Abstract

Objectives: Basal cell carcinoma is the most common malignancy in the Caucasian race and is a serious health problem with its ever-increasing incidence and high cost. Although the treatment is surgical, some elderly patients do not accept surgical intervention. In this case, non-surgical treatments come into prominence. The Hypericum perforatum (HP) / St. John's Wort plant has been used in the treatment of many diseases for centuries among local people. Here, we aimed to elucidate the effect and molecular mechanism of the HP plant on BCC cells.

Methods: Human BCC cell lines TE 354.T were acquired from ATCC®, then were cultured in Dulbecco’s Modified Eagle’s Medium. BCC cells were seeded at a concentration of 2x10⁶ cells in each flask (n=12). After incubation, while six of the flasks were applied with a 0.8% HP extract and 99.2% medium for 48 hours, no application was made to the control group. The effects of HP on mitochondrial mediated intrinsic and extrinsic apoptotic pathway agents, cell cycle G2/M checkpoint kinases and inflammatory mediators were investigated in BCC cancer cells. The expression and activities of these mediators in both groups were evaluated by ELISA test.

Results: It was determined that HP extract treatment increased the expression of apoptotic proteins (AIF, GADD153, GRP78, caspase-3, Bax) and cell cycle G2/M checkpoint kinase (Wee1), though it reduced antiapoptotic protein (Bcl-2) and inflammatory mediators (iNOS, COX-2, cPLA2, NFkB) in BCC cell lines.

Conclusion: HP extract can support routine chemotherapy on BCC cells with its apoptotic, anti-inflammatory and anti-cancer effect, and may be a beacon of hope in reducing resistance to chemotherapeutic drugs in the treatment of BCC.

Keyword: Hypericum perforatum; St. John’s wort; Human basal cell carcinoma; Apoptotic; Anti-inflammatory effect.

İnsan Bazal Hücreli Karsinom TE 354.T Hücre Hattında Hypericum Perforatum Ekstraktının Apoptotik ve Antiinflamatuvar Etkileri

Öz

Amaç: Bazal hücreli karsinom (BHK), beyaz ırkta en sık görülen malignitedir ve sürekli artan insidansı ve yüksek maliyeti ile ciddi bir sağlık problemidir. Tedavisi cerrahi olsa da bazı yaşlı hastalar cerrahi müdahaleyi kabul etmemektedirler. Bu durumda ameliyatı olmayan tedaviler ön plana çıkmaktadır. Hypericum perforatum (HP)/ Sarı Kantaron bitkisi halk arasında yüzyıllar boyunca pek çok hastalığın tedavisinde kullanılmaktadır. Bu çalışmada, HP bitkisinin insan BCC hücreleri üzerindeki etkisinin ve moleküler mekanizmalarının aydınlatılması amaçlanmıştır.

Yöntemler: İnsan BHK hücre hatları TE 354.T, ATCC®den elde edildi. Daha sonra Dulbecco Modifiye Eagle ortamında kültive edildi. BHK hücreleri, her bir flaskta (n = 12) 2x10⁶ hücre konsantrasyonunda üretildi. İnkübasyondan sonra, flasklardan 6'sına 48 saat boyunca %0.8 HP ekstresi ve % 99.2 medyum ile uygulanırken, kontrol grubuna herhangi bir uygulama yapılmadı. HP’nin BHK kanser hücrelerinde mitokondriyal aracılı intrinsik ve ekstrinsik apoptotik yol ajanları, hücre döngüsü G2 / M kontrol noktasını kinaz ve inflamatuar mediyatörler üzerindeki etkileri araştırıldı. Her iki gruptaki mediatörlerin ekspresyonu ve aktiviteleri ELISA testi ile değerlendirildi.

Bulgular: HP ekstresi tedavisinin BHK hücre hatlarında, apoptotik proteinlerin (AIF, GADD153, GRP78, kaspaz -3, Bax) ve hücre döngüsü G2 / M kontrol noktasını kinaz ve inflamatuar mediyatörler üzerindeki etkileri artırıldığı, buna karşılık antiapoptotik proteini (Bcl-2) ve inflamatuar mediyatörler (iNOS, COX-2, cPLA2, NFκB) azalttığı belirlendi.

Sonuç: HP ekstresi, apoptotik, antiinflamatuvar ve anti-kanser etkisi ile BHK’da rutin kemoterapiyi destekleyebilir ve BHK tedavisinde kemoterapötik ilaçlar ile karşılaşılan direnç azaltılabilir.

Anahtar kelimeler: Hypericum perforatum; Sarı Kantaron; İnsan bazal hücre karsinomu; Apoptotik; Anti-inflamatuvar etki.

INTRODUCTION

Basal cell carcinoma is the most common malignancy in in the Caucasian race. The American Cancer Society reports that 8 out of 10 skin cancers are diagnosed as BCC. Treatment is usually provided through surgical intervention, however, for BCC, when the operation is not possible, a non-surgical approach is considered. In this case, in addition to medical treatment, alternative and complementary treatments come into prominence1.

Hypericum perforatum (HP)/ St. John’s wort is a plant that has been used by humans for the treatment of various diseases for centuries. Hypericin, pseudohypericin, hyperforin, adhyperforin, hyperoside, quercetin, quercitrin, isoquercitrin, rutin, kaempferol, biapigenin and chlorogenic acid which are the main ingredients in plant extract, are important active compounds2,3. Studies have shown that some of the active ingredients contained in HP affect apoptosis in the cell4. It has been reported that apigenin induces Bax (proapoptotic Bcl-2-associated X protein) and Bcl-2 (B-cell lymphoma 2) in lung cancer line cell, leading to apoptosis5. Apoptotic pathways are important in terms of cancer evolution and chemotherapeutic resistance6,7. There are studies showing that agents regulating apoptotic pathways may provide a treatment option in cancer8. On the other hand, hypericin and hyperforin have been shown to reduce inflammatory prostaglandin E2 and COX-2 (cyclooxygenase-2) release from activated macrophages. It is reported that hypericin and hyperforin can be potential target drugs in cancer treatment due to their anti-inflammatory effect9.

In our study, the impact of HP extract on BCC cells and mediators of apoptotic pathways was investigated. In BCC cells incubated with HP extract, the expression profile of AIF (apoptosis-inducing factor), GADD153 (growth arrest and DNA damage 153), grp78 (glucose-regulated
protein 78), caspase-3, Bax, Bcl-2 and cell cycle G2/M checkpoint kinase Wee 1 and also inflammation mediators as iNOS (inducible nitric oxide synthase), COX-2, cPLA2 (cytosolic Phospholipase A2), NFkB (Nuclear Factor kappa B) was examined and compared with the control group.

METHODS

This study was carried out between June 26th, 2018 and November 15th, 2018 in the laboratory of Department of Pharmacology, Faculty of Medicine, Cukurova University, Turkey. No ethical approval was required for the cell line study, which complied with all relevant regulations.

Preparation of HP extract

HP was harvested in Pozantı city in Turkey in July. The aboveground parts (flowers, leaves and stem) were desiccated in the incubator at 24 hours. The desiccated portions were pulverized in a blender. This powder (40 g) was extracted by holding in a mixer overnight in 100 ml of 80% ethyl alcohol solution and then filtered with filter paper. The alcohol in the solution was evaporated by using rotary evaporator (IKA RV 10 basic, IKA company, Germany) in vacuo at 70°C with minor modifications as defined previously.10 Thus, the extract was obtained in the form of dry powder. HP extract was prepared in 0.8% concentration for experiments using Dulbecco’s modification of Eagle’s medium (DMEM) (GIBCO).11

Cell culture

The human BCC cell line TE 354.T (CRL-772TM) was obtained from American Type Culture Collection (ATCC®). BCC cells were grown on fetal bovine serum (Hyclone), 1% L-Glutamine (Hyclone), 1% Penicillin streptomycin (Hyclone) and DMEM.

Cell viability test

The cytotoxicity of the extract was determined by measuring dark blue formazan production in living cells using MTT (3-(4,5-dimethyl-2-thiazolyl)-2,5-diphenyl tetrazolium bromide, Sigma). Stock solution at 5 mg/ml concentration was prepared by dissolving MTT in phosphate buffered saline (PBS). BCC cells were seeded in 96-wells at a concentration of 1x104 cells in each well and kept overnight. It was incubated for 48 hours with 0.8% HP extract. Then, the MTT solution was added at a concentration of 0.5 mg/ml and kept at 37°C for 2 hours. Supernatants were elaborately separated and 200 µl DMSO (Sigma-Aldrich) was added to form the formazan crystals. The amount of formazan was measured using a plate in a 570 nm wavelength UV spectrophotometer (Rayto Life and Analytical Sciences, China).

Extract application and cell homogenization

BCC cells were seeded in 75 cm2 flasks at a concentration of 2x106 cells in each flask (n=12). After incubation at 37°C in 5% of CO2 environment, while six of the flasks were applied with a 0.8% HP extract and 99.2% medium for 48 hours, no application was made to the control group.

Cells were then washed with PBS and lysates were prepared on ice with RIPA Lysis Buffer (89900, Thermo Scientific) within fifteen minutes. It was centrifuged at 15000 rpm for twenty minutes. Resulting supernatants were taken into tubes and pellets were discarded. These supernatants were then used in the ELISA test.

Determination of protein amount

The amount of protein was measured using the ELISA test. The total amount of protein in homogenized cells was determined by the Bradford method. Bovine serum albumin and seven diluted standard solutions (1, 2, 3, 5, 7, 8 and 10 μg/ml) were prepared to compose a standard curve to compare the protein concentrations in the samples to be measured. 10 μl of each sample was taken and distilled water was added until the total volume reached 100 μl. 1 μl of Bradford solution was added to each
standard and sample, then mixed using a vortex. Protein amounts were then measured at 595 nm by using a spectrophotometer (Rayto Life Reader, China). Protein concentrations were measured against standard solutions in μg/μl and shown in the Prism program (GraphPad Software, USA).

ELISA test

Quantifications of AIF, GADD153, GRP78, Bax, cleaved caspase-3, Bcl-2, Wee 1, iNOS, COX-2, cPLA2 and NfκB proteins was carried out according to the manufacturer's instructions using ELISA kits obtained from Shenzhen Genesis Technology (Guangdong, China).

Statistical Analysis

The protein level results obtained from the BCC cell line with HP extract were determined as the HP treated group. The protein level results obtained from BCC cell line without HP were evaluated as the control group. Data were analyzed using R programming version 4.0.2. Unpaired Student's t test was used to compare parameters in the control and HP treated groups. All data were shown as "mean values ± standard deviation" and a p value of <0.05 was considered statistically significant.

RESULTS

Compared to the HP treated BCC cell culture line and the control group, in the group receiving HP treatment, it was determined that the amount of AIF, GADD153, GRP78, Bax, cleaved caspase-3, which has a role in the apoptotic pathway, were increased, as well as the cell cycle G2 / M checkpoint kinase protein Wee 1 was found to increase. The AIF, GADD153, GRP78, cleaved caspase-3, Bax and Wee 1 results of the HP treated group and the control group are expressed as mean ± standard deviation as shown in Table I.

However, it was determined that Bcl-2 expression, which is an antiapoptotic protein, decreased. The levels of inflammatory mediators iNOS, COX-2, cPLA2 and NfκB were also decreased. Moreover, HP treatment has been observed to reduce the viability of human BCC cells. All the findings were found statistically significant (p<0.05). The control group and the HP treated group results are expressed as mean ± standard deviation as Bcl-2, iNOS, COX-2, cPLA2, NfκB levels are presented in Table II. The schematic drawing of the effects of HP on BCC cell is shown in Figure 1.

Table I: The effect of Hypericum perforatum extract on apoptosis and cell cycle G2/M checkpoint kinase on human basal cell carcinoma cell lines.

|          | Control          | HP treated       | t    | p       |
|----------|------------------|------------------|------|---------|
| AIF      | 0.683 ± 0.052 pg/ml | 1.703 ± 0.220 pg/ml* | 33.81 | <0.001  |
| GADD153  | 0.188 ± 0.038 pg/ml | 2.193 ± 0.612 pg/ml* | 10.34 | <0.001  |
| GRP78    | 0.480 ± 0.063 pg/ml | 4.543 ± 0.816 pg/ml* | 15.69 | <0.001  |
| Caspase-3| 0.476 ± 0.419 pg/ml | 3.400 ± 1.380 pg/ml* | 6.411 | <0.001  |
| Bax      | 0.772 ± 0.310 pg/ml | 5.057 ± 2.844 pg/ml* | 4.736 | <0.001  |
| Wee 1    | 0.336 ± 0.028 pg/ml | 0.980 ± 0.080 pg/ml* | 24.03 | <0.001  |

Table II: The effect of Hypericum perforatum extract on antiapoptosis and inflammation on human basal cell carcinoma cell lines.

|          | Control          | HP treated       | t    | p       |
|----------|------------------|------------------|------|---------|
| Bcl-2    | 10.48 ± 2.550pg/ml | 5.250 ± 3.273pg/ml* | 3.986 | 0.002   |
| iNOS     | 1858 ± 470.5 IU/ml | 1358 ± 226.8 IU/ml* | 3.027 | 0.004   |
| COX-2    | 5904 ± 1697 pg/ml  | 3906 ± 1192 pg/ml* | 3.046 | 0.025   |
| cPLA2    | 6717 ± 673.5pg/ml  | 5600 ± 451.7pg/ml* | 4.355 | <0.001  |
| NfκB     | 8.267 ± 1.705ng/ml | 6.000 ± 0.894ng/ml* | 3.723 | 0.003   |

Results are presented as mean ± SD. Statistical analysis: Student t test (*: For control p<0.05).
Figure 1. Hypericum perforatum/ St. John’s wort extract affects mitochondrial-mediated intrinsic apoptotic pathway and extrinsic apoptotic pathway mediators, cell cycle G2/M checkpoint kinase and inflammatory mediators. It causes anti-inflammatory effects, apoptosis and DNA damage in human basal cell carcinoma cells.

DISCUSSION

BCC, a non-melanoma skin cancer, can generally be successfully treated with surgical excision\(^1\). However, a number of patients do not accept surgical intervention. In this case, non-surgical treatments come into prominence. In recent years, the cellular effects of plants used by the public on different types of cancer have been the subject of research\(^14\). Hypericum perforatum has biologically active ingredients such as hyperic3 and it is frequently used by the public in the treatment of various diseases\(^2\). More importantly, HP extract is known to affect apoptosis\(^4\) and is therefore chosen as the material of our study.

Apoptosis is a multi-step process that plays an important role in managing cell quantity and proliferation as part of normal progress. Apoptosis occurs spontaneously in malignant tumors and causes a decrease in tumor growth. Apoptotic pathways are extremely important in terms of chemotherapeutic resistance and cancer development and prognosis\(^5\)-\(^8\),\(^15\). Furthermore, anti-inflammatory agents have been determined to have anti-cancer target effects through the impact on iNOS, COX-2, cPLA2, NFkB etc.\(^16\)-\(^18\).

Bcl-2 is a protein family mainly related to the outer membrane of mitochondria and it has both proapoptotic (Bax) and antiapoptotic (Bcl-2) members. Caspase, is a protease family connected with extrinsic and intrinsic pathway, which is the mitochondrial pathway. Activated caspase-3 causes apoptosis and DNA fragmentation. When the cell is damaged through Bax, apoptosis gains resistance\(^19\). Wee 1 protein plays a role in cell division and increases cell apoptotic stimulation and stops cell division in G2/M phase. AIF which is another protein leads the cell to apoptosis by causing DNA damage by apoptotic stimulation. GADD153 protein is released from the endoplasmic reticulum in stress situations and causes DNA damage. GRP78 protein is located in the lumen of the endoplasmic reticulum and its amount increases and participates in apoptosis through apoptotic stimulation\(^20\).

It has been demonstrated in several studies that hypericin has antitumoral activity, which is one of the active components of the HP that we use in our study. It is believed that hypericin destroys tumor cells through both apoptosis and necrosis. The antitumoral effect of hypericin has been studied in melanoma, breast, colon, glioma, prostate, pituitary, nasopharyngeal, oesophagus cancers in vivo and in vitro, and its mechanism of action has been investigated\(^4\),\(^11\),\(^21\). Apigenin, a component of HP, has been shown to stop the cell cycle in many human cancer cell lines and induce apoptosis by activating both intrinsic and extrinsic apoptotic pathways of apoptosis\(^5\). Hyperforin, another substance in the composition of St. John’s wort, increased apoptosis by causing caspase-3
activation and bcl-2 protein expression inhibition in human myeloid cancer cells\textsuperscript{22}.

When we look at the studies of the HP extract on apoptosis, Martarelli et al.\textsuperscript{23}, emphasized that the HP causes a significant decrease in tumor growth and metastasis, and stated that this natural compound may be useful in the treatment of prostate cancer. In another study, HP has been reported to modulate apoptosis in splenic lymphocytes of mice given in two doses (30 mg and 100 mg) per day and partially decrease Fas-Ag expression and partially increase bcl-2 expression\textsuperscript{24}. In a study by Jang et al.\textsuperscript{25}, St. John's wort has been shown to have a protective effect against H2O2-induced apoptosis in human neuroblastoma cells. Yegani et al.\textsuperscript{26} evaluated the proapoptotic effect of HP extract in human colorectal adenocarcinoma cell line HT29. They detected that the Bcl-2 was significantly decreased and the Bax, cleaved-caspase 3, Wee1, GRP78, GADD153 and AIF were significantly increased in 0.8% concentration HP extract treated human colorectal adenocarcinoma cell line. Similarly in our study, when the BCC cell culture line was compared with the control group, it was observed that the levels of AIF, GADD153, GRP78, Bax, cleaved-caspase-3, which were assigned in the apoptotic pathway, and Wee 1 protein increased in the HP treated group. However, it was determined that Bcl-2 expression, which is an antiapoptotic protein, decreased; iNOS, COX-2, cPLA2, NFkB protein levels, which are inflammatory mediators, decreased as well.

CONCLUSION

The results of this study are expected to help elucidate the molecular mechanism of the HP plant's apoptotic and anti-inflammatory effects on non-melanoma skin cancer BCC cells. In our study, it was determined that HP extract induces apoptosis, reduces the level of mediators in the antiapoptotic pathway, and is also able to reduce inflammation, which is important in the development of cancer. Due to the detection of anti-cancer and anti-inflammatory effects of HP extract in human BCC cells, in treatment, it has been assumed that it may be a supportive agent for chemotherapeutics used routinely and reducing resistance formation. As a result, it has been concluded that HP extract, which has an impact on the BCC cell line, may be an effective agent in the treatment of BCC and that in-vivo studies are needed.
