Abstract

The plant may be considered a bio-synthetic laboratory, not only for the bio-chemicals such as carbohydrates, protein, and lipid that are utilized as food by man, but also for a multitude of compounds like glycosides, alkaloids, tannins etc, that exerts physiological effects. The compound those are responsible for therapeutic effects are usually the secondary metabolite. Bombex ceiba plant extracts have been evaluated for its antidiabetic properties by in-vitro inhabitation of alpha amylase and alpha glucosidase enzymes. The results so far obtained are encouraging by showing inhibition of these enzymes to a large extent. The water and ethanolic extracts of all the plant parts (thalamus and flower) show the highest inhibition as compared to DCM extracts.

The corresponding IC50 values are as thalamus DCM extract 36.22, ethanolic extract 35.32, and water extract 31.31 and the flower DCM extract 38.13, ethanolic extract 35.23, and water extract 33.00. The water, ethanolic and DCM extract of thalamus shows the concentration of sodium as 340, 310, 120 (ppm), potassium as 151, 180, 98 (ppm), lithium 31, 25, 11 (ppm) and that of calcium 110, 80, 89 (ppm). The water, ethanolic and DCM extract of flower shows the concentration of sodium as 300, 295, 95 (ppm), potassium as 149, 175, 81 (ppm), lithium 28, 20, 05 (ppm) and that of calcium 95, 75, 64 (ppm).

Introduction

Medicinal plants are the plants used for centuries as remedies for human diseases because they contain components of therapeutic value. About 80% of world population relies on the use of traditional medicine which is predominantly based on plant material.

Semal is called Kings of the Forest due to their massive size and showy flowers. It is a large deciduous tree with a straight cylindrical stem and horizontally spreading branches in whorls. This horizontally branching system in whorls, large size and the buttress at the base are the first seen characteristics to distinguish the species in the forest. The tree reaches up to 40 meter in height and 2 meter in diameter with the clear bole of 24-30 meter. Large trees are invariably buttressed at the base. Stem buttresses at the base and go up to 5-6 meter in height. Family: Braginaceae.

The Bombes ceiba possesses the active constituents which have a direct role in the management of diabetes mellitus as compiled by Rawat Mukesh and Parmar Namita [1]. Bombax ceiba Linn is a popular plant among native communities for its medicinal properties. The root is specially used for debility and impotence. A case study of a patient of involuntary weight loss without any detectable cause who was administered 1.5 g of B. ceiba root powder with milk for 24 weeks as the study carried out by S. K. Verma, Vartika Jain, and S. S. Katewa [2].

The study by Verma Rameshwar, Devre Kishor, Gangrade Tushar, Gore Siddharth, Gour Sudarshan [3] provides an insight on pharmacological, phytochemical properties and therapeutic benefits of the plant. A study undertaken by Bhushan Gandhare, Nihitil Soni, Hemant J. Dhongade [4] evaluated the antioxidant potential of bark of Bombax ceiba. The study by Roja Sri Donipati, Dr. M. V. Rama Rao and Dr. P. Subhasini [5], mentioned the microbial activity of Hexane, Methanol and chloroform extracts of flowers of Bombax ceiba for potential antimicrobial activity against various bacterial strains. The whole plant of Bombax ceiba used as traditional folk medicines for the treatment of anti-
Dysenteric, anti-diarrheal and anti-pyretic effects. Bombax ceiba Linn contains glycosides, tannins, flavonoid, b-sitosterol, lupeol as shown by Garg Nitika, Meena Ajay, Nainjaspreet [6].

Experiment work
A. Study area and plant collection: The Bombax ceiba flowers were collected from the FRI Dehradun. The Bombax ceiba flowers were shade dried and powdered in mixture. The powder of Bombax ceiba was used for experiment.

B. Extraction: 50 gms of each Bombax ceiba flower petals and the thalamus were weighed separately and accurately and then extracted in a Soxhlet Apparatus using thimble in order to get the pure form of extract. Various solvents were used depending upon their polarity index with increasing polarity (dichloromethane, ethanol and water).

a) Extraction A:

The sample was extracted with a particular solvent (viz dichloromethane) in a Soxhlet apparatus for a required period, till no extract was coming out of the sample, as being examined by taking a small amount of the extracted solvent from the main chamber of the Soxhlet apparatus over the watch glass for the appearance of precipitate. After the Extraction with dichloromethane, the extract solution was subjected to filtration to remove the residue from extract. The filtrate was then collected and evaporated to remove the volatile solvent to its 1/4 volume on water bath at a suitable temperature. The whole filtrate was then made in solid form (powdered) after being kept in an oven. The residue was collected, and subjected to further extraction process using ethanol as an extractants and by using water as an extractant decoction method was employed.

Flame Photometric Estimation of Na, K, Ca, Li

Flame Photometer Model - 1385 is a microprocessor based unit designed for medical application. The microprocessor provides automation in operation, measurement and end-result presentation. The unit can do the estimation of Sodium (Na+), potassium (K+), Lithium (Li+) and calcium (Ca+2) in single aspiration of a sample as per Whitney EN, Rolfes SR and St. Paul, MN - 1996.

A. Preparation of Various Extract

For preparation of water extract, 10 mg of the extracts of flower (DCM, Ethanol, and Water) were separately mixed with 10 ml of water. The extracts were completely exhausted by adding small quantities of water and filtering off every time in a successive manner, to yield final volume of 1 liter.

B. Preparation of Mixed Standard Solutions

Mixed standard solution of Na+, K+, Ca+2 and Li+2 were prepared by dissolving 254.2 mg of NaCl, 190.6 mg of KCl, 27.6 mg of CaCl2 and 184.3 mg of Li2SO4·H2O in 1 litre of water, so it gives 100 ppm (4.35 millimole/lit.) of Na+, 100 ppm (2.558 millimole/lit.) of K+, 100 ppm (2.495 millimole/lit.) of Ca+2 and 20 ppm (2.88 millimole/lit.) of Li+2 solution.

In-vitro inhibition of alpha-amylase and alpha-glucosidase by plant extracts

a) Inhibition of alpha amylose Enzyme

Alpha amylose is an enzyme that hydrolyses alpha-bonds of large alpha linked polysaccharide such as glycogen and starch to yield glucose and maltose. Alpha amylose inhibition activity was based on the starch iodine method that was originally developed by Laila A. Shekib, Samir M. El-Iraqui, Taissier M. Abo-Bakr [7]. In alpha amylose inhibition method 1ml substrate- potato starch (1% w/v), different concentrations of (Acarbose std drug / Plant extracts), 1ml of alpha amylose enzyme (1% w/v) and 2ml of acetate buffer (0.1 M, 7.2 pH) was added. NOTE- Potato starch solution, alpha amylose solution and drug solution was prepared in acetate buffer. The above mixture was incubated for 1 hr. Then 0.1 ml iodine-iodide indicator (635mg Iodine and 1gm potassium iodide in 250 ml distilled water) was added in the mixture. Absorbance was taken at 565 nm in UV-Visible spectroscopy. % inhibition was calculated and all the tests were performed in triplicate.

b) Inhibition of alpha-glucosidase Enzyme

The inhibitory activity was determined by incubating a solution of starch substrate (2 % w/v maltose or sucrose) 1 ml with 0.2 M Tris buffer pH 8.0 and various concentration of plant extract for 5 min at 37°C. The reaction was initiated by adding 1 ml of alpha-glucosidase enzyme (1U/ml) to it followed by incubation for 40 min at 35°C. Then the reaction was terminated by the addition of 2 ml of 6N HCl. Then the intensity of the colour was measured at 540nm [8].

c) Calculation of 50% Inhibitory Concentration (IC50)

The concentration of the plant extracts required to scavenge 50% of the radicals (IC50) was calculated by using the percentage scavenging activities at five different concentrations of the extract. Percentage inhibition (% I) was calculated by

\[ %I = \frac{(Ac-As)}{Ac} \times 100 \]

Where Ac is the absorbance of the control and As is the absorbance of the sample.

Observations and Result

i. Antidiabetic Property of Bombax ceiba plant extracts by inhibition of Alpha-amylase

The alpha-amylose inhibition of various plant extracts (flower and thalamus) extracts have been analyzed, and it was found that (water extract of thalamus) posses the highest inhibition potential followed by (ethanolic extract of thalamus). The percentage inhibition by plant extracts was found to be concentration dependent, percentage inhibition increases with the increase in the concentration of the plant extracts. The IC50 value was determined from the straight line graph. The IC50 value of all the plant extracts was found lesser than the reference...
compound (ACAROSE). The IC$_{50}$ value of various plant extracts follows the order (water extract of thalamus, ethanolic extract of thalamus, ethanolic extract of flower, DCM extract of thalamus, water extract of flower and DCM extract of flower) was found to be (32.95, 33.45, 33.85, 34.95, 35.15 and 35.65) respectively and are presented in (Tables 1-7).

### Table 1: Report of % inhibition of (alpha-amylase) by ACAROSE Standard for in vitro antidiabetic studies.

| S. No | Conc. of Sample (µg/ml) | % of Inhibition | IC$_{50}$ |
|-------|-------------------------|----------------|----------|
| 1     | 10                      | 35.12          |          |
| 2     | 20                      | 56.22          |          |
| 3     | 30                      | 74.23          |          |
| 4     | 40                      | 87.22          |          |
| 5     | 50                      | 93.97          |          |

### Table 2: Report of % inhibition of (alpha-amylase) by dichloromethane extract of flower.

| Conc. (µg/ml) | % Inhibition | IC$_{50}$ |
|---------------|--------------|-----------|
| 10            | 41.15        | 34.35     |
| 20            | 45.13        |           |
| 30            | 45.26        |           |
| 40            | 62.62        |           |
| 50            | 74.11        |           |

### Table 3: Report of % inhibition of (alpha-amylase) by Ethanolic extract of flower.

| Conc. (µg/ml) | % Inhibition | IC$_{50}$ |
|---------------|--------------|-----------|
| 10            | 17.16        | 32.15     |
| 20            | 47.25        |           |
| 30            | 56.19        |           |

ii. Antidiabetic Property of Various Extracts of *Bombax ceiba* by inhibition of (Alpha-glucosidase)

The *Bombax ceiba* plant extracts (Flower, Thalamus) have been analysed for the inhibition of (alpha glucosidase). The inhibition percentage was determined by Spectrophotometric method, and IC$_{50}$ value of all the plant extracts was determined. The lower IC$_{50}$ value indicates higher inhibition percentage. Among the all plant extracts the higher inhibition of alpha glucosidase inhibition was shown by (Water extract of flower) (Figures 1-11), and the IC$_{50}$ value as determined was found to be (36.2). The various plant extracts follow the order as per their inhibition potential as (water extract of flower, Ethanol Extract of Thalamus, water extract of thalamus, ethanolic extract of flower, DCM extract of flower and DCM extract of Thalamus). The percentage inhibition was found to be concentration dependent as the value of percentage inhibition increases correspondingly with the increase in the concentration of plant. The IC50 values of all the plant extracts have been found to be less than the reference compound (ACAROSE) (Tables 8-11) as per their percentage inhibition is taken into consideration. The IC50 value of various plant extracts is as (37.2, 36.82, 36.21, 37.3, 36.3 36.5) respectively for (DCM extract of flower; ethanolic extract of flower; water extract of flower; DCM extract of thalamus, ethanolic extract of thalamus and water extract of thalamus) (Tables 12-14).

iii. Metal Analyses by Flame Photometry

The metals which have been analysed by Flame Photometry include (Na, K, Li and Ca). In flame photometric analysis the elements analysed were burnt in presence of a given flame, the burnt element gives its characteristic coloured flame which is being analysed. All the metal concentrations are in (ppm) units and are tabulated in (Tables 15 & 16). The graph traced between metal ion concentration and plant extracts are shown in (Figures 12-16).

Table 15: Report of Flame Photometric Analysis of Metal Ions (in ppm) in (water, ethanolic and DCM) Flower Extracts of Bombax ceiba.

Discussion

Bombex ceiba plant extracts have been evaluated for its antidiabetic properties by in-vitro inhabitation of alpha amylase and alpha glucosidase enzymes. The results so far obtained are encouraging by showing inhibition of these enzymes to a large extent. The ethanol and water extracts of all the plant parts show the highest inhibition as compared to DCM extracts. The results obtained in this study are in line with the already obtained results for the antidiabetic potential of the plant. The polar solvent extracts being showing the highest potential against the alpha amylase and alpha glucosidase enzyme. The plant-based antidiabetic drugs or agents contains diversity of major active constituents such as phenols, Coumarins, lignans, terpenoids, carotenoids, glycosides, flavonoids, organic acids, alkaloids and xanthenes.

The highest concentration of potassium in stem, root and flower extracts were found to be 151, 180, and 98 ppm respectively. The concentration is within the limit set by FAO/WHO., 1984 [10]. It helps to promote efficient cognitive functioning by playing a significant role in getting oxygen to the brain as reported by Charlene J. Nuble 2005 [11]. The highest sodium ion concentration in the water, ethanolic and DCM extracts have been found to be 340, 310 and 120 ppm respectively and is within the limits of FAO/WHO., 1984 [10]. Sodium (Na) is the major extracellular cation and it plays a role in body fluid distribution.

Calcium strengthens your bones, particularly before you are 35 years old. Recommended Dietary Allowances 1989 [12]
mentioned that (99%) of calcium is found in bones and teeth. The calcium concentration in the stem, root and flower extracts have been found to be 110, 80 and 89 ppm respectively. The calcium concentration in the concerned plant extracts is sufficient if used as a supplement to overcome calcium related diseases.

The concentration of lithium in the Water, ethanolic and DCM extracts of Bombax ceiba were found to be (31, 25 and 11 ppm) respectively and is within the range set by FAO/WHO., 1984 [10].

Conclusion

The plant screened for phytochemical constituents seemed to have the potential to act as a source of useful drugs and also to improve the health status of the consumers as a result of the presence of various compounds that are vital for good health. The plant in reference showed that in addition to the ornamental purpose the ceiba species posses a good quality of phytochemicals which directly or indirectly help in the health maintenance of living beings. In conclusion it can be mentioned that plants bear a good potential to overcome every problem in a human body. The concerned plant possesses a high degree of value as source of antidiabetic drug. Every type of activity concerned with a plant is due to the phytochemicals which remain in built within these plants. The antidiabetic activity of the plant is due its potential in habit amylase productions, which in turn leads to non decomposition of higher carbohydrates into lower there by make blood glucose leval within required limit of the cell.

The presence of metal constituents in the plant species could be beneficial because these metals form the base for the development of higher moiety of phytochemical and the change in the state of higher phytochemicals is being overcome by the metal which lies at the central moiety of the higher phytochemicals. So concerned plant flowers should be consumed more and more to over various types of human disorders.

Your next submission with Juniper Publishers will reach you the below assets

• Quality Editorial service
• Swift Peer Review
• Reprints availability
• E-prints Service
• Manuscript Podcast for convenient understanding
• Global attainment for your research
• Manuscript accessibility in different formats
(Pdf, E-pub, Full Text, Audio)
• Unceasing customer service
