motivated by our earlier work on the Heisenberg group [24]. Our assumptions on the potential $V$ are exactly those
considered in [15 16 17 5], namely $V(x) \geq V_0 > 0$ in $\mathbb{R}^N$ and $V^{-1} \in L^1(\mathbb{R}^N)$ or $\{|x \in \mathbb{R}^N : V(x) < M\} < \infty$ for every $M > 0$. Very recently, Yang has established in [35] when $a(x, \nabla u) = |\nabla u|^{N-2} \nabla u$ the multiplicity of solutions when the nonlinear term $f$ satisfies the Ambrosetti-Rabinowitz condition and the potential $V$ is under a stronger assumption than ours. More precisely, it is assumed in [35] that $V^{-1} \in L^{\frac{1}{q}}(\mathbb{R}^N)$ which implies $V^{-1} \in L^1(\mathbb{R}^N)$ when $V(x) \geq V_0 > 0$ in $\mathbb{R}^N$. The stronger assumption of integrability on $V^{-1}$ in [35] guarantees that the embedding $E \to L^q(\mathbb{R}^N)$ is compact for all $1 \leq q < \infty$. The argument in [35], as pointed out by the author of [35], depends crucially on this compact embedding for all $1 \leq q < \infty$. The assumption on the potential $V$ in our paper only assures the compact embedding $E \to L^q(\mathbb{R}^N)$ for $q \geq N$. Nevertheless, this compact embedding for $q \geq N$ is sufficient for us to carry out the proof of the multiplicity of solutions to equation (1.3) and existence of solutions to equation (1.4) without the perturbation term. (See Proposition 5.2 and Remark 5.2 in Section 5 for more details). Moreover, our theorems hold even when $f$ does not satisfy the Ambrosetti-Rabinowitz condition.

The paper is organized as follows: In the next section, we give the main assumptions which are used throughout this paper except the last section and our main results. In Section 3, we prove some preliminary results. Section 4 is devoted to study the existence of nontrivial solutions for the nonuniformly elliptic equations of $N$–Laplacian type (1.2). The multiplicity of nontrivial solutions to Equation (1.3) is investigated in Section 5. Section 6 is about the existence of nontrivial solutions to the equation without the perturbation (1.4). Finally, in Section 7 we study the results in Sections 5 and 6 again without the well-known Ambrosetti-Rabinowitz (AR) condition.

2. Assumptions and Main Results

Motivated by the Trudinger-Moser inequality in Lemma 1.1, we consider here the maximal growth on the nonlinear term $f(x, u)$ which allows us to treat Eq. (1.2) variationally in a subspace of $W^{1,N}(\mathbb{R}^N)$. We assume that $f : \mathbb{R}^N \times \mathbb{R} \to \mathbb{R}$ is continuous, $f(x, 0) = 0$ and $f$ behaves like $\exp \left( \alpha |u|^{N/(N-1)} \right)$ as $|u| \to \infty$. More precisely, we assume the following growth conditions on the nonlinearity $f(x, u)$ as in [15 16 17 5]:

(f1) There exist constants $\alpha_0$, $b_1$, $b_2 > 0$ such that for all $(x, u) \in \mathbb{R}^N \times \mathbb{R}^+$,

$$0 < f(x, u) \leq b_1 |u|^{N-1} + b_2 \left[ \exp \left( \alpha_0 |u|^{N/(N-1)} \right) - S_{N-2}(\alpha_0, u) \right],$$

where

$$S_{N-2}(\alpha_0, u) = \sum_{k=0}^{N-2} \frac{\alpha_0^k}{k!} |u|^{kN/(N-1)}.$$

(f2) There exist $p > N$ such that for all $x \in \mathbb{R}^N$ and $s > 0$,

$$0 < pF(x, s) = p \int_0^s f(x, \tau)d\tau \leq sf(x, s)$$

This is the well-known Ambrosetti-Rabinowitz condition.

(f3) There exist constants $R_0$, $M_0 > 0$ such that for all $x \in \mathbb{R}^N$ and $s \geq R_0$,

$$F(x, s) \leq M_0 f(x, s).$$
Since we are interested in nonnegative weak solutions, it is convenient to define

\[ f(x, u) = 0 \quad \text{for all} \quad (x, u) \in \mathbb{R}^N \times (-\infty, 0]. \tag{2.1} \]

Let \( A \) be a measurable function on \( \mathbb{R}^N \times \mathbb{R} \) such that \( A(x, 0) = 0 \) and \( a(x, \tau) = \frac{\partial A(x, \tau)}{\partial \tau} \) is a Caratheodory function on \( \mathbb{R}^N \times \mathbb{R} \). Assume that there are positive real numbers \( c_0, c_1, k_1 \) and two nonnegative measurable functions \( h_0, h_1 \) on \( \mathbb{R}^N \) such that \( h_1 \in L^{1/loc}_1(\mathbb{R}^N) \), \( h_0 \in L^{N/(N-1)}(\mathbb{R}^N) \), \( h_1(x) \geq 1 \) for a.e. \( x \) in \( \mathbb{R}^N \) and the following conditions hold:

\begin{align*}
(A1) \quad & |a(x, \tau)| \leq c_0 \left( h_0(x) + h_1(x) |\tau|^{N-1} \right), \quad \forall \tau \in \mathbb{R}^N, \ a.e. \ x \in \mathbb{R}^N \\
(A2) \quad & c_1 |\tau - \tau_1|^N \leq \langle a(x, \tau) - a(x, \tau_1), \tau - \tau_1 \rangle \quad \forall \tau, \tau_1 \in \mathbb{R}^N, \ a.e. \ x \in \mathbb{R}^N \\
(A3) \quad & 0 \leq a(x, \tau). \tau \leq N A(x, \tau) \quad \forall \tau \in \mathbb{R}^N, \ a.e. \ x \in \mathbb{R}^N \\
(A4) \quad & A(x, \tau) \geq k_0 h_1(x) |\tau|^N \quad \forall \tau \in \mathbb{R}^N, \ a.e. \ x \in \mathbb{R}^N.
\end{align*}

Then \( A \) verifies the growth condition:

\[ |A(x, \tau)| \leq c_0 \left( h_0(x) |\tau| + h_1(x) |\tau|^N \right) \quad \forall \tau \in \mathbb{R}^N, \ a.e. \ x \in \mathbb{R}^N \tag{2.2} \]

Next, we introduce some notations:

\[
E = \left\{ u \in W^{1,N}_0(\mathbb{R}^N) : \int_{\mathbb{R}^N} h_1(x) |\nabla u|^N \, dx + \int_{\mathbb{R}^N} V(x) |u|^N < \infty \right\}
\]

\[
\|u\|_E = \left( \int_{\mathbb{R}^N} \left( h_1(x) |\nabla u|^N + \frac{1}{k_0 N} V(x) |u|^N \right) \, dx \right)^{1/N}, \quad u \in E
\]

\[
\lambda_1(N) = \inf \left\{ \frac{\|u\|_E^N}{\int_{\mathbb{R}^N} \frac{|u|^N}{|x|^\beta} \, dx} : u \in E \setminus \{0\} \right\}
\]

We also assume the following conditions on the potential as in \([15, 16, 17, 5]\):

(V1) \( V \) is a continuous function such that \( V(x) \geq V_0 > 0 \) for all \( x \in \mathbb{R}^N \), we can see that \( E \) is a reflexive Banach space when endowed with the norm

\[
\|u\|_E = \left( \int_{\mathbb{R}^N} \left( h_1(x) |\nabla u|^N + \frac{1}{k_0 N} V(x) |u|^N \right) \, dx \right)^{1/N}
\]

and for all \( N \leq q < \infty \),

\[ E \hookrightarrow W^{1,N}_0(\mathbb{R}^N) \hookrightarrow L^q(\mathbb{R}^N) \]

with continuous embedding. Furthermore,

\[ \lambda_1(N) = \inf \left\{ \frac{\|u\|_E^N}{\int_{\mathbb{R}^N} \frac{|u|^N}{|x|^\beta} \, dx} : u \in E \setminus \{0\} \right\} > 0 \quad \text{for any} \ 0 \leq \beta < N. \tag{2.3} \]

In order to get the compactness of the embedding

\[ E \hookrightarrow L^p(\mathbb{R}^N) \quad \text{for all} \ p \geq N \]

we also assume the following conditions on the potential \( V \):

(V2) \( V(x) \to \infty \) as \( |x| \to \infty \); or more generally, for every \( M > 0 \),

\[ \mu \left( \left\{ x \in \mathbb{R}^N : V(x) \leq M \right\} \right) < \infty. \]

or
(V3) The function $|V(x)|^{-1}$ belongs to $L^1(\mathbb{R}^N)$. 

Now, from (f1), we obtain for all $(x, u) \in \mathbb{R}^N \times \mathbb{R}$,

$$|F(x, u)| \leq b_3 \left( \exp \left( \alpha_1 |u|^{N/(N-1)} \right) - S_{N-2}(\alpha_1, u) \right)$$

for some constants $\alpha_1, b_3 > 0$. Thus, by Lemma 1.1, we have $F(x, u) \in L^1(\mathbb{R}^N)$ for all $u \in W^{1,N}(\mathbb{R}^N)$. Define the functionals $J, J_\varepsilon : E \to \mathbb{R}$ by

$$J_\varepsilon(u) = \int_{\mathbb{R}^N} A(x, \nabla u) dx + \frac{1}{N} \int_{\mathbb{R}^N} V(x) |u|^N dx - \int_{\mathbb{R}^N} \frac{F(x, u)}{|x|^\beta} dx - \varepsilon \int_{\mathbb{R}^N} h(u) dx$$

$$J(u) = \frac{1}{N} \int_{\mathbb{R}^N} |\nabla u|^N dx + \frac{1}{N} \int_{\mathbb{R}^N} V(x) |u|^N dx - \int_{\mathbb{R}^N} \frac{F(x, u)}{|x|^\beta} dx$$

then the functionals $J, J_\varepsilon$ are well-defined by Lemma 1.1. Moreover, $J, J_\varepsilon$ are the $C^1$ functional on $E$ and $\forall u, v \in E$,

$$DJ_\varepsilon(u)v = \int_{\mathbb{R}^N} a(x, \nabla u) \nabla u dx + \int_{\mathbb{R}^N} V(x) |u|^{N-2} v dx - \int_{\mathbb{R}^N} \frac{f(x, u)v}{|x|^\beta} dx - \varepsilon \int_{\mathbb{R}^N} h(u) v dx$$

$$DJ(u)v = \int_{\mathbb{R}^N} |\nabla u|^{N-2} \nabla u \nabla v dx + \int_{\mathbb{R}^N} V(x) |u|^{N-2} v dx - \int_{\mathbb{R}^N} \frac{f(x, u)v}{|x|^\beta} dx.$$

Note that in the case of $N$–Laplacian: $A(x, \tau) = \frac{1}{N} |\tau|^N$, we choose

$$a(x, \tau) = |\tau|^{N-2} \tau, \quad k_0 = \frac{1}{N}, \quad h_1(x) = 1.$$

We next state our main results.

**Theorem 2.1.** Suppose that (V1) and (V2) (or (V3)) and (f1)-(f2) are satisfied. Furthermore, assume that

$$(f4) \limsup_{s \to 0^+} \frac{F(x, s)}{k_0 |s|^N} < \lambda_1(N) \text{ uniformly in } x \in \mathbb{R}^N.$$ 

Then there exists $\varepsilon_1 > 0$ such that for each $0 < \varepsilon < \varepsilon_1$, problem (L2) has a nontrivial weak solution of mountain-pass type.

**Theorem 2.2.** Suppose that (V1) and (V2) (or (V3)) and (f1)-(f3) are satisfied. Furthermore, assume that

$$(f4) \limsup_{s \to 0^+} \frac{N F(x, s)}{|s|^N} < \lambda_1(N) \text{ uniformly in } x \in \mathbb{R}^N.$$ 

and there exists $r > 0$ such that

$$(f5) \lim_{s \to \infty} s f(x, s) \exp \left( -\alpha_0 |s|^{N/(N-1)} \right)$$

$$> \frac{1}{\left[ N - \beta \right] e^{\alpha_0 d(N-\beta)/N} + \mathcal{C}_r N^{-\beta - \frac{r N - \beta}{N - \beta}}} \left( \frac{N - \beta}{\alpha_0} \right)^{N-1} > 0$$
uniformly on compact subsets of $\mathbb{R}^N$ where $d$ and $C$ will be defined in section 3. Then there exists $\varepsilon_2 > 0$, such that for each $0 < \varepsilon < \varepsilon_2$, problem (1.3) has at least two nontrivial weak solutions and one of them has a negative energy.

**Theorem 2.3.** Under the same hypotheses in Theorem 2.2, the problem without the perturbation (1.4) has a nontrivial weak solution.

As we remarked earlier in the introduction, all the main theorems above remain to hold when the nonlinear term $f$ does not satisfy the Ambrosetti-Rabinowitz condition. As a result, we then establish the existence and multiplicity of solutions in a wider class of nonlinear terms. See Section 7 for more details.

### 3. Preliminary Results

First, we recall what we call the Radial Lemma (see [10, 17]) which asserts:

$$|u(x)|^N \leq \frac{N}{\omega_{N-1}} \frac{\|u\|_N^N}{|x|}, \forall x \in \mathbb{R}^N \setminus \{0\}$$

for all $u \in W^{1,N} (\mathbb{R}^N)$ radially symmetric. Using this Radial Lemma, we can prove the following two lemmas (Lemmas 3.1 and 3.2) with an easy adaptation from Lemma 2.2 and Lemma 2.3 in [17] for $\beta = 0$ and Lemma 4.2 in [5].

**Lemma 3.1.** For $\kappa > 0$, $0 \leq \beta < N$ and $\|u\|_E \leq M$ with $M$ sufficiently small and $q > N$, we have

$$\int_{\mathbb{R}^N} \left[ \exp \left( \kappa \frac{|u|^{N/(N-1)}}{|x|^\beta} \right) - S_{N-2} (\kappa, u) \right] |u|^q \frac{1}{|x|^\beta} dx \leq C (N, \kappa) \|u\|^q_E.$$  

**Lemma 3.2.** Let $\kappa > 0$, $0 \leq \beta < N$, $u \in E$ and $\|u\|_E \leq M$ such that $M^{N/(N-1)} < (1 - \frac{\beta}{N}) \frac{M}{\kappa}$, then

$$\int_{\mathbb{R}^N} \left[ \exp \left( \kappa \frac{|u|^{N/(N-1)}}{|x|^\beta} \right) - S_{N-2} (\kappa, u) \right] |u| \frac{1}{|x|^\beta} dx \leq C (N, M, \kappa) \|u\|_{p'}$$

for some $p' > N$.

Next, we have

**Lemma 3.3.** Let $\{w_k\} \subset W^{1,N} (\Omega)$ where $\Omega$ is a bounded open set in $\mathbb{R}^N$, $\|\nabla w_k\|_{L^N(\Omega)} \leq 1$. If $w_k \rightharpoonup w \neq 0$ weakly and almost everywhere, $\nabla w_k \rightharpoonup \nabla w$ almost everywhere, then

$$\exp \left\{ \alpha \frac{|w_k|^{N/(N-1)}}{|x|^\beta} \right\}$$

is bounded in $L^1 (\Omega)$ for $0 < \alpha < (1 - \frac{\beta}{N}) \alpha_N \left( 1 - \|\nabla w\|_{L^N(\Omega)} \right)^{-1/(N-1)}$.

**Proof.** Using the Brezis-Lieb Lemma in [10], we deduce that

$$\|\nabla w_k\|_{L^N(\Omega)} - \|\nabla w\|_{L^N(\Omega)} \rightarrow \|\nabla w\|_{L^N(\Omega)}.$$  

Thus for $k$ large enough and $\delta > 0$ small enough:

$$0 < \alpha (1 + \delta) \|\nabla w_k - \nabla w\|_{L^N(\Omega)}^{N/(N-1)} < \alpha_N \left( 1 - \frac{\beta}{N} \right).$$

By the singular Trudinger-Moser inequality on bounded domains [3], we get the conclusion. □
In the next two lemmas we check that the functional $J_\varepsilon$ satisfies the geometric conditions of the mountain-pass theorem. Then, we are going to use a mountain-pass theorem without a compactness condition such as the one of the (PS) type to prove the existence of the solution. This version of the mountain-pass theorem is a consequence of the Ekeland’s variational principle.

**Lemma 3.4.** Suppose that (V1), (f1) and (f4) hold. Then there exists $\varepsilon_1 > 0$ such that for $0 < \varepsilon < \varepsilon_1$, there exists $\rho_\varepsilon > 0$ such that $J_\varepsilon(u) > 0$ if $\|u\|_E = \rho_\varepsilon$. Furthermore, $\rho_\varepsilon$ can be chosen such that $\rho_\varepsilon \to 0$ as $\varepsilon \to 0$.

**Proof.** From (f4), there exist $\tau$, $\delta > 0$ such that $|u| \leq \delta$ implies

$$F(x, u) \leq k_0 (\lambda_1(N) - \tau) |u|^N$$

for all $x \in \mathbb{R}^N$. Moreover, using (f1) for each $q > N$, we can find a constant $C = C(q, \delta)$ such that

$$F(x, u) \leq C |u|^q \left[ \exp \left( \frac{\kappa}{\delta} |u|^{N/(N-1)} \right) - S_{N-2}(\kappa, u) \right]$$

for $|u| \geq \delta$ and $x \in \mathbb{R}^N$. From (3.1) and (3.2) we have

$$F(x, u) \leq k_0 (\lambda_1(N) - \tau) |u|^N + C |u|^q \left[ \exp \left( \frac{\kappa}{\delta} |u|^{N/(N-1)} \right) - S_{N-2}(\kappa, u) \right]$$

for all $(x, u) \in \mathbb{R}^N \times \mathbb{R}$. Now, by (A4), Lemma 3.2, (2.3) and the continuous embedding $E \hookrightarrow L^N(\mathbb{R}^N)$, we obtain

$$J_\varepsilon(u) \geq k_0 \|u\|_E^N - k_0 \left( \lambda_1(N) - \tau \right) \int_{\mathbb{R}^N} \frac{|u|^N}{|x|^\delta} dx - C \|\varepsilon\|_E^q - \varepsilon \|h\|_E \|u\|_E$$

$$\geq k_0 \left( 1 - \frac{\left( \lambda_1(N) - \tau \right)}{\lambda_1(N)} \right) \|u\|_E^N - C \|u\|_E^q - \varepsilon \|h\|_E \|u\|_E$$

Thus

$$J_\varepsilon(u) \geq \|u\|_E \left[ k_0 \left( 1 - \frac{\left( \lambda_1(N) - \tau \right)}{\lambda_1(N)} \right) \|u\|_E^{N-1} - C \|u\|_E^{q-1} - \varepsilon \|h\|_E \right]$$

Since $\tau > 0$ and $q > N$, we may choose $\rho > 0$ such that $k_0 \left( 1 - \frac{\left( \lambda_1(N) - \tau \right)}{\lambda_1(N)} \right) \rho^{N-1} - C \rho^{q-1} > 0$. Thus, if $\varepsilon$ is sufficiently small then we can find some $\rho_\varepsilon > 0$ such that $J_\varepsilon(u) > 0$ if $\|u\| = \rho_\varepsilon$ and even $\rho_\varepsilon \to 0$ as $\varepsilon \to 0$. \hfill $\Box$

**Lemma 3.5.** There exists $e \in E$ with $\|e\|_E > \rho_\varepsilon$ such that $J_\varepsilon(e) < \inf_{\|u\| = \rho_\varepsilon} J_\varepsilon(u)$.

**Proof.** Let $u \in E \setminus \{0\}$, $u \geq 0$ with compact support $\Omega = \text{supp}(u)$. By (f2), we have that for $p > N$, there exists a positive constant $C > 0$ such that

$$\forall s \geq 0, \forall x \in \Omega: F(x, s) \geq cs^p - d.$$ 

Then by (2.2), we get

$$J_\varepsilon(tu) \leq Ct \int_{\Omega} h_0(x) |\nabla u| dx + Ct^N \|u\|_E^N - Ct^p \int_{\Omega} \frac{|u|^p}{|x|^\delta} dx + C + \varepsilon t \left| \int_{\Omega} hudx \right|$$

Since $p > N$, we have $J_\varepsilon(tu) \to -\infty$ as $t \to \infty$. Setting $e = tu$ with $t$ sufficiently large, we get the conclusion. \hfill $\Box$
Now, we define the Moser Functions which have been frequently used in the literature (see, for example, [15], [17], [5]):

$$\tilde{m}_l(x, r) = \frac{1}{\omega_{N-1}^{1/N}} \begin{cases} \frac{(\log l)^{(N-1)/N}}{\log r} & \text{if } |x| \leq \frac{r}{l} \\ \frac{(\log l)^{1/N}}{\log r} & \text{if } \frac{r}{l} \leq |x| \leq r \\ 0 & \text{if } |x| \geq r \end{cases}$$

We then immediately have \( \tilde{m}_l(\cdot, r) \in W^{1,N}(\mathbb{R}^N) \), the support of \( \tilde{m}_l(x, r) \) is the ball \( B_r \), and

$$\int_{\mathbb{R}^N} |\nabla \tilde{m}_l(x, r)|^N dx = 1, \quad \|\tilde{m}_l\|_{W^{1,N}(\mathbb{R}^N)}^N = 1 + \frac{1}{\log l} \left( \frac{(N-1)!}{N^N} r^N + o(1) \right).$$

Then

$$\|\tilde{m}_l\|_{E}^N \leq 1 + \frac{\max V(x)}{\log l} \left( \frac{(N-1)!}{N^N} r^N + o(1) \right).$$

Consider \( m_l(x, r) = \tilde{m}_l(x, r)/\|\tilde{m}_l\|_E \), we can write

$$m_l^{N/(N-1)}(x, r) = \omega_{N-1}^{-1/(N-1)} \log l + d_l$$

for \( |x| \leq r/l \).

Using (3.5), we conclude that \( \|\tilde{m}_l\| \to 1 \) as \( l \to \infty \). Consequently,

$$d_l \to 0 \quad \text{as } l \to \infty,$$

$$d = \lim \inf_{l \to \infty} d_l$$

$$d \geq -\max V(x) \omega_{N-1}^{-1/(N-1)}(N-2)! \frac{N-2}{N^N} r^N.$$

The following lemma was established in [17] when \( \beta = 0 \). We adapt the proof given in [17] to our case \( 0 \leq \beta < N \). See also [24] for a similar result on the Heisenberg group.

**Lemma 3.6.** Suppose that (V1) and (f1)-(f5) hold. Then there exists \( k \in \mathbb{N} \) such that

$$\max_{t \geq 0} \left\{ \frac{t^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, tm_k)}{|x|^{\beta}} dx \right\} < \frac{1}{N} \left( \frac{N-\beta}{N} \frac{\alpha_N}{\alpha_0} \right)^{N-1}.$$

**Proof.** Choose \( r > 0 \) as in the assumption (f5) and \( \beta_0 > 0 \) such that

$$\lim_{s \to \infty} s f(x, s) \exp \left( -\alpha_0 |s|^{N/(N-1)} \right) \geq \beta_0$$

$$> \frac{1}{\varepsilon^{N-\beta} (\alpha_N d(N-\beta)/N) + C r^{N-\beta} - \frac{N-\beta}{N^N} \left( \frac{N-\beta}{\alpha_0} \right)^{N-1}}.$$
ELLIPTIC EQUATIONS WITH CRITICAL GROWTH IN $\mathbb{R}^N$

where

$$C = \lim_{k \to \infty} \zeta_k \log k \int_0^{\zeta_k^{-1}} \exp \left[ (N - \beta) \log k \left( \frac{t^{N/(N-1)}}{k} - \zeta_k s \right) \right] ds > 0, \quad \zeta_k = \|\tilde{m}_k\|,$$

$$C \geq 1 - e^{-(N-\beta) \log n} \frac{N - \beta}{N - \beta}.$$

Suppose, by contradiction, that for all $k$ we get

$$\max_{t \geq 0} \left\{ \frac{t^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, tm_k)}{|x|^\beta} dx \right\} \geq \frac{1}{N} \left( \frac{N - \beta}{N} \frac{\alpha_N}{\alpha_0} \right)^{N-1}$$

where $m_k(x) = m_k(x, r)$. By (3.4), for each $k$ there exists $t_k > 0$ such that

$$\frac{t_k^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, t_k m_k)}{|x|^\beta} dx = \max_{t \geq 0} \left\{ \frac{t^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, tm_k)}{|x|^\beta} dx \right\}$$

Thus

$$\frac{t_k^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, t_k m_k)}{|x|^\beta} dx \geq \frac{1}{N} \left( \frac{N - \beta}{N} \frac{\alpha_N}{\alpha_0} \right)^{N-1}.$$ 

From $F(x, u) \geq 0$, we obtain

(3.9) $$t_k^N \geq \left( \frac{N - \beta}{N} \frac{\alpha_N}{\alpha_0} \right)^{N-1}$$

Since at $t = t_k$ we have

$$\frac{d}{dt} \left( \frac{t^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, tm_k)}{|x|^\beta} dx \right) = 0$$

it follows that

(3.10) $$t_k^N = \int_{\mathbb{R}^N} t_k m_k \frac{f(x, t_k m_k)}{|x|^\beta} dx = \int_{|x| \leq r} t_k m_k \frac{f(x, t_k m_k)}{|x|^\beta} dx$$

Using hypothesis $(f5)$, given $\tau > 0$ there exists $R_\tau > 0$ such that for all $u \geq R_\tau$ and $|x| \leq r$, we have

(3.11) $$uf(x, u) \geq (\beta_0 - \tau) \exp \left( \alpha_0 |u|^{N/(N-1)} \right).$$

From (3.10) and (3.11), for large $k$, we obtain

$$t_k^N \geq (\beta_0 - \tau) \int_{|x| \leq r} \frac{\exp \left( \alpha_0 |t_k m_k|^{N/(N-1)} \right)}{|x|^\beta} dx$$

$$= (\beta_0 - \tau) \frac{\omega_{N-1}}{N - \beta} \left( \frac{\omega_{N-1}}{N} \right)^{N-1} \log k + \alpha_k^N d_k$$

Thus, setting

$$L_k = \frac{\alpha_0 N \log k}{\alpha_N} t_k^{N/(N-1)} + \alpha_k^N d_k - N \log t_k - (N - \beta) \log k$$
we have

$$1 \geq (\beta_0 - \tau) \frac{\omega_{N-1}}{N - \beta} r^{N-\beta} \exp L_k$$

Consequently, the sequence \((t_k)\) is bounded. Otherwise, up to subsequences, we would have \(\lim_{k \to \infty} L_k = \infty\) which leads to a contradiction. Moreover, by (3.7), (3.9) and

$$t^N_k \geq (\beta_0 - \tau) \frac{\omega_{N-1}}{N - \beta} r^{N-\beta} \exp \left[ \left( N \frac{\alpha_0 t^N_k}{\alpha N} - (N - \beta) \right) \log k + \alpha_0 t^N_k d_k \right]$$

it follows that

$$t^N_k \to_{k \to \infty} \left( \frac{N - \beta \alpha N}{\alpha_0} \right)^{N-1}$$

Setting

$$A_k = \{ x \in B_r : t_k m_k \geq R \} \quad \text{and} \quad B_k = B_r \setminus A_k$$

From (3.10) and (3.11) we have

$$t^N_k \geq (\beta_0 - \tau) \int_{|x| \leq r} \frac{\exp \left( \alpha_0 |t_k m_k|^{N/(N-1)} \right)}{|x|^\beta} dx + \int_{B_k} \frac{t_k m_k f(x, t_k m_k)}{|x|^\beta} dx$$

$$- (\beta_0 - \tau) \int_{B_k} \frac{\exp \left( \alpha_0 |t_k m_k|^{N/(N-1)} \right)}{|x|^\beta} dx$$

Notice that \(m_k(x) \to 0\) and the characteristic functions \(\chi_{B_k} \to 1\) for almost everywhere \(x\) in \(B_r\). Therefore the Lebesgue’s dominated convergence theorem implies

$$\int_{B_k} \frac{t_k m_k f(x, t_k m_k)}{|x|^\beta} dx \to 0$$

and

$$\int_{B_k} \frac{\exp \left( \alpha_0 |t_k m_k|^{N/(N-1)} \right)}{|x|^\beta} dx \to \frac{\omega_{N-1}}{N - \beta} r^{N-\beta}$$

Moreover, using that

$$t^N_k \to_{k \to \infty} \left( \frac{N - \beta \alpha N}{\alpha_0} \right)^{N-1}$$
we have

$$
\int_{|x| \leq r} \frac{\exp \left( \alpha_0 |t_k \tilde{m}_k|^{N/(N-1)} \right)}{|x|^\beta} \, dx
\geq \int_{|x| \leq r} \frac{\exp \left( \alpha_N |m_k|^{N/(N-1)} (N - \beta)/N \right)}{|x|^\beta} \, dx
= \int_{|x| \leq r/k} \frac{\exp \left( \alpha_N |m_k|^{N/(N-1)} (N - \beta)/N \right)}{|x|^\beta} \, dx
+ \int_{r/k \leq |x| \leq r} \frac{\exp \left( \alpha_N |m_k|^{N/(N-1)} (N - \beta)/N \right)}{|x|^\beta} \, dx
$$

and

$$
\int_{|x| \leq r/k} \frac{\exp \left( \alpha_N |m_k|^{N/(N-1)} (N - \beta)/N \right)}{|x|^\beta} \, dx
= \int_{|x| \leq r/k} \frac{\exp \left[ \alpha_N \omega_{N-1}^{-1/(N-1)} \log k (N - \beta)/N + d_k \alpha_N (N - \beta)/N \right]}{|x|^\beta} \, dx
= \frac{\omega_{N-1}}{N - \beta} \left( \frac{r}{k} \right)^{N-\beta} k^{N-\beta} \log k (N - \beta)/N,
= \frac{\omega_{N-1}}{N - \beta} r^{N-\beta} k^{\alpha_N \log k (N - \beta)/N}.
$$

Now, using the change of variable

$$
x = \frac{\log \left( \frac{r}{\zeta} \right)}{\zeta_k \log k}, \quad \text{with } \zeta_k = \|\tilde{m}_k\|
$$

by straightforward computation, we have

$$
\int_{r/k \leq |x| \leq r} \frac{\exp \left( \alpha_N |m_k|^{N/(N-1)} (N - \beta)/N \right)}{|x|^\beta} \, dx
= \omega_{N-1} r^{N-\beta} \zeta_k \log k \int_0^{\zeta_k^{-1}} \exp \left[ (N - \beta) \log k (s^{N/(N-1)} - \zeta_k s) \right] \, ds
$$

which converges to $C \omega_{N-1} r^{N-\beta}$ as $k \to \infty$ where

$$
C = \lim_{k \to \infty} \zeta_k \log k \int_0^{\zeta_k^{-1}} \exp \left[ (N - \beta) \log k (s^{N/(N-1)} - \zeta_k s) \right] \, ds > 0.
$$
Finally, taking $k \to \infty$ in (3.13), using (3.12) and using (3.7) (see [15, 17]), we obtain
\[
\left( \frac{N - \beta}{N} \alpha_0 \right)^{N-1} \geq (\beta_0 - \tau) \left[ \frac{\omega_{N-1}}{N - \beta} r^{N - \beta} e^{(\alpha_0 d - N - \beta)/N} + C \omega_{N-1} r^{N - \beta} - \frac{\omega_{N-1}}{N - \beta} r^{N - \beta} \right]
\]
which implies that
\[
\beta_0 \leq \frac{1}{\left[ \frac{e^{(\alpha_0 d - N - \beta)/N}}{N - \beta} + C r^{N - \beta} r^{N - \beta} \right]} \left( \frac{N - \beta}{\alpha_0} \right)^{N-1}.
\]
This contradicts to (3.8), and the proof is complete. \hfill \Box

4. THE EXISTENCE OF SOLUTION FOR THE PROBLEM (1.2)

It is well known that the failure of the (PS) compactness condition creates difficulties in studying this class of elliptic problems involving critical growth and unbounded domains. In next several lemmas, instead of (PS) sequence, we will use and analyze the compactness of Cerami sequences of $J_{\varepsilon}$.

**Lemma 4.1.** Let $(u_k) \subset E$ be an arbitrary Cerami sequence of $J_{\varepsilon}$, i.e.,
\[
J_{\varepsilon}(u_k) \to c, \quad (1 + \|u_k\|_E) \|DJ_{\varepsilon}(u_k)\|_E' \to 0 \text{ as } k \to \infty.
\]
Then there exists a subsequence of $(u_k)$ (still denoted by $(u_k)$) and $u \in E$ such that
\[
\begin{align*}
\frac{f(x, u_k)}{|x|^\beta} &\to \frac{f(x, u)}{|x|^\beta} \quad \text{strongly in } L^1_{\text{loc}}(\mathbb{R}^N) \\
\nabla u_k(x) &\to \nabla u(x) \quad \text{almost everywhere in } \mathbb{R}^N \\
a(x, \nabla u_k) &\to a(x, \nabla u) \quad \text{weakly in } \left( L^{N/(N-1)}_{\text{loc}}(\mathbb{R}^N) \right)^N \\
u_k &\rightharpoonup u \quad \text{weakly in } E
\end{align*}
\]
Furthermore $u$ is a weak solution of (1.2).

For simplicity, we will only sketch the proof where includes the nonuniform terms $a(x, \nabla u)$ and $A(x, \nabla u)$.

**Proof.** Let $v \in E$, then we have
\[
(4.1) \quad \int_{\mathbb{R}^N} A(x, \nabla u_k) dx + \frac{1}{N} \int_{\mathbb{R}^N} V(x) |u_k|^N dx - \int_{\mathbb{R}^N} \frac{F(x, u_k)}{|x|^\beta} dx - \varepsilon \int_{\mathbb{R}^N} hu_k dx \to c
\]
and
\[
|DJ_{\varepsilon}(u_k) v| = \left| \int_{\mathbb{R}^N} a(x, \nabla u_k) \nabla v dx + \int_{\mathbb{R}^N} V(x) |u_k|^{N-2} u_k v dx - \int_{\mathbb{R}^N} \frac{f(x, u_k)v}{|x|^\beta} dx - \varepsilon \int_{\mathbb{R}^N} hv dx \right|
\]
\[
\leq \frac{\tau_k \|v\|_E}{(1 + \|u_k\|_E)}
\]
(4.2)
where $\tau_k \to 0$ as $k \to \infty$. Choosing $v = u_k$ in (4.2) and by (A3), we get
\[
\int_{\mathbb{R}^N} \frac{f(x, u_k)u_k}{|x|^\beta} dx + \varepsilon \int_{\mathbb{R}^N} hu_k dx - N \int_{\mathbb{R}^N} A(x, \nabla u_k) - \int_{\mathbb{R}^N} V(x) |u_k|^{N-2} u_k dx
\leq \tau_k \frac{\|u_k\|_E}{1 + \|u_k\|_E} \to 0
\]
This together with (4.1), \((f2)\) and \((A4)\) leads to
\[
\left(\frac{p}{N} - 1\right) \|u_k\|_E^N \leq C \left(1 + \|u_k\|_E\right)
\]
and hence $\|u_k\|_E$ is bounded and thus
\[
\int_{\mathbb{R}^N} \frac{f(x, u_k)u_k}{|x|^\beta} dx \leq C, \int_{\mathbb{R}^N} \frac{F(x, u_k)}{|x|^\beta} dx \leq C.
\]
Thanks to the assumptions on the potential $V$, the embedding $E \hookrightarrow L^q(\mathbb{R}^N)$ is compact for all $q \geq N$, by extracting a subsequence, we can assume that $u_k \to u$ weakly in $E$ and for almost all $x \in \mathbb{R}^N$.

Thanks to Lemma 2.1 in [19], we have
\[
\frac{f(x, u_n)}{|x|^\beta} \to \frac{f(x, u)}{|x|^\beta} \text{ in } L^1_{\text{loc}}(\mathbb{R}^N).
\]
Next, up to a subsequence, we can define an energy concentration set for any fixed $\delta > 0$,
\[
\Sigma_\delta = \left\{ x \in \mathbb{R}^N : \liminf_{r \to 0^+} \lim_{k \to \infty} \int_{B_r(x)} \left(|u_k|^N + |\nabla u_k|^N\right) dx' \geq \delta \right\}
\]
Since $(u_k)$ is bounded, $\Sigma_\delta$ must be a finite set. Adapting an argument similar to [5] (we omit the details here), we can prove that for any compact set $K \subset \subset \mathbb{R}^N \setminus \Sigma_\delta$,
\[
\lim_{k \to \infty} \int_K \frac{|f(x, u_k) u_k - f(x, u) u|}{|x|^\beta} dx = 0
\]
Next we will prove that for any compact set $K \subset \subset \mathbb{R}^N \setminus \Sigma_\delta$,
\[
\lim_{k \to \infty} \int_K |\nabla u_k - \nabla u|^N dx = 0
\]
It is enough to prove for any $x^* \in \mathbb{R}^N \setminus \Sigma_\delta$, and $B_r(x^*, r) \subset \mathbb{R}^N \setminus \Sigma_\delta$, there holds
\[
\lim_{k \to \infty} \int_{B_{r/2}(x^*)} |\nabla u_k - \nabla u|^N dx = 0
\]
For this purpose, we take \( \phi \in C_0^\infty (B_r (x^*)) \) with \( 0 \leq \phi \leq 1 \) and \( \phi = 1 \) on \( B_{r/2} (x^*) \). Obviously \( \phi u_k \) is a bounded sequence. Choose \( h = \phi u_k \) and \( h = \phi u \) in (4.2), we have:

\[
\int_{B_r (x^*)} \phi (a (x, \nabla u_k) - a (x, \nabla u)) (\nabla u_k - \nabla u) \, dx \leq \int_{B_r (x^*)} a (x, \nabla u_k) \nabla \phi (u - u_k) \, dx \\
+ \int_{B_r (x^*)} \phi a (x, \nabla u) (\nabla u - \nabla u_k) \, dx + \int_{B_r (x^*)} \phi (u_k - u) \frac{f (x, u_k)}{|x|^3} \, dx \\
+ \tau_k \| \phi u_k \|_E + \tau_k \| \phi u \|_E - \varepsilon \int_{B_r (x^*)} \phi h (u_k - u) \, dx
\]

Note that by Holder’s inequality and the compact embedding of \( E \hookrightarrow L^N (\Omega) \), we get

\[
(4.8) \quad \lim_{k \to \infty} \int_{B_r (x^*)} a (x, \nabla u_k) \nabla \phi (u - u_k) \, dx = 0
\]

Since \( \nabla u_k \rightharpoonup \nabla u \) and \( u_k \to u \), there holds

\[
(4.9) \quad \lim_{k \to \infty} \int_{B_r (x^*)} \phi a (x, \nabla u) (\nabla u - \nabla u_k) \, dx = 0 \quad \text{and} \quad \lim_{k \to \infty} \int_{B_r (x^*)} \phi h (u_k - u) \, dx = 0
\]

This implies that

\[
\lim_{k \to \infty} \int_{B_r (x^*)} \phi (u_k - u) f (x, u_k) \, dx = 0
\]

So we can conclude that

\[
\lim_{k \to \infty} \int_{B_r (x^*)} \phi (a (x, \nabla u_k) - a (x, \nabla u)) (\nabla u_k - \nabla u) \, dx = 0
\]

and hence we get (4.7) by (4.2). Thus we have (4.6) by a covering argument. Since \( \Sigma_\delta \) is finite, it follows that \( \nabla u_k \) converges to \( \nabla u \) almost everywhere. This immediately implies, up to a subsequence, \( a (x, \nabla u_k) \rightharpoonup a (x, \nabla u) \) weakly in \( \left( L_{loc}^{N/(N-1)} (\mathbb{R}^N) \right)^{N-2} \). Using all these facts, letting \( k \) tend to infinity in (4.2) and combining with (4.4), we obtain

\[
\langle DJ_\varepsilon (u), v \rangle = 0 \quad \forall v \in C_0^\infty (\mathbb{R}^N).
\]

This completes the proof of the Lemma. \( \square \)

Now, we are ready to prove Theorem 2.1. The existence of the solution of (1.2) follows by a standard ”mountain-pass” procedure.

4.1. The proof of Theorem 2.1.

Proposition 4.1. Under the assumptions (V1) and (V2) (or (V3)), and (f1)-(f4), there exists \( \varepsilon_1 > 0 \) such that for each \( 0 < \varepsilon < \varepsilon_1 \), the problem (1.2) has a solution \( u_M \) via mountain-pass theorem.

Proof. For \( \varepsilon \) sufficiently small, by Lemmas 3.4 and 3.5, \( J_\varepsilon \) satisfies the hypotheses of the mountain-pass theorem except possibly for the (PS) condition. Thus, using the mountain-pass theorem without the (PS) condition, we can find a sequence \( (u_k) \) in \( E \) such that

\[
J_\varepsilon (u_k) \to c_M > 0 \quad \text{and} \quad (1 + \| u_k \|_E) \| DJ_\varepsilon (u_k) \| \to 0
\]

where \( c_M \) is the mountain-pass level of \( J_\varepsilon \). Now, by Lemma 4.1, the sequence \( (u_k) \) converges weakly to a weak solution \( u_M \) of (1.2) in \( E \). Moreover, \( u_M \neq 0 \) since \( h \neq 0 \). \( \square \)
5. The multiplicity results of the Problem (1.3)

In this section, we deal with the problem (1.3). Note that this is the special case of the problem (1.2) with $A(x, \tau) = |\tau|^N$. Some preliminary lemmas in the case $\beta = 0$ were treated in [15, 17]. We will not include details of the proof here, but refer the reader to [15, 17]. The key ingredient of this section is the proof of Proposition 5.2 which is substantially different from those in [15, 17].

Lemma 5.1. There exists $\eta > 0$ and $v \in E$ with $\|v\|_E = 1$ such that $J_{\varepsilon}(tv) < 0$ for all $0 < t < \eta$. In particular, $\inf_{\|u\|_E \leq \rho} J_{\varepsilon}(u) < 0$.

Corollary 5.1. Under the hypotheses (V1) and (f1)-(f5), if $\varepsilon$ is sufficiently small then

$$\max_{t \geq 0} J_{\varepsilon}(tm) = \max_{t \geq 0} \left\{ \frac{t^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, tm)}{|x|^\beta} dx - t \int_{\mathbb{R}^N} \varepsilon |hm| dx \right\} < \frac{1}{N} \left( \frac{N - \beta \alpha_N}{N \alpha_0} \right)^{N-1}$$

Note that we can conclude by inequality (3.3) and Lemma 5.1 that

$$(5.1) \quad - \infty < c_0 = \inf_{\|u\|_E \leq \rho} J_{\varepsilon}(u) < 0.$$

Next, we will prove that this infimum is achieved and generate a solution. In order to obtain convergence results, we need to improve the estimate of Lemma 3.6.

Corollary 5.2. Under the hypotheses (V1) and (f1)-(f5), there exist $\varepsilon_2 \in (0, \varepsilon_1]$ and $u \in W^{1,N}(\mathbb{R}^N)$ with compact support such that for all $0 < \varepsilon < \varepsilon_2$,

$$J_{\varepsilon}(tu) < c_0 + \frac{1}{N} \left( \frac{N - \beta \alpha_N}{N \alpha_0} \right)^{N-1}$$

for all $t \geq 0$.

Proof. It is possible to increase the infimum $c_0$ by reducing $\varepsilon$. By Lemma 3.4, $\rho_\varepsilon \varepsilon \to 0$. Consequently, $c_0 \varepsilon \to 0$. Thus there exists $\varepsilon_2 > 0$ such that if $0 < \varepsilon < \varepsilon_2$ then, by Corollary 5.1, we have

$$\max_{t \geq 0} J_{\varepsilon}(tm) < c_0 + \frac{1}{N} \left( \frac{N - \beta \alpha_N}{N \alpha_0} \right)^{N-1}$$

Taking $u = m_k \in W^{1,N}(\mathbb{R}^N)$, the result follows. \qed

Lemma 5.2. If $(u_k)$ is a Cerami sequence for $J_{\varepsilon}$ at any level with

$$(5.2) \quad \liminf_{k \to \infty} \|u_k\|_E < \left( \frac{N - \beta \alpha_N}{N \alpha_0} \right)^{(N-1)/N}$$

then $(u_k)$ possesses a subsequence which converges strongly to a solution $u_0$ of (1.3).

Proof. See Lemma 5.2 in [17] for $\beta = 0$ and Lemma 4.6 in [5] for $0 \leq \beta < N$. \qed

5.1. Proof of Theorem 2.2. The proof of the existence of the second solution of (1.3) follows by a minimization argument and Ekeland’s variational principle.

Proposition 5.1. There exists $\varepsilon_2 > 0$ such that for each $\varepsilon$ with $0 < \varepsilon < \varepsilon_2$, Eq. (1.3) has a minimum type solution $u_0$ with $J_{\varepsilon}(u_0) = c_0 < 0$, where $c_0$ is defined in (5.1).
Proof. Let $\rho_\varepsilon$ be as in Lemma 3.4. We can choose $\varepsilon_2 > 0$ sufficiently small such that

$$\rho_\varepsilon < \left( \frac{N - \beta}{\alpha_0} \frac{\alpha_N}{\alpha_0} \right)^{(N-1)/N}$$

Since $B_{\rho_\varepsilon}$ is a complete metric space with the metric given by the norm of $E$, convex and the functional $J_\varepsilon$ is of class $C^1$ and bounded below on $B_{\rho_\varepsilon}$, by the Ekeland’s variational principle there exists a sequence $(u_k)$ in $B_{\rho_\varepsilon}$ such that

$$J_\varepsilon(u_k) \to c_0 = \inf_{\|u\|_E \leq \rho_\varepsilon} J_\varepsilon(u) \quad \text{and} \quad \|DJ_\varepsilon(u_k)\| \to 0$$

Observing that $\|u_k\|_E \leq \rho_\varepsilon < \left( \frac{N - \beta}{\alpha_0} \frac{\alpha_N}{\alpha_0} \right)^{(N-1)/N}$ by Lemma 5.2 it follows that there exists a subsequence of $(u_k)$ which converges to a solution $u_0$ of (1.3). Therefore, $J_\varepsilon(u_0) = c_0 < 0$. □

Remark 5.1. By Corollary 5.2, we can conclude that

$$0 < c_M < c_0 + \frac{1}{N} \left( \frac{N - \beta}{\alpha_0} \frac{\alpha_N}{\alpha_0} \right)^{N-1}$$

Proposition 5.2. If $\varepsilon_2 > 0$ is sufficiently small, then the solutions of (1.4) obtained in Propositions 4.1 and 5.1 are distinct.

Remark 5.2. Before we give a proof of the proposition, we like to make some remarks.

We note the following Hardy-Littlewood inequality holds for nonegative functions $f$ and $g$ in $\mathbb{R}^N$:

$$\int_{\mathbb{R}^N} f(x)g(x)dx \leq \int_{\mathbb{R}^N} f^*(x)g^*(x)dx$$

where $f^*$ and $g^*$ are symmetric and decreasing rearrangement of $f$ and $g$ respectively. However, the following inequality:

$$\int_{|x|>R} f(x)dx \leq \int_{|x|>R} f^*(x)dx$$

does not hold for all $R > 0$ in general. Therefore, we will avoid using the symmetrization argument when we prove

$$\int_{\mathbb{R}^N} \frac{F(x, u_k)}{|x|^\beta}dx \to \int_{\mathbb{R}^N} \frac{F(x, u_0)}{|x|^\beta}dx.$$ 

Nevertheless, this can be taken care by a ”double truncation” argument. This argument differs from those given in [13, 14, 15, 35]. Using this argument, the compact embedding $E \to L^q(\mathbb{R}^N)$ for $q \geq N$ is sufficient.

Proof. By Propositions 4.1 and 5.1, there exist sequences $(u_k)$, $(v_k)$ in $E$ such that

$$u_k \to u_0, \quad J_\varepsilon(u_k) \to c_0 < 0, \quad DJ_\varepsilon(u_k)u_k \to 0$$

and

$$v_k \to u_M, \quad J_\varepsilon(v_k) \to c_M > 0, \quad DJ_\varepsilon(v_k)v_k \to 0, \quad \nabla v_k(x) \to \nabla u_M(x) \quad \text{almost everywhere in } \mathbb{R}^N.$$
Now, suppose by contradiction that $u_0 = u_M$. As in the proof of Lemma 4.1 we obtain

\begin{equation}
\frac{f(x, v_k)}{|x|^{\beta}} \rightarrow \frac{f(x, u_0)}{|x|^{\beta}} \text{ in } L^1(B_R) \text{ for all } R > 0
\end{equation}

Moreover, by $(f2), (f3)$

\[
\frac{F(x, v_k)}{|x|^{\beta}} \leq \frac{R_0 f(x, v_k)}{|x|^{\beta}} + \frac{M_0 f(x, v_k)}{|x|^{\beta}}
\]

so by the Generalized Lebesgue’s Dominated Convergence Theorem,

\[
\frac{F(x, v_k)}{|x|^{\beta}} \rightarrow \frac{F(x, u_0)}{|x|^{\beta}} \text{ in } L^1(B_R)
\]

We will prove that

\[
\int_{\mathbb{R}^N} \frac{F(x, v_k)}{|x|^{\beta}} dx \rightarrow \int_{\mathbb{R}^N} \frac{F(x, u_0)}{|x|^{\beta}} dx.
\]

It’s sufficient to prove that given $\delta > 0$, there exists $R > 0$ such that

\[
\int_{|x| > R} \frac{F(x, v_k)}{|x|^{\beta}} dx \leq 3\delta \quad \text{and} \quad \int_{|x| > R} \frac{F(x, u_0)}{|x|^{\beta}} dx \leq 3\delta.
\]

To prove it, we recall the following facts from our assumptions on nonlinearity: there exists $c > 0$ such that for all $(x, s) \in \mathbb{R}^N \times \mathbb{R}^+$ :

\begin{equation}
F(x, s) \leq c |s|^N + cf(x, s)
\end{equation}

\[
F(x, s) \leq c |s|^N + cR (\alpha_0, s) s
\]

\[
\int_{\mathbb{R}^N} \frac{f(x, v_k)v_k}{|x|^{\beta}} dx \leq C, \quad \int_{\mathbb{R}^N} \frac{F(x, v_k)}{|x|^{\beta}} dx \leq C.
\]

First, we will prove it for the case $\beta > 0$.

We have that

\[
\int_{|x| > R} \frac{F(x, v_k)}{|x|^{\beta}} dx \leq c \int_{|x| > R} \frac{|v_k|^N}{|x|^{\beta}} dx + c \int_{|x| > R} \frac{f(x, v_k)}{|x|^{\beta}} dx
\]

\[
\leq \frac{c}{R^\beta} \|v_k\|^N_E + c \frac{1}{A} \int_{\mathbb{R}^N} \frac{f(x, v_k)v_k}{|x|^{\beta}} dx.
\]

Since $\|v_k\|_E$ is bounded and using (5.4), we can first choose $A$ such that

\[
c \frac{1}{A} \int_{\mathbb{R}^N} \frac{f(x, v_k)v_k}{|x|^{\beta}} dx < \delta
\]

and then choose $R$ such that

\[
\frac{c}{R^\beta} \|v_k\|^N_E < \delta
\]
which thus
\[ \int_{|x| > R, |v_k| > A} \frac{F(x, v_k)}{|x|^{\beta}} dx \leq 2\delta. \]

Now, note that with such \( A \), we have for \(|s| \leq A\):
\[
F(x, s) \leq c |s|^N + cR (\alpha_0, s) s
\leq c |s|^N + c \sum_{j=N-1}^{\infty} \frac{\alpha_0^j}{j!} |s|^{Nj/(N-1)+1}
\leq |s|^N \left[ c + c \sum_{j=N-1}^{\infty} \frac{\alpha_0^j}{j!} A^{Nj/(N-1)+1-N} \right]
\leq C(\alpha_0, A) |s|^N.
\]

So we get
\[
\int_{|x| > R, |v_k| \leq A} \frac{F(x, v_k)}{|x|^{\beta}} dx \leq \frac{C(\alpha_0, A)}{R^\beta} \int_{|x| > R, |v_k| \leq A} |v_k|^N dx
\leq \frac{C(\alpha_0, A)}{R^\beta} \|v_k\|_E^N.
\]

Again, note that \( \|v_k\|_E \) is bounded, we can choose \( R \) such that
\[
\int_{|x| > R, |v_k| \leq A} \frac{F(x, v_k)}{|x|^{\beta}} dx \leq \delta.
\]

In conclusion, we can choose \( R > 0 \) such that
\[
\int_{|x| > R} \frac{F(x, v_k)}{|x|^{\beta}} dx \leq 3\delta.
\]

Similarly, we can choose \( R > 0 \) such that
\[
\int_{|x| > R} \frac{F(x, u_0)}{|x|^{\beta}} dx \leq 3\delta.
\]

Now, if \( \beta = 0 \), similarly, we have
\[
\int_{|x| > R, |v_k| > A} F(x, v_k) dx \leq c \int_{|x| > R} |v_k|^N dx + c \int_{|x| > R, |v_k| > A} f(x, v_k) dx
\leq \frac{c}{A} \int_{|x| > R} |v_k|^{N+1} dx + \frac{1}{A} \int_{\mathbb{R}^N} f(x, v_k) v_k dx
\leq \frac{c}{A} \|v_k\|_E^{N+1} + \frac{1}{A} \int_{\mathbb{R}^N} f(x, v_k) v_k dx
\]
Next, we have
\[ \int_{|x| > R} F(x, v_k) dx \leq C(\alpha_0, A) \int_{|x| > R} |v_k|^N dx \]
\[ \leq 2^{N-1} C(\alpha_0, A) \left( \int_{|x| > R} |v_k - u_0|^N dx + \int_{|x| > R} |u_0|^N dx \right). \]

Now, using the compactness of embedding \( E \hookrightarrow L^q(\mathbb{R}^N) \), \( q \geq N \) and noticing that \( v_k \rightharpoonup u_0 \), again we can choose \( R \) such that
\[ \int_{|x| > R} F(x, v_k) dx \leq \delta. \]

Combining all the above estimates, we have the fact that
\[ \lim_{k \to \infty} \int_{\mathbb{R}^N} F(x, v_k) dx \to \int_{\mathbb{R}^N} \frac{F(x, u_0)}{|x|^\beta} dx. \]

since \( \delta \) is arbitrary and (5.3) holds.

The remaining argument is similar to that in [17] when \( \beta = 0 \). For \( 0 \leq \beta < N \), we also refer to [24]. For completeness, we will include a proof here.

From the above convergence formula (5.5), we have
\[ \lim_{k \to \infty} \|\nabla v_k\|_N^N = Nc_M - \lim_{k \to \infty} \int_{\mathbb{R}^N} V(x) |v_k|^N dx + N \int_{\mathbb{R}^N} \frac{F(x, u_0)}{|x|^\beta} dx + N \varepsilon \int_{\mathbb{R}^N} h u_0 dx \]

Now, let
\[ w_k = \frac{v_k}{\|\nabla v_k\|_N} \quad \text{and} \quad w_0 = \lim_{k \to \infty} \frac{u_0}{\|\nabla v_k\|_N} \]

we have \( \|\nabla w_k\|_N = 1 \) for all \( k \) and \( w_k \rightharpoonup w_0 \) in \( D^{1,N}(\mathbb{R}^N) \), the closure of the space \( C_0^\infty (\mathbb{R}^N) \) endowed with the norm \( \|\nabla \varphi\|_N \). In particular, \( \|\nabla w_0\|_N \leq 1 \) and \( w_k |_{B_R} \rightharpoonup w_0 |_{B_R} \) in \( W^{1,N}(B_R) \) for all \( R > 0 \). We claim that \( \|\nabla w_0\|_N < 1 \).

Indeed, if \( \|\nabla w_0\|_N = 1 \), then we have \( \lim_{k \to \infty} \|\nabla v_k\|_N = \|\nabla u_0\|_N \) and thus \( v_k \to u_0 \) in \( W^{1,N}(\mathbb{R}^N) \) since \( v_k \to u_0 \) in \( L^q(\mathbb{R}^N) \), \( q \geq N \). So we can find \( g \in W^{1,N}(\mathbb{R}^N) \) (for some \( q \geq N \)) such that \( |v_k(x)| \leq g(x) \) almost everywhere in \( \mathbb{R}^N \). From assumption (f1), we have for some \( \alpha_1 > \alpha_0 \) that
\[ |f(x, s)| \leq b_1 |s|^N + C \left[ \exp \left( \alpha_1 |s|^{N/(N-1)} \right) - S_{N-2}(\alpha_1, s) \right] \]
for all \((x, s) \in \mathbb{R}^N \times \mathbb{R}\). Thus,

\[
\frac{|f(x, v_k)v_k|}{|x|^\beta} \leq b_1 \frac{|v_k|^N}{|x|^\beta} + C \frac{\left[ \exp \left( \alpha_1 |v_k|^{N/(N-1)} \right) - S_{N-2} (\alpha_1, v_k) \right]}{|x|^\beta}
\]

\[
\leq b_1 \frac{|v_k|^N}{|x|^\beta} + C \frac{\left[ \exp \left( \alpha_1 |g|^{N/(N-1)} \right) - S_{N-2} (\alpha_1, g) \right]}{|x|^\beta}
\]

almost everywhere in \(\mathbb{R}^N\). Now, by the Lebesgue’s dominated convergence theorem,

\[
\lim_{k \to \infty} \int_{\mathbb{R}^N} \frac{f(x, v_k)v_k}{|x|^\beta} \, dx = \int_{\mathbb{R}^N} \frac{f(x, u_0)u_0}{|x|^\beta} \, dx
\]

Similarly, since \(u_k \to u_0\) in \(E\), we also have

\[
\lim_{k \to \infty} \int_{\mathbb{R}^N} \frac{f(x, u_k)u_k}{|x|^\beta} \, dx = \int_{\mathbb{R}^N} \frac{f(x, u_0)u_0}{|x|^\beta} \, dx
\]

Now, note that

\[
DJ_\varepsilon (u_k) u_k = \|u_k\|_E^N - \int_{\mathbb{R}^N} \frac{f(x, u_k)u_k}{|x|^\beta} \, dx - \int_{\mathbb{R}^N} \varepsilon hu_k \, dx \to 0
\]

and

\[
DJ_\varepsilon (v_k) v_k = \|v_k\|_E^N - \int_{\mathbb{R}^N} \frac{f(x, v_k)v_k}{|x|^\beta} \, dx - \int_{\mathbb{R}^N} \varepsilon hv_k \, dx \to 0
\]

we conclude that

\[
\lim_{k \to \infty} \|v_k\|_E^N = \lim_{k \to \infty} \|u_k\|_E^N = \|u_0\|_E^N
\]

and thus \(J_\varepsilon (v_k) \to J_\varepsilon (u_0) = c_0 < 0\) and this is a contradiction.

So \(\|\nabla u_0\|_N < 1\). Using Remark 5.1 we have

\[
c_M - J_\varepsilon (u_0) < \frac{1}{N} \left( \frac{N - \beta}{N - \alpha_0} \right)^{N-1} \frac{\alpha_N}{N}
\]

and thus

\[
\alpha_0 < \frac{N - \beta}{N} \frac{\alpha_N}{\left[ N (c_M - J_\varepsilon (u_0)) \right]^{1/(N-1)}}
\]

Now if we choose \(q > 1\) sufficiently close to 1 and set

\[
L(w) = c_M - \frac{1}{N} \int_{\mathbb{R}^N} V(x) |w|^N \, dx + \int_{\mathbb{R}^N} \frac{F(x, w)}{|x|^\beta} \, dx + \varepsilon \int_{\mathbb{R}^N} hw \, dx
\]

then for some \(\delta > 0\),

\[
q\alpha_0 \|\nabla v_k\|_N^{N/(N-1)} \leq \frac{N - \beta}{N} \frac{\alpha_N \|\nabla v_k\|_N^{N/(N-1)}}{\left[ N (c_M - J_\varepsilon (u_0)) \right]^{1/(N-1)}} - \delta
\]

\[
= \frac{N - \beta}{N} \frac{\alpha_N (NL(v_k))^{1/(N-1)} + o_k(1)}{\left[ N (c_M - J_\varepsilon (u_0)) \right]^{1/(N-1)}} - \delta
\]
Note that
\[ \lim_{k \to \infty} L(v_k) = c_M - \lim_{k \to \infty} \frac{1}{N} \int_{\mathbb{R}^N} V(x) |v_k|^N \, dx + \int_{\mathbb{R}^N} \frac{F(x, u_0)}{|x|^\beta} \, dx + \varepsilon \int_{\mathbb{R}^N} h u_0 \, dx + o_k(1) \]
and
\[ \left( c_M - \lim_{k \to \infty} \frac{1}{N} \int_{\mathbb{R}^N} V(x) |v_k|^N \, dx + \int_{\mathbb{R}^N} \frac{F(x, u_0)}{|x|^\beta} \, dx + \varepsilon \int_{\mathbb{R}^N} h u_0 \, dx \right) \left( 1 - \|\nabla v_0\|_N^N \right) \]
\[ \leq c_M - J_{\epsilon} (u_0) \]
so for \( k, R \) sufficiently large,
\[ q\alpha_0 \|\nabla v_k\|_N^{N/(N-1)} \leq \frac{N - \beta}{N} \frac{\alpha_N}{\left[ 1 - \|\nabla v_0\|_N^N \right]^{1/(N-1)} - \delta} \]
By Lemma 3.3, note that \( \nabla w_k \to \nabla w_0 \) almost everywhere since \( \nabla v_k(x) \to \nabla u_M(x) = \nabla u_0(x) \) almost everywhere in \( \mathbb{R}^N \):
\[ (5.7) \]
\[ \int_{B_R} \exp \left( q\alpha_0 \|\nabla v_k\|_N^{N/(N-1)} |v_k|^{N/(N-1)} \right) \frac{d x}{|x|^\beta} \leq C \]
By (f1) and Holder’s inequality,
\[ \left| \int_{\mathbb{R}^N} f(x, v_k)(v_k - u_0) \frac{d x}{|x|^\beta} \right| \]
\[ \leq b_1 \int_{\mathbb{R}^N} \frac{|v_k|^{N-1} |v_k - u_0|}{|x|^\beta} \, dx + b_2 \int_{B_R} \frac{|v_k - u_0| \exp \left( \alpha_0 |v_k|^{N/(N-1)} \right)}{|x|^\beta} \, dx \]
\[ \leq b_1 \left( \int_{\mathbb{R}^N} \frac{|v_k|^N}{|x|^\beta} \, dx \right)^{(N-1)/N} \left( \int_{\mathbb{R}^N} \frac{|v_k - u_0|^N}{|x|^\beta} \, dx \right)^{1/N} \]
\[ + b_2 \left( \int_{\mathbb{R}^N} \frac{|v_k - u_0|^q}{|x|^\beta} \, dx \right)^{1/q} \left( \int_{B_R} \exp \left( q\alpha_0 \|\nabla v_k\|_N^{N/(N-1)} |v_k|^{N/(N-1)} \right) \frac{d x}{|x|^\beta} \right)^{1/q} \]
where \( q' = q/(q-1) \). By (5.7), we have
\[ \left| \int_{\mathbb{R}^N} f(x, v_k)(v_k - u_0) \frac{d x}{|x|^\beta} \right| \leq C_1 \|v_k - u_0\|_N + C_2 \|v_k - u_0\|_N^{\beta/q'}. \]
Using the Holder inequality and the compact embedding \( E \hookrightarrow L^q, q \geq N \), we get
\[
\int_{\mathbb{R}^N} \frac{|v_k - u_0|^N}{|x|^\beta} \, dx = \int_{|x|<1} \frac{|v_k - u_0|^N}{|x|^\beta} \, dx + \int_{|x|\geq1} \frac{|v_k - u_0|^N}{|x|^\beta} \, dx
\leq \left( \int_{|x|<1} \frac{1}{|x|^{\beta s}} \, dx \right)^{1/s} \left( \int_{|x|<1} |v_k - u_0|^{s'N} \, dx \right)^{1/s'} + \|v_k - u_0\|_N^N
\to 0 \text{ as } k \to \infty
\]
for some \( s > 1 \) sufficiently close to 1. Similarly,
\[
\int_{\mathbb{R}^N} \frac{|v_k - u_0|^N'}{|x|^\beta} \, dx \xrightarrow{k \to \infty} 0.
\]
Thus we can conclude that
\[
\int_{\mathbb{R}^N} |\nabla v_k|^{N-2} \nabla v_k (\nabla v_k - \nabla u_0) \, dx + \int_{\mathbb{R}^N} V(x) |v_k|^{N-2} v_k (v_k - u_0) \, dx \to 0
\]
since \( DJ_\varepsilon(v_k)(v_k - u_0) \to 0 \).

On the other hand, since \( v_k \to u_0 \)
\[
\int_{\mathbb{R}^N} |\nabla u_0|^{N-2} \nabla u_0 (\nabla v_k - \nabla u_0) \, dx \to 0
\]
and
\[
\int_{\mathbb{R}^N} V(x) |u_0|^{N-2} u_0 (v_k - u_0) \, dx \to 0
\]
we have
\[
\int_{\mathbb{R}^N} |\nabla v_k - \nabla u_0|^N \, dx + \int_{\mathbb{R}^N} V(x) |v_k - u_0|^N
\leq C_1 \int_{\mathbb{R}^N} \left(|\nabla v_k|^{N-2} \nabla v_k - |\nabla u_0|^{N-2} \nabla u_0\right) (\nabla v_k - \nabla u_0) \, dx
\quad + C_2 \int_{\mathbb{R}^N} V(x) \left(|v_k|^{N-2} v_k - |u_0|^{N-2} u_0\right) (v_k - u_0) \, dx
\]
where we did use the inequality \( \left(|x|^{N-2} x - |y|^{N-2} y\right) (x - y) \geq 2^{2-N} |x - y|^N \). So we can conclude that \( v_k \to u_0 \) in \( E \). Thus \( J_\varepsilon(v_k) \to J_\varepsilon(u_0) = c_0 < 0 \). Again, this is a contradiction. The proof is thus complete. \( \Box \)

6. The existence result to the problem \([1.4]\)

In this section, we deal with the problem \([1.4]\). The main result of ours shows that we don’t need a nonzero small perturbation in this case to guarantee the existence of a solution.
6.1. **Proof of Theorem 2.3.** It’s similar to the proof of Theorems 2.1 and 2.2. We can find a sequence \((v_k)\) in \(E\) such that

\[
J(v_k) \to c_M > 0 \quad \text{and} \quad (1 + \|v_k\|_E) \|DJ(v_k)\| \to 0
\]

where \(c_M\) is the mountain-pass level of \(J\). Now, by Lemma 4.1, the sequence \((v_k)\) converges weakly to a weak solution \(v\) of \((1.4)\) in \(E\). Now, suppose that \(v = 0\). Similarly as in the proof of Proposition 5.2, we have that:

\[
\int_{\mathbb{R}^N} F(x, v_k) |x|^\beta \to 0 \tag{6.1}
\]

So

\[
\lim_{k \to \infty} \|v_k\|_E^N = \lim_{k \to \infty} \left( NJ(v_k) + N \int_{\mathbb{R}^N} \frac{F(x, v_k)}{|x|^\beta} \, dx \right) = NC_M
\]

Note that by Lemma 3.6, we have \(0 < C_M < \frac{1}{N} \left( \frac{N - \beta}{N} \frac{\alpha_N}{\alpha_0} \right)^{N-1} \), so

\[
\limsup_{k \to \infty} \|v_k\|_E < \left( \frac{N - \beta}{N} \frac{\alpha_N}{\alpha_0} \right)^{(N-1)/N}.
\]

Thus by \((f1)\), we have

\[
f(x, v_k)v_k \leq b_1 \frac{v_k^N}{|x|^\beta} + b_2 \frac{R(\alpha_0, v_k)}{|x|^\beta} v_k
\]

Note that

\[
b_1 \int_{\mathbb{R}^N} \frac{v_k^N}{|x|^\beta} + b_2 \int_{\mathbb{R}^N} \frac{R(\alpha_0, v_k)}{|x|^\beta} v_k \to 0
\]

since by Lemma 3.2 and by the compact embedding \(E \hookrightarrow L^s(\mathbb{R}^N)\), \(s \geq N\), \(\int_{\mathbb{R}^N} \frac{R(\alpha_0, v_k)}{|x|^\beta} \leq C(M, N) \|v_k\|_s \to 0\). Moreover, \(\int_{|x| \geq 1} \frac{v_k^N}{|x|^\beta} \leq \|v_k\|^N \to 0\) again by the compact embedding \(E \hookrightarrow L^N(\mathbb{R}^N)\) and \(\int_{|x| \leq 1} \frac{v_k^N}{|x|^\beta} \leq C \|v_k\|_{N^*} \to 0\) by Holder’s inequality and by the compact embedding \(E \hookrightarrow L^s(\mathbb{R}^N)\), \(s \geq N\). So we can conclude that

\[
\int_{\mathbb{R}^N} \frac{f(x, v_k)v_k}{|x|^\beta} \, dx \to 0
\]

which thus \(\lim_{k \to \infty} \|v_k\|_E^N = \lim_{k \to \infty} \int_{\mathbb{R}^N} \frac{f(x, v_k)v_k}{|x|^\beta} \, dx = 0\) and it’s impossible. So we get the non-triviality of the solution.
7. Existence and Multiplicity Without the Ambrosetti-Rabinowitz Condition

The main purpose of this section is to prove that all of the results of existence and multiplicity in Sections 5 and 6 hold even when the nonlinear term $f$ does not satisfy the Ambrosetti-Rabinowitz condition. It is not difficult to see that there are many interesting examples of such $f$ which do not satisfy the Ambrosetti-Rabinowitz condition, but satisfy our weaker conditions listed below.

In this section, instead of conditions (f2) and (f3), we assume that

(f2') $H(x, t) \leq H(x, s)$ for all $0 < t < s$, $\forall x \in \mathbb{R}^N$ where $H(x, u) = uf(x, u) - NF(x, u)$.

(f3') There exists $c > 0$ such that for all $(x, s) \in \mathbb{R}^N \times \mathbb{R}^+$: $F(x, s) \leq c|s|^N + cf(x, s)$.

(f4') $\lim_{u \to \infty} \frac{F(x, u)}{|u|^N} = \infty$ uniformly on $x \in \mathbb{R}^N$.

We should stress that (f1) + (f3) will imply (f3').

The key to establish the results in earlier sections is to prove that the Cerami sequence associated to the Lagrange-Euler functional is bounded. Once we will have proved this, the remaining should be the same as in previous sections. Therefore, we only include the proof of this essential ingredient in this section.

Lemma 7.1. Let $\{u_k\}$ be an arbitrary Cerami sequence associated to the functional

$$I(u) = \frac{1}{N} \|u\|^N - \int_{\mathbb{R}^N} \frac{F(x, u)}{|x|^\beta} dx$$

such that

$$\frac{1}{N} \|u_k\|^N - \int_{\mathbb{R}^N} \frac{F(x, u_k)}{|x|^\beta} dx \to C_M$$

$$(1 + \|u_k\|) \left| \int_{\mathbb{R}^N} |\nabla u_k|^{N-1} \nabla u_k \nabla v dx + \int_{\mathbb{R}^N} V(x) |u_k|^{N-1} u_k v dx - \int_{\mathbb{R}^N} \frac{f(x, u_k)v}{|x|^\beta} dx \right| \leq \varepsilon_k \|v\|$$

where $C_M \in \left(0, \frac{1}{N} \left(1 - \frac{\beta}{N} \frac{\alpha}{\alpha_0}\right)^{-1}\right)$. Then $\{u_k\}$ is bounded up to a subsequence.

Proof. Suppose that

$$\|u_k\| \to \infty$$

Setting

$$v_k = \frac{u_k}{\|u_k\|}$$

then $\|v_k\| = 1$. We can then suppose that $u_k \to v$ in $E$ (up to a subsequence). We may similarly show that $v_k^+ \to v^+$ in $E$, where $w^+ = \max\{w, 0\}$. Thanks to the assumptions on the potential $V$, the embedding $E \hookrightarrow L^q(\mathbb{R}^N)$ is compact for all $q \geq N$. So, we can assume that $v_k^+ \to v^+$ a.e. in $\mathbb{R}^N$.
Indeed, if \( S^+ = \{ x \in \mathbb{R}^N : v^+(x) > 0 \} \) has a positive measure, then in \( S^+ \), we have
\[
\lim_{k \to \infty} u_k^+(x) = \lim_{k \to \infty} v_k^+(x) \|u_k\| = +\infty
\]
and thus by \((f4')\):
\[
\lim_{k \to \infty} \frac{F(x, u_k^+(x))}{|x|^\beta |u_k^+(x)|^N} = +\infty \text{ a.e. in } S^+
\]
This means that
\[
\lim_{n \to \infty} \frac{F(x, u_k^+(x))}{|x|^\beta |u_k^+(x)|^N} |v_k^+(x)|^N = +\infty \text{ a.e. in } S^+
\]
and so
\[
\int_{\mathbb{R}^N} \liminf_{k \to \infty} \frac{F(x, u_k^+(x))}{|x|^\beta |u_k^+(x)|^N} |v_k^+(x)|^N \, dx = +\infty
\]
However, since \( \{u_k\} \) is the arbitrary Cerami sequence at level \( C_M \), we see that
\[
\|u_k\|^N = NC_M + N \int_{\mathbb{R}^N} \frac{F(x, u_k^+(x))}{|x|^\beta} \, dx + o(1)
\]
which implies that
\[
\int_{\mathbb{R}^N} \frac{F(x, u_k^+(x))}{|x|^\beta} \, dx \to +\infty
\]
and then
\[
\liminf_{k \to \infty} \int_{\mathbb{R}^N} \frac{F(x, u_k^+(x))}{|x|^\beta |u_k^+(x)|^N} |v_k^+(x)|^N \, dx
\]
\[
= \liminf_{k \to \infty} \int_{\mathbb{R}^N} \frac{F(x, u_k^+(x))}{|x|^\beta \|u_k\|^N} \, dx
\]
\[
= \liminf_{k \to \infty} \frac{\int_{\mathbb{R}^N} F(x, u_k^+(x)) \, dx}{NC_M + N \int_{\mathbb{R}^N} \frac{F(x, u_k^+(x))}{|x|^\beta} \, dx + o(1)}
\]
\[
= \frac{1}{N}
\]
Now, note that \( F(x, s) \geq 0 \), by Fatou’s lemma and \((7.3)\) and \((7.4)\), we get a contradiction. So \( v \leq 0 \text{ a.e. which means that } v_k^+ \to 0 \text{ in } E \).

Letting \( t_k \in [0, 1] \) such that
\[
I(t_ku_k) = \max_{t \in [0, 1]} I(tu_k)
\]
For any given \( R \in \left( 0, \left( \frac{1-\frac{\beta}{N}\alpha_0}{\alpha_0 - \alpha} \right)^{\frac{N-1}{N}} \right) \), let \( \varepsilon = \left( \frac{1-\frac{\beta}{N}}{R^{N/(N-1)}} - \alpha_0 > 0 \right) \), since \( f \) has critical growth \((f1)\) on \( \mathbb{R}^N \), there exists \( C = C(R) > 0 \) such that
\[
F(x, s) \leq C|s|^N + \left( \frac{1-\frac{\beta}{N}}{R^{N/(N-1)}} - \alpha_0 \right) R(\alpha_0 + \varepsilon, s), \forall (x, s) \in \mathbb{R}^N \times \mathbb{R}.
\]
Since \( \|u_k\| \to \infty \), we have

\[
I(t_k u_k) \geq I\left( \frac{R}{\|u_k\|} u_k \right) = I(R v_k)
\]

and by (7.5), \( \|v_k\| = 1 \) and the fact that \( \int_{\mathbb{R}^N} \frac{f(x,v_k)}{|x|^\beta} \, dx = \int_{\mathbb{R}^N} \frac{F(x,v_k^+)}{|x|^\beta} \, dx \), we get

\[
(7.7)
\]

\[
NI(R v_k)
\]

\[
\geq R^N - NCR^N \int_{\mathbb{R}^N} \frac{|v_k^+|^N}{|x|^\beta} \, dx - N \left( \frac{1 - \frac{\beta}{N}}{R^{N-1}} \right) \alpha_N - \alpha_0 \int_{\mathbb{R}^N} R(\alpha_0 + \varepsilon, R |v_k^+|) \, dx
\]

\[
\geq R^N - NCR^N \int_{\mathbb{R}^N} \frac{|v_k^+|^N}{|x|^\beta} \, dx - N \left( \frac{1 - \frac{\beta}{N}}{R^{N-1}} \right) \alpha_N - \alpha_0 \int_{\mathbb{R}^N} R((1 - \frac{\beta}{N}) \alpha_N, |v_k|) \, dx
\]

Since \( v_k^+ \to 0 \) in \( E \) and the embedding \( E \hookrightarrow L^p(\mathbb{R}^N) \) is compact for all \( p \geq N \), using the Holder inequality, we can show easily that \( \int_{\mathbb{R}^N} |v_k^+(x)|^N \, dx \to 0 \) as \( k \to \infty \). Also, by Lemma 1.1,

\[
\int_{\mathbb{R}^N} \frac{R((1 - \frac{\beta}{N}) \alpha_N, |v_k(x)|)}{|x|^\beta} \, dx
\]

is bounded by a universal \( C \).

Thus using (7.6) and letting \( k \to \infty \) in (7.7), and then letting \( R \to \left[ \left( \frac{(1 - \frac{\beta}{N}) \alpha_N}{\alpha_0} \right)^{-\frac{N-1}{N}} \right]^{-1} \), we get

\[
(7.8)
\]

\[
\liminf_{k \to \infty} I(t_k u_k) \geq \frac{1}{N} \left( \left( 1 - \frac{\beta}{N} \right) \frac{\alpha_N}{\alpha_0} \right)^{N-1} > C_M
\]

Note that \( I(0) = 0 \) and \( I(u_k) \to C_M \), we can suppose that \( t_k \in (0,1) \). Thus since \( DI(t_k u_k) t_k u_k = 0 \),

\[
t_k^N \|u_k\|^N = \int_{\mathbb{R}^N} \frac{f(x,t_k u_k) t_k u_k}{|x|^\beta} \, dx
\]

By (f2') :

\[
NI(t_k u_k) = t_k^N \|u_k\|^N - N \int_{\mathbb{R}^N} \frac{F(x,t_k u_k)}{|x|^\beta} \, dx
\]

\[
= \int_{\mathbb{R}^N} [f(x,t_k u_k) t_k u_k - NF(x,t_k u_k)] \, dx
\]

\[
\leq \int_{\mathbb{R}^N} \frac{[f(x,u_k) u_k - NF(x,u_k)]}{|x|^\beta} \, dx.
\]
Moreover, we have
\[
\int_{\mathbb{R}^N} \left[ \frac{f(x, u_k) u_k - NF(x, u_k)}{|x|^\beta} \right] dx = \|u_k\|^N_N + NC_M - \|u_k\|^N_N + o(1)
\]
which is a contraction to (7.8). This proves that \(\{u_k\}\) is bounded in \(E\). \(\square\)
