Radiative corrections to the decay

\[ H^+ \rightarrow W^+ A^0 \]

Abstract

Full one-loop electroweak corrections to the on-shell decay \( H^+ \rightarrow W^+ A^0 \) are computed in the framework of models with two Higgs doublets (THDM). Such a decay may be dominant for \( H^\pm \) over a wide range of parameter space relevant at present and future colliders. We show that the corrections may approach 40% and in particular are sensitive to \( \lambda_5 \), which parametrizes the discrete symmetry breaking term. We suggest that a measurement of the branching ratio of \( H^+ \rightarrow W^+ A^0 \) may offer a possibility of measuring the magnitude of \( \lambda_5 \).

1. Introduction

The phenomenology of charged Higgs bosons ($H^\pm$) has received much attention in recent years since their discovery would provide conclusive evidence of physics beyond the Standard Model (SM). Charged Higgs bosons are predicted in many theoretically well-motivated extensions of the SM. The simplest model which contains a $H^\pm$ is the Two Higgs Doublet Model (THDM), which is formed by adding an extra complex $SU(2)_L \otimes U(1)_Y$ scalar doublet to the SM lagrangian. Motivations for such a structure include CP-violation in the Higgs sector and a possible solution to the cosmological domain wall problem. In particular, the Higgs sector of the Minimal Supersymmetric Standard Model (MSSM) takes the form of a constrained THDM.

The phenomenology of $H^\pm$ has received substantial attention at $e^+e^-$ colliders, hadron colliders, $\mu^+\mu^-$ colliders and $\gamma\gamma$ colliders. Most phenomenological studies have been carried out in the context of the MSSM. The combined null–searches from all four CERN LEP collaborations derive the lower limit $m_{H^\pm} \geq 77.4$ GeV (95% c.l), a limit which applies to all models in which $\text{BR}(H^\pm \rightarrow \tau\nu\tau) + \text{BR}(H^\pm \rightarrow cs) = 1$, where BR signifies branching ratio. Current mass bounds from LEP–II for the neutral pseudoscalar $A^0$ of the MSSM ($m_A \geq 90.5$ GeV) force $m_{H^\pm} \geq 120$ GeV in this model, which is stronger than the direct search limit above. Limits on $m_{H^\pm}$ from the Fermilab Tevatron searches are $\tan\beta$ dependent since a significant $\text{BR}(t \rightarrow H^+b)$ is required in order to obtain a visible signal. The limits are competitive with those from LEP–II for the regions $\tan\beta \leq 1$ or $\geq 40$.

In the MSSM, $m_{H^\pm}$ and the mass of the pseudoscalar $m_A$ are approximately degenerate for values greater than 200 GeV, and so the two body decay $H^\pm \rightarrow A^0W$ is never allowed for masses of interest at the CERN Large Hadron Collider (LHC). The three–body decay $H^\pm \rightarrow A^0W^* \rightarrow A^0f\bar{f}$ is open for smaller $m_{H^\pm}$ although it possesses a small branching ratio ($\text{BR} \leq 5\%$ for $m_{H^\pm} \geq 110$ GeV) [14]. Therefore for masses of interest at the LHC the principal decay channel is $H^\pm \rightarrow tb$, with decays to SUSY particles possibly open as $m_{H^\pm}$ increases [13]. Recently there has been a surge of interest in studies of the MSSM with unconstrained CP–violating phases. In such scenarios $H^0 – A^0$ mixing may be induced radiatively although this only leads to maximum mass splittings of the order 20 GeV for small values of $\tan\beta$; thus the two body decay would not be open even in this case. Non–supersymmetric THDMs (hereafter to be called simply ‘THDM’) have also received considerable attention in the literature. In such models all the Higgs masses may be taken as free parameters (in contrast to the MSSM), thus allowing the possibility of the two body decay $H^\pm \rightarrow A^0W$ for certain choices of $m_A$ and $m_{H^\pm}$. This decay mode possesses no mixing angle suppression, in contrast to $H^\pm \rightarrow h^0W$, and may compete with conventional decays [17], [18]. In fact, in a sizeable region of parameter space we show that it may be the dominant channel. Motivated by the results in Ref. [17] the authors calculated in Ref. [19] the Yukawa corrections to the decay $H^\pm \rightarrow A^0W^{(*)}$ and found that in the on–shell case the corrections may approach 50$\%$ for small values of $\tan\beta$. In this paper we complete that analysis and include the full bosonic corrections for the case of the $W$ being on–shell.

Conventional Higgs searches at LEP–II assume the decays $H^\pm \rightarrow \tau\nu_\tau$ and $cs$, although the OPAL collaboration has recently carried out the first search for $H^\pm \rightarrow A^0W^*$ topologies in the context of the THDM (Model I). A recent study [21] showed that the
decay $H^\pm \to A^0 W$ offers good chances of detection for $H^\pm$ at the LHC, where an analysis in the context of the MSSM with an extra singlet superfield was carried out (NMSSM). Much of this work would be relevant for the THDM that we consider, although our bosonic corrections would not be directly applicable to the NMSSM, since the latter possesses two more neutral Higgs bosons in addition to different Higgs self-couplings.

The paper is organized as follows. In section 2 we introduce our notation and outline the form of the 1–loop corrections. In section 3 we explain the importance of including diagrams with the emission of a soft photon, $H^+ \to W^+ A^0 \gamma$, in order to keep the radiative corrections infra-red finite. Section 4 covers the various experimental and theoretical constraints that we impose. Section 5 presents our numerical results for the full corrections (bosonic and Yukawa), while section 6 contains our conclusions. The explicit form of the corrections is contained in the appendix.

2. Lowest order result and structure of one-loop radiative corrections

2.1 Lowest order result

We will be using the notation and conventions of our previous work [19], which we briefly review here. The momentum of the charged Higgs boson $H^+$ is denoted by $p_H$ ($p_H$ is incoming), $p_W$ is the momentum of the $W^+$ gauge boson and $p_A$ the momentum of the CP-odd $A^0$ ($p_W$ and $p_A$ are outgoing).

The lowest–order part of the lagrangian describing the interaction of the $W^\pm$ with $H^\pm$ and $A^0$ comes from the covariant derivative which is given by:

$$\mathcal{L} = \frac{e}{2s_W} W^+_\mu (H^- \partial^- A^0) + \text{h.c.} \quad (2.1)$$

This interaction is model independent (SUSY or non–SUSY) and depends only on standard parameters: electric charge ($e$) and Weinberg angle ($s_W = \sin \theta_W$).

The lowest–order Feynman diagram for the two–body decay $H^+ \to A^0 W^+$ is depicted in the following figure:

$$\begin{align*}
\text{Figure. 1}
\end{align*}$$

In the Born approximation, the decay amplitude of the charged Higgs into an on-shell CP–odd Higgs boson $A^0$ and the gauge boson $W^+$ (Fig.1) can be written as:

$$\mathcal{M}^0(H^+ \to W^+ A^0) = \epsilon^*_\mu \Gamma^\mu_0 \quad \text{where} \quad \Gamma^\mu_0 = i \frac{e}{2s_W} (p_H + p_A)_\mu \quad (2.2)$$
Here $\epsilon_\mu$ is the $W^\pm$ polarization vector. We then have the following decay width:

$$
\Gamma_{0}^{0} = \frac{\alpha}{16 s^2_W \cdot m^2_W m^3_{H^\pm}} \lambda^2 (m^2_{H^\pm}, m^2_W, m^2_W) \tag{2.3}
$$

where $\lambda = \lambda(x, y, z) = x^2 + y^2 + z^2 - 2(xy + xz + yz)$ is the familiar two–body phase space function. Note that in the MSSM the two–body decay of the charged Higgs boson into $W^+A^0$ is kinematically not allowed. In this paper we will not present results for the case of $W^\pm$ being off–shell. Ref. [19] evaluated the Yukawa corrections in the off–shell case for $m_{H^\pm}$ in the range of LEP–II, finding maximum values of a few percent.

### 2.2 One–Loop radiative corrections

We shall evaluate the bosonic one-loop radiative corrections to the decay $H^+ \rightarrow W^+A^0$, and add them to the Yukawa corrections previously evaluated in Ref. [19]. This set of corrections is ultra–violet (UV) and infra–red (IR) divergent. The UV singularities are treated by dimensional regularization [22] in the on–mass–shell renormalization scheme. The IR divergences are treated by the introduction of a small fictitious mass $\delta$ for the photon, which we shall explain in the next section.

The typical Feynman diagrams for the virtual corrections of order $\alpha$ are listed in figure 2.1 → 2.16. These contributions have to be supplemented by the counterterm renormalizing the vertex $H^+A^0W^-$ (eq [2.3]). Note that in the THDM, the vertices $W^+A^0G^-$, $W^+G^0H^-$, $W^+W^--A^0$ and $A^0H^+H^-$ are not present, and so the mixing $G^+H^+$, $G^0A^0$ and $W^+H^+$ does not give any contribution to our process. In our case, the gauge boson $W$ is on-shell and so the mixing $W^\pm-G^\pm$ is absent. The full set of Feynman diagrams are generated and computed using the FeynArts and FeynCalc [23, 24] packages. The amplitudes of the typical vertices are given in terms of the one-loop scalar functions [25] and are written explicitly in appendix B. We also use the fortran FF–package [26] in the numerical analysis.

In what follows we will use the on-shell renormalization scheme developed in Ref. [19] (and refs therein). The vertex counterterm is given by:

$$
\delta \mathcal{L} = \frac{e}{2 s_W} W^+_{\mu}(H^- \frac{\epsilon_{\mu}}{\partial} A^0) \left( \frac{1}{2} \delta Z_{WW} + \frac{1}{2} \delta Z_{A^0A^0} + \frac{1}{2} \delta Z_{H^+H^+} + \delta Z_e - \frac{\delta s_W}{s_W} \right) \tag{2.4}
$$

where $\delta Z_{WW}, \delta Z_{A^0A^0}$ and $\delta Z_{H^+H^+}$ are the wave function renormalization constants for the $W^\pm$ gauge boson, $A^0$ and $H^\pm$ Higgs boson defined as follows:

$$
\delta Z_{ii} = -\frac{\partial \Sigma_{ii}(k^2)}{\partial k^2} |_{k^2=m^2_i} \quad i = W, A^0, H^\pm \tag{2.5}
$$

$$
\delta m^2_i = \text{Re} \Sigma_{ii}(m^2_i) \quad i = W, Z \tag{2.6}
$$

where $\Sigma_{ii}(k^2)$ is the bare self-energy of the $H^\pm$, $A^0$ or $W$. The electric charge counterterm and $\frac{\delta s_W}{s_W}$ are defined as:

$$
\frac{\delta s_W}{s_W} = -\frac{1}{2} \frac{c^2_W}{s^2_W} \left( \frac{\delta m^2_W}{m^2_W} - \frac{\delta m^2_Z}{m^2_Z} \right) \tag{2.7}
$$

$$
\delta Z_e = -\frac{1}{2} \delta Z_{\gamma\gamma} + \frac{1}{2} \frac{s_W}{c_W} \delta Z_{\gamma Z} = \frac{1}{2} \frac{\partial \Sigma_{\gamma\gamma}(k^2)}{\partial k^2} |_{k^2=0} + \frac{s_W}{c_W} \Sigma_{\gamma Z}(0) \tag{2.8}
$$
The index $T$ in $\Sigma_T^{\gamma\gamma}$ and $\Sigma_T^{\gamma Z}$ denotes that we take the transverse part. The scalar one-loop self-energies entering in the above equations (2.5 → 2.8) are given in appendix C1 and C2, while gauge boson self energies can be found in [27].

The one-loop amplitude $\mathcal{M}^1$ (vertex plus counterterms) can be written as:

$$\mathcal{M}^1(H^+ \to W^+ A^0) = \frac{e}{2s_W}(\Gamma_H p_H^\mu + \Gamma_W p_W^\mu)\epsilon^*_\mu$$  \hspace{1cm} (2.9)$$

where $\Gamma_H$ and $\Gamma_W$ can be cast as follow:

$$\Gamma_W = \Gamma_{\text{vertex}}^W + \delta \Gamma_{\text{vertex}}^W$$  \hspace{1cm} (2.10)$$

$$\Gamma_H = \Gamma_{\text{vertex}}^H + \delta \Gamma_{\text{vertex}}^H$$  \hspace{1cm} (2.11)$$

Here $\Gamma_{\text{vertex}}^{W,H}$ represents the vertex corrections and $\delta \Gamma_{\text{vertex}}^{W,H}$ is the counterterm contribution needed to remove the UV divergences contained in $\Gamma_{\text{vertex}}^{W,H}$.

The expressions of the counterterms are:

$$\delta \Gamma_{\text{vertex}}^W = -(\delta Z_e - \frac{\delta s_W}{s_W} + \frac{1}{2}(\delta Z_{H^+H^+} + \delta Z_{A^0} + \delta Z_W))$$

$$\delta \Gamma_{\text{vertex}}^H = -2\delta \Gamma_{\text{vertex}}^W$$  \hspace{1cm} (2.12)$$

In the on-shell case the interference term $2Re\mathcal{M}^0*\mathcal{M}^1$, found from squaring the one-loop corrected amplitude $|\mathcal{M}^0 + \mathcal{M}^1|^2$, is equal to $\Gamma_H |\mathcal{M}^0|^2$ [19]. Hence the one-loop corrected width $\Gamma^1_{on}$ can be written as

$$\Gamma^1_{on} = (1 + \Gamma_H)\Gamma^0_{on}$$  \hspace{1cm} (2.13)$$

with $\Gamma_H$ (defined by eq. 2.11) being interpreted as the fractional contribution to the tree-level width, $\Gamma^0_{on}$. Note that $\Gamma_W$ (eq. 2.10) does not contribute to $\Gamma^1_{on}$.

3. Real photon emission: $H^+ \to W^+ A^0 \gamma$

The vertex correction supplemented by the counterterms is UV finite but there still remains infra-red divergences. These arise from the diagrams 2.10 and 2.11 with $V = \gamma$ and also from the wave function renormalisation constant $\delta Z_{H^+H^+}$ (Diagram 2.33) and $\delta Z_{WW}$. In order to obtain a finite result, one has to add the correction from the emission of a real photon in the final state as drawn in figures 2.17 → 2.19.

In terms of the momenta of the particles in the final state, the square amplitude of the process $H^+ \to A^0 W^+ \gamma$ is given by:

$$|M(H^+ \to A^0 W^+ \gamma)|^2 = -\frac{e^4}{s_W^2}\lambda(m_{H^+}^2, m_A^2, m_W^2)[\frac{m_{H^+}^2}{m_W^2}(2p_H k_\gamma)^2 - \frac{1}{(2p_W k_\gamma)^2} + \frac{m_A^2 - m_{H^+}^2}{m_W^2} - 1] \frac{1}{(2p_W k_\gamma)(2p_H k_\gamma)}$$ \hspace{1cm} (3.1)$$

where $k_\gamma$ denotes the momentum of the photon. Note that as a consequence of gauge invariance, the amplitude of the sum of the three diagrams (Figs. 2.17 → 2.19), should vanish when multiplied by the four-momentum of the photon, which provides a good
check of the calculation. The integrals over three body phase space can be found in [28], and one obtains the following expression for the width:

\[
\Gamma_{Br} = -\frac{e^2 M_{H^\pm}^2}{\pi^2 \lambda^2} \left[ I_{HH} + I_{WW} + (1 + \frac{m_{H^\pm}^2 - m_W^2}{m_W^2}) I_{HW} \right]
\]  \hspace{2cm} (3.2)

Where \( I_{HH} \), \( I_{WW} \) and \( I_{HW} \) are given as follows:

\[
I_{HH} = \frac{1}{4m_{H^\pm}^4} \left\{ \lambda^2 \log\left( \frac{\lambda}{\delta m_{H^\pm} m_W} \right) - \lambda^2 - (m_W^2 - m_{A}^2) \log\left( \frac{\beta_1}{\beta_2} \right) - m_{H^\pm}^2 \log(\beta_0) \right\}
\]

\[
I_{WW} = \frac{1}{4m_{H^\pm}^2 m_W^2} \left\{ \lambda^2 \log\left( \frac{\lambda}{\delta m_{H^\pm} m_W} \right) - \lambda^2 - (m_{H^\pm}^2 - m_{A}^2) \log\left( \frac{\beta_0}{\beta_2} \right) - m_W^2 \log(\beta_1) \right\}
\]

\[
I_{HW} = \frac{1}{4m_{H^\pm}^2} \left\{ 2 \log\left( \frac{\lambda}{\delta m_{H^\pm} m_W} \right) \log(\beta_2) + 2 \log^2(\beta_2) - \log^2(\beta_0) - \log^2(\beta_1) + 2 \text{Sp}(1 - \beta_2^2) - \text{Sp}(1 - \beta_0^2) - \text{Sp}(1 - \beta_1^2) \right\}
\]  \hspace{2cm} (3.3)

where \( \lambda = \lambda(m_{H^\pm}^2, m_A^2, m_W^2) \) is the two body phase space, \( \delta \) is a small fictitious photon mass, \( \text{Sp} \) is the dilogarithm function and \( \beta_i \) are defined as:

\[
\beta_0 = \frac{m_{H^\pm}^2 - m_W^2 - m_A^2 + \lambda^2}{2m_W m_A} \quad , \quad \beta_1 = \frac{m_{H^\pm}^2 - m_W^2 + m_A^2 - \lambda^2}{2m_{H^\pm} m_A} \quad , \quad \beta_2 = \frac{m_{H^\pm}^2 + m_W^2 - m_A^2 - \lambda^2}{2m_{H^\pm} m_W}
\]  \hspace{2cm} (3.4)

We stress here that the IR divergence contained in \( I_{HH} \) \( (I_{WW}) \) is cancelled by the wave function renormalisation constant of the charged Higgs \( H^\pm \) \( (W^\pm) \), while the IR divergence contained in \( I_{HW} \) is cancelled by the vertex diagrams 2.10 and 2.11 (with \( V = \gamma \)). One can confirm easily that adding the virtual corrections with the Bremsstrahlung diagrams yields an IR finite result. This feature has been checked both algebraically and numerically.

4. THDM scalar potential: Theoretical and Experimental constraints

In this section we define the THDM scalar potential that we will be using. In appendix A we list the trilinear and quartic scalar self–couplings which are relevant to our study. Other relevant couplings involving Higgs boson interactions with gauge bosons and fermions can be found in Ref. [1]. For a full list of scalar trilinear and quartic couplings see Ref. [29]. It has been shown [1] that the most general THDM scalar potential which is both \( SU(2)_L \otimes U(1)_Y \) and CP invariant is given by:

\[
V(\Phi_1, \Phi_2) = \lambda_1(|\Phi_1|^2 - v_1^2)^2 + \lambda_2(|\Phi_2|^2 - v_2^2)^2 + \lambda_3(|\Phi_1|^2 - v_1^2) (|\Phi_2|^2 - v_2^2) + \lambda_4(|\Phi_1|^2|\Phi_2|^2 - |\Phi_1^+ \Phi_2|^2) + \lambda_5(Re(\Phi_1^+ \Phi_2) - v_1 v_2)^2 + \lambda_6[Im(\Phi_1^+ \Phi_2)]^2
\]  \hspace{2cm} (4.1)

where \( \Phi_1 \) and \( \Phi_2 \) have weak hypercharge \( Y=1 \), \( v_1 \) and \( v_2 \) are respectively the vacuum expectation values of \( \Phi_1 \) and \( \Phi_2 \) and the \( \lambda_i \) are real–valued parameters. Note that this
potential violates the discrete symmetry $\Phi_i \rightarrow -\Phi_i$ softly by the dimension two term $\lambda_5 Re(\Phi_i^\dagger \Phi_2)$ and has the same general structure as the scalar potential of the MSSM. One can prove easily that for $\lambda_5 = 0$ the exact symmetry $\Phi_i \rightarrow -\Phi_i$ is recovered. We note that Ref. 30 lists the complete Higgs trilinear and quartic interactions for two 6 parameter potentials, referred to as 'Potential A' and 'Potential B'. Potential A is equivalent to our potential if $\lambda_5 \rightarrow 0$, and in this limit the Feynman rules in the appendix A are in agreement with those in Ref. 30.

After electroweak symmetry breaking, the W and Z gauge bosons acquire masses given by $m_W^2 = \frac{1}{2} g^2 v^2$ and $m_Z^2 = \frac{1}{2} (g^2 + g'^2) v^2$, where $g$ and $g'$ are the $SU(2)_L$ and $U(1)_Y$ gauge couplings and $v^2 = v_1^2 + v_2^2$. The combination $v_1^2 + v_2^2$ is thus fixed by the electroweak scale through $v_1^2 + v_2^2 = (2\sqrt{2} G_F)^{-1}$, and we are left with 7 free parameters in eq. (4.1), namely the $(\lambda_i)_{i=1,...,6}$ and $\tan \beta = v_2/v_1$. Meanwhile, three of the eight degrees of freedom of the two Higgs doublets correspond to the 3 Goldstone bosons ($G^\pm, G^0$) and the remaining five become physical Higgs bosons: $H^0, h^0$ (CP–even), $A^0$ (CP–odd) and $H^\pm$. Their masses are obtained as usual by the shift $\Phi_i \rightarrow \Phi_i + v_i$ and read [1]:

$$m_A^2 = \lambda_6 v^2, \quad m_{H^\pm}^2 = \lambda_4 v^2, \quad m_{H,A}^2 = \frac{1}{2} [A + C \pm \sqrt{(A-C)^2 + 4B^2}]$$

where

$$A = 4v_1^2(\lambda_1 + \lambda_3) + v_2^2 \lambda_5, \quad B = v_1 v_2(4\lambda_3 + \lambda_5), \quad C = 4v_2^2(\lambda_2 + \lambda_3) + v_1^2 \lambda_5(4.2)$$

The angle $\beta$ diagonalizes both the CP–odd and charged scalar mass matrices, leading to the physical states $H^\pm$ and $A^0$. The CP–even mass matrix is diagonalized by the angle $\alpha$, leading to the physical states $H^0, h^0$, with $\alpha$ given by:

$$\sin 2\alpha = \frac{2B}{\sqrt{(A-C)^2 + 4B^2}}, \quad \cos 2\alpha = \frac{A - C}{\sqrt{(A-C)^2 + 4B^2}} \quad (4.3)$$

It is then straightforward algebra to invert the previous equations to obtain the $\lambda_i$ in terms of physical scalar masses, $\tan \beta, \alpha$ and $\lambda_5$:

$$\lambda_4 = \frac{g^2}{2m_W^2} m_{H^\pm}^2, \quad \lambda_6 = \frac{g^2}{2m_W^2} m_A^2, \quad \lambda_3 = \frac{g^2}{8m_W^2} \frac{s_\alpha c_\alpha}{s_\beta c_\beta} (m_H^2 - m_h^2) - \frac{\lambda_5}{4} (4.4)$$

$$\lambda_1 = \frac{g^2}{8s_\beta m_W^2} [c_\alpha^2 m_H^2 + s_\alpha^2 m_h^2 - \frac{s_\alpha c_\alpha}{\tan \beta} (m_H^2 - m_h^2)] - \frac{\lambda_5}{4} (-1 + \tan^2 \beta) \quad (4.5)$$

$$\lambda_2 = \frac{g^2}{8s_\beta m_W^2} [s_\alpha^2 m_H^2 + c_\alpha^2 m_h^2 - s_\alpha c_\alpha \tan \beta (m_H^2 - m_h^2)] - \frac{\lambda_5}{4} (-1 + \frac{1}{\tan^2 \beta}) \quad (4.6)$$

We are free to take as 7 independent parameters $(\lambda_i)_{i=1,...,6}$ and $\tan \beta$ or equivalently the four scalar masses, $\tan \beta, \alpha$ and one of the $\lambda_i$. In what follows we will take $\lambda_5$ as a free parameter. In our analysis we also take into account the following constraints when the independent parameters are varied.

- The contributions to the $\delta \rho$ parameter from the Higgs scalars [31] should not exceed the current limits from precision measurements [32]: $-0.0017 \leq \delta \rho \leq -0.0027$.
- From the requirement of perturbativity for the top and bottom Yukawa couplings [33].
tan $\beta$ is constrained to lie in the range $0.3 \leq \tan \beta \leq 130$. Upper and lower bounds have also been obtained from the experimental limits on the processes $e^+e^- \rightarrow Z^* \rightarrow h^0\gamma$ and/or $e^+e^- \rightarrow A^0\gamma$. For very light $h$ or $A^0$ ($\approx 10$ GeV) Ref. [34] derived $0.15 \leq \tan \beta \leq 75$, with the limits weakening for heavier $m_h(m_A)$. For our study we will restrict the discussion to values $\tan \beta \geq 0.5$.

- We require that tree-level unitarity is not violated in a variety of Higgs scattering processes [35].

5. Numerical results and discussion

In this section we present our numerical results for $\Gamma_H$, which is the fractional correction to the tree-level width (eq.2.13). We take the following experimental input for the physical parameters [36]. The fine structure constant: $\alpha = \frac{\alpha}{4\pi} = 1/137.03598$, the gauge boson masses: $m_Z = 91.187$ GeV, $m_W = 80.41$ GeV, the lepton masses: $m_e = 0.511\text{MeV}$, $m_\mu = 0.1057\text{GeV}$, $m_\tau = 1.784\text{GeV}$. For the light quark masses we use the effective values which are chosen in such a way that the experimentally extracted hadronic part of the vacuum polarizations is reproduced [37]:

- $m_d = 47\text{MeV}$,
- $m_u = 47\text{MeV}$,
- $m_s = 150\text{MeV}$,
- $m_c = 1.55\text{GeV}$,
- $m_b = 4.5\text{GeV}$.

For the top quark mass we take $m_t = 175\text{GeV}$. In the on-shell scheme we consider, $\sin^2 \theta_W$ is given by $\sin^2 \theta_W \equiv 1 - \frac{m_t^2}{m_Z^2}$, and this expression is valid beyond tree-level.

Let us make some comment about the Yukawa corrections discussed in Ref. [19]. In the case of an on-shell $W$, we showed that for small $\tan \beta$ in both Model I and II one can find large corrections of up to around $\pm 10\%$ (away from threshold effects at $m_A \approx 2m_t$). In Model I for large $\tan \beta$ all fermion corrections decouple and reach a constant value of $3.3\%$ for $\tan \beta > 4$. In Model II $\Gamma_H$ is enhanced for large $\tan \beta$ ($> 20$) since in this scenario the internal $b$ quarks in the loop couple more strongly to $A^0$. Typically for $m_{H^\pm} = 440$ one can reach a correction of about $-7\% \rightarrow -20\%$ for large $\tan \beta > 90$ and light $m_A$ ($60 \leq m_A \leq 100\text{GeV}$). For $m_A > 100\text{GeV}$ the $\tan \beta$ dependence of the Yukawa correction is rather weak and lies in the range of $-5\% \rightarrow 5\%$ for $100 \leq m_A \leq 330\text{GeV}$.

We stress at this stage that in the low $\tan \beta$ ($\tan \beta < 2$) regime the corrections in Model I and Model II are practically identical. Perturbative constraints on the $\lambda_i$ and unitarity constraints on the quartic scalar couplings constrain the magnitude of $\tan \beta$. As shown in [33], $\tan \beta \geq 20$ violates the unitarity bounds if $\lambda_5 = 0$, although for $\lambda_5 \neq 0$ values of $\tan \beta \geq 40$ are comfortably allowed. However, perturbative constraints on the $\lambda_i$ (in particular $\lambda_1$) disfavour $\tan \beta \geq 30$ [35], and so in our analysis we will only consider small to moderate values of $\tan \beta$. Therefore our results are applicable to both Model I and II. Note that in order to satisfy the experimental constraint on $\delta\rho$ we have assumed (for the graphs we have plotted) that $\alpha = \beta - \frac{\pi}{2}$ and the charged Higgs boson mass $m_{H^\pm}$ is quasi-degenerate with $m_H$.

In Fig.3 we plot $\Gamma_H$ as a function of $m_{H^\pm}$ for $m_H = m_{H^\pm} - 10\text{GeV}$, $m_h = 120\text{GeV}$, $m_A = 150\text{GeV}$ and $\alpha = \beta - \frac{\pi}{2}$ for several values of $\lambda_5$. With the above set of parameters and for $\tan \beta = 0.5(1.5)$ and $\lambda_5 = 0$ in Fig.3.a (Fig.3.b), the unitarity constraints in the spirit of Ref. [35] require $m_{H^\pm} \leq 370 (480)$ GeV, with this bound weakening for increasing $\lambda_5$. This can be seen both in fig.3.a and fig.3.b, where we cut the curves at
the value of the charged Higgs mass which violates the unitarity constraint. Both for Fig.3.a and Fig.3.b the Yukawa correction is positive and lies in the range 3.6% → 11.9% and 3.3% → 4.3% for Fig.3.a and Fig.3.b respectively while the bosonic correction is negative. In Fig.3.a (tan β = 0.5), the bosonic correction is in the range −0.6% → −0.9% for λ5 = 0 and mH± ∈ [231, 370], and so in this case the Yukawa correction is dominant; for larger λ5 = 8.5 the bosonic correction becomes strongly negative ( −11% → −50% for mH± ∈ [230, 620]) and dominates the Yukawa corrections.

In Fig.3.b we take tan β = 1.5, and the bosonic correction is in the range −0.6% → −1.6% for λ5 = 0 and mH± ∈ [230, 475]; for λ5 = 1 and mH± ∈ [230, 520] it is in the range −1.7% → −4.7% . In the above two cases the bosonic and Yukawa corrections interfere destructively leading to a small total correction of about ≈ 3%. In the case where λ5 ≥ 3 the bosonic correction becomes strongly negative and dominates the Yukawa correction.

Fig.4.a and Fig.4.b show the total contribution to ΓH as function of mA for mH = 500, mh = 360 and mH± = 530 GeV. Fig.4.a corresponds to tan β = 0.8 and Fig.4.b corresponds to tan β = 1.6 (with α = β − π/2). In both figures the Yukawa correction is positive in the region mA ≤ 277 GeV and mA ≥ 352 GeV, while for mA ≈ 350 GeV the channel A → tt opens, leading to a very large negative correction. Note that the bosonic correction is negative for every value of mA.

We can conclude that for the intermediate mass range of mA (away from threshold effects mA ≈ 2mh) and for λ5 ≤ 4 there is a cancellation between the Yukawa correction and the bosonic correction. For large λ5 the contribution to ΓH is dominated by the bosonic correction and is consequently negative. For mA ≈ 350 GeV (≈ 2mh) there is constructive interference between the Yukawa and bosonic corrections.

In Fig.5.a we plot the bosonic contribution to ΓH (denoted Γbos H) as a function of λ5 for tan β = 0.5, 5, 8. The fermionic correction (independent of λ5) takes the values -3.21%, 3.22%, 3.24%. One can see from the curves that Γbos H increases with λ5 and may approach −40%. This is expected from the form of the trilinear scalar couplings which increase linearly with λ5.

Fig.5.b shows the dependence of Γbos H on sin α for −π/2 < α < π/2. Here C1, C2 and C3 correspond to three distinct parameter configurations which satisfy both the unitarity and ρ parameter constraints (see figure caption). The fermionic corrections (independent of α) for C1, C2 and C3 take the values 3.2%, 3.5% and 3.4% respectively. The bosonic corrections become important for sin α ≈ ±1.

It is apparent from the figures that Γbos H has a complicated dependence on α, β, λ5 and the physical Higgs masses. This is clear from the explicit form of the trilinear couplings in appendix A.1, which mediate the numerous triangular loop corrections. Therefore enhancement in the bosonic sector may occur in a variety of scenarios. Of particular interest is the sensitivity to λ5, a measurement of which (along with the Higgs masses and mixing angles) would allow reconstruction of the Higgs potential. We suggest the measurement of BR(H± → A0W) as a way of obtaining information on λ5. The decay mode (H± → A0W) may in fact be dominant and in Fig.6 we show the ratio

\[ R = \frac{\Gamma(H^± \rightarrow A^0W)}{\Gamma(H^± \rightarrow A^0W) + \Gamma(H^± \rightarrow tb)} \] (5.1)

as a function of tan β for various values of mA, fixing mH± = 500 GeV. We plot the tree-level width for (H± → A0W) given in Eq. 2.3, and the tree-level width for H± → tb given
in Ref. [14], assuming Model II type couplings. Since other channels such as $H^\pm \to h^0W$ and $H^\pm \to H^0W$ may be open the above ratio should be interpreted as the upper bound on $\text{BR}(H^\pm \to A^0W)$. Note that these additional channels are suppressed by the factors $\cos^2(\beta - \alpha)$ and $\sin^2(\beta - \alpha)$ respectively, while $\Gamma(H^\pm \to A^0W)$ possesses no mixing angle suppression. One can see that the decay $H^\pm \to A^0W$ is maximized for moderate values of $\tan \beta$ (i.e. when $\Gamma(H^\pm \to tb)$ is minimized). The curves with lighter $m_A$ are less phase space suppressed and so the value of $R$ may be larger. For fixed $m_A$ and $\tan \beta$ the sensitivity to $m_{H^\pm}$ is rather mild. Larger $m_{H^\pm}$ slightly increases $R$ since $\Gamma(H^\pm \to A^0W) \sim m_{H^\pm}^3$ while $\Gamma(H^\pm \to tb) \sim m_{H^\pm}$.

Given the possible large BR, an accurate measurement of $\text{BR}(H^\pm \to A^0W)$ may allow one to obtain information on $\lambda_5$. As explained above, the radiative corrections show sensitivity to several of the input parameters. If experimental information on the Higgs masses and mixing angles were available then it might be possible to measure $\lambda_5$. At a $e^+e^-$ linear collider [38] one could measure the Higgs masses from a variety of production mechanisms ($e^+e^- \to Zh^0, ZH^0, h^0A^0, H^0A^0, H^\pm H^\mp$). Information on the mixing angles $\alpha, \beta$ could be obtained [39] from an analysis of the production cross-sections and branching ratios. Other processes which are sensitive to $\lambda_5$ are $e^+e^- \to H^+H^-$ [5] and $H^\pm W^\mp$ [40], while theoretical bounds on the Higgs masses in the case of $\lambda_5 \neq 0$ are explored in Ref. [35, 41].

6. Conclusions

We have computed the radiative corrections to the on-shell decay $H^+ \to A^0W^+$ in the general Two Higgs Doublet Model, taking into account the experimental constraint on the $\rho$ parameter and also unitarity constraints on the scalar sector parameters. We have included the Yukawa corrections, the full electroweak corrections (bosonic), and also the real photon emission in the final state (Bremsstrahlung). The computation was done with dimensional regularization in the on-shell scheme. We find that the total radiative corrections may approach 40% in regions of parameter space for both small and moderate $\tan \beta$. The bosonic correction is sensitive to the soft discrete symmetry breaking parameter $\lambda_5$, and may interfere both constructively and destructively with the Yukawa correction. For larger $\lambda_5$ the bosonic contribution becomes strongly negative and in general dominates the Yukawa correction. For $m_A \approx 2m_t$ and low $\tan \beta$ the Yukawa correction is maximized and interferes constructively with the bosonic correction, resulting in large negative corrections to the tree-level width. Finally, we showed that the decay $H^\pm \to A^0W^\mp$ may supersede $H^\pm \to tb$ as the dominant decay channel, and thus a precise measurement of its branching ratio may allow information to be obtained on $\lambda_5$.

Appendix A: THDM trilinear and quartic scalar couplings

In this appendix we list the Feynman rules in the general THDM for the trilinear and quartic scalar couplings relevant for our study. All formulae are written in terms of the physical masses, $\alpha$, $\beta$ and the soft breaking term $\lambda_5$. Note that in the trilinear couplings (quartic couplings) we have factorised out $ie$ ($i\epsilon^2$). In the following $g_C = 1/(2s_W m_W s_\beta)$, $v^2 = \frac{2m_H^2}{g^2}$, $c_{\beta\alpha}^\pm = \cos(\beta \pm \alpha)$ and $s_{\beta\alpha}^\pm = \sin(\beta \pm \alpha)$.

A.1 Trilinear scalar coupling

$$g_{H_0H^0H^-} = -2g_C (m_{H_0}^2 (c_\alpha^3 s_\alpha + s_\beta^3 c_\alpha) + m_{H^0}^2 s_{2\beta} c_{\beta\alpha}^+ - s_{\beta\alpha}^+ \lambda_5 v^2) \quad (A.1)$$

$$g_{H^0H^+G^-} = g_C s_{2\beta} s_{\beta\alpha} (m_{H^0}^2 - m_{H^\pm}^2) \quad (A.2)$$

$$g_{h_0H^0H^-} = -2g_C (m_{h_0}^2 (c_\alpha^3 s_\beta - s_\alpha^3 c_\beta) + m_{H^0}^2 s_{2\beta} c_{\beta\alpha}^- - c_{\beta\alpha}^- \lambda_5 v^2) \quad (A.3)$$

$$g_{h_0H^+G^-} = -g_C s_{2\beta} c_{\beta\alpha}^- (m_{h_0}^2 - m_{H^\pm}^2) \quad (A.4)$$

$$g_{H^0A^0A^0} = -2g_C (m_{H_0}^2 (s_\alpha^3 c_\beta + c_\alpha^3 s_\beta) + m_A^2 s_{2\beta} c_{\beta\alpha}^- - s_{\beta\alpha}^- \lambda_5 v^2) \quad (A.5)$$

$$g_{H^0A^0G^0} = g_C s_{2\beta} s_{\beta\alpha} (m_{H_0}^2 - m_A^2) \quad (A.6)$$

$$g_{h_0A^0A^0} = -2g_C (m_{h_0}^2 (c_\alpha^3 s_\beta - s_\alpha^3 c_\beta) + m_A^2 s_{2\beta} c_{\beta\alpha}^- - c_{\beta\alpha}^- \lambda_5 v^2) \quad (A.7)$$

$$g_{h_0A^0G^0} = g_C s_{2\beta} c_{\beta\alpha}^- (m_{h_0}^2 - m_A^2) \quad (A.8)$$

$$g_{A^0H^+G^-} = ig_C s_{2\beta} (m_{H^\pm}^2 - m_A^2) \quad (A.9)$$

A.2 Quartic scalar coupling

$$g_{H^0H_0H^0H^0} = -12g_C^2 (m_{H^0}^2 (c_\alpha^3 s_\alpha + s_\beta^3 c_\alpha)^2 + m_{H^0}^2 s_\alpha^2 c_\alpha^2 s_{\beta\alpha}^-^2 - \lambda_5 v^2 (c_\alpha^2 - c_\beta^2)^2) \quad (A.10)$$

$$g_{h_0H^0h_0h_0} = -12g_C^2 (m_{h_0}^2 s_\alpha^2 c_\alpha^2 c_{\beta\alpha}^-^2 + m_{h_0}^2 (c_\beta^3 c_\alpha - s_\beta^3 s_\alpha)^2 - \lambda_5 v^2 (c_\alpha^2 - c_\beta^2)^2) \quad (A.11)$$

$$g_{A^0A^0A^0A^0} = -12g_C^2 (m_{H_0}^2 (c_\alpha^3 s_\beta + s_\alpha^3 c_\beta)^2 + m_{H_0}^2 (c_\beta^3 c_\alpha - s_\beta^3 s_\alpha)^2 - \lambda_5 v^2 c_{2\beta}^2 \quad (A.12)$$

$$g_{G^0A^0A^0G^0} = -3g_C^2 s_{2\beta}^2 (m_{H^0}^2 c_{\beta\alpha}^-^2 + m_{H^0}^2 s_{\beta\alpha}^-^2) \quad (A.13)$$

$$g_{H^0H^0H^+H^-} = -8g_C^2 (m_{H^0}^2 (c_\alpha^3 s_\beta + s_\alpha^3 c_\beta)^2 + m_{H^0}^2 (c_\beta^3 c_\alpha - s_\beta^3 s_\alpha)^2 - \lambda_5 v^2 c_{2\beta}^2 \quad (A.14)$$

$$g_{G^+G^-G^+G^-} = -2g_C^2 s_{2\beta}^2 (m_{H^0}^2 c_{\beta\alpha}^-^2 + m_{H^0}^2 s_{\beta\alpha}^-^2) \quad (A.15)$$

$$g_{h_0h_0h_0h_0} = -4g_C^2 (m_{h_0}^2 s_\alpha c_\alpha (s_\beta c_\beta + 3s_\alpha c_\alpha s_{\beta\alpha}^-^2) - m_{h_0}^2 s_\alpha c_\beta (s_\beta c_\alpha + 3s_\alpha c_\beta c_{\beta\alpha}^-^2) - \lambda_5 v^2 (3s_\alpha^2 c_{\alpha}^2 - s_\beta^2 c_{\beta}^2)^2 \quad (A.16)$$

$$g_{h_0h_0A^0A^0} = -2g_C^2 (m_{h_0}^2 (s_\alpha c_\alpha^3 + c_\alpha c_{\beta}^3) (c_\alpha^3 c_\beta + s_\alpha^3 s_\beta) + 2m_{h_0}^2 s_\alpha c_\alpha c_{\beta\alpha}^- (c_\alpha c_\beta - s_\alpha s_\beta) + m_A^2 (c_\alpha^2 - c_\beta^2) (c_\alpha^2 - c_\beta^2 + 2s_\alpha s_\beta c_{\beta\alpha}^-) + 2\lambda_5 v^2 (c_\beta^3 c_{\alpha}^2 - s_\beta^3 c_{\alpha}^2) - c_{\beta\alpha}^-^2 (1 + s_2s_{2\beta})) \quad (A.17)$$

$$g_{h_0h_0A^0A^0} = -2g_C^2 (m_{h_0}^2 (s_\alpha^3 c_\beta + c_\alpha^3 c_\beta) s_\alpha c_\beta c_{\beta\alpha}^- + 2m_{h_0}^2 (c_\beta c_{\alpha}^3 - s_\beta s_{\alpha}^3) (c_\alpha c_\beta - s_\alpha s_\beta) + m_A^2 (c_\alpha^2 - c_\beta^2) (c_\alpha^2 - c_\beta^2 + 2s_\alpha s_\beta c_{\beta\alpha}^-) + 2\lambda_5 v^2 (c_{2\beta}^2 c_{\alpha}^2 - c_{2\beta}^2 c_{\beta}^2) - c_{\beta\alpha}^-^2 (1 + s_2s_{2\beta})) \quad (A.18)$$
Appendix B: One-loop vertex: $H^+ \rightarrow W A^0$

In this appendix we will list the analytic expression for each generic diagram of Fig.2. The sum over all the particle contents yields the corresponding contribution to the one-loop amplitude for $H^+ \rightarrow W A^0$. For scalar and tensor integrals we use the same convention as [5], the analytical expression of all scalar functions can be found in [25, 26].

B. 1 Fermionic Loops

The diagram with the $uud$ triangle, Fig.2.1, yields the following contribution to the one-loop amplitude:

$$M_{2,1} = -\frac{e\alpha N_C}{2\sqrt{2}\pi s_W} Y_{uu}(Y_{ud}^L(2B_0 + B_1) + m_uC_0(m_uY_{ud}^L + m_dY_{ud}^R))$$

$$+ Y_{ud}^L[m_W^2C_2 - 2C_{00} - 2m_A^2C_{11} + C_{12}(m_{H^\pm} - m_W^2 - m_A^2)] \right) (B.1)$$

$N_C = 3(1)$ for quarks (leptons). Therein, all the $B_0$, $B_1$, $C_i$ and $C_{ij}$ have the same arguments:

$$[B_0, B_1](m_{H^\pm}, m_{u}^2, m_{d}^2) \right) [C_i, C_{ij}](m_{A}^2, m_{H^\pm}^2, p_W^2, m_{u}^2, m_{u}^2)$$

The summation has to be performed over all fermion families; in practice only the third quark generation is relevant.

The corresponding expression for the the diagram with the $ddu$ triangle in Fig.2.2 is obtained from the previous one by making the following replacements:

$$Y_{ud}^L \leftrightarrow Y_{ud}^R \right) Y_{uu} \leftrightarrow Y_{dd}, \ m_u \leftrightarrow m_d$$

B. 2 Bosonic Loops

Diagram 2.3

$$M_{2,3} = \frac{e\alpha}{2\pi} g_{H^+ s_k s_h} g_{A s l} g_{W + s_j s_i} C_1(m_{A}^2, m_{H^\pm}^2, m_{W}^2, m_{S_j}^2, m_{S_i}^2, m_{S_k}^2) \right) (B.2)$$

The couplings are summarized in the following table:
Diagram 2.4

\[ M_{2.4}[h] = -\frac{e\alpha c_{\beta\alpha}^{-2}}{16\pi s_{W}^{3}} \left\{ -4B_{0}(m_{H^{\pm}}^{2}, m_{h}^{2}, m_{W}^{2}) + [2(-m_{A}^{2} + m_{H^{\pm}}^{2} - 2m_{A}^{2}) - 4p_{W}^{2}]C_{0}[h] \\
+3(-m_{A}^{2} + m_{H^{\pm}}^{2}) - 4p_{W}^{2}]C_{1}[h] + [4(-m_{A}^{2} + m_{H^{\pm}}^{2}) - 4p_{W}^{2}]C_{2}[h] + 4C_{00}[h] \\
+\left[m_{H^{\pm}}^{2} + 3m_{A}^{2} - p_{W}^{2}\right]C_{11}[h] - 2[m_{H^{\pm}}^{2} - m_{A}^{2}]C_{12}[h] \right\} \]

(B.3)

\[ M_{2.4}[H] = M_{2.4}[h][c_{\beta\alpha}^{-2} \rightarrow s_{\beta\alpha}^{-2}, m_{h} \rightarrow m_{H}, h \rightarrow H] \]

(B.4)

Where the arguments of \( C_{i} \) and \( C_{ij} \) are given as follows:

\[ [C_{i}, C_{ij}][S] = [C_{i}, C_{ij}](m_{A}^{2}, m_{H^{\pm}}^{2}, p_{W}^{2}, m_{Z}^{2}, m_{S}^{2}, m_{W}^{2}) \]

Diagram 2.5

\[ M_{2.5}[h] = -\frac{e\alpha c_{\beta\alpha}^{-2}}{16\pi s_{W}^{3}} \left\{ \left\{ B_{0}(m_{H^{\pm}}^{2}, m_{W}^{2}, m_{h}^{2}) + B_{1}(m_{H^{\pm}}^{2}, m_{W}^{2}, m_{h}^{2}) + [p_{W}^{2} - 2m_{H^{\pm}}^{2}]C_{1}[h] \\
+2C_{00}[h] + \left[m_{H^{\pm}}^{2} - (p_{W}^{2} - m_{A}^{2})\right]C_{11}[h] - \left[p_{W}^{2} - m_{A}^{2} + m_{H^{\pm}}^{2}\right]C_{12}[h] \right\} \]

(B.5)

\[ M_{2.5}[H] = M_{2.5}[h][c_{\beta\alpha}^{-2} \rightarrow s_{\beta\alpha}^{-2}, m_{h} \rightarrow m_{H}, h \rightarrow H] \]

(B.6)

\[ M_{2.5}[A] = M_{2.5}[h][c_{\beta\alpha}^{-2} \rightarrow -1, m_{h} \rightarrow m_{A}, h \rightarrow A] \]

(B.7)

Where the arguments of \( C_{i} \) and \( C_{ij} \) are as follows:

\[ [C_{i}, C_{ij}][S] = [C_{i}, C_{ij}](m_{A}^{2}, m_{H^{\pm}}^{2}, p_{W}^{2}, m_{H^{\pm}}^{2}, m_{W}^{2}, m_{S}^{2}) \]
Diagram 2.6

\[ M_{2.6}[h] = \frac{e\alpha c_{\beta\alpha} - m_W}{8\pi c_W^2} g_{h^0 H + H^-} (2C_0[h] + C_1[h]) \] (B.8)

\[ M_{2.6}[H] = M_{2.6}[h][c_{\beta\alpha} \rightarrow -s_{\beta\alpha}, h \rightarrow H] \] (B.9)

Where \( C_0 \) and \( C_1 \) have the same arguments as follows:

\[ [C_0, C_1][S] = [C_0, C_1](m_A^2, m_H^2, p_W^2, m_Z^2, m_S^2, m_W^2) \]

Diagram 2.7

\[ M_{2.7}[h] = -\frac{e\alpha (c_W^2 - s_W^2)c_W^2}{16\pi s_W^3 c_W^2} \{ B_0(m_H^2, m_Z^2, m_{H^\pm}^2) + B_1(m_H^2, m_Z^2, m_{H^\pm}^2) + [p_W^2 - m_H^2 - m_{H^\pm}^2]C_1[h] + 2C_0[h] + [-p_W^2 + m_A^2 + m_{H^\pm}^2]C_1[h] \}
\[ -[p_W^2 - m_A^2 + m_{H^\pm}^2]C_1[h] \] (B.10)

\[ M_{2.7}[H] = M_{2.7}[h][c_{\beta\alpha} \rightarrow s_{\beta\alpha}, h \rightarrow H, m_h \rightarrow m_H] \] (B.11)

The arguments of \( C_i \) and \( C_{ij} \) are given by:

\[ [C_i, C_{ij}][S] = [C_i, C_{ij}](m_A^2, m_H^2, p_W^2, m_Z^2, m_S^2, m_{H^\pm}^2) \]

Diagram 2.8

\[ M_{2.8}[h] = \frac{e\alpha s_{\beta\alpha} - m_W}{8\pi s_W^2} g_{h^0 A^0 A^0} (2C_0[h] + C_1[h]) \] (B.12)

\[ M_{2.8}[H] = M_{2.8}[h][s_{\beta\alpha} \rightarrow c_{\beta\alpha}, h \rightarrow H, g_{h^0 A^0 A^0} \rightarrow g_{h^0 A^0 A^0}] \] (B.13)

Where \( C_0 \) and \( C_1 \) have the same arguments:

\[ [C_0, C_1][S] = [C_0, C_1](m_A^2, m_H^2, p_W^2, m_Z^2, m_A^2, m_W^2) \]

Diagram 2.9

\[ M_{2.9}[h] = \frac{e\alpha s_{\beta\alpha} - m_W}{8\pi s_W^2} g_{h^0 H^+ H^-} (2C_0[h] + C_1[h]) \] (B.14)

\[ M_{2.9}[H] = M_{2.9}[h][s_{\beta\alpha} \rightarrow c_{\beta\alpha}, h \rightarrow H, g_{h^0 H^+ H^-} \rightarrow g_{h^0 H^+ H^-}] \] (B.15)

Where \( C_0 \) and \( C_1 \) have the same arguments:

\[ [C_0, C_1][S] = [C_0, C_1](m_A^2, m_H^2, p_W^2, m_W^2, m_H^2, m_S^2) \]
Again the diagram:

\[ M_{2.10}[Z] = \frac{-\alpha(c_W^2 - s_W^2)m_W}{8\pi c_W^2}g_{A^0 H^+ G^-}(2C_0[Z] + C_1[Z]) \quad (B.16) \]

\[ M_{2.10}[\gamma] = \frac{\alpha m_W}{4\pi}g_{A^0 H^+ G^-}(2C_0[\delta] + C_1[\delta]) \quad (B.17) \]

Again the \( C_0 \) and \( C_1 \) have the same arguments:

\[ [C_0, C_1][V] = [C_0, C_1](m_A^2, m_{H^\pm}^2, p_W^2, m_{W^\pm}^2, m_{H^\pm}^2, m_{\gamma}^2) \]

Here \( \delta \) is a small photon mass introduced to regularise the infrared divergence contained in the \( C_0 \) function.

Diagram 2.11

\[ M_{2.11}[Z] = \frac{\alpha(c_W^2 - s_W^2)}{16\pi s_W^3}(4B_0(m_{H^\pm}^2, m_Z^2, m_{H^\pm}^2) + [2p_W^2 + m_A^2 - m_{H^\pm}^2 + 2m_{W}^2]2C_0[Z] \]

\[ + [4p_W^2 + 3(m_A^2 - m_{H^\pm}^2)]C_1[Z] + [p_W^2 + m_A^2 - m_{H^\pm}^2]4C_2[Z] - 4C_{00}[Z] \]

\[ + [p_W^2 - m_{H^\pm}^2 - 3m_A^2]C_{11}[Z] + [m_{H^\pm}^2 - m_A^2]2C_{12}[Z]) \quad (B.18) \]

\[ M_{2.11}[\gamma] = M_{2.11}[Z]\left[\frac{(c_W^2 - s_W^2)}{s_W^2}\right] \rightarrow 2, m_Z \rightarrow \delta \quad (B.19) \]

All \( C_i \) and \( C_{ij} \) have the same arguments:

\[ [C_i, C_{ij}][V] = [C_i, C_{ij}](m_A^2, m_{H^\pm}^2, p_W^2, m_{W^\pm}^2, m_{H^\pm}^2, m_{\gamma}^2) \]

Diagram 2.12

\[ M_{2.12}[h, Z] = -\frac{\alpha c_{3\alpha}}{16\pi s_W c_W^2}(2B_0(m_A^2, m_Z^2, m_h^2) + B_1(m_A^2, m_Z^2, m_h^2)) \quad (B.20) \]

\[ M_{2.12}[H^+, W^+] = -\frac{\alpha}{16\pi s_W^3}(2B_0(m_A^2, m_W^2, m_{H^\pm}^2) + B_1(m_A^2, m_W^2, m_{H^\pm}^2)) \quad (B.21) \]

\[ M_{2.12}[H, Z] = -\frac{\alpha s_{3\alpha}}{16\pi s_W c_W^2}(2B_0(m_A^2, m_Z^2, m_H^2) + B_1(m_A^2, m_Z^2, m_H^2)) \quad (B.22) \]

Diagram 2.13

\[ M_{2.13}[Z] = \frac{\alpha(c_W^2 - s_W^2)}{16\pi s_W c_W^2}(B_0(m_{H^\pm}^2, m_Z^2, m_{H^\pm}^2) - B_1(m_{H^\pm}^2, m_{H^\pm}^2, m_Z^2)) \quad (B.23) \]

\[ M_{2.13}[\gamma] = -\frac{\alpha}{8\pi s_W}(B_0(m_{H^\pm}^2, m_{H^\pm}^2, \delta) - B_1(m_{H^\pm}^2, m_{H^\pm}^2, \delta)) \quad (B.24) \]
Diagram 2.14

\[ M_{2.14} = -\frac{e\alpha}{16\pi s_W^2} (2B_0(m^2_{H^+}, m^2_W, m^2_A) + B_1(m^2_{H^+}, m^2_W, m^2_A)) \]  

(B.25)

Diagram 2.15 and 2.16

For this kind of topology, it is clear that the amplitude is proportional to the W gauge boson momentum (Lorentz invariance) and consequently for the W on-shell the amplitude vanishes.

\[ M_{2.15} = 0, \quad M_{2.16} = 0 \]  

(B.26)

Appendix C: Charged and CP-odd Higgs bosons self-energies

This appendix is devoted to the self-energies of the charged and CP-odd Higgs bosons which are needed for the on-shell renormalisation scheme. The gauge bosons self energies γ-γ, γ-Z, Z-Z and W-W can be found in [27].

C.1 CP-odd Higgs boson self-energy

The CP-odd Higgs self-energy \( \Sigma^{AA} \) can be cast into three parts: i) fermionic part 2.20, ii) pure scalar part 2.21, 2.22, 2.23 and 2.26 iii) mixing of gauge boson and scalar 2.24, 2.25, 2.27 and 2.28 in such a way that:

\[ \Sigma^{AA}(q^2) = \Sigma_f^{AA}(q^2) + \Sigma_S^{AA}(q^2) + \Sigma_{VS}^{AA}(q^2) \]  

(C.1)

with

\[ \Sigma_f^{AA}(q^2) = -\frac{\alpha N_C}{\pi} Y_{f\bar{f}}^2 (A_0(m_f^2) + q^2 B_1(q^2, m_f^2, m_f^2)) \]  

(C.2)

\[ \Sigma_S^{AA}(q^2) = \frac{\alpha}{4\pi} (g_{hAA} B_0(q^2, m_A, m^2_h) + g_{HAA}^2 B_0(q^2, m_A, m^2_H) + g_{AG} B_0(q^2, m_A, m^2_Z) + g_{HAG} B_0(q^2, m^2_H, m^2_Z) + g_{H+GA} B_0(q^2, m^2_{H+}, m^2_Z) + g_{G+AG} B_0(q^2, m^2_G, m^2_Z) + \frac{\alpha}{8\pi} (-g_{AAAA} A_0(m^2_A) - g_{hAA} A_0(m^2_h)) \]  

(C.3)

\[ \Sigma_{VS}^{AA}(q^2) = -\frac{\alpha}{16\pi c_W^2 s_W^2} (c_{\beta\alpha}^2 A_0(m^2_Z) + (m_h^2 + q^2) B_0(q^2, m_h^2, m^2_Z) + 2q^2 B_1(q^2, m_h^2, m^2_Z) + s_{\beta\alpha}^2 A_0(m^2_Z) + (m_h^2 + q^2) B_0(q^2, m_h^2, m^2_Z) + 2q^2 B_1(q^2, m_h^2, m^2_Z) + c_W^2 A_0(m^2_W) + (m_{H+}^2 + q^2) B_0(q^2, m_{H+}^2, m_{H+}^2) + 2q^2 B_1(q^2, m_{H+}^2, m_{H+}^2)) \]  

(C.4)
C.2 Charged Higgs boson self-energy

The charged Higgs boson self-energy $\Sigma^{H^+H^-}$ can be cast into three parts: i) fermionic part 2.29, ii) pure scalar part 2.30, 2.31, 2.32 and 2.35 iii) mixing of gauge boson and scalar 2.33, 2.34 and 2.36 in such a way that:

$$\Sigma^{H^+H^-}(q^2) = \Sigma_f^{H^\pm H^\mp}(q^2) + \Sigma_s^{H^+H^-}(q^2) + \Sigma_{\nu S}^{H^+H^-}(q^2) \quad (C.5)$$

$$\Sigma_f^{H^\pm H^\mp}(q^2) = \frac{-\alpha N_C}{2\pi}(Y_{fJ}^L + Y_{fJ}^R)(A_0(m_f^2) + q^2B_1(q^2, m_f^2, m_f^2))$$

$$+ (m_f^2(Y_{fJ}^L + Y_{fJ}^R) + 2m_f^2m_fY_{fJ}^LY_{fJ}^R)B_0(q^2, m_f^2, m_f^2) \quad (C.6)$$

$$\Sigma_s^{H^+H^-}(q^2) = \frac{\alpha}{4\pi}(g_{AH+G}B_0(q^2, m_A^2, m_W^2) + g_{H^+H^-B_0}(q^2, m_W^2, m_{H^\pm}^2)$$

$$+ g_{H^+H^-B_0}(q^2, m_W^2, m_{H^\pm}^2) - \frac{\alpha}{8\pi}(g_{H^+H^-A_0}(m_A^2) + g_{H^+H^-A_0}(m_H^2)$$

$$+ g_{H^+H^-A_0}(m_H^2) + 2g_{H^+H^-A_0}(m_{H^\pm}^2) + \frac{2}{s_W^2}(m_{H^\pm}^2 - 2A_0(m_{H^\pm}^2))$$

$$\Sigma_{\nu S}^{H^+H^-}(q^2) = \frac{-\alpha}{16\pi s_W^2}(4s_W^2((m_{H^\pm}^2 + q^2)B_0(q^2, 0, m_{H^\pm}^2) - 2q^2B_1(q^2, m_{H^\pm}^2, 0))$$

$$+ (s_W^2 - s_W^2)^2(A_0(m_{H^\pm}^2) + m_{H^\pm}^2 + q^2)B_0(q^2, m_{H^\pm}^2, m_{H^\pm}^2)$$

$$- 2q^2B_1(q^2, m_{H^\pm}^2, m_{H^\pm}^2) + (A_0(m_A^2) + (m_W^2 + 4q^2)B_0(q^2, m_{H^\pm}^2, m_{H^\pm}^2)$$

$$+ 4q^2B_1(q^2, m_{H^\pm}^2, m_{H^\pm}^2) + c_{\beta\alpha}^2(A_0(m_{W}^2) + (m_{W}^2 + 4q^2)B_0(q^2, m_{W}^2, m_{W}^2)$$

$$+ 4q^2B_1(q^2, m_{W}^2, m_{W}^2) + s_{\beta\alpha}^2(A_0(m_{H}^2) + (m_{W}^2 + 4q^2)B_0(q^2, m_{H}^2, m_{H}^2)$$

$$+ 4q^2B_1(q^2, m_{H}^2, m_{H}^2)) \quad (C.8)$$
