DIRAC COHOMOLOGY FOR GRADED AFFINE HECKE ALGEBRAS

DAN BARBASCH, DAN CIUBOTARU, AND PETER E. TRAPA

Abstract. We define analogues of the Casimir and Dirac operators for graded affine Hecke algebras, and establish a version of Parthasarathy’s Dirac operator inequality. We then prove a version of Vogan’s Conjecture for Dirac cohomology. The formulation of the conjecture depends on a uniform geometric parametrization of spin representations of Weyl groups. Finally, we apply our results to the study of unitary representations.

1. Introduction

This paper develops the theory of Dirac cohomology for modules over a graded affine Hecke algebra. The cohomology of such a module \( X \) is a representation of a spin double cover \( \tilde{W} \) of a relevant Weyl group. Our main result shows that when \( X \) is irreducible, the \( \tilde{W} \) representation (when nonzero) determines the central character of \( X \). This can be interpreted as a \( p \)-adic analogue of Vogan’s Conjecture (proved by Huang and Pandžić [HP]) for Harish-Chandra modules.

In more detail, fix a root system \( R \) (not necessarily crystallographic), let \( V \) denote its complex span, write \( V^\vee \) for the complex span of the coroots, \( W \) for the Weyl group, and fix a \( W \)-invariant inner product \( \langle \cdot, \cdot \rangle \) on \( V^\vee \). Let \( \mathbb{H} \) denote the associated graded affine Hecke algebra with parameters defined by Lusztig [Lal] (Definition 2.1). As a complex vector space, \( \mathbb{H} \simeq \mathbb{C}[W] \otimes S(V^\vee) \). Lusztig proved that maximal ideals in the center of \( \mathbb{H} \), and hence central characters of irreducible \( \mathbb{H} \) modules, are parametrized by \( (W \text{-orbits of}) \) elements of \( V \). In particular it makes sense to speak of the length of the central character of an irreducible \( \mathbb{H} \) module.

After introducing certain Casimir-type elements in Section 2, we then turn to the Dirac operator in Section 3. Let \( C(V^\vee) \) denote the corresponding Clifford algebra for the inner product \( \langle \cdot, \cdot \rangle \) on \( V^\vee \). For a fixed orthonormal basis \( \{\omega_i\} \) of \( V^\vee \), the Dirac operator is defined (Definition 3.1) as

\[
D = \sum_i \tilde{\omega}_i \otimes \omega_i \in \mathbb{H} \otimes C(V^\vee)
\]

where \( \tilde{\omega}_i \in \mathbb{H} \) is given by (2.14). In Theorem 3.1, we prove \( D \) is roughly the square root of the Casimir element \( \sum_i \omega_i^2 \in \mathbb{H} \) (Definition 2.3).

For a fixed space of spinors \( S \) for \( C(V^\vee) \) and a fixed \( \mathbb{H} \) module \( X \), \( D \) acts as an operator \( D \) on \( X \otimes S \). Since \( W \) acts by orthogonal transformation on \( V^\vee \), we can consider its preimage \( \tilde{W} \) in \( \text{Pin}(V^\vee) \). By restriction \( X \) is a representation of \( W \), and so \( X \otimes S \) is a representation of \( \tilde{W} \). Lemma 3.4 shows that \( D \) (and hence \( D \)) are approximately \( \tilde{W} \) invariant. Thus \( \ker(D) \) is also a representation of \( \tilde{W} \).

Corollary 3.6 shows that if \( X \) is irreducible, unitary, and \( \ker(D) \) is nonzero, then

1
any irreducible representation of $\widetilde{W}$ occurring in $\ker(D)$ determines the length of the central character of $X$. This is an analogue of Parthasarathy’s Dirac operator inequality \cite{Pa} (cf. \cite{SV} Section 7) for Harish-Chandra modules.

We then define the Dirac cohomology of $X$ as $H^D(X) = \ker(D)/ (\ker(D) \cap \text{im}(D))$ in Definition 4.7. (For unitary representations $H^D(X) = \ker(D)$.) Once again $H^D(X)$ is a representation of $\widetilde{W}$. At least when $H$ is a Hecke algebra related to $p$-adic group representations, one is naturally led to the following version of Vogan’s Conjecture: if $X$ is irreducible and $H^D(X)$ is nonzero, then any irreducible representation of $\widetilde{W}$ occurring in $H^D(X)$ determines the central character of $X$, not just its length. Our main result, Theorem 4.8, establishes this for algebras $H$ attached to crystallographic root systems and equal parameters. The proof is completed in Section 5. As explained in Remark 5.10, the proof also applies to establish Theorem 4.8 for the special kinds of unequal parameters for which Lusztig’s geometric theory applies \cite{Lu2}-\cite{Lu3}.

To make Theorem 4.8 precise, we need a way of passing from an irreducible $\widetilde{W}$ representation to a central character, i.e. an element of $V$. This is a fascinating problem in its own right. The irreducible representations of $\widetilde{W}$—the so-called spin representations of $W$—have been known for a long time from the work of Schur, Morris, Reade, and others. But only recently has a uniform parametrization of them in terms of nilpotent orbits emerged \cite{C}. This parametrization (partly recalled in Theorem 4.1) provides exactly what is needed for the statement of Theorem 4.8.

One of the main reasons for introducing the Dirac operator (as in the real case) is to study unitary representations. We give applications in Section 4.2. Corollary 4.4 and Remark 4.6 in particular contain powerful general statements about unitary representations. Given the machinery of the Dirac operator, their proofs are remarkably simple.

We remark that while this paper is inspired by the ideas of Parthasarathy, Vogan, and Huang-Pandžić, it is essentially self-contained. There are two exceptions. We have already mentioned that we use the main results of \cite{C}. The other nontrivial result we need is the classification (and $W$-module structure) of certain tempered $H$-modules \((K\lambda [Lu1] Lu3)\). These results (in the form we use them) are not available at arbitrary parameters. This explains the crystallographic condition and restrictions on parameters in the statement of Theorem 4.8 and in Remark 5.10.

For applications to unitary representations of $p$-adic groups, these hypotheses are natural. Nonetheless we expect a version of Theorem 4.8 to hold for arbitrary parameters and noncrystallographic root systems.

The results of this paper suggest generalizations to other types of related Hecke algebras. They also suggest possible generalizations along the lines of \cite{K} for a version of Kostant’s cubic Dirac operator. Finally, in \cite{EFM} and \cite{CT} (and also in unpublished work of Hiroshi Oda) functors between Harish-Chandra modules and modules for associated graded affine Hecke algebras are introduced. It would be interesting to understand how these functors relate Dirac cohomology in the two categories.

2. Casimir operators

2.1. Root systems. Fix a root system $\Phi = (V_0, R, V_0^\vee, R^\vee)$ over the real numbers. In particular: $R \subset V_0 \setminus \{0\}$ spans the real vector space $V_0$; $R^\vee \subset V^\vee \setminus \{0\}$ spans
the real vector space $V_0^\vee$; there is a perfect bilinear pairing

$$(\cdot, \cdot) : V_0 \times V_0^\vee \to \mathbb{R};$$

and there is a bijection between $R$ and $R^\vee$ denoted $\alpha \mapsto \alpha^\vee$ such that $(\alpha, \alpha^\vee) = 2$ for all $\alpha$. Moreover, for $\alpha \in R$, the reflections

$$s_\alpha : V_0 \to V_0, \quad s_\alpha(v) = v - (v, \alpha^\vee)\alpha,$$

$$s_\alpha^\vee : V_0^\vee \to V_0^\vee, \quad s_\alpha^\vee(v') = v' - (\alpha, v')\alpha^\vee$$

leave $R$ and $R^\vee$ invariant, respectively. Let $W$ be the subgroup of $GL(V_0)$ generated by $\{s_\alpha \mid \alpha \in R\}$. The map $s_\alpha \mapsto s_\alpha^\vee$ given an embedding of $W$ into $GL(V_0^\vee)$ so that

$$(v, vv') = (vv', v')$$

(2.1)

for all $v \in V_0$ and $v' \in V_0^\vee$.

We will assume that the root system $\Phi$ is reduced, meaning that $\alpha \in R$ implies $2\alpha \notin R$. However, initially we do not need to assume that $\Phi$ is crystallographic, meaning that for us $(\alpha, \beta^\vee)$ need not always be an integer. We will fix a choice of positive roots $R^+ \subset R$, let $\Pi$ denote the corresponding simple roots in $R^+$, and let $R^{\vee,+}$ denote the corresponding positive coroots in $R^\vee$. Often we will write $\alpha > 0$ or $\alpha < 0$ in place of $\alpha \in R^+$ or $\alpha \in (-R^+)$, respectively.

We fix, as we may, a $W$-invariant inner product $\langle \cdot, \cdot \rangle$ on $V_0^\vee$. The constructions in this paper of the Casimir and Dirac operators depend, up to a positive scalar, on the choice of this inner product. Using the bilinear pairing $(\cdot, \cdot)$, we define a dual inner product on $V_0$ as follows. Let $\{\omega_i \mid i = 1, \cdots, n\}$ and $\{\omega^i \mid i = 1, \cdots, n\}$ be $\mathbb{R}$-bases of $V_0^\vee$ which are in duality; i.e. such that $(\omega_i, \omega^j) = \delta_{i,j}$, the Kronecker delta. Then for $v_1, v_2 \in V_0$, set

$$\langle v_1, v_2 \rangle = \sum_{i=1}^{n} (v_1, \omega_i)(v_2, \omega^i).$$

(2.2)

(Since the inner product on $V_0^\vee$ is also denoted $\langle \cdot, \cdot \rangle$, this is an abuse of notation. But it causes no confusion in practice.) Then (2.2) defines an inner product on $V_0$ which once again is $W$-invariant. It does not depend on the choice of bases $\{\omega_i\}$ and $\{\omega^i\}$. If $v$ is a vector in $V$ or in $V^\vee$, we set $|v| := \langle v, v \rangle^{1/2}$.

2.2. The graded affine Hecke algebra. Fix a root system $\Phi$ as in the previous section. Set $V = V_0 \otimes_{\mathbb{R}} \mathbb{C}$, and $V^\vee = V_0^\vee \otimes_{\mathbb{R}} \mathbb{C}$. Fix a $W$-invariant “parameter function” $c : R \to \mathbb{R}$, and set $c_{\alpha} = c(\alpha)$.

**Definition 2.1** ([La1] §4). The graded affine Hecke algebra $\mathbb{H} = \mathbb{H}(\Phi, c)$ attached to the root system $\Phi$ and with parameter function $c$ is the complex associative algebra with unit generated by the symbols $\{t_w \mid w \in W\}$ and $\{t_f \mid f \in S(V^\vee)\}$, subject to the relations:

1. The linear map from the group algebra $\mathbb{C}[W] = \bigoplus_{w \in W} \mathbb{C}w$ to $\mathbb{H}$ taking $w$ to $t_w$ is an injective map of algebras.
2. The linear map from the symmetric algebra $S(V^\vee)$ to $\mathbb{H}$ taking an element $f$ to $t_f$ is an injective map of algebras.

We will often implicitly invoke these inclusions and view $\mathbb{C}[W]$ and $S(V^\vee)$ as subalgebras of $\mathbb{H}$. As is customary, we also write $f$ instead of $t_f$ in $\mathbb{H}$. The final relation is
We call $\chi W$ whose kernel is the maximal ideal parametrized by the $t$ that $\nu$. It follows from a simple calculation that $\Omega$ is well-defined independent of the choice of basis, for example. So indeed $\Omega$.

But the last two terms cancel (which can be seen by taking $\{,\}$).

$\Omega = \sum_{i=1}^{n} \omega_i \omega_i \in \mathbb{H}$.  

It follows from a simple calculation that $\Omega$ is well-defined independent of the choice of bases.

**Lemma 2.4.** The element $\Omega$ is central in $\mathbb{H}$.

**Proof.** To see that $\Omega$ is central, in light of Definition 2.1, it is sufficient to check that $t_{s_{\alpha}} \Omega = \Omega t_{s_{\alpha}}$ for every $\alpha \in \Pi$. Using (2.3) twice and the fact that $(\alpha, s_{\alpha}(\omega)) = - (\alpha, \omega)$ (as follows from (2.1)), we find

$$t_{s_{\alpha}} (\omega_i \omega_i) = (s_{\alpha}(\omega_i)s_{\alpha}(\omega_i))t_{s_{\alpha}} + c_{\alpha}(\alpha, \omega^i)s_{\alpha}(\omega_i) + c_{\alpha}(\alpha, \omega_i)\omega^i.  \quad (2.5)$$

Therefore, we have

$$t_{s_{\alpha}} \Omega = \sum_{i=1}^{n} s_{\alpha}(\omega_i)s_{\alpha}(\omega_i)t_{s_{\alpha}} + c_{\alpha} \sum_{i=1}^{n} (\alpha, \omega^i)s_{\alpha}(\omega_i) + c_{\alpha} \sum_{i=1}^{n} (\alpha, \omega_i)\omega^i$$

$$= \Omega t_{s_{\alpha}} + c_{\alpha} \sum_{i=1}^{n} (\alpha, s_{\alpha}(\omega_i))\omega_i + c_{\alpha} \sum_{i=1}^{n} (\alpha, \omega_i)\omega^i$$

$$= \Omega t_{s_{\alpha}} - c_{\alpha} \sum_{i=1}^{n} (\alpha, \omega^i)\omega_i + c_{\alpha} \sum_{i=1}^{n} (\alpha, \omega_i)\omega^i.  \quad (2.6)$$

But the last two terms cancel (which can be seen by taking $\{\omega_i\}$ to be a self-dual basis, for example). So indeed $t_{s_{\alpha}} \Omega = \Omega t_{s_{\alpha}}$. 

**Lemma 2.5.** Let $(\pi, X)$ is an irreducible $\mathbb{H}$-module with central character $\chi_{\nu}$ for $\nu \in V$ (as in Definition 2.2). Then

$$\pi(\Omega) = \langle \nu, \nu \rangle \text{ Id}_X.$$

**Proof.** Since $\Omega$ is central (by Lemma 2.4), it acts by a multiple of the identity on $X$. We use the weight decomposition of $(\pi, X)$ with respect to the abelian subalgebra $S(V^\vee)$. Let $x \neq 0$ be an eigenvector for the weight $w
\nu \in V$, $w \in W$. Then we have:

$$\pi(\omega_i \omega^i)x = (w \nu, \omega_i)(w \nu, \omega^i)x,$$
and when we sum over the dual bases \(\{\omega_i\} \cup \{\omega^i\}\), we find
\[
\pi(\Omega)x = \sum_{i=1}^{n} (w\nu,\omega_i)\nu(w\nu,\omega^i)x = (w\nu, w\nu)x = \langle \nu, \nu \rangle x, \tag{2.7}
\]
by (2.2) and the \(W\)-invariance of \(\langle \ , \ \rangle\).

2.4. We will need the following formula. To simplify notation, we define
\[
t_{w\beta} := t_{ws_{\beta}}t_{w^{-1}}, \quad \text{for } w \in W, \beta \in R. \tag{2.8}
\]

**Lemma 2.6.** For \(w \in W\) and \(\omega \in V^\vee\),
\[
t_{w\beta} \omega t_{w^{-1}} = w(\omega) + \sum_{\beta > 0 \text{ s.t. } w\beta < 0} c_{\beta}(\beta, \omega)t_{w\beta} \tag{2.9}
\]
Proof. The formula holds if \(w = s_\alpha\), for \(\alpha \in \Pi\), by (2.3):
\[
t_{s_\alpha} \omega s_{\alpha} = s_\alpha w(\omega) + c_\alpha(\alpha, \omega)t_{s_\alpha}. \tag{2.10}
\]
We now do an induction on the length of \(w\). Suppose the formula holds for \(w\), and let \(\alpha\) be a simple root such that \(s_\alpha w\) has strictly greater length. Then
\[
t_{s_\alpha} t_{w\beta} t_{w^{-1}} t_{s_\alpha} = t_{s_\alpha} \left[ w(\omega) + \sum_{\beta : w\beta < 0} c_{\beta}(\beta, \omega)t_{w\beta} \right] t_{s_\alpha} =
\]
\[
= s_\alpha w(\omega) + c_\alpha(\alpha, \omega)t_{s_\alpha} + \sum_{\beta : w\beta < 0} c_{\beta}(\beta, \omega)t_{s_\alpha} t_{w\beta} t_{s_\alpha}. \tag{2.11}
\]
The claim follows. \(\square\)

2.5. **The \(\ast\)-operation, Hermitian and unitary representations.** The algebra \(H\) has a natural conjugate linear anti-involution defined on generators as follows ([BM2, Section 5]):
\[
t_{w}^* = t_{w^{-1}}, \quad w \in W, \quad \omega^* = -\omega + \sum_{\beta > 0} c_{\beta}(\beta, \omega)t_{s_\beta}, \quad \omega \in V^\vee. \tag{2.12}
\]
In general there are other conjugate linear anti-involutions on \(H\), but this one is distinguished by its relation to the canonical notion of unitarity for \(p\)-adic group representations [BM1, BM2].

An \(H\)-module \((\pi, X)\) is said to be \(\ast\)-Hermitian (or just Hermitian) if there exists a Hermitian form \(\langle , \rangle_X\) on \(X\) which is invariant in the sense that:
\[
(\pi(h)x, y)_X = (x, \pi(h^*)y)_X, \quad \text{for all } h \in H, \ x, y \in X. \tag{2.13}
\]
If such a form exists which is also positive definite, then \(X\) is said to be \(\ast\)-unitary (or just unitary).

Because the second formula in (2.12) is complicated, we need other elements which behave more simply under \(\ast\). For every \(\omega \in V^\vee\), define
\[
\bar{\omega} = \omega - \frac{1}{2} \sum_{\beta > 0} c_{\beta}(\beta, \omega)t_{s_\beta} \in H. \tag{2.14}
\]
Then it follows directly from the definitions that $\omega^* = -\omega$. Thus if $(\pi, X)$ is Hermitian $\mathbb{H}$-module
\begin{equation}
(\pi(\bar{\omega})x, \pi(\bar{\omega})x)_X = (\pi(\bar{\omega}^*)\pi(\bar{\omega})x, x)_X = -(\pi(\bar{\omega}^2)x, x)_X.
\end{equation}
If we further assume that $X$ is unitary, then
\begin{equation}
(\pi(\bar{\omega}^2)x, x)_X \leq 0, \quad \text{for all } x \in X, \omega \in V_0^\vee.
\end{equation}
For each $\omega$ and $x$, this is a necessary condition for a Hermitian representation $X$ to be unitary. It is difficult to apply because the operators $\pi(\bar{\omega}^2)$ are intractable in general. Instead we introduce a variation on the Casimir element of Definition 2.3 whose action in an $\mathbb{H}$-module will be seen to be tractable.

**Definition 2.7.** Let $\{\omega_i\}, \{\omega^i\}$ be dual bases of $V_0^\vee$ with respect to $(\ , \ )$. Define
\begin{equation}
\tilde{\Omega} = \sum_{i=1}^n \bar{\omega}_i \bar{\omega}^i \in \mathbb{H}.
\end{equation}
It will follow from Theorem 2.11 below that $\tilde{\Omega}$ is independent of the bases chosen.

If we sum (2.16) over a self-dual orthonormal basis of $V^\vee$, we immediately obtain the following necessary condition for unitarity.

**Proposition 2.8.** A Hermitian $\mathbb{H}$-module $(\pi, X)$ with invariant form $(\ , \ )_X$ is unitary only if
\begin{equation}
(\pi(\tilde{\Omega})x, x)_X \leq 0, \quad \text{for all } x \in X.
\end{equation}

The remainder of this section will be aimed at computing the action of $\tilde{\Omega}$ in an irreducible $\mathbb{H}$ module as explicitly as possible (so that the necessary condition of 2.8 becomes as effective as possible). Since $\tilde{\Omega}$ is no longer central, nothing as simple as Lemma 2.5 is available. But Proposition 2.10(2) below immediately implies that $\tilde{\Omega}$ invariant under conjugation by $t_w$ for $w \in W$. It therefore acts on each $W$ isotypic component of $\mathbb{H}$ module, and on each isotypic component it turns out to act in a relatively simple manner (Corollary 2.12).

To get started, set
\begin{equation}
T_\omega = \omega - \bar{\omega} = \frac{1}{2} \sum_{\beta > 0} c_\beta(\beta, \omega) t_{s_\beta} \in \mathbb{H}
\end{equation}
and
\begin{equation}
\Omega_W = \frac{1}{4} \sum_{\alpha > 0, \beta > 0 \text{ s.t. } s_\alpha(\beta) < 0} c_\alpha c_\beta (\alpha, \beta) t_{s_\alpha} t_{s_\beta} \in \mathbb{C}[W].
\end{equation}
Note that $\Omega_W$ is invariant under the conjugation action of $W$.

**Lemma 2.9.** If $\omega_1, \omega_2 \in V^\vee$, we have
\begin{equation}
[T_{\omega_1}, T_{\omega_2}] = \frac{1}{4} \sum_{\alpha > 0, \beta > 0 \text{ s.t. } s_\alpha(\beta) < 0} c_\alpha c_\beta ((\alpha, \omega_1)(\beta, \omega_2) - (\beta, \omega_1)(\alpha, \omega_2)) t_{s_\alpha} t_{s_\beta}.
\end{equation}

**Proof.** From the definition (2.19), we see that
\begin{equation}
[T_{\omega_1}, T_{\omega_2}] = \frac{1}{4} \sum_{\alpha > 0, \beta > 0} c_\alpha c_\beta ((\alpha, \omega_1)(\beta, \omega_2) - (\beta, \omega_1)(\alpha, \omega_2)) t_{s_\alpha} t_{s_\beta}.
\end{equation}
Assume $\alpha > 0, \beta > 0$ are such that $s_\alpha(\beta) > 0$. Notice that if $\gamma = s_\alpha(\beta)$, then $t_{s_\alpha} t_{s_\gamma} = t_{s_\alpha} t_{s_\gamma}$. Also, it is elementary to verify (by a rank 2 reduction to the span of $\alpha^\vee$ and $\beta^\vee$, for instance) that

$$(s_\alpha(\beta), \omega_1(\alpha, \omega_2) - (\alpha, \omega_1)(s_\alpha(\beta), \omega_2)) = -((\alpha, \omega_1)(\beta, \omega_2) - (\beta, \omega_1)(\alpha, \omega_2)).$$

Since $c$ is $W$-invariant, this implies that the contributions of the pairs of roots $\{\alpha, \beta\}$ and $\{s_\alpha(\beta), \alpha\}$ (when $s_\alpha(\beta) > 0$) cancel out in the above sum. The claim follows.

**Proposition 2.10.** Fix $w \in W$ and $\omega, \omega_1, \omega_2 \in V^\vee$. The elements defined in (2.14) have the following properties:

1. $\bar{\omega}^* = -\bar{\omega}$;
2. $t_w \bar{\omega} t_{\bar{w}^{-1}} = w(\omega)$;
3. $[\bar{\omega}_1, \bar{\omega}_2] = -[T_{\omega_1}, T_{\omega_2}]$.

**Proof.** As remarked above, property (1) is obvious from (2.12). For (2), using Lemma 2.6 we have:

$$t_w \bar{\omega} t_{\bar{w}^{-1}} = t_w \omega t_{\bar{w}^{-1}} - \frac{1}{2} \sum_{\beta > 0} c_\beta(\beta, \omega)t_{\bar{w}}t_{s_\beta}t_{\bar{w}^{-1}}$$

$$= w(\omega) + \sum_{\beta > 0: w_\beta \neq 0} c_\beta(\beta, \omega)t_{\bar{w}} - \frac{1}{2} \sum_{\beta > 0} c_\beta(\beta, \omega)t_{\bar{w}_\beta}$$

$$= w(\omega) + \frac{1}{2} \sum_{\beta > 0: w_\beta \neq 0} c_\beta(\beta, \omega)t_{\bar{w}_\beta} - \frac{1}{2} \sum_{\beta > 0: w_\beta \neq 0} c_\beta(\beta, \omega)t_{\bar{w}_\beta}$$

$$= w(\omega) - \frac{1}{2} \sum_{\beta' > 0} c_\beta(w^{-1}\beta', \omega)t_{s_\beta} = \bar{w}(\omega).$$

For the last step, we set $\beta' = -w_\beta$ in the first sum and $\beta' = w_\beta$ in the second sum, and also used that $c_\beta = c_\beta$ since $c$ is $W$-invariant.

Finally, we verify (3). We have

$$[\bar{\omega}_1, \bar{\omega}_2] = [\omega_1 - T_{\omega_1}, \omega_2 - T_{\omega_2}]$$

$$= [T_{\omega_1}, T_{\omega_2}] - ([T_{\omega_1}, \omega_2] + [\omega_1, T_{\omega_2}]).$$

We do a direct calculation:

$$[T_{\omega_1}, \omega_2] = \frac{1}{2} \sum_{\alpha > 0} c_\alpha(\alpha, \omega_1)(s_\alpha(\omega_2) - \omega_2)t_{s_\alpha} - \omega_2)t_{s_\alpha}.$$  

Applying Lemma 2.6 we get

$$[T_{\omega_1}, \omega_2] = \frac{1}{2} \sum_{\alpha > 0} c_\alpha(\alpha, \omega_1)(s_\alpha(\omega_2) - \omega_2)t_{s_\alpha} + \frac{1}{2} \sum_{\alpha > 0, \beta > 0 \text{ s.t. } s_\alpha(\beta) < 0} c_\alpha c_\beta(\alpha, \omega_1)(\beta, \omega_2)t_{s_\alpha(\beta)}t_{s_\alpha(\beta)}$$

$$= -\frac{1}{2} \sum_{\alpha > 0} c_\alpha(\alpha, \omega_1)(\alpha, \omega_2)^\vee t_{s_\alpha} + \frac{1}{2} \sum_{\alpha > 0, \beta > 0 \text{ s.t. } s_\alpha(\beta) < 0} c_\alpha c_\beta(\alpha, \omega_1)(\beta, \omega_2)t_{s_\alpha} t_{s_\beta}.$$  

From this and Lemma 2.3 it follows immediately that $[T_{\omega_1}, \omega_2] + [\omega_1, T_{\omega_2}] = 2[T_{\omega_1}, T_{\omega_2}]$. This completes the proof of (3).
Theorem 2.11. Let $\tilde{\Omega}$ be the $W$-invariant element of $\mathbb{H}$ from Definition 2.7. Recall the notation of 2.19. Then

$$\tilde{\Omega} = \Omega - \sum_{i=1}^{n} T_{\omega_i} T_{\omega^i} = \Omega - \frac{1}{4} \sum_{\alpha > 0, \beta > 0 \text{ s.t. } s_{\alpha}(\beta) < 0} c_{\alpha} c_{\beta} \langle \alpha, \beta \rangle t_{\alpha \beta} t_{\beta \alpha}. \quad (2.22)$$

Proof. From Definition 2.7, we have

$$\tilde{\Omega} = \sum_{i=1}^{n} \omega_i \omega^i - \sum_{i=1}^{n} (\omega_i T_{\omega^i} + T_{\omega_i} \omega^i) + \sum_{i=1}^{n} T_{\omega_i} T_{\omega^i}, \quad (2.23)$$

On the other hand, we have $\tilde{\omega} = (\omega - \omega^*)/2$, and so

$$\tilde{\omega}_i \tilde{\omega}^i = (\omega_i \omega^i + \omega_i^* \omega^i*)/4 - (\omega_i \omega^i* + \omega_i^* \omega^i)/4. \quad (2.24)$$

Summing (2.24) over $i$ from 1 to $n$, we find:

$$\tilde{\Omega} = \sum_{i=1}^{n} \frac{\omega_i \omega^i + \omega_i^* \omega^i*}{4} - \sum_{i=1}^{n} \frac{\omega_i \omega^i + \omega_i^* \omega^i}{4} + \sum_{i=1}^{n} (\omega_i T_{\omega^i} + T_{\omega_i} \omega^i). \quad (2.25)$$

We conclude from (2.23) and (2.25) that

$$\sum_{i=1}^{n} T_{\omega_i} T_{\omega^i} = \frac{1}{2} \sum_{i=1}^{n} (\omega_i T_{\omega^i} + T_{\omega_i} \omega^i), \quad (2.26)$$

and

$$\tilde{\Omega} = \Omega - \frac{1}{2} \sum_{i=1}^{n} (\omega_i T_{\omega^i} + T_{\omega_i} \omega^i) = \Omega - \sum_{i=1}^{n} T_{\omega_i} T_{\omega^i}. \quad (2.27)$$

This is the first assertion of the theorem. For the remainder, write out the definition of $T_{\omega_i}$ and $T_{\omega^i}$, and use (2.2):

$$\sum_{i=1}^{n} T_{\omega_i} T_{\omega^i} = \frac{1}{4} \sum_{\alpha > 0, \beta > 0 \text{ s.t. } s_{\alpha}(\beta) < 0} c_{\alpha} c_{\beta} \langle \alpha, \beta \rangle t_{\alpha \beta} t_{\beta \alpha} = \frac{1}{4} \sum_{\alpha > 0, \beta > 0 \text{ s.t. } s_{\alpha}(\beta) < 0} c_{\alpha} c_{\beta} \langle \alpha, \beta \rangle t_{\alpha \beta} t_{\beta \alpha} \quad (2.28)$$

with the last equality following as in the proof of Lemma 2.8. □

Corollary 2.12. Retain the setting of Proposition 2.8 but further assume $(\pi, X)$ is irreducible and unitary with central character $\chi_v$ with $v \in V$ (as in Definition 2.24). Let $(\sigma, U)$ be an irreducible representation of $W$ such that $\text{Hom}_W(U, X) \neq 0$. Then

$$\langle \nu, \nu \rangle \leq c(\sigma) \quad (2.29)$$

where

$$c(\sigma) = \frac{1}{4} \sum_{\alpha > 0} c_{\alpha}^2 \langle \alpha, \alpha \rangle + \frac{1}{4} \sum_{\alpha > 0, \beta > 0 \text{ s.t. } \alpha \neq \beta} c_{\alpha} c_{\beta} \langle \alpha, \beta \rangle \frac{\text{tr}_\sigma(s_{\alpha \beta})}{\text{tr}_\sigma(1)} \quad (2.30)$$

is the scalar by which $\Omega_W$ acts in $U$ and $\text{tr}_\sigma$ denotes the character of $\sigma$. 
Proof. The result follow from the formula in Theorem 2.11 by applying Proposition 2.8 to a vector \(x\) in the \(\sigma\) isotypic component of \(X\). □

Theorem 2.11 will play an important role in the proof of Theorem 3.5 below.

3. The Dirac operator

Throughout this section we fix the setting of Section 2.1.

3.1. The Clifford algebra. Denote by \(C(V^\vee)\) the Clifford algebra defined by \(V^\vee\) and \(\langle\ ,\ \rangle\). More precisely, \(C(V^\vee)\) is the quotient of the tensor algebra of \(V^\vee\) by the ideal generated by

\[
\omega \otimes \omega' + \omega' \otimes \omega + 2\langle\omega, \omega'\rangle, \quad \omega, \omega' \in V^\vee.
\]

Equivalently, \(C(V^\vee)\) is the associative algebra with unit generated by \(V^\vee\) with relations:

\[
\omega^2 = -\langle\omega, \omega\rangle, \quad \omega \omega' + \omega' \omega = -2\langle\omega, \omega'\rangle.
\] (3.1)

Let \(O(V^\vee)\) denote the group of orthogonal transformation of \(V^\vee\) with respect to \(\langle\ ,\ \rangle\). This acts by algebra automorphisms on \(C(V^\vee)\), and the action of \(-1 \in O(V^\vee)\) induces a grading

\[
C(V^\vee) = C(V^\vee)_{\text{even}} + C(V^\vee)_{\text{odd}}.
\] (3.2)

Let \(\epsilon\) be the automorphism of \(C(V^\vee)\) which is +1 on \(C(V^\vee)_{\text{even}}\) and \(-1\) on \(C(V^\vee)_{\text{odd}}\). Let \(\iota\) be the transpose antiautomorphism of \(C(V^\vee)\) characterized by

\[
\omega^\iota = -\omega, \quad \omega \in V^\vee, \quad (ab)^\iota = b^\iota a^\iota, \quad a, b \in C(V^\vee).
\] (3.3)

The Pin group is

\[
\text{Pin}(V^\vee) = \{a \in C(V^\vee) \mid \epsilon(a)V^\vee a^{-1} \subset V^\vee, \ a^\iota = a^{-1}\}.
\] (3.4)

It sits in a short exact sequence

\[
1 \longrightarrow \{\pm 1\} \longrightarrow \text{Pin}(V^\vee) \longrightarrow O(V^\vee) \longrightarrow 1,
\] (3.5)

where the projection \(p\) is given by \(p(a)(\omega) = \epsilon(a)\omega a^{-1}\).

We call a simple \(C[V^\vee]\) module \((\gamma, S)\) of dimension \(2^{[\text{dim } V/2]}\) a spin module for \(C(V^\vee)\). When \(\text{dim } V\) is even, there is only one such module (up to equivalence), but if \(\text{dim } V\) is odd, there are two inequivalent spin modules. We may endow such a module with a positive definite Hermitian form \(\langle\ ,\ \rangle_S\) such that

\[
\langle\gamma(a)s, s'\rangle_S = \langle s, \gamma(a^\iota)\rangle_S, \quad \text{for all } a \in C(V^\vee) \text{ and } s, s' \in S.
\] (3.6)

In all cases, \((\gamma, S)\) restricts to an irreducible unitary representation of \(\text{Pin}(V^\vee)\).

3.2. The Dirac operator \(D\).

Definition 3.1. Let \(\{\omega_i\}, \{\omega^i\}\) be dual bases of \(V^\vee\), and recall the elements \(\bar{\omega}_i \in H\) from 2.14. The abstract Dirac operator is defined as

\[
D = \sum_i \bar{\omega}_i \otimes \omega_i \in H \otimes C(V^\vee).
\]

It is elementary to verify that \(D\) does not depend on the choice of dual bases.
Frequently we will work with a fixed spin module $(\gamma, S)$ for $C(V^\vee)$ and a fixed $\mathbb{H}$-module $(\pi, X)$. In this setting, it will be convenient to define the Dirac operator for $X$ (and $S$) as $D = (\pi \otimes \gamma)(D)$. Explicitly,

$$D = \sum_{i=1}^{n} \pi(\tilde{e}_i) \otimes \gamma(\omega^i) \in \text{End}_{\mathbb{H}\otimes C(V^\vee)}(X \otimes S). \quad (3.7)$$

**Lemma 3.2.** Suppose $X$ is a Hermitian $\mathbb{H}$-module with invariant form $(,)_X$. With notation as in (3.6), endow $X \otimes S$ with the Hermitian form $(x \otimes s, x' \otimes s')_{X \otimes S} = (x, x')_X \otimes (s, s')_S$. Then the operator $D$ is self-adjoint with respect to $(,)_X \otimes S$,

$$(D(x \otimes s), x' \otimes s')_{X \otimes S} = (x \otimes s, D(x' \otimes s'))_{X \otimes S} \quad (3.8)$$

**Proof.** This follows from a straight-forward verification. \hfill \square

We immediately deduce the following analogue of Proposition 2.8.

**Proposition 3.3.** In the setting of Lemma 3.2, a Hermitian $\mathbb{H}$-module is unitary only if

$$(D^2(x \otimes s), x \otimes s)_{X \otimes S} \geq 0, \quad \text{for all } x \otimes s \in X \otimes S. \quad (3.9)$$

To be a useful criterion for unitarity, we need to establish a formula for $D^2$ (Theorem 3.5 below).

### 3.3. The spin cover $\widetilde{W}$. The Weyl group $W$ acts by orthogonal transformations on $V^\vee$, and thus is a subgroup of $O(V^\vee)$. We define the group $\widetilde{W}$ in $\text{Pin}(V^\vee)$:

$$\widetilde{W} := p^{-1}(O(V^\vee)) \subset \text{Pin}(V^\vee), \text{ where } p \text{ is as in (3.5).} \quad (3.10)$$

Therefore, $\widetilde{W}$ is a central extension of $W$,

$$1 \rightarrow \{\pm 1\} \rightarrow \widetilde{W} \xrightarrow{p} W \rightarrow 1. \quad (3.11)$$

We will need a few details about the structure of $\widetilde{W}$. For each $\alpha \in R$, define elements $f_\alpha \in C(V^\vee)$ via

$$f_\alpha = \alpha^\vee/|\alpha^\vee| \in V^\vee \subset C(V^\vee). \quad (3.12)$$

It follows easily that $p(f_\alpha) = s_\alpha$, the reflection in $W$ through $\alpha$. Thus $\{f_\alpha \mid \alpha \in R\}$ (or just $\{f_\alpha \mid \alpha \in \Pi\}$) generate $\widetilde{W}$. Obviously $f_\alpha^2 = -1$. Slightly more delicate considerations (e.g. [Mo1], Theorem 3.2) show that if $\alpha, \beta \in R$, $\gamma = s_\alpha(\beta)$, then

$$f_\beta f_\alpha = -f_\alpha f_\gamma. \quad (3.13)$$

A representation of $\widetilde{W}$ is called genuine if it does not factor to $W$, i.e. if $-1$ acts nontrivially. Otherwise it is called nongenuine. (Similar terminology applies to $\mathbb{C}[\widetilde{W}]$ modules.) Via restriction, we can regard a spin module $(\gamma, S)$ for $C(V^\vee)$ as a unitary $\widetilde{W}$ representation. Clearly it is genuine. Since $R^\vee$ spans $V^\vee$, it is also irreducible (e.g. [Mo1], Theorem 3.3). For notational convenience, we lift the $\text{sgn}$ representation of $W$ to a nongenuine representation of $\widetilde{W}$ which we also denote by $\text{sgn}$.

We write $\rho$ for the diagonal embedding of $\mathbb{C}[\widetilde{W}]$ into $\mathbb{H} \otimes C(V^\vee)$ defined by extending

$$\rho(\tilde{w}) = t_p(\tilde{w}) \otimes \tilde{w} \quad (3.14)$$

linearly.
Lemma 3.4. Recall the notation of Definition 3.1 and (3.14). For $\tilde{w} \in \tilde{W}$, \[ \rho(\tilde{w})D = \text{sgn}(\tilde{w})D\rho(\tilde{w}) \] as elements of $\mathbb{H} \otimes C(V^\vee)$.

Proof. From the definitions and Proposition 2.10(2), we have \[ \rho(\tilde{w})D\rho(\tilde{w}^{-1}) = \sum_{i} t_{p(\tilde{w})} \tilde{\omega}_{i} t_{p(\tilde{w}^{-1})} \otimes \tilde{w}_{i} \omega_{i}^{-1} \] \[ = \sum_{i} p(\tilde{w}) \cdot \omega_{i} \otimes \tilde{w}_{i} \omega_{i}^{-1} \] where we have used the $\cdot$ to emphasize the usual action of $W$ on $S(V^\vee)$. We argue that in $C(V^\vee)$ \[ \tilde{w}_{i} \omega_{i} \tilde{w}_{i}^{-1} = \text{sgn}(\tilde{w})(p(\tilde{w}) \cdot \omega_{i}). \] Then the lemma follows from the fact that the definition of $D$ is independent of the choice of dual bases.

Since $\tilde{W}$ is generated by the various $f_{\alpha}$ for $\alpha$ simple, it is sufficient to verify (3.15) for $\tilde{w} = f_{\alpha}$. This follows from direct calculation: \[ f_{\alpha} \omega^{j} f_{\alpha}^{-1} = -\frac{1}{(\alpha^{\vee},\alpha^{\vee})} \alpha^{\vee} \omega^{j} \alpha^{\vee} = -\frac{1}{(\alpha^{\vee},\alpha^{\vee})} \alpha^{\vee}(-\alpha^{\vee} \omega^{i} - 2(\omega,\alpha^{\vee})) - \omega^{j} + (\omega,\alpha) \alpha^{\vee} = -s_{\alpha} \cdot \omega^{j}. \] \[ \square \]

3.4. A formula for $D^2$. Set \[ \Omega_{\tilde{W}} = \frac{1}{4} \sum_{\alpha > 0, \beta > 0, s_{\alpha}(\beta) < 0} c_{\alpha} c_{\beta} |\alpha||\beta| f_{\alpha} f_{\beta}. \] (3.16) This is a complex linear combination of elements of $\tilde{W}$, i.e. an element of $C[\tilde{W}]$. Using (3.13), it is easy to see $\Omega_{\tilde{W}}$ is invariant under the conjugation action of $\tilde{W}$.

Theorem 3.5. With notation as in (2.4), (3.7), (3.14), and (3.16), \[ D^2 = -\Omega \otimes 1 + \rho(\Omega_{\tilde{W}}), \] as elements of $\mathbb{H} \otimes C(V^\vee)$.

Proof. It will be useful below to set \[ R^2_{\alpha} := \{(\alpha, \beta) \in R \times R : \alpha > 0, \beta > 0, \alpha \neq \beta, s_{\alpha}(\beta) < 0\}. \] (3.18) To simplify notation, we fix a self-dual (orthonormal) basis $\{\omega_{i} : i = 1, \ldots, n\}$ of $V^\vee$. From Definition 3.1 we have \[ D^2 = \sum_{i=1}^{n} \tilde{\omega}_{i} \otimes \omega_{i} + \sum_{i \neq j} \tilde{\omega}_{i} \omega_{j} \otimes \omega_{i} \omega_{j} \] Using $\omega_{i}^{2} = -1$ and $\omega_{i} \omega_{j} = -\omega_{j} \omega_{i}$ in $C(V^\vee)$ and the notation of Definition 2.7 we get \[ D^2 = -\Omega \otimes 1 + \sum_{i<j} [\tilde{\omega}_{i}, \tilde{\omega}_{j}] \otimes \omega_{i} \omega_{j} \].
Applying Theorem 3.11 to the first term and Proposition 2.10(3) to the second, we have
\[
D^2 = -\Omega \otimes 1 + \frac{1}{4} \sum_{\alpha > 0} \langle \alpha, \alpha \rangle + \frac{1}{4} \sum_{(\alpha, \beta) \in R_2^2} c_\alpha c_\beta \langle \alpha, \beta \rangle t_{s_\alpha} t_{s_\beta} \otimes 1
- \sum_{i < j} [T_{\omega_i}, T_{\omega_j}] \otimes \omega_i \omega_j.
\]

Rewriting \([T_{\omega_i}, T_{\omega_j}]\) using Proposition 2.10(3), this becomes
\[
D^2 = -\Omega \otimes 1 + \frac{1}{4} \sum_{\alpha > 0} \langle \alpha, \alpha \rangle + \frac{1}{4} \sum_{(\alpha, \beta) \in R_2^2} c_\alpha c_\beta \langle \alpha, \beta \rangle t_{s_\alpha} t_{s_\beta} \otimes 1
- \frac{1}{4} \sum_{i < j} (\omega_i, \alpha) (\omega_j, \beta) - (\omega_i, \beta) (\omega_j, \alpha) t_{s_\alpha} t_{s_\beta} \otimes \omega_i \omega_j,
\]
and since \(\omega_i \omega_j = -\omega_j \omega_i\) in \(C(V^\vee)\),
\[
D^2 = -\Omega \otimes 1 + \frac{1}{4} \sum_{\alpha > 0} \langle \alpha, \alpha \rangle + \frac{1}{4} \sum_{(\alpha, \beta) \in R_2^2} c_\alpha c_\beta \langle \alpha, \beta \rangle t_{s_\alpha} t_{s_\beta} \otimes 1
- \frac{1}{4} \sum_{i < j} (\omega_i, \alpha) (\omega_j, \beta) \omega_i \omega_j.
\]

Using \(2.2\) and the definition of \(f_\alpha\) in (3.12), we get
\[
D^2 = -\Omega \otimes 1 + \frac{1}{4} \sum_{\alpha > 0} \langle \alpha, \alpha \rangle + \frac{1}{4} \sum_{(\alpha, \beta) \in R_2^2} c_\alpha c_\beta \langle \alpha, \beta \rangle t_{s_\alpha} t_{s_\beta} \otimes 1
- \frac{1}{4} \sum_{(\alpha, \beta) \in R_2^2} c_\alpha c_\beta t_{s_\alpha} t_{s_\beta} \otimes (\langle \alpha \| \beta \rangle f_\alpha f_\beta + \langle \alpha, \beta \rangle)
= -\Omega \otimes 1 + \frac{1}{4} \sum_{\alpha > 0} \langle \alpha, \alpha \rangle + \frac{1}{4} \sum_{(\alpha, \beta) \in R_2^2} c_\alpha c_\beta |\alpha \| \beta \rangle t_{p(f_\alpha)} t_{p(f_\beta)} \otimes f_\alpha f_\beta.
\]

The theorem follows.

\[\square\]

**Corollary 3.6.** In the setting of Proposition 3.3 assume further that \(X\) is irreducible and unitary with central character \(\chi_\nu\) with \(\nu \in V\) (as in Definition 2.2). Let \((\tilde{\sigma}, \tilde{U})\) be an irreducible representation of \(\tilde{W}\) such that \(\text{Hom}_{\tilde{W}}(\tilde{U}, X \otimes S) \neq 0\). Then
\[
\langle \nu, \nu \rangle \leq c(\tilde{\sigma})
\]
where
\[
c(\tilde{\sigma}) = \frac{1}{4} \sum_{\alpha > 0} c_\alpha^2 \langle \alpha, \alpha \rangle + \frac{1}{4} \sum_{\alpha > 0, \beta > 0, \alpha \neq \beta, s_{\alpha}(\beta) < 0} c_\alpha c_\beta |\alpha \| \beta \rangle \frac{\text{tr}_\tilde{\sigma}(f_\alpha f_\beta)}{\text{tr}_\tilde{\sigma}(1)},
\]
is the scalar by which \(\Omega_{\tilde{W}}\) acts in \(\tilde{U}\) and \(\text{tr}_\tilde{\sigma}\) denotes the character of \(\tilde{\sigma}\).

**Proof.** The corollary follows by applying Proposition 3.3 to a vector \(x \otimes s\) in the \(\tilde{\sigma}\) isotypic component of \(X \otimes S\), and then using the formula for \(D^2 = (\pi \otimes \gamma)(D^2)\) from Theorem 3.5 and the formula for \(\pi(\Omega)\) from Lemma 2.5. \(\square\)
4. DIRAC COHOMOLOGY AND VOGAN’S CONJECTURE

Suppose $(\pi, X)$ is an irreducible $\mathbb{H}$ module with central character $\chi_\nu$. By Lemma 3.4, the kernel of the Dirac operator on $X \otimes S$ is invariant under $\tilde{\mathcal{W}}$. Suppose $\ker(D)$ is nonzero and that $\tilde{\sigma}$ is an irreducible representation of $\tilde{\mathcal{W}}$ appearing in $\ker(D)$. Then in the notation of Corollary 3.6, Theorem 3.5 and Lemma 2.5 imply that

$$\langle \nu, \nu \rangle = c(\tilde{\sigma}).$$

In particular, the length of $\nu$ is determined by the $\tilde{\mathcal{W}}$ structure of $\ker(D)$. Theorem 4.8 below says that $\chi_\nu$ itself is determined by this information.

In this section (for the reasons mentioned in the introduction), we fix a crystallographic root system $\Phi$ and set the parameter function $c$ in Definition 2.1 to be identically 1, i.e. $c_\alpha = 1$ for all $\alpha \in R$.

4.1. Geometry of irreducible representations of $\tilde{\mathcal{W}}$. Let $\mathfrak{g}$ denote the complex semisimple Lie algebra corresponding to $\Phi$. In particular, $\mathfrak{g}$ has a Cartan subalgebra $\mathfrak{h}$ such that $\mathfrak{h} \simeq V$ canonically. Write $N$ for the nilpotent cone in $\mathfrak{g}$. Let $G$ denote the adjoint group $\text{Ad}(\mathfrak{g})$ acting by the adjoint action on $N$.

Given $e \in N$, let $\{e, h, f\} \subset \mathfrak{g}$ denote an $\mathfrak{sl}_2$ triple with $h \in \mathfrak{h}$ semisimple. Set

$$\nu_e = \frac{1}{2} h \in \mathfrak{h} \simeq V.$$ (4.1)

The element $\nu_e$ depends on the choices involved. But its $W$-orbit (and in particular $\langle \nu_e, \nu_e \rangle$) and the central character $\chi_\nu$ of Definition 2.2 are well-defined independent of the $G$ orbit of $e$.

Let $N_{\text{sol}} = \{ e \in N \mid \text{the centralizer of } e \text{ in } \mathfrak{g} \text{ is a solvable Lie algebra} \}$. (4.2)

Then $G$ also acts on $N_{\text{sol}}$.

Next let $A(e)$ denote the component group of the centralizer of $e \in N$ in $G$. To each $e \in N$, Springer has defined a graded representation of $W \times A(e)$ (depending only on the $G$ orbit of $e$) on the total cohomology $H^\bullet(B_e)$ of the Springer fiber over $e$. Set $d(e) = 2 \dim(B_e)$, and define

$$\sigma_{e, \phi} = \left( H^{d(e)}(B_e) \right)^{\phi} \in \text{Irr}(W) \cup \{0\},$$ (4.3)

the $\phi$ invariants in the top degree. (In general, given a finite group $H$, we write $\text{Irr}(H)$ for the set of equivalence classes of its irreducible representations.) Let $\text{Irr}_0(A(e)) \subset \text{Irr}(A(e))$ denote the subset of representations of “Springer type”, i.e. those $\phi$ such that $\sigma_{e, \phi} \neq 0$.

Finally, let $\text{Irr}_{\text{gen}}(\tilde{\mathcal{W}}) \subset \text{Irr}(\tilde{\mathcal{W}})$ denote the subset of genuine representations.

**Theorem 4.1** ([C]). Recall the notation of (4.1), (4.2), and (4.3). Then there is a surjective map

$$\Psi : \text{Irr}_{\text{gen}}(\tilde{\mathcal{W}}) \to G \backslash N_{\text{sol}}$$ (4.4)

with the following properties:

1. If $\Psi(\tilde{\sigma}) = G \cdot e$, then

$$c(\tilde{\sigma}) = \langle \nu_e, \nu_e \rangle,$$ (4.5)

where $c(\tilde{\sigma})$ is defined in (3.20).

2. Fix a spin module $(\gamma, S)$ for $C(V^\vee)$. 

Corollary 4.2. Suppose $(\pi, X)$ is an irreducible unitary $\mathbb{H}$-module with central character $\chi_\nu$ with $\nu \in V$ (as in Definition 2.2). Fix a spin module $(\gamma, S)$ for $C(V^\vee)$.

(a) Let $(\tilde{\sigma}, \tilde{U})$ be a representation of $\tilde{W}$ such that $\text{Hom}_{\tilde{W}}(\tilde{U}, X \otimes S) \neq 0$. In the notation of Theorem 4.1, write $\Psi(\tilde{\sigma}) = G \cdot e$. Then
$$\langle \nu, \nu \rangle \leq \langle \nu_e, \nu_e \rangle. \quad (4.6)$$

(b) Suppose $e \in \mathcal{N}_{\text{sol}}$ and $\phi \in \text{Irr}_0(A(e))$ such that $\text{Hom}_W(\sigma_{e, \phi}, X) \neq 0$. Then
$$\langle \nu, \nu \rangle \leq \langle \nu_e, \nu_e \rangle. \quad (4.7)$$

Remark 4.3. The bounds in Corollary 4.2 represents the best possible in the sense that there exist $X$ such that the inequalities are actually equalities. For example, consider part (b) of the corollary, fix $\phi \in \text{Irr}_0(A(e))$, and let $X_t(e, \phi)$ be the unique tempered representation of $\mathbb{H}$ parametrized by $(e, \phi)$ in the Kazhdan-Lusztig classification ([KL]). Thus $X_t(e, \phi)$ is an irreducible unitary representation with central character $\chi_{\nu_e}$ and, as a representation of $W$,
$$X_t(e, \phi) \simeq H^*(B_e)^\circ.$$ In particular, $\sigma_{e, \phi}$ occurs with multiplicity one in $X_t(e, \phi)$ (in the top degree). Thus the inequality in Corollary 4.2(b) applied to $X_t(e, \phi)$ is an equality.

The representations $X_t(e, \phi)$ will play an important role in our proof of Theorem 4.8.

4.2. Applications to unitary representations. Recall that there exists a unique open dense $G$-orbit in $\mathcal{N}$, the regular orbit; let $\{e_r, h_r, f_r\}$ be a corresponding $\mathfrak{sl}_2$ with $h_r \in \mathfrak{h}$, and set $\nu_r = \frac{1}{2} h_r$. If $\mathfrak{g}$ is simple, then there exists a unique open dense $G$-orbit in the complement of $G \cdot e_r$ in $\mathcal{N}$ called the subregular orbit. Let $\{e_{sr}, h_{sr}, f_{sr}\}$ be an $\mathfrak{sl}_2$ triple for the subregular orbit with $h_{sr} \in \mathfrak{h}$, and set $\nu_{sr} = \frac{1}{2} h_{sr}$.

The tempered module $X_t(e_r, \text{triv})$ is the Steinberg discrete series, and we have $X_t(e_r, \text{triv})|_W = \text{sgn}$. When $\mathfrak{g}$ is simple, the tempered module $X_t(e_{sr}, \text{triv})$ has dimension $\dim V + 1$, and $X_t(e_{sr}, \text{triv})|_W = \text{sgn} \oplus \text{refl}$, where refl is the reflection $W$-type.

Now we can state certain bounds for unitary $\mathbb{H}$-modules.

Corollary 4.4. Let $(\pi, X)$ be an irreducible unitary $\mathbb{H}$-module with central character $\chi_\nu$ with $\nu \in V$ (as in Definition 2.2). Then, we have:

1. $\langle \nu, \nu \rangle \leq \langle \nu_e, \nu_e \rangle$;
2. if $\mathfrak{g}$ is simple of rank at least 2, and $X$ is not the trivial or the Steinberg $\mathbb{H}$-module, then $\langle \nu, \nu \rangle \leq \langle \nu_{sr}, \nu_{sr} \rangle$.

Proof. The first claim follows from Corollary 4.2(1) since $\langle \nu_e, \nu_e \rangle \leq \langle \nu_e, \nu_e \rangle$, for every $e \in \mathcal{N}$.
For the second claim, assume $X$ is not the trivial or the Steinberg $\mathbb{H}$-module. Then $X$ contains a $W$-type $\sigma$ such that $\sigma \neq \text{triv} \cdot \text{sgn}$. We claim that $\sigma \otimes S$, where $S$ is a fixed irreducible spin module, contains a $\bar{W}$-type $\tilde{\sigma}$ which is not a spin module. If this were not the case, assuming for simplicity that $\dim V$ is even, we would find that $\sigma \otimes S = S \oplus \cdots \oplus S$, where there are $\text{tr}_\sigma(1)$ copies of $S$ in the right hand side. In particular, we would get $\text{tr}_\sigma(s_{\alpha} \alpha) \text{tr}_S(f_{\alpha} f_{\beta}) = \text{tr}_\sigma(1) \text{tr}_S(f_{\alpha} f_{\beta})$. Notice that this formula is true when $\dim V$ is odd too, since the two inequivalent spin modules in this case have characters which have the same value on $f_{\alpha} f_{\beta}$. If $(\alpha, \beta) \neq 0$, then we know that $\text{tr}_S(f_{\alpha} f_{\beta}) \neq 0$ \cite{Mo1}. This means that $\text{tr}_\sigma(s_{\alpha} s_{\beta}) = \text{tr}_\sigma(1)$, for all non-orthogonal roots $\alpha, \beta$. One verifies directly that, when $\Phi$ is simple of rank two, this relation does not hold. Thus we obtain a contradiction.

Returning to the second claim in the corollary, let $\tilde{\sigma}$ be a $\bar{W}$-type appearing in $X \otimes S$ which is not a spin module. Let $e$ be a nonregular nilpotent element such that $\Psi(\tilde{\sigma}) = G \cdot e$. Corollary \ref{cor:1} says that $\langle \nu, \nu \rangle \leq \langle \nu_e, \nu_e \rangle$. To complete the proof, recall that if $g$ is simple, the largest value for $\langle \nu_e, \nu_e \rangle$, when $e$ is not a regular element, is obtained when $e$ is a subregular nilpotent element. \hfill $\square$

**Remark 4.5.** Standard considerations for reducibility of principal series allow one to deduce a strengthened version of Corollary \ref{cor:2}(1), namely that $\nu$ is contained in the convex hull of the Weyl group orbit of $\nu_e$. We also note that Corollary \ref{cor:2} implies, in particular, that the trivial $\mathbb{H}$-module is isolated in the unitary dual of $\mathbb{H}$ for all simple root systems of rank at least two. (Sometimes this is called Kazhdan’s Property $T$.)

**Remark 4.6.** There is another, subtler application of Corollary \ref{cor:2}. Assume that $X(s, e, \psi)$ is an irreducible $\mathbb{H}$-module parametrized in the Kazhdan-Lusztig classification by the $G$-conjugacy class of $\{s, e, \psi\}$, where $s \in \mathfrak{h}_0 \cong V_0$, $[s, e] = e$, $\psi \in \text{Irr}_0 A(s, e)$. The group $A(s, e)$ embeds canonically in $A(e)$. Let $\text{Irr}_0 A(s, e)$ denote the subset of elements in $\text{Irr}^0 A(s, e)$ which appear in the restriction of an element of $\text{Irr}_0 A(e)$. The module $X(s, e, \psi)$ is characterized by the property that it contains every $W$-type $\sigma_{(e, \phi)}$, $\phi \in \text{Irr}_0 A(e)$ such that $\text{Hom}_{A(s, e)}(\psi, \phi) \neq 0$.

Let $\{e, h, f\}$ be an $\mathfrak{sl}_2$ triple containing $e$. One may choose $s$ such that $s = \frac{1}{2} \mathfrak{h} + s_z$, where $s_z \in V_0$ centralizes $\{e, h, f\}$ and $s_z$ is orthogonal to $h$ with respect to $\langle , \rangle$. When $s_z = 0$, we have $A(s, e) = A(h, e) = A(e)$, and $X(\frac{1}{2} h, e, \psi)$ is the tempered module $X_t(e, \phi) (\phi = \psi)$ from before.

Corollary \ref{cor:2} implies that if $e \in \mathcal{N}_{\text{sol}}$, then $X(s, e, \psi)$ is unitary if and only if $X(s, e, \psi)$ is tempered.

### 4.3 Dirac cohomology and Vogan’s Conjecture

As discussed above, Vogan’s Conjecture suggests that for an irreducible unitary representation $X$, the $\bar{W}$ structure of the kernel of the Dirac operator $D$ should determine the infinitesimal character of $X$. This is certainly false for nonunitary representations. But since it is difficult to imagine a proof of an algebraic statement which applies only to unitary representations, we use an idea of Vogan and enlarge the class of irreducible unitary representations for which $\ker(D)$ is nonzero to the class of representations with nonzero Dirac cohomology in the following sense.

**Definition 4.7.** In the setting of Definition \ref{def:3} define

$$H^D(X) := \ker D / (\ker D \cap \text{im} D)$$

\begin{equation}
\tag{4.8}
\end{equation}
and call it the Dirac cohomology of $X$. (For example, if $X$ is unitary, Lemma 3.2 implies $\ker(D) \cap \text{im}(D) = 0$, and so $H^D(X) = \ker(D)$.)

Our main result is as follows.

**Theorem 4.8.** Let $\mathbb{H}$ be the graded affine Hecke algebra attached to a crystallographic root system $\Phi$ and constant parameter function $c \equiv 1$ (Definition 2.2). Suppose $(\pi, X)$ is an $\mathbb{H}$ module with central character $\chi_\nu$ with $\nu \in V$ (as in Definition 4.4). In the setting of Definition 4.4 suppose that $H^D(X) \neq 0$. Let $(\tilde{\sigma}, U)$ be a representation of $\tilde{W}$ such that $\text{Hom}_{\tilde{W}}(\tilde{U}, H^D(X)) \neq 0$. Using Theorem 4.4 write $\Psi(\tilde{\sigma}) = G \cdot e$. Then

$$\chi_\nu = \chi_{\nu_e}.$$

We roughly follow the outline of the proof in the real case proposed by Vogan in [V] Lecture 3 and completed in [HP].

**Proposition 4.9.** Let $(\pi, X)$ be an irreducible $\mathbb{H}$ module with central character $\chi_\nu$ with $\nu \in V$ (as in Definition 4.4). In the setting of Definition 3.1, suppose that $\frac{\nu}{\nu} \in Z(\mathbb{H})$. Write $\Psi(\tilde{\sigma}) = G \cdot e$ as in Theorem 4.4. Assume further that $\langle \nu, \nu \rangle = \langle \nu_e, \nu_e \rangle$. Then

$$\text{Hom}_{\tilde{W}}(\tilde{U}, H^D(X)) \neq 0.$$

**Proof.** Let $x \otimes s$ be an element of the $\tilde{\sigma}$ isotypic component of $X \otimes S$. By Theorem 4.8 we have

$$D^2(x \otimes s) = (-\langle \nu, \nu \rangle + \langle \nu_e, \nu_e \rangle)(x \otimes s) = 0. \quad (4.9)$$

Since $X$ is unitary, $\ker D \cap \text{im} D = 0$, and so $\mathbb{H}$ implies $x \otimes s \in \ker(D) = H^D(X)$.

As in setting of real groups, Theorem 4.8 can be deduced from a purely algebraic statement (c.f. Theorem 2.5 and Corollary 3.5 in [HP]).

**Theorem 4.10.** Let $z \in Z(\mathbb{H})$ be given. Then there exist $a, b \in \mathbb{H} \otimes C(V^\vee)$ and a unique element $\zeta(z)$ in the center of $\mathbb{C}[\tilde{W}]$ such that

$$z \otimes 1 = \rho(\zeta(z)) + Da + bD$$

as elements in $\mathbb{H} \otimes C(V^\vee)$.

**Proposition 4.11.** Theorem 4.10 implies Theorem 4.8.

**Proof.** In the setting of Theorem 4.8 suppose $\text{Hom}_{\tilde{W}}(\tilde{U}, H^D(X)) \neq 0$. Then there exist $\tilde{x} = x \otimes s \neq 0$ in the $\tilde{\sigma}$ isotypic component of $X \otimes S$ such that $\tilde{x} \in \ker(D) \setminus \text{im} D$. Then for every $z \in Z(\mathbb{H})$, we have

$$(\pi(z) \otimes 1)\tilde{x} = \chi_\nu(z)\tilde{x}$$

and

$$(\pi \otimes \gamma)(\rho(\zeta(z)))\tilde{x} = \tilde{\sigma}(\zeta(z))\tilde{x}.$$

Note that the right-hand sides of the previous two displayed equations are scalar multiples of $\tilde{x}$. Assuming Theorem 4.10 we have

$$(\pi(z) \otimes 1 - (\pi \otimes \gamma)\rho(\zeta(z)))\tilde{x} = (Da + bD)\tilde{x} = Da\tilde{x}, \quad (4.10)$$
which would imply that \( \tilde{x} \in \text{im}D \), unless \( Da\tilde{x} = 0 \). So we must have \( Da\tilde{x} = 0 \), and therefore
\[
\chi_{\nu}(z) = \tilde{\sigma}(\zeta(z)), \quad \text{for all } z \in Z(\mathbb{H}). \tag{4.11}
\]
The statement of Theorem 4.8 (and hence of the current proposition) will follow if we can show \( \tilde{\sigma}(\zeta(z)) = \chi_{\nu}(z) \) for all \( z \in Z(\mathbb{H}) \) where \( \Psi(\tilde{\sigma}) = G \cdot e \) as in Theorem 4.1.

Using Theorem \ref{thm:4.11}b), choose \( \phi \in \text{Irr}_0(A(e)) \) such that
\[
\text{Hom}_{\tilde{W}^e}(\tilde{\sigma}, \sigma_e, \phi \otimes S) \neq 0, \tag{4.12}
\]
and consider the unitary \( \mathbb{H} \) module \( X(e, \phi) \) of Remark \ref{rem:4.2} with central character \( \chi_{\nu_e} \). Then since \( X_e(e, \phi) \) contains the \( W \) type \( \sigma_{e, \phi} \), (4.12) implies
\[
\text{Hom}_{\tilde{W}^e}(\tilde{U}, X \otimes S) \neq 0.
\]
So Proposition 4.9 implies that
\[
\text{Hom}_{\tilde{W}^e}(\tilde{U}, H^D(X)) \neq 0.
\]
Since \( X(e, \phi) \) has central character \( \chi_{\nu_e} \), (4.11) applies to give \( \chi_{\nu_e}(z) = \tilde{\sigma}(\zeta(z)) \) for all \( z \in \mathbb{H} \). This completes the proof. \( \square \)

5. PROOF OF THEOREM 4.10

In this section, we let \( \mathbb{H} \) be defined by an arbitrary root system \( \Phi \) and arbitrary parameter function \( c \). All the results below (including the proof of Theorem 4.10) hold in this generality.

Motivated by \cite[Section 3]{HP}, we define
\[
d : \mathbb{H} \otimes C(V^\vee) \longrightarrow \mathbb{H} \otimes C(V^\vee). \tag{5.1}
\]
on a simple tensor of the form \( a = h \otimes v_1 \cdots v_k \) (with \( h \in H \) and \( v_i \in V^\vee \)) via
\[
d(a) = Da - (-1)^k aD,
\]
and extend linearly to all of \( \mathbb{H} \otimes C(V^\vee) \).

Then Lemma \ref{lem:3.2} implies that \( d \) interchanges the spaces
\[
(\mathbb{H} \otimes C(V^\vee))^{\text{triv}} = \{ a \in \mathbb{H} \otimes C(V^\vee) \mid \rho(\tilde{w})a = a\rho(\tilde{w}) \} \tag{5.2}
\]
and
\[
(\mathbb{H} \otimes C(V^\vee))^{\text{sgn}} = \{ a \in \mathbb{H} \otimes C(V^\vee) \mid \rho(\tilde{w})a = \text{sgn}(\tilde{w})a\rho(\tilde{w}) \}. \tag{5.3}
\]
(Such complications are not encountered in \cite{HP} since the underlying real group is assumed to be connected.) Let \( d^{\text{triv}} \) (resp. \( d^{\text{sgn}} \)) denote the restriction of \( d \) to the space in (5.2) (resp. (5.3)). We will deduce Theorem 4.10 from the following.

**Theorem 5.1.** With notation as in the previous paragraph,
\[
\ker(d^{\text{triv}}) = \text{im}(d^{\text{sgn}}) \oplus \rho(C[\tilde{W}]^W).
\]

To see that Theorem 5.1 implies Theorem 4.10 take \( z \in Z(\mathbb{H}) \). Since \( z \otimes 1 \) is in \( (\mathbb{H} \otimes C_{\text{even}}(V^\vee))^{\text{triv}} \) and clearly commutes with \( D, z \otimes 1 \) is in the kernel of \( d^{\text{triv}} \). So the conclusion of Theorem 5.1 implies \( z \otimes 1 = d^{\text{sgn}}(a) + \rho(\zeta(z)) \) for a unique \( \zeta(z) \in \mathbb{C}[\tilde{W}]^W \) and an element \( a \) of \( (\mathbb{H} \otimes C_{\text{odd}}(V^\vee))^{\text{sgn}} \). In particular \( d^{\text{sgn}}(a) = Da + aD \). Thus
\[
z \otimes 1 = \rho(\zeta(z)) + Da + aD,
\]
in fact a slightly stronger conclusion than that of Theorem 4.10.
Thus everything comes down to proving Theorem 5.1. The remainder of this section is devoted to doing so. We begin with some preliminaries.

**Lemma 5.2.** We have
\[ \rho(C[W],W) \subset \ker(d^{\text{triv}}). \]

**Proof.** Fix \( \tilde{w} \in W \) and let \( s_{\alpha_1} \cdots s_{\alpha_k} \) be a reduced expression of \( p(w) \) with \( \alpha_i \) simple. Then (after possibly replacing \( \alpha_1 \) with \( -\alpha_1 \)), \( \tilde{w} = f_{\alpha_1} \cdots f_{\alpha_k} \). Set \( a = \rho(\tilde{w}) \). Then the definition of \( d \) and Lemma 3.4 imply
\[ d(a) = Da - (1)^k aD = (1 - (-1)^k \text{sgn}(\tilde{w}))Da = (1 - (-1)^k(-1)^k)Da = 0, \]
as claimed. \qed

**Lemma 5.3.** We have \( (d^{\text{triv}})^2 = (d^{\text{sgn}})^2 = 0 \).

**Proof.** For any \( a \in \mathbb{H} \otimes C(V^\vee) \), one computes directly from the definition of \( d \) to find
\[ d^2(a) = D^2a - aD^2. \]
By Theorem 3.3, \( D^2 = -\Omega \otimes 1 + \rho(\Omega_W) \). By Lemma 2.4, \( -\Omega \otimes 1 \) automatically commutes with \( a \). If we further assume that \( a \) is in \( (\mathbb{H} \otimes C(V^\vee))^{\text{triv}} \), then \( a \) commutes with \( \rho(\Omega_W) \) as well. Since each term in the definition \( \Omega_W \) is in the kernel of \( \text{sgn} \), the same conclusion holds if \( a \) is in \( (\mathbb{H} \otimes C(V^\vee))^{\text{sgn}} \). The lemma follows. \qed

We next introduce certain graded objects (as in the approach of [HP, Section 4]). Let \( S^j(V^\vee) \) denote the subspace of elements of degree \( j \) in \( S(V^\vee) \). Let \( \mathbb{H}^j \) denote the subspace of \( \mathbb{H} \) consisting of products elements in the image of \( C[W] \) and \( S^j(V^\vee) \) under the maps described in (1) and (2) in Definition 2.1. Then it is easy to check (using (2.3)) that \( \mathbb{H}^0 \subset \mathbb{H}^1 \subset \cdots \) is an algebra filtration. Set \( \mathbb{H}' = \mathbb{H}'/\mathbb{H}'^{-1} \) and let \( \mathbb{H} = \bigoplus \mathbb{H}^j \) denote the associated graded algebra. Then \( \mathbb{H} \) identifies with \( C[W] \times S(V^\vee) \) with \( C[W] \) acting in natural way:
\[ t_w \omega t_{w^{-1}} = w(\omega). \]
We will invoke these identification often without comment. Note that \( \mathbb{H} \) does not depend on the parameter function \( c \) used to define \( \mathbb{H} \).

The map \( d \) of (5.1) induces a map
\[ \overline{d} : \mathbb{H} \otimes C(V^\vee) \longrightarrow \mathbb{H} \otimes C(V^\vee). \] (5.4)
Explicitly, if we fix a self-dual basis \( \{\omega_1, \ldots, \omega_n\} \) of \( V^\vee \), then the value of \( \overline{d} \) on a simple tensor of the form \( a = t_w f \otimes v_1 \cdots v_k \) (with \( t_w f \in C[W] \times S(V^\vee) \) and \( v_i \in V^\vee \)) is given by
\[ \overline{d}(a) = \sum_i \omega_i t_w f \otimes \omega_i v_1 \cdots v_k - (-1)^k \sum_i t_w f \omega_i \otimes v_1 \cdots v_k \omega_i \]
\[ = \sum_i t_w w^{-1}(\omega_i) f \otimes \omega_i v_1 \cdots v_k - (-1)^k \sum_i t_w f \omega_i \otimes v_1 \cdots v_k \omega_i. \] (5.5)
We will deduce Theorem 5.1 from the computation of the cohomology of \( \overline{d} \). We need some final preliminaries.
Lemma 5.4. The map $\tilde{d}$ of (5.3) is an odd derivation in the sense that if $a = t_w f \otimes v_1 \cdots v_k \in \mathbb{H}$ and $b \in \mathbb{H}$ is arbitrary, then
\[
\tilde{d}(ab) = \tilde{d}(a)b + (-1)^k a\tilde{d}(b).
\]

Proof. Fix $a$ as in the statement of the lemma. A simple induction reduces the general case of the lemma to the following three special cases: (i) $b = \omega \otimes 1$ for $\omega \in V^\vee$; (ii) $b = 1 \otimes \omega$ for $\omega \in V^\vee$; and (iii) $b = t_s \otimes 1$ for $s = s_\alpha$ a simple reflection in $W$. (The point is that these three types of elements generate $\mathbb{H}$.) Each of these cases follows from a straightforward verification. For example, consider the first case, $b = \omega \otimes 1$. Then from the definition of $\tilde{d}$,
\[
\tilde{d}(ab) = \sum_i \omega_i t_w f \omega \otimes \omega_1 v_1 \cdots v_k - (-1)^k \sum_i t_w f \omega_i \otimes v_1 \cdots v_k \omega_i.
\]

On the other hand, since it is easy to see that $d(b) = 0$ in this case, we have
\[
\tilde{d}(a)b + (-1)^k a\tilde{d}(b) = \tilde{d}(a)b
\]
\[
= \sum_i \omega_i t_w f \omega \otimes \omega_1 v_1 \cdots v_k - (-1)^k \sum_i t_w f \omega_i \otimes v_1 \cdots v_k \omega_i.
\]

Since $S(V^\vee)$ is commutative, (5.6) and (5.7) coincide, and the lemma holds in this case. The other two remaining cases hold by similar direct calculation. We omit the details. \qed

Lemma 5.5. The map $\tilde{d}$ satisfies $\tilde{d}^2 = 0$.

Proof. Fix $a = t_w f \otimes v_1 \cdots v_k \in \mathbb{H}$ and let $b$ be arbitrary. Using Lemma 5.4 one computes directly from the definitions to find
\[
\tilde{d}^2(ab) = \tilde{d}^2(a)b + a\tilde{d}^2(b).
\]
It follows that to establish the current lemma in general, it suffices to check that $\tilde{d}^2(b) = 0$ for each of the three kinds of generators $b$ appearing in the proof of Lemma 5.4. Once again this is a straightforward verification whose details we omit. (Only case (iii) is nontrivial.) \qed

Lemma 5.6. Let $\bar{\rho}$ denote the diagonal embedding of $\mathbb{C}[(\tilde{W})$ in $\mathbb{H} \otimes C(V^\vee)$ defined by linearly extending
\[
\bar{\rho}(\tilde{w}) = t_{\rho(f_\alpha)} \otimes \tilde{w}
\]
for $\tilde{w} \in \tilde{W}$. Then
\[
\bar{\rho}(\mathbb{C}[(\tilde{W})]) \subset \ker(\tilde{d}).
\]

Proof. As noted in Section 3.3 the various $f_\alpha = \alpha^\vee/|\alpha^\vee|$ (for $\alpha$ simple) generate $\tilde{W}$. Furthermore $\rho(f_\alpha) = s_\alpha$. So Lemma 5.4 implies that the current lemma will follow if we can prove
\[
\tilde{d}(t_{s_\alpha} \otimes \alpha^\vee) = 0
\]
for each simple $\alpha$. For this we compute directly,
\[
\overline{d}(t_{s_\alpha} \otimes \alpha^\vee) = \sum_i \omega_i t_{s_\alpha} \otimes \omega_i \alpha^\vee + \sum_i t_{s_\alpha} \omega_i \otimes \alpha^\vee \omega_i \\
= \sum_i t_{s_\alpha} s_\alpha (\omega_i) \otimes \omega_i \alpha^\vee + \sum_i t_{s_\alpha} \omega_i \otimes \alpha^\vee \omega_i \\
= t_{s_\alpha} (\omega - (\alpha, \omega_i)) \alpha^\vee \otimes \omega_i \alpha^\vee + \sum_i t_{s_\alpha} \omega_i \otimes \alpha^\vee \omega_i \\
= t_{s_\alpha} \omega_i \otimes (\omega_i \alpha^\vee + \alpha^\vee \omega_i) - \sum_i t_{s_\alpha} (\alpha, \omega_i) \alpha^\vee \otimes \omega_i \alpha^\vee \\
= -2 \sum_i t_{s_\alpha} \omega_i \otimes (\alpha^\vee, \omega_i) - \sum_i t_{s_\alpha} \alpha^\vee \otimes (\alpha, \omega_i) \omega_i \alpha^\vee \\
= -2 \sum_i t_{s_\alpha} (\alpha^\vee, \omega_i) \omega_i \otimes 1 - \sum_i t_{s_\alpha} \alpha^\vee \otimes (\omega_i, \alpha) \omega_i \alpha^\vee \\
= -2 t_{s_\alpha} \alpha^\vee \otimes 1 + t_{s_\alpha} \alpha^\vee \otimes (\alpha^\vee)^2 - (\alpha^\vee, \alpha^\vee) \\
= -2 t_{s_\alpha} \alpha^\vee \otimes 1 + 2 t_{s_\alpha} \alpha^\vee \otimes 1 = 0.
\]
\(\square\)

Note from (5.5), it follows that $\overline{d}$ preserves the subspace $S(V^\vee) \otimes C(V^\vee) \subset W \otimes C(V^\vee)$. Write $\overline{d}'$ for the restriction of $\overline{d}$ to $S(V^\vee) \otimes C(V^\vee)$.

**Lemma 5.7.** With notation as in the previous paragraph,
\[
\ker(\overline{d}') = \text{im}(\overline{d}) \oplus C(1 \otimes 1).
\]

**Proof:** An elementary calculation shows that $\overline{d}'$ is a multiple of the differential in the Koszul complex whose cohomology is well-known. (See [HP], Lemma 4.1, for instance.) \(\square\)

We can now assemble these lemmas into the computation of the cohomology of $\overline{d}$.

**Proposition 5.8.** We have
\[
\ker(\overline{d}) = \text{im}(\overline{d}) \oplus \overline{p}(C[\widetilde{W}]).
\]

**Proof:** By Lemmas 5.5 and 5.6, $\text{im}(\overline{d}) + \overline{p}(C[\widetilde{W}]) \subset \ker(\overline{d})$. Since it follows from the definition of $\overline{d}$ that $\text{im}(\overline{d})$ and $\overline{p}(C[\widetilde{W}])$ intersect trivially, we need only establish the reverse inclusion. Fix $a \in \ker(\overline{d})$ and write it as a sum of simple tensors of the form $t_{w,f} \otimes v_1 \cdots v_k$. For each $w_j \in W$, let $a_j$ denote the sum of the simple tensors appearing in this expression for $a$ which have $t_{w_j}$ in them. Thus $a = a_1 + \cdots + a_l$, and we can arrange the indexing so that each $a_i$ is nonzero. Since $\overline{d}(a) = 0$,
\[
\overline{d}(a_1) + \cdots + \overline{d}(a_l) = 0.
\]
(5.8)

Each term $\overline{d}(a_i)$ is a sum of simple tensors of the form $t_{w_1}^i f \otimes v_1 \cdots v_k$. Since the $w_i$ are distinct, the only way (5.8) can hold is if each $\overline{d}(a_i) = 0$. Choose $\overline{w}_i \in \widetilde{W}$ such that $\overline{p}(\overline{w}_i) = w_i$. Set
\[
a'_i = \overline{p}(\overline{w}_i^{-1}) a_i \in S(V) \otimes C(V^\vee).
\]
Using Lemmas 5.4 and 5.6 we have

$$\overline{\rho}(\tilde{w}_i) \overline{d}(a'_i) = \overline{d}(\overline{\rho}(\tilde{w}_i)a_i) = \overline{d}(a_i) = 0.$$ 

Thus for each \(i\),

$$\overline{d}(a'_i) = 0.$$ 

Since each \(a'_i \in S(V^\vee) \otimes C(V^\vee)\), Lemma 5.7 implies \(a'_i = d'(b'_i) + c_i(1 \otimes 1)\) with \(b'_i \in S(V^\vee) \otimes C(V^\vee)\) and \(c_i \in C\). Using Lemmas 5.4 and 5.6 once again, we have

$$a_i = \overline{\rho}(\tilde{w}_i)a'_i = \overline{\rho}(\tilde{w}_i)d'(b'_i) + c_i\overline{\rho}(\tilde{w}_i)$$

$$\in \text{im}(\overline{d}) + \rho(C[\tilde{W}]).$$

Hence \(a = a_1 + \cdots + a_l \in \text{im}(\overline{d}) + \rho(C[\tilde{W}])\) and the proof is complete. \(\square\)

The considerations around (5.2) also apply in the graded setting. In particular, using an argument as in the proof of Lemma 3.4, we conclude \(d\) interchanges the spaces

$$(\overline{H} \otimes C(V^\vee))^{\text{triv}} = \{a \in \overline{H} \otimes C(V^\vee) \mid \rho(\tilde{w})a = a\rho(\tilde{w})\} \quad (5.9)$$

and

$$(\overline{H} \otimes C(V^\vee))^{\text{sgn}} = \{a \in \overline{H} \otimes C(V^\vee) \mid \rho(\tilde{w})a = \text{sgn}(\tilde{w})a\rho(\tilde{w})\}. \quad (5.10)$$

As before, let \(d^{\text{triv}}\) (resp. \(d^{\text{sgn}}\)) denote the restriction of \(d\) to the space in (5.2) (resp. (5.3)). Passing to the subspace

$$(\overline{H} \otimes C(V^\vee))^{\text{triv}} \oplus \overline{H} \otimes C(V^\vee))^{\text{sgn}}$$

in Proposition 5.8 we obtain the following corollary.

**Corollary 5.9.** With notation as in the previous paragraph,

$$\ker(d^{\text{triv}}) = \text{im}(d^{\text{sgn}}) \oplus \overline{\rho}(C[\tilde{W}]).$$

Theorem 5.1 and hence Theorem 4.10 now follow from Corollary 5.9 by an easy induction based on the degree of the filtration. \(\square\)

**Remark 5.10.** As remarked above, our proof shows that Theorem 4.10 holds for graded affine Hecke algebras attached to arbitrary root systems and arbitrary parameters. The proof of Theorem 4.8 depends on two other key ingredients: Theorem 4.1 and the classification (and W-structure) of tempered modules. Both results are available for the algebras considered by Lusztig in [Lu2], the former by [C, Theorem 3.10.1] and the latter by [Lu3]. Thus our proof establishes Theorem 4.8 for cases of the unequal parameters as in [Lu2].
