Supplementary Table 1 for "The evolution of antibiotic resistance in a structured host population" - François Blanquart, Sonja Lehtinen, Marc Lipsitch, Christophe Fraser

List of the derivatives showing the impact of each parameter on the sensitive and resistant invasion fitness. Each derivative was decomposed into the sum of four terms (four columns) for better interpretation. The first column refers to the corresponding figure 2 panel (B to I). For simplicity, they are shown for a perfectly sensitive and resistant strain, $a_s \to \infty$ and $a_R = 0$, except for the derivatives with respect to $a_s$ and $a_R$.

The derivatives with respect to the treatment rate ($B, \partial \lambda_S / \partial \tau$ and $\partial \lambda_R / \partial \tau$) are calculated assuming all rates $\tau_i$ and $\tau^C_i$ are proportional to the same variable, and taking the derivative with respect to this variable.

The derivatives with respect to the treatment rate in colonised over that in uncolonised hosts ($F, \partial \lambda_S / \partial f^C$ and $\partial \lambda_R / \partial f^C$) are calculated keeping the fraction of treated hosts constant. For example, in a population where only the sensitive strain is present, in the full transmission scenario, the fraction of host under treatment is $N^0, 1, 2, 3, 1, 4, 5, 6, 7, 8/N^0, 1, 2, 0, 1, 3, 1, 4, 5, 6$.

Thus, to keep the fraction of treated host constant across values of $f^C$, we suppose that the ratio $\tau^C_i / \tau_i$ is constant across classes, that is $\tau^C_i = \tau_i f^C$, and we rescale $\tau_i \sim \frac{\beta_S}{f^C \beta_S - u_S f^C + u_S} \tau_i$ and $\tau^C_i \sim \frac{\beta_S}{f^C \beta_S - u_S f^C + u_S} \tau_i$ (the scaling is $\tau_i \sim \tau_i$ when $f^C = 1$). A similar approach can be used for $\partial \lambda_S / \partial f^C$, and in the no inter-class transmission scenario. In the no inter-class transmission scenario, when only the sensitive bacteria is present, the fraction of treated hosts in class $n$ is $\frac{\tau^C_n}{\omega_n} = \frac{u_{n,S}}{N_n \beta_{(n,S)-n}} \frac{\tau_n^C - \tau_n}{\omega_n}$. Thus, we rescale $\tau_n \sim \frac{\beta_{(n,S)-n}}{f^C \beta_{(n,S)-n} - N_n u_{n,S} f^C + u_{n,S}} N_n \frac{\tau_n^C - \tau_n}{\omega_n}$ and $\tau^C_n \sim \frac{\beta_{(n,S)-n}}{f^C \beta_{(n,S)-n} - N_n u_{n,S} f^C + u_{n,S}} N_n \frac{\tau_n^C - \tau_n}{\omega_n}$.

The derivatives $\partial \lambda_S / \partial \omega$ and $\partial \lambda_R / \partial \omega$ are first calculated directly (line 3 and 4 in the table below). Then, they are calculated while keeping the fraction of treated hosts constant ($H$). To do so, we assume $\omega_i$, $\tau_i$ and $\tau^C_i$ are all proportional to the same variable, and we calculate the derivative with respect to that variable.
| Fig. 2 panel | Derivative | Natural clearance | Colonisation of untreated | Colonisation of treated | Antibiotic clearance |
|--------------|------------|------------------|---------------------------|------------------------|---------------------|
| B            | $\partial \lambda_S / \partial \tau$ | 0 | $-\frac{\beta_S u_R}{\beta_R} \sum_{i=1}^{n} \frac{\tau_i (u_R + \omega_i) + \tau_i^c (\beta_R - u_R)}{\omega_i (\beta_R + \omega_i)}$ | 0 | $-\frac{\tau^c}{\tau}$ |
| B            | $\partial \lambda_R / \partial \tau$ | 0 | $\frac{\beta_S \tau^c}{\beta_S \tau}$ | $\frac{\beta_R}{\beta_S} \sum_{i=1}^{n} \frac{\tau_i u_S + \tau_i^c (\beta_S - u_S)}{\omega_i \tau}$ | 0 |
|              | $\partial \lambda_S / \partial \omega$ | 0 | $\frac{\beta_S u_R}{\beta_R \omega} \sum_{i=1}^{n} \frac{\tau_i (u_R \beta_R + 2u_R \omega_i + \omega_i^2 + \tau_i^c (\beta_S - u_S) (u_R + 2\omega_i))}{\omega_i (\beta_R + \omega_i)^2}$ | 0 | 0 |
|              | $\partial \lambda_R / \partial \omega$ | 0 | 0 | $-\frac{\beta_R}{\beta_S} \sum_{i=1}^{n} \frac{\tau_i u_S + \tau_i^c (\beta_S - u_S)}{\omega_i \omega}$ | 0 |
| C            | $\partial \lambda_S / \partial c$ | 0 | $\frac{u_R}{(1-c)^2} (1 + O(\tau))^c$ | 0 | 0 |
| C            | $\partial \lambda_R / \partial c$ | 0 | $-u_S - \tau^c$ | $-\sum_{i=1}^{n} \frac{\tau_i u_S + \tau_i^c (\beta_S - u_S)}{\omega_i \omega}$ | 0 |
| D            | $\partial \lambda_S / \partial a_R$ | 0 | $\frac{\beta_S u_R}{\beta_R} \sum_{i=1}^{n} \frac{\tau_i (u_R + \omega_i) (\tau_i u_R + \tau_i^c (\beta_R - u_R + \omega_i))}{\omega_i (\beta_R + \omega_i)^2}$ | $\frac{\beta_S (\beta_R - u_R)}{\beta_R} \sum_{i=1}^{n} \frac{u_R \beta_R + \beta_R \omega_i}{\beta_R} \tau_i u_R + \frac{\tau_i^c (\beta_R - u_R + \omega_i)}{\omega_i (\beta_R + \omega_i)^2}$ | 0 |

* $O(\tau)$ denotes a small complicated term of the same order as the treatment rates $\tau_i$ and $\tau_i^c$.

** in that case, the derivatives with respect to $\omega$ were calculated while keeping the fraction of treated hosts constant.
