HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
A note on the Cauchy problem for the 2D generalized Zakharov-Kuznetsov equations

Francis Ribaud\textsuperscript{*} \quad Stéphane Vento\textsuperscript{†}

Abstract. In this note we study the generalized 2D Zakharov-Kuznetsov equations \( \partial_t u + \Delta \partial_x u + u^k \partial_x u = 0 \) for \( k \geq 2 \). By an iterative method we prove the local well-posedness of these equations in the Sobolev spaces \( H^s(\mathbb{R}^2) \) for \( s > 1/4 \) if \( k = 2 \), \( s > 5/12 \) if \( k = 3 \) and \( s > 1 - 2/k \) if \( k \geq 4 \).

Keywords: KdV-like equations, Cauchy problem
AMS Classification: 35Q53, 35B65, 35Q60

1 Introduction

In this short note, we are interested with the Cauchy problem associated to the generalized Zakharov-Kuznetsov (gZK) equations

\[ u_t + \Delta u_x + u^k u_x = 0, \quad (1.1) \]

in two-dimensional space and for \( k = 2, 3, 4, \ldots \). These equations are natural multi-dimensional generalizations of the well-known generalized Korteweg-de Vries equations and have been derived in [8] when \( k = 1 \) to model the propagation of nonlinear ionic-sonic waves in a magnetized plasma.

We give sharp results concerning the well-posedness issue in standard Sobolev spaces \( H^s(\mathbb{R}^2) \) for suitable \( s \in \mathbb{R} \). This work follows and use similar technics as in the paper [6] where we proved that the 3D associated problem for \( k = 1 \) is locally well-posed in \( H^{1+}(\mathbb{R}^3) \).

Remark that the Sobolev spaces \( H^s(\mathbb{R}^2) \) are invariant by the natural rescaling of the equation as soon as \( s = s_k := 1 - 2/k \). Thus a natural question is whether (gZK) is well-posed in \( H^s(\mathbb{R}^2) \) for \( s > s_k \).

Theorem 1.1. For any $u_0 \in H^s(\mathbb{R}^2)$ with

\[
\begin{cases}
    s > 1/4 & \text{if } k = 2, \\
    s > 5/12 & \text{if } k = 3, \\
    s > 1 - 2/k & \text{if } k \geq 4,
\end{cases}
\]

there exist $T > 0$, a Banach space $X^s_T$ and a unique solution $u$ of the Cauchy problem associated to (1.1) with $u(0) = u_0$ such that $u \in X^s_T \cap C_b([0,T], H^s(\mathbb{R}^2))$. Moreover, the flow-map $u_0 \mapsto u$ is Lipschitz on every bounded set of $H^s(\mathbb{R}^2)$.

This theorem improves the recent works of Farah, Linares and Pastor in [2]-[4]-[5] where local well-posedness was obtained in $H^s(\mathbb{R}^2)$ for $s > 3/4$ if $2 \leq k \leq 8$ and $s > s_k$ if $k > 8$.

In view of the ill-posedness result obtained in [5], Theorem 1.1 is optimal (up to the end point) for $k \geq 4$ whereas in the particular cases $k = 2$ and 3, we still have a gap (respectively $1/4$ and $1/12$) compared with the scaling index. Concerning the end point $s = s_k$, local well-posedness could perhaps be reached by following the strategy developed in [7], but with a flow-map only continuous.

In a standard way our proof is based on a fixed point scheme applied to the Duhamel formulation of (1.1):

\[
u(t) = U(t)u_0 - \frac{1}{k + 1} \int_0^t U(t - t')\partial_x(u^{k+1})(t')dt'.
\]
2 Proof of the main result

2.1 The case \( k \geq 4 \)

As mentioned in the introduction, we want to take advantage of the \( L^4_T L^\infty_y \) linear estimate (1.4). This motivates the choice of our resolution space:

\[
X^s_T = \{ u \in C_b([0,T], H^s(\mathbb{R}^2)) : \| u \|_{X^s_T} < \infty \},
\]

where

\[
\| u \|_{X^s_T} = \| u \|_{L^\infty_T H^s_y} + \| \langle \nabla \rangle^{s+1/4} u \|_{L^\infty_T L^2_y} + \| \langle \nabla \rangle^{s-3/4} u \|_{L^4_T L^\infty_y}.
\]

Combining estimates (1.3)-(1.4) as well as the straightforward bound

\[
\| U(t) \varphi \|_{L^\infty_T L^2} \lesssim \| \varphi \|_{L^2},
\]

(2.1)

we get

\[
\| U(t) \varphi \|_{X^s_T} \lesssim \| \varphi \|_{H^s}.
\]

(2.2)

Note that the bound for the second term can be handled by using a low-high frequencies decomposition and next Bernstein inequality and estimate (1.3).

Having the linear part under control, it remains to deal with the integral term. It is not too hard to adapt the proofs of Propositions 3.5-3.6-3.7 in [6] to deduce

\[
\left\| \int_0^t U(t-t') \partial_x u^{k+1}(t') dt' \right\|_{X^s_T} \lesssim \| \langle \nabla \rangle^{s-1} \partial_x u^{k+1} \|_{L^1_T L^2_y}.
\]

(2.3)

The multi-dimensional version of Theorem A.13 in [3] applies and leads to

\[
\| \langle \nabla \rangle^{s-1} \partial_x u^{k+1} \|_{L^1_T L^2_y} \lesssim \| \langle \nabla \rangle^s u^{k+1} \|_{L^1_T L^2_y} \lesssim \| \langle \nabla \rangle^s u \|_{L^2_T L^{14/3}_y} \| u \|_{L^k_{7k/a} - L^7_{7k/2} y}. (2.4)
\]

We claim that the first product in the right hand side of (2.4) is controlled by the \( X^s_T \) norm of \( u \). Indeed, an interpolation argument shows that

\[
\| \langle \nabla \rangle^\alpha u \|_{L^p_y L^q_T} \lesssim \| u \|_{X^s_T}
\]

(2.5)

as soon as there exists \( \theta \in [0,1] \) such that

\[
\frac{1}{p} = \frac{1-\theta}{4}, \quad \frac{1}{q} = \frac{\theta}{2}, \quad \alpha = \left( s + \frac{7\theta - 3}{4} \right)^-.
\]
Taking $\alpha = s$, i.e. $\theta = 3/7^+$, it follows that
\[ \left\| \langle \nabla \rangle^s u \right\|_{L^7_y L^{14/3}_x} \lesssim \| u \|_{X^s_T}. \]
If we choose now $\theta = 4/7k$ in (2.5), we infer
\[ \left\| \langle \nabla \rangle^{(s-3/4+1/k)^-} u \right\|_{L^7_y L^{7k/2}_x} \lesssim \| u \|_{X^s_T}. \]
In order to get the desired contraction factor, we will interpolate this inequality with the bound
\[ \left\| \langle \nabla \rangle^{(s-3/4+1/k)^-} \right\|_{L^\infty_T L^2_y} \lesssim T^0 \left\| \langle \nabla \rangle^s u \right\|_{L^T_x L^2_y} \lesssim T^0 \| u \|_{X^s_T}. \tag{2.6} \]
This leads to
\[ \left\| \langle \nabla \rangle^{(s-3/4+1/k)^-} \right\|_{L^\infty_T L^{7k/2}_x} \lesssim T^0 \| u \|_{X^s_T}. \tag{2.7} \]
By virtue of the Sobolev inequalities, we get
\[ \left\| u \right\|_{L^{7k/6}_x L^{7k/2}_y} \lesssim \left\| \langle \nabla \rangle^{(1/4+1/k)^-} u \right\|_{L^\infty_T L^{7k/2}_y} \lesssim \left\| \langle \nabla \rangle^{(s-3/4+1/k)^-} \right\|_{L^\infty_T L^{7k/2}_y} \lesssim T^0 \| u \|_{X^s_T}. \tag{2.8} \]
for $s - 3/4 + 1/k > 1/4 - 1/k$, that is $s > s_k$. Gathering together (2.2)-(2.3)-(2.4)-(2.7) and (2.8) we infer that
\[ \| F(u) \|_{X^s_T} \lesssim \| u_0 \|_{H^s} + T^0 \| u \|_{X^s_T}^{k+1}, \]
where $F(u)$ denote the right hand side of (1.2). The well-posedness result follows then from standard arguments.

2.2 The case $k = 2$

The proof in this case follows the same lines as in the case $k \geq 4$, but with the $L^4_y$ norm replaced with a $L^2_y$ maximal in time norm. So let us endow the $X^s_T$ space with the norm
\[ \| u \|_{X^s_T} = \| u \|_{L^\infty_T H^s_x} + \| \langle \nabla \rangle^{s+1} u \|_{L^2_T L^2_y} + \| \langle \nabla \rangle^{s-3/4+} u \|_{L^2_L L^\infty_y}. \]
for any $s > 1/4$. Using now (1.5), we easily see that
\[ \|U(t)u_0\|_{X^s_T} \lesssim \|u_0\|_{H^s}, \quad (2.9) \]
and
\[ \left\| \int_0^t U(t-t')\partial_x u^3(t')dt' \right\|_{X^s_T} \lesssim \|\langle \nabla \rangle^{s-1} \partial_x u^3\|_{L^1_tL^2_y}. \quad (2.10) \]
Again, the fractional Leibniz rule yields the bound
\[ \|\langle \nabla \rangle^{s-1} \partial_x u^3\|_{L^1_tL^2_y} \lesssim \|\langle \nabla \rangle^s u\|_{L_x^{7/2}H_y^{14/3-}} \|u\|_{L_x^{14/5}L_y^{7+}}. \]
By interpolation, we get
\[ \|\langle \nabla \rangle^\alpha u\|_{L^p_xL^q_y} \lesssim \|u\|_{X^s_T} \quad (2.11) \]
for $\alpha, p$ and $q$ satisfying
\[ \frac{1}{p} = \frac{1-\theta}{2}, \quad \frac{1}{q} = \frac{\theta}{2}, \quad \alpha = \left(s + \frac{7\theta - 3}{4}\right)^- \]
for $0 \leq \theta \leq 1$. On one hand, we deduce that
\[ \|\langle \nabla \rangle^{s-1} \partial_x u^3\|_{L^1_tL^2_y} \lesssim \|u\|_{X^s_T}, \]
were we took $\theta = 3/7^+$ in (2.11). On the other hand, for $\theta = 2/7^-$, we infer
\[ \|\langle \nabla \rangle^{(s-1/4)^-} u\|_{L^{14/5}_xL^{7+}_y} \lesssim \|u\|_{X^s_T}, \]
which interpolated with (2.6) gives
\[ \|\langle \nabla \rangle^{(s-1/4)^-} u\|_{L^{14/5}_xL^{7+}_y} \lesssim T^{\theta^+}\|u\|_{X^s_T}. \]
This yields the desired result for $s > 1/4$.

### 2.3 The case $k = 3$

Now we consider the intermediate case $k = 3$. To prove our result, we define the resolution space as the intersection of the two previous spaces, i.e. equipped with the norm
\[ \|u\|_{X^s_T} = \|u\|_{L^\infty_TH^s_y} + \|\langle \nabla \rangle^{s+1} u\|_{L^\infty_xL^2_y} + \|\langle \nabla \rangle^{s-3/4^+} u\|_{(L^2_x \cap L^4_y)L^\infty_y}. \]
Actually we don’t require the full range \( L^2_x \cap L^4_x \) for the maximal in time norm, but only
\[
\|\langle \nabla \rangle^{s-3/4^+} u \|_{L^3_y L^{\infty}_x} \lesssim \|u\|_{X^s_T},
\]
(2.12)
According to (2.2)-(2.3)-(2.9)-(2.10) we have
\[
\|F(u)\|_{X^s_T} \lesssim \|u_0\|_{H^s} + \|\langle \nabla \rangle^s u^4\|_{L^1_y L^2_x}.
\]
Using again the Leibniz rule for fractional derivatives, we infer
\[
\|\langle \nabla \rangle^s u^4\|_{L^1_y L^2_x} \lesssim \|\langle \nabla \rangle^s u\|_{L^{21/4^+}_y L^{14/3^-}_x} \|u\|_{L^{63/17}_x L^{21/2^+}_y}^3.
\]
From an interpolation argument with (2.12), we easily check that both these norms are acceptable as soon as \( s > 5/12 \).
