Deoxygenative nucleophilic difluoromethylselenenylation of carboxylic acids and alcohols with BT-SeCF$_2$H$^+$

Matteo Tironi, Stefan Dix and Matthew N. Hopkinson$^*$$^\dagger$

The benzothiazolium salt BT-SeCF$_2$H is introduced as an efficient nucleophilic reagent for transferring difluoromethylselenyl groups onto organic molecules. SeCF$_2$H-containing selenoesters could be prepared upon deoxygenative substitution of readily available carboxylic acids, while silver catalysis allowed for efficient formation of (difluoromethyl)selenoethers, including the established electrophilic reagent BnSeCF$_2$H, directly from simple alcohols. To the best of our knowledge, these deoxygenative reactions represent the first reported nucleophilic difluoromethylselenenylation processes and thus open up new approaches to prepare valuable fluorinated compounds.

Introduction

Incorporating fluorine atoms and larger fluorine-containing functional groups is a tried and tested method for modulating the physical characteristics, biological activity and bioavailability of organic compounds.\textsuperscript{1} While well-established moieties such as the CF$_3$ group remain the most widely studied, the investigation of alternative fluorinated motifs that offer new possibilities for fine-tuning a molecule’s properties has become a major area of research.\textsuperscript{2} Organoselenium derivatives are fundamental for many biological functions, with selenium itself being an essential human micronutrient. Multiple selenoethers and selenoesters have accordingly attracted attention as potential therapeutics including as anticancer, anti-microbial and anti-viral agents.\textsuperscript{3} Selenium derivatives have also found applications in materials science\textsuperscript{4} and as versatile synthetic intermediates and catalysts, especially in oxidation and radical chemistry.\textsuperscript{5}

Combining the beneficial effects of fluorine substitution with organoselenium chemistry is an attractive approach for developing new functional (bio)molecules and materials. In recent years, significant research interest has focused on difluoromethylselenyl groups with the SeCF$_2$ moiety in particular being the subject of several studies.\textsuperscript{6} The difluoromethylselenyl group (SeCF$_2$H), on the other hand, has been less extensively investigated despite the well-known advantages partially fluorinated groups can offer over the corresponding perfluoro analogues (e.g. lipophilicity modulation, conformational effects, potential for hydrogen bonding).\textsuperscript{1,7} One reason for the lack of studies on the SeCF$_2$H group is the scarcity of synthetic routes to access it. Traditionally, indirect methods involving either insertion of difluorocarbene into a selenyl\textsuperscript{8} or formal nucleophilic difluoromethylation of a diselenide or cyanoselenide were employed.\textsuperscript{9} Direct difluoromethylselenenylation methods, in which SeCF$_2$H is installed as a whole group, do not require access to a selenium-containing precursor and allow SeCF$_2$H to be more readily studied alongside other fluorinated or non-fluorinated groups in structure–activity relationship (SAR) investigations. To date, however, only two reagent classes have been developed for direct difluoromethylselenenylation, with both serving as electrophilic or radical sources of the SeCF$_2$H group. The selenoether BnSeCF$_2$H (\textit{A}, Scheme 1a), which is itself produced only in low yield (13–36%) from BnSeCN, typically requires \textit{in situ} activation with SO$_2$Cl$_2$, with ClSeCF$_2$H serving as the actual difluoromethylselenenylation reagent.\textsuperscript{10}

Sulfonyl derivatives \textit{B} (Ar = Ph, $p$-Tol, Scheme 1a) react under milder conditions but are themselves synthesised from \textit{A}.\textsuperscript{11} While nucleophilic approaches are commonly employed to install the SeCF$_3$ group, to the best of our knowledge, no direct nucleophilic difluoromethylselenenylation method has been reported and there are currently no sources of the SeCF$_3$H anion available.

In 2019, we introduced 2-fluoroalkylchalcogenyl-substituted benzothiazolium salts as new reagents for installing fluorine-containing groups onto organic molecules. These BT-reagents can be prepared from relatively inexpensive starting materials and serve as practical sources of fluorooalkylchalcogenyl anions in synthetically appealing deoxygenative functionalisation reac-

acids.\textsuperscript{13,14} In addition to perfluoroalkyl derivatives such as 1-bis(benzothiazole)diselenide (Scheme 1a), the partially fluorinated analogue BT-SCF$_2$H could be successfully engaged in efficient deoxygenative difluoromethylthiolation reactions, providing (difluoromethyl)thioesters directly from carboxylic acids under mild conditions.\textsuperscript{13} Inspired by these results, we considered whether a (difluoromethyl)selenenyl anion could be accessed and, if so, whether it would act as a source of hitherto unexplored SeCF$_2$H anions for nucleophilic transformations. Herein, we report the successful synthesis of BT-SeCF$_2$H and its application as a reagent in unprecedented deoxygenative difluoromethylselenylation reactions (Scheme 1b). In addition to providing SeCF$_2$H-containing selenoesters from diverse carboxylic acids, silver catalysis allowed for the efficient synthesis of (difluoromethyl)selenoethers, including the established electrophilic reagent BnSeCF$_2$H (A), directly from unactivated alcohols.

### Results and discussion

#### Synthesis of BT-SeCF$_2$H

The synthesis of the new benzothiazolium salt BT-SeCF$_2$H is shown in Scheme 2. As for the other BT-reagents,\textsuperscript{12,14} a two-stage approach was envisaged proceeding through a neutral non-methylated benzothiazole intermediate. In the first step, bis(benzothiazole)diselenide \textsuperscript{15} was reduced to the corresponding selenol using NaBH$_4$. Following precipitation as the benzothiazolium chloride adduct, subsequent treatment with difluorocarbene generated under basic conditions from HCF$_2$OTf afforded the stable heteroarene 2, which could be isolated in 71\% yield upon column chromatography.

N-Methylation using methyl trifluoromethanesulfonate in CH$_2$Cl$_2$ at rt followed by precipitation with diethyl ether afforded BT-SeCF$_2$H in 96\% yield (overall yield of 68\% from 1, 35 mmol scale). BT-SeCF$_2$H was obtained as an off-white solid that required no further purification and is stable at least over several months when stored under air at room temperature.

#### Deoxydifluoromethylselenylation of carboxylic acids

With BT-SeCF$_2$H in hand, we sought to investigate its reactivity as a nucleophilic difluoromethylselenylating reagent. Inspired by the successful application of BT-SCF$_2$H in deoxygenative substitution reactions of carboxylic acids,\textsuperscript{13} BT-SeCF$_2$H (1.25 eq.) was first reacted with $n$-dodecanoic acid 3a and NaH (2 eq.) in THF. After 2 h at rt, we were delighted to observe clean formation of the (difluoromethyl)selenoester 4a in 45\% NMR yield. Selenoesters have found multiple applications as pharmaceutical candidates and synthetic reagents, but studies on difluoromethyl derivatives are lacking.\textsuperscript{16} In 2020, Wang and co-workers reported the only methodology for preparing (difluoromethyl)selenoesters; a radical process from aldehydes employing BnSeCF$_2$H (A) together with AIBN.\textsuperscript{17} The successful synthesis of (difluoromethyl)selenoesters using BT-SeCF$_2$H not only offers a complementary route starting from readily available carboxylic acids, it also represents the first reported nucleophilic difluoromethylselenylation process. Mechanistically, 4a likely results from an initial attack of the carboxylate to the 2-position of BT-SeCF$_2$H followed either by elimination of SeCF$_2$H$_2$ and subsequent addition/elimination to a 2-carboxybenzothiazolium intermediate, or alternatively through a concerted rearrangement process.\textsuperscript{‡} Increasing the amount of BT-SeCF$_2$H to 2 eq. and raising the reaction temperature to 45 °C improved the NMR yield to 81\%, with 4a being isolated in 78\% yield after column chromatography.

The scope of the deoxygenative difluoromethylselenylation reaction was then tested with a range of carboxylic acid derivatives (Scheme 3). A wide selection of aliphatic substrates

\textsuperscript{‡}A concerted mechanism proceeding through a 4-membered transition state was suggested by DFT studies on the related deoxydifluoromethylthiolation of carboxylic acids with BT-SCF$_2$H (see ref. 13).
could be successfully converted into the corresponding (difluoromethyl)selenoesters 4a-g in excellent yields (67–89%). Primary, secondary and even tertiary derivatives were all tolerated with 1-adamantanecarboxylic acid 3e providing selenoester 4e in 89% yield after column chromatography. Aromatic acids could also be successfully employed with these reactions being conducted at room temperature. A wide range of functional groups were tolerated with electron-neutral and comparatively electron-deficient moieties leading to the highest yields. The successful formation of the halogen-substituted products 4i-k is particularly noteworthy as these compounds could serve as SeCF₂H-containing building blocks amenable to subsequent functionalisation through cross-coupling. As demonstrated by the series 4o-q, substituents at the ortho-, meta- and para-positions were tolerated with little difference in the product yields observed.

Finally, the applicability of the deoxydifluoromethylselenylation method to the synthesis of SeCF₂H-containing pharmaceutical analogues was evaluated. A range of (difluoromethyl)selenoesters of common non-steroidal anti-inflammatory drugs (NSAIDs) could be prepared in excellent yields directly from the pharmaceutical compound (4t-w, 67–91%). The sulphonamide probenecid (3x), which is used to treat gout, could also be converted in 65% yield, while the naturally occurring fatty acid linoleic acid (3y) provided selenoester 4y in 92% yield.

Deoxydifluoromethylselenylation of alcohols

Having established the reactivity of BT-SeCF₂H as a nucleophilic reagent for the difluoromethylselenylation of carboxylic acids, we next turned our attention to the synthesis of selenoethers directly from aliphatic alcohols. Although more widely studied than (difluoromethyl)selenoesters, synthetic routes to alkyl-SeCF₂H compounds are largely limited to indirect methods that require pre-installation of a diselenide or cyanoselenide motif onto the substrate.⁹ To date, only a handful of direct difluoromethylselenylation reactions affording aliphatic products have been disclosed involving either nucleophilic attack onto in situ-activated BnSeCF₂H (A)¹⁰c, e or, in a very recent report from Zhang and co-workers, radical group transfer from PhSO₂SeCF₂H (B).¹¹c

In an initial test reaction, 4-nitrobenzyl alcohol 5a was reacted with BT-SeCF₂H (1.25 eq.) and NEt₂ (2 eq.) in MeCN at rt. After 2 h, ¹H and ¹⁹F NMR indicated the formation of the desired selenoether 6a in 42% yield. Increasing the amount of reagent and base and adding them in portions, as well as the optimisation of the temperature (−40 °C) and reaction time (4 h) allowed for an increase in the NMR yield of 6a to 65% with the pure product being isolated in 62% yield after column chromatography. At this stage, the generality of the method was tested with a selection of benzylic alcohols (Scheme 4). While a series of substrates bearing electron-withdrawing substituents such as −CN, −CF₃ and −CO₂Me provided the corresponding (difluoromethyl)selenoethers 6a-e in good yields, more electron-rich derivatives reacted only with low efficiency. Addition of these alcohols to the BT-reagent followed by elimination of −SeCF₂H would lead to a comparatively less electrophilic 2-alkoxybenzothiazolium intermediate. Nucleophilic substitution at this species is likely less favoured, and decomposition of the −SeCF₂H anion may outcompete product formation. With the aim of providing a stabilising
5g benzyl alcohols (obtained with a selection of electron-neutral and electron-rich
to an increase in NMR yield to 63%. Moreover, selenoether
alcohol (0.3 mmol), BT-SeCF₂H (2 eq.), NEt(iPr)₂ (2 eq.) added, stirred for
another 2 h at −40 °C. Isolated yields.

Scheme 4 Scope of the deoxydifluoromethylselenenylation of aliphatic
alcohols. Conditions: 5 (0.3 mmol), BT-SeCF₂H (2 eq.), NEt(lPr)₂ (2 eq.)
and, where indicated AgOTf (0.5 eq.), in MeCN (0.2 M), −40 °C, 2 h then
additional BT-SeCF₂H (0.25 eq.), NEt(lPr)₂ (2 eq.) added, stirred for
another 2 h at −40 °C. Isolated yields.

counter-cation, which could increase the lifetime of SeCF₂H
in the reaction medium, silver(i) salts were tested as catalytic
additives. While 4-bromobenzyl-containing selenoether 6f was
provided in only 31% yield under the standard conditions
described above, addition of Ag₂O (0.25 eq., 0.5 eq. of Ag⁺) led
to an increase in NMR yield to 63%. Moreover, selenoether 6f
was obtained in 81% NMR yield (67% isolated) when the reaction
was conducted in the presence of AgOTf (0.5 eq.).

Under these silver catalysis conditions, good yields were obtained with a selection of electron-neutral and electron-rich
benzyl alcohols (5g–k, up to 95% with 4-[(tert-butyl)benzyl
alcohol 5h), while the propargylic substrate 5l also reacted with
moderate efficiency (42% yield of 6l). Notably, the
method is also tolerant of terminal alkenes (6k), which
are known to be activated by silver(i). Finally, direct deoxytrifluoro-
methylselenenylation of benzyl alcohol was tested as a method
for preparing BnSeCF₂H (A). This electrophilic and radical
difluoromethylselenenylation reagent was introduced by Billard and co-workers in 2016[6a] and has been previously synthesised
from benzyl bromide in a two-step sequence involving nucleo-

Conclusions

In conclusion, BT-SeCF₂H has been introduced as a practical
reagent for hitherto unexplored nucleophilic difluoromethyl-
selenenylation reactions. Deoxygenative substitution of carboxylic acids provides [difluoromethyl]selenoesters, while silver cataly-
sis allows for the efficient synthesis of benzylic and propargylic
CF₂H-substituted selenoethers, including the established elec-
triphilic reagent BnSeCF₂H (A), directly from unactivated alcohols.
In opening up nucleophilic approaches, we believe this
work will inspire new routes towards difluoromethyl-
selenylated compounds and accelerate the study of the SeCF₂H
group in medicinal and materials chemistry.

Conflicts of interest

M.N.H. and S.D. are co-inventors on a European and
International Patent Application concerning the synthesis and
use of benzothiazolium reagents for installing fluorine-containing
functional groups (EP 3 677 576 A1; WO 2020141195 A1).
