INTRODUCTION

Hair is a primary characteristic of mammals. Hair is an important component of the body derived from ectoderm of skin. It is a protective appendage on the body and considered necessary structure of the integument along with sebaceous glands, sweat glands and nails. Everyone nowadays is realising that continuous exposure of harmful chemicals to the hair causes hair damage. Two drugs have been approved by the Food and Drug Administration for the treatment of hair loss due to androgenetic alopecia: topical minoxidil solution and oral finasteride. Major causes of hair loss are dihydrotestosterone (derivative of testosterone, a male hormone), poor blood flow, sebum emotional strains, stress and nervous disorders, ageing, infections, hormonal imbalance, polluted environment, toxic substances, injury and impairment, radiation. Shampoos are not only scalp cleaners, but indubitably act as preventing the hair shaft damage. Many scalp diseases are also treated by active ingredients that are added to the shampoo's formulations. The aim of this study is to evaluate the effectiveness of medicated shampoo against hair loss.

MATERIALS AND METHODS

A questionnaire consisting of 16 questions which evaluates the effectiveness of shampoo and oil usage were made. It is distributed to randomly chosen 100 people. Questions include frequency of washing hair, type of shampoo used, number of hairs that fall out each day, type and frequency of oil usage. Responses were recorded and analysed.

RESULTS AND DISCUSSION

In the results, 31% of people reported with no hair problems. 42% of people are washing their hair once every two or three days, 29% of people are washing once a day, 18% of people are washing every week, 11% of people are washing every other day. 37% of people have used medicated shampoo. 64.9% of people felt that the use of medicated shampoo controls the hair loss. 38% of people have used home remedies. 73% of people felt that the use of home remedies controlled hair loss. 50% of people prefer Acacia (Shikakai).21.1 % of people prefer aloe vera.23.7 % of people prefer Hibiscus.53 % of people prefer henna. 35% of people have used herbal shampoo. 77.1% of people felt that the use of herbal shampoo controls hair loss. 41% of people are unsure about the number of hairs that fall out each day. 18% of people reported that more than 100 hairs fall out each day.

Preference of hair washing

- Washing hair once every two or three days: 35%
- Washing once a day: 29%
- Washing every week: 20%
- Washing every other day: 14%

86% of people use coconut oil. 5% of people use tea green oil.

16.7% of people have oily type dandruff. 27% of people have dandruff. 55.6% of people have dry skin related problems.

36% of people reported that less than 100 hairs fall out each day. 41% of people are unsure about the number of hairs that fall out each day. 18% of people prefer herbal shampoo controls hair loss. 41% of people prefer aloe vera. 23.7% of people prefer hibiscus. 5.3% of people prefer henna. 35% of people have used herbal shampoo.

64.9% of people felt that the use of medicated shampoo controls hair loss. 50% of people prefer Acaicia (Shikakai). 21.1% of people prefer aloe vera. 23.7% of people prefer hibiscus. 52.3% more people use medicated shampoo than herbal shampoo.

41% of people reported that less than 100 hairs fall out each day. 36% of people have dandruff. 55.6% of people have dry skin related dandruff. 16.7% of people have oily type dandruff. 27% of people have fungal dandruff. 7% of people use castor oil. 36% of people oil their hair once a day. 29% of people oil their hair once a week. 16% of people oil their hair once two or three days. 19% of people oil their hair every other day.

By analysing the data, out of 31% of people with no hair problem, 35% of people are washing their hair once every two or three days, 29% of people are washing once a day, 20% are washing every week, 16% of people are washing every other day. 90% of people use coconut oil, 3% of people use tea green oil, 7% of people use castor oil. 36% of people oil their hair once a day, 29% of people oil their hair once a week, 16% of people oil their hair once two or three days, 19% of people oil their hair every other day. By interpreting the data, it can be concluded that people who prefer to wash their hair once every two or three days, prefer coconut oil and oil their hair once a day will experience no hair problem.

Coconut oil treats damaged hair by penetrating into hair fibres and acting as a moisturizer. When coconut oil is used as a presoak and post-wash and post-wash grooming product, it can reduce protein loss for both damaged and healthy hair. The lauric acid present in coconut oil has an affinity for hair proteins and because of its low molecular weight it can penetrate the hair fibres and prevent hair damage (6). Coconut oil also has a protective effect on chemically treated hair and hair treated with boiling water (7).

77.1% of people felt that the use of herbal shampoo controls the hair loss. Hence it can be concluded that the use of herbal shampoo controls hair loss.

**CONCLUSION**

Hair fall has become a major problem affecting the day to day activities. Frequent washing, blow drying, and dyeing your hair doesn’t destroy hair follicles or slow hair growth. However, these activities might make your current hair more brittle and fragile. But even if you damage a hair to the point of falling out, the same hair follicle will produce a new one to take its place. Now a days, both men and women take more care about hair problems. However, the significant use of medicated shampoo is not well known among many individuals. Hence the usage of medicated shampoo has become less. The choice of use of herbal shampoo, coconut oil, washing hair once every two or three days, oiling the hair once a day will prevent hair loss.
