Abstract

We have researched the reality and the future of the consumer education to the elderly as well as elderly with slight dementia supported by the Grant of Japanese Ministry of Education, Culture, Sports, Science and Technology (MEXT). We executed the questionnaire investigation and the evaluation for the experiments. We report in this paper about those contents, the results of the mail survey and the future way of advancing our plan. The mail survey shows that (a) social welfare facilities will be short, therefore a consumption education for the elderly will be needed, and also (b) we should enrich the nursing care of the society and increase the number of people talented for welfare and nursing care.

Key words: Consumer education, elderly, slight dementia, questionnaire survey, Takizawa method

1. Introduction and Purpose

As many of us may know, aging of the society is occurring at a rapid pace in Japan. At the same time, the number of elderly in need of nursing care is steadily increasing, and it is presumed to rise to 5.2 million in 2025, and of it 2.3 million bedridden. In addition with the declining birthrates far beyond prospective, Japanese public finance is reaching the crisis of failure. This problem is now a haste and most important political subject in Japan.

With such background, we started a research with the grant of the MEXT. The purpose of our research is not a calculation of the elderly in need of nursing care, nor its countermeasure. But our research is on how to not make the elderly in need of nursing care in the first place, moreover, to propose a scheme or methods for the elderly to participate in society as consumers, and to do a fundamental research for those. With it becoming possible, we will build a sustainable life independent society, and are thinking to be able to assist the reactivation of economy.

Our research is composed of three substitute terms. The first is a questionnaire about the present consumption education to the elderly and its perspective to the social welfare facilities of over Japan. We will report the contents afterwards. The second is the improvement and the trial of new evaluation chart referring to the rehabilitation effect of daily life activity, and it has actually been tried out. And as for the third, we did the experiment of consumption education rehabilitation to the elderly who are being cared for at the day nursing and care facility. In this paper, we report the first substitute term.

2. Method: Questionnaire survey of the elderly consumer education

Mail survey was carried out for a month from March to April in 2003 to the social welfare facilities. It was mailed to about 2000 places. Also, the Internet survey with the same content was done for three months from July to September. The letters for request were sent to about 2000 facilities.

About the mail survey, almost 250 effective affirmative responses were collected. A collection rate is about 13%. This rate is not so sufficient statistically. However, we believe that respondents of our survey are concerned highly and therefore their opinions will give us effective suggestions to our subjects, that is, the future of the consumer education to the elderly and with slight dementia.

And as for the Internet survey, although about 2000 cooperation requests were sent after the establishment of the homepage, only 20 were collected. This could be said as a present condition of Japan according to the Internet survey. It is not certain whether or not Internet is used in 2000 facilities where the requests were mailed. Also, as the Internet survey, the number of questions might have been too many. This is one of our future examination subjects.
3. Results of mail survey
In this chapter we express the main results based the mail survey.

3.1 The perspective of nursing care and welfare
Figure 1 shows the survey result of the perspective of nursing care and welfare as the future social conditions.
First, we will pay attention to the consumption problem and the consumer education, which are our research subjects.
Regarding "5. The cases of elderly involved in a consumption trouble will increase more and more", about 80% replied to agree. It also shows high rate of around 75% according to "4. The social security-related expenditure will crunch, and enough nursing care will be unavailable in the facilities". Of course, these results show that the independence of elderly is needed. Also, we can rate this as the relation of 70% to "10. Education is needed for elderly to live independently as one consumer".
What else could be paid attention is nearly 90% affirmative opinion on "7. More people to carry nursing care and welfares are needed", or "8. Society nursing care facilities with autonomous communities (city and else) as the leader should be productive", which marked high rate of 85%.

3.2 Present condition of consumer education
Then, as a present condition, what are the social welfare facilities in track of the elderly consumption problems or consumption activities? The figure 2 will show its present condition.
As the term 8 shows, we can see that the 50% of the facilities are not mentioning about the consumption activities or shopping activities. Also, considering this subject, although 40 to 50% of them are listening and communicating with users or his/her family, the number of the facilities that are organizing the fact as a data is very low. Therefore, we may understand that at present condition, the facts gained from elderly consumption activities or shopping activities, are not organized enough as a data.

![Fig.1  Perspective and present conditions of nursing care and welfares](image-url)
8. Not mentioning about their consumption problem or buying activities in the facilities

Fig. 2 Present condition of keeping track of consumer problems or shopping activities of elderly

Fig. 3 The actual condition of consumer problems
3.3 Actual condition of consumer problems
At present, in Japan, consumption crimes targeting the elderly or females are occurring frequently, and are a big social problem. The figure 3 shows what was examined concerning the degree of 12 terms. Referring to the shopping activities or consumption problems of the elderly, the social welfare facilities keeping track on “2. Have bought something you don't need” and “12. Forgetting that you have already bought it, and bought the same one” are about 25 to 30%, but in present, we may know that there aren't so many in general.

But, as seen in the first question (referring to the state of society) from now on, it is expected that the cases of elderly being involved in consumption troubles will increase. Furthermore, it is needed to observe closely the fact that the socioeconomic factor such as business conditions and social crimes are related.

3.4 Need of perspective consumer education
The figure 4 is a survey result about the need of perspective consumption education. Although present execution conditions according to the same term is also researched, the truth is that in any of the terms they are hardly being carried out. As we can see about 40% in either term that it is hard to determine now.

"Want to carry it out" or "Will examine" are generally few, and except for "2. Personal experience" that was 20%, are mostly about 10 to 15 %. Also, regarding to "7. Game using computers", it is only 5% with "want to carry it out" and "will examine" together.

From the fact that the "Consumption educations are needed" was about 70% in the first question, it can be focused on the point that none of the ideas has become specific about concrete education methods or means.

3.5 Correspondence of dementia
By this investigation, related questions were done to the slight dementia too, but the figure 5 is a part of it. By the way, the main measures for determination of dementia are Hasegawa method and of nursing care insurance.

The execution rate of the "mental training" is 17%. And the present condition, the actual work on the consumption problems and its countermeasure or education is rarely done comparing with the cases of general elderly.

3.6 About Takizawa method and motivative exercise
We investigated about both the degree of recognition and the degree of concern of the Takizawa method and motivative exercise as a related research.

Fig.4 Need of perspective consumer education
The figure 6 shown below is a result about the degree of recognition. Until now, we verified the validity of the Takizawa method and motivative exercise. We can confirm that the degree of recognition is very low through this result of investigation. The degree of recognition for anyone of "the validity", "the effect of the walker with the sled" and "physical therapist of 1 to many patients" doesn't meet 10%, either.

On the other hand, as for the degree of the concern (fig.7), when we put "It is a little interested." together "It is interested." then it is about 50%. The person in charge of the rehabilitation spot did not satisfy with the present condition but expected the method of the new rehabilitation as to another our research.

From this, we want to continue the activities for the diffusion of the Takizawa method and motivative exercise.

Takizawa Program in Fig. 6 means Takizawa method.

Fig.7  Degree of concern of the Takizawa method and motivative exercise
3.7 Results of the mail survey

Putting together the results of the questionnaire survey, we can state as follows:

1. Considering the future state of society, with the crunch of social security-related expenditure as its reason, social welfare facilities will be short.

2. Therefore, a consumption education for the elderly to live independently will be needed.

3. Also, we should enrich the nursing care of the society (neighborhood association), and increase the number of people talented for welfare and nursing care.

4. However, at present, at the nursing care and welfare facilities, it can’t be said that education for elderly be done, and the truth is that concrete ideas in perspective are in short.

5. People of the facility thought it as a future examination subject. (It can be said that it is harder for the elderly with dementia.)

4. Consideration: A future plan

We expect continuing fosterage from MEXT and other related organizations for a continuation research. And in such condition, we are thinking of continuing the research in the following aspects:

The present condition of consumption education for elderly in Japan is as mentioned above, but we would like to compare and research this result with the present condition of the United States of America and other countries. Also, we would like to investigate on advanced education practices, too.

Moreover, it is also a subject to develop consumption education methods or programs as a practical matter based on the result of the trial in this research about the consumption education proceeded.

Furthermore, we wish to propose a better method in verifying the result. To reach the goal, our plan is to promote the activities of more academic conferences locally, nationally and internationally in order to gain understanding, knowledge, cooperation and collaboration with our own system and with other countries.
