CHARACTERIZATION OF MULTILINEAR MULTIPLIERS IN TERMS OF SOBOLEV SPACE REGULARITY

LOUKAS GRAFAKOS AND BAE JUN PARK

Abstract. We provide necessary and sufficient conditions for multilinear multiplier operators with symbols in $L^r$-based product-type Sobolev spaces uniformly over all annuli to be bounded from products of Hardy spaces to a Lebesgue space. We consider the case $1 < r \leq 2$ and we characterize boundedness in terms of inequalities relating the Lebesgue indices (or Hardy indices), the dimension, and the regularity and integrability indices of the Sobolev space. The case $r > 2$ cannot be handled by known techniques and remains open. Our result not only extends but also establishes the sharpness of previous results of Miyachi, Nguyen, Tomita, and the first author [13, 14, 15, 23], who only considered the case $r = 2$.

1. Introduction

Given a bounded function $\sigma$ on $\mathbb{R}^n$ the linear Fourier multiplier operator $T_\sigma$ acting on a Schwartz function $f$ is given by

$$T_\sigma f(x) := \int_{\mathbb{R}^n} \sigma(\xi) \hat{f}(\xi) e^{2\pi i \langle x, \xi \rangle} d\xi,$$

where $\hat{f}(\xi) := \int_{\mathbb{R}^n} f(x) e^{-2\pi i \langle x, \xi \rangle} dx$ is the Fourier transform of $f$. The classical Mikhlin multiplier theorem [22] states that $T_\sigma$ admits an $L^p$-bounded extension for $1 < p < \infty$ whenever

$$|\partial^\alpha_\xi \sigma(\xi)| \lesssim |\xi|^{-|\alpha|}, \quad \xi \neq 0$$

for all multi-indices $\alpha$ with $|\alpha| \leq [n/2] + 1$. Hörmander [19] refined this result, introducing the weaker condition

$$\sup_{j \in \mathbb{Z}} \|\sigma(2^j \cdot) \hat{\psi}\|_{L^2(\mathbb{R}^n)} < \infty$$

for $s > n/2$, where $L^2_s(\mathbb{R}^n)$ denotes the standard fractional Sobolev space of order $s$ on $\mathbb{R}^n$ and $\psi$ is a Schwartz function on $\mathbb{R}^n$ whose Fourier transform is supported in the annulus $1/2 < |\xi| < 2$ and satisfies $\sum_{j \in \mathbb{Z}} \hat{\psi}(\xi/2^j) = 1$ for $\xi \neq 0$. Calderón and Torchinsky [2] proved that if (1.1) holds for $s > n/p - n/2$, then $T_\sigma$ is bounded on $H^p(\mathbb{R}^n)$ for $0 < p \leq 1$. They also showed that $L^2_s$ in (1.1) can be replaced by $L^p_s$ for the $L^p$-boundedness, using a complex interpolation method, and their assumptions were weakened by Grafakos, He, Honzík, and Nguyen [10].

The multilinear counterparts of the Fourier multiplier theory have analogous formulations but substantially more complicated proofs. Let $m$ be a positive integer greater than 1; this
index will serve as the degree of the multilinearity of a Fourier multiplier. For a bounded function \( \sigma \) on \((\mathbb{R}^n)^m\) we define the corresponding \( m \)-linear multiplier operator \( T_{\sigma} \) by

\[
T_{\sigma}(f_1, \ldots, f_m)(x) := \int_{(\mathbb{R}^n)^m} \sigma(\vec{\xi}) \left( \prod_{j=1}^m \hat{f}_j(\xi_j) \right) e^{2\pi i \langle x, \sum_{j=1}^m \xi_j \rangle} d\vec{\xi}
\]

for Schwartz functions \( f_j \) on \( \mathbb{R}^n \), where \( \vec{\xi} := (\xi_1, \ldots, \xi_m) \) and \( d\vec{\xi} := d\xi_1 \cdots d\xi_m \). As a multi-linear extension of Mikhlin’s result, Coifman and Meyer [3] proved that if \( L \) is sufficiently large and \( \sigma \) satisfies

\[
|\partial_{\xi_1}^{\alpha_1} \cdots \partial_{\xi_m}^{\alpha_m} \sigma(\xi_1, \ldots, \xi_m)| \lesssim |\xi_1| + \cdots + |\xi_m|^{-1}
\]

for multi-indices \( \alpha_1, \ldots, \alpha_m \) satisfying \(|\alpha_1| + \cdots + |\alpha_m| \leq L \), then \( T_{\sigma} \) is bounded from \( L^{p_1} \times \cdots \times L^{p_m} \) to \( L^p \) for all \( 1 < p_1, \ldots, p_m \leq \infty \) and \( 1 < p < \infty \) with \( 1/p_1 + \cdots + 1/p_m = 1/p \).

This result was extended to \( p \leq 1 \) by Kenig and Stein [21] and Grafakos and Torres [18].

Let \( \Psi^{(m)} \) be the \( m \)-linear counterpart of \( \psi \). That is, \( \Psi^{(m)} \) is a Schwartz function on \((\mathbb{R}^n)^m\) having the properties:

\[
\text{Supp}(\hat{\Psi^{(m)}}) \subset \{ \vec{\xi} \in (\mathbb{R}^n)^m : 1/2 < |\vec{\xi}| \leq 2 \}, \quad \sum_{j \in \mathbb{Z}} \hat{\Psi^{(m)}}(\vec{\xi}/2^j) = 1, \quad \vec{\xi} \neq \vec{0}.
\]

Let \( (\vec{I} - \vec{\Delta})^{s/2} F = \left((1 + 4\pi^2 |\cdot|^2 + \cdots + |\cdot|^m |^2) \right)^{s/2} \hat{F} \) be a nice function on \((\mathbb{R}^n)^m\), where \( F^{\vee}(\vec{\xi}) := \hat{F}(\vec{\xi}) \) is the inverse Fourier transform of \( F \). For \( s \geq 0 \) and \( 0 < r < \infty \) we define the Sobolev space \( L^r_s((\mathbb{R}^n)^m) \) in terms of the finiteness of the norm:

\[
||F||_{L^r_s((\mathbb{R}^n)^m)} := ||(\vec{I} - \vec{\Delta})^{s/2} F||_{L^r((\mathbb{R}^n)^m)}.
\]

Tomita [27] was the first to obtain an \( L^{p_1} \times \cdots \times L^{p_m} \) to \( L^p \) boundedness for \( T_{\sigma} \) in the range \( 1 < p_1, \ldots, p_m, p < \infty \), under a condition analogous to (1.1) for the Sobolev space \( L^p_s((\mathbb{R}^n)^m) \). Grafakos and Si [17] extended this result to \( p \leq 1 \) using \( L^r \)-based Sobolev norms of \( \sigma \) for \( 1 < r \leq 2 \).

**Theorem A.** ([17]) Let \( 1 < r \leq 2, r \leq p_1, \ldots, p_m < \infty, 0 < p < \infty \), and \( 1/p_1 + \cdots + 1/p_m = 1/p \). Suppose that \( s > mn/r \).

If \( \sigma \) satisfies

\[
\sup_{j \in \mathbb{Z}} \left\| \sigma(2^j \cdot, \ldots, 2^j \cdot, m) \hat{\Psi^{(m)}} \right\|_{L^r_s((\mathbb{R}^n)^m)} < \infty,
\]

then we have

\[
||T_{\sigma}(f_1, \ldots, f_m)||_{L^p((\mathbb{R}^n)^m)} \lesssim \sup_{j \in \mathbb{Z}} \left\| \sigma(2^j \cdot, \ldots, 2^j \cdot, m) \hat{\Psi^{(m)}} \right\|_{L^r_s((\mathbb{R}^n)^m)} \prod_{i=1}^m \|f_i\|_{L^{p_i}(\mathbb{R}^n)}
\]

for functions \( f_1, \ldots, f_m \in \mathcal{S}(\mathbb{R}^n) \).

In the preceding theorem and in the rest of this paper, \( \mathcal{S}(\mathbb{R}^n) \) denotes the space of all Schwartz functions on \( \mathbb{R}^n \).

The standard Sobolev space in (1.3) in many recent multiplier results is replaced by a product type Sobolev space where the different powers of the Laplacian fall on different variables \( \xi_i \in \mathbb{R}^n \). For \( s_1, \ldots, s_m \geq 0 \) and a function \( F \) on \((\mathbb{R}^n)^m\) let

\[
(\vec{I} - \vec{\Delta})^{s_1/2} \cdots (\vec{I} - \vec{\Delta}_{s_m})^{s_m/2} F := \left((1 + 4\pi^2 |\cdot|^2 \right)^{s_1/2} \cdots (1 + 4\pi^2 |\cdot|^m |^2)^{s_m/2} \hat{F} \right)^{\vee}
\]
and for $0 < r < \infty$ and $\vec{s} := (s_1, \ldots, s_m)$, define
\[ \|F\|_{L^r_{\vec{s}}(\mathbb{R}^n)^m} := \|(I - \Delta)^{s_1/2} \cdots (I - \Delta)^{s_m/2} F\|_{L^r(\mathbb{R}^n)^m}. \]

Here $\Delta$ is the Laplacian acting in the $i$th variable and $s_i \geq 0$. For a function $\sigma$ on $(\mathbb{R}^n)^m$, throughout this work we will use the notation:
\[ L^r_{\vec{s}}(\mathbb{R}^n)^m \sigma := \mathop{\sup}_{j \in \mathbb{Z}} \|\sigma(2^j 1, \ldots, 2^j m)\|_{L^r_{\vec{s}}(\mathbb{R}^n)^m}. \]

Research work has also focused on boundedness properties of $T_\sigma$ under the assumption $L^r_{\vec{s}}(\mathbb{R}^n)^m \sigma < \infty$ for given $\vec{s}$. Under this assumption with $r = 2$, Fujita and Tomita [7] provided weighted estimates for $T_\sigma$. Miyachi and Tomita [23] obtained boundedness for bilinear multipliers (i.e., $m = 2$) in the full range of indices $0 < p_1, p_2 \leq \infty$ extending a result of Calderón and Torchinsky [2] to the bilinear setting; here Lebesgue spaces in the domain are replaced by Hardy spaces when $p_i \leq 1$. Multilinear extensions were later provided by Grafakos, Miyachi, and Tomita [13], Grafakos and Nguyen [15], Grafakos, Miyachi, Nguyen, and Tomita [14], but all these results were proved only in the case $r = 2$.

We review most of these results in one formulation:

**Theorem B.** ([13, 14, 15, 23]) Let $0 < p_1, \ldots, p_m \leq \infty$, $0 < p < \infty$, and $1/p_1 + \cdots + 1/p_m = 1/p$. Suppose that
\[ s_1, \ldots, s_m > n/2, \quad \sum_{k \in J} (s_k/n - 1/p_k) > -1/2 \]
for every nonempty subset $J$ of $\{1, \ldots, m\}$. If $\sigma$ satisfies $L^2_{\vec{s}}(\mathbb{R}^n)^m \sigma < \infty$, then we have
\[ \|T_\sigma(f_1, \ldots, f_m)\|_{L^p(\mathbb{R}^n)} \leq L^2_{\vec{s}}(\mathbb{R}^n)^m \sigma \prod_{i=1}^m \|f_i\|_{H^{p_i}(\mathbb{R}^n)} \]
for Schwartz functions $f_1, \ldots, f_m \in S(\mathbb{R}^n)$.

Here and in the sequel, $H^{p}(\mathbb{R}^n)$ denotes the classical real Hardy space of Fefferman and Stein [5]. This space is defined for $0 < p \leq \infty$ and coincides with $L^p(\mathbb{R}^n)$ for $1 < p \leq \infty$.

The optimality of (1.4) was also studied in [15, 14, 23] and indeed, if (1.5) holds, then we must necessarily have
\[ s_1, \ldots, s_m \geq n/2, \quad \sum_{k \in J} (s_k/n - 1/p_k) \geq -1/2 \]
for every nonempty subset $J$ of $\{1, \ldots, m\}$. However, this does not guarantee the validity of (1.5) in the critical case
\[ \min(s_1, \ldots, s_m) = n/2 \quad \text{or} \quad \sum_{k \in J} (s_k/n - 1/p_k) = -1/2 \quad \text{for some} \ J \subset \{1, \ldots, m\} \]
and recently, it was proved in Park [25] that (1.5) fails in the case (1.6) as well.

**Theorem C.** ([25]) Let $0 < p_1, \ldots, p_m \leq \infty$, $0 < p < \infty$, and $1/p_1 + \cdots + 1/p_m = 1/p$. Suppose that $\sigma$ satisfies $L^2_{\vec{s}}(\mathbb{R}^n)^m \sigma < \infty$ for $s_1, \ldots, s_m > 0$. Then (1.5) does not hold if
\[ \min(s_1, \ldots, s_m) \leq n/2 \quad \text{or} \quad \sum_{k \in J} (s_k/n - 1/p_k) \leq -1/2 \quad \text{for some} \ J \subset \{1, \ldots, m\}. \]
Therefore (1.4) is a necessary and sufficient condition for (1.5) to hold.

In this paper, we focus on the case $1 < r \leq 2$ and we prove necessary and sufficient conditions for bounded functions $\sigma$ on $(\mathbb{R}^n)^m$ that satisfy the Hörmander condition $L^{r,\Psi(m)}_\theta[\sigma] < \infty$ to be bounded multilinear multipliers. The case $r < 2$ was also considered in [11] but the results obtained there were non optimal. The characterization we provide is given in terms of explicit inequalities relating different relevant indices and provides generalizations for Theorems B and C, and an extension of Theorem A. The main result of this article is the following:

**Theorem 1.1.** Let $1 < r \leq 2$, $s_1, \ldots, s_m \geq 0$, $0 < p_1, \ldots, p_m \leq \infty$, $0 < p < \infty$, and $1/p_1 + \cdots + 1/p_m = 1/p$. Suppose that $\sigma$ satisfies $L^{r,\Psi(m)}_\theta[\sigma] < \infty$. Then the conditions

\begin{equation}
\tag{1.7}
s_1, \ldots, s_m > n/r \quad \text{and} \quad \sum_{k \in J} (s_k/n - 1/p_k) > -1/r'
\end{equation}

hold for every nonempty subset $J$ of $\{1, 2, \ldots, m\}$ if and only if

\begin{equation}
\tag{1.8}
\|T_\sigma(f_1, \ldots, f_m)\|_{L^p(\mathbb{R}^n)} \lesssim L^{r,\Psi(m)}_\theta[\sigma] \prod_{i=1}^m \|f_i\|_{L^{p_i}(\mathbb{R}^n)}
\end{equation}

for $f_1, \ldots, f_m \in S(\mathbb{R}^n)$.

The implicit constant in (1.8) depends only on the dimension $n$, the degree of multilinearity $m$, and the indices $p_j$, $s_j$, and $r$. Here $r' = r/(r - 1)$. We remark that, when $r = 2$, Theorem 1.1 coincides with Theorem B and C. Moreover, since

$s_1, \ldots, s_m > n/r$ implies $\sum_{k \in J} (s_k/n - 1/p_k) > -1/r'$ for all $J$ when $r \leq p_1, \ldots, p_m$,

and

$L^{r,\Psi(m)}_\theta[\sigma] \leq \sup_{j \in \mathbb{Z}} \|\sigma(2^j \cdot, \ldots, 2^j \cdot, \cdot, \cdot, \cdot, \cdot)\|_{L^r((\mathbb{R}^n)^m)}$ for $s \geq s_1 + \cdots + s_m$,

Theorem 1.1 also covers Theorem A and extends its range of indices to $0 < p_1, \ldots, p_m \leq \infty$.

1.1. **Necessary condition.** In order to prove the direction $(1.8) \Rightarrow (1.7)$ in Theorem 1.1, two different multipliers will be constructed based on an idea contained in [25]. However, the methods in [25] essentially rely on Plancherel’s theorem to obtain the upper bound of

$L^{2,\Psi(m)}_\theta[\sigma] = \sup_{j \in \mathbb{Z}} \left\| \left( \prod_{k=1}^m (1 + 4\pi^2 |x|^2)^{s_k/2} \right) \sigma(2^j \cdot, \ldots, 2^j \cdot) \right\|_{L^2((\mathbb{R}^n)^m)}$

and this cannot be applied in the case $1 < r < 2$ anymore.

To overcome this difficulty, we benefit from a recent calculation of Grafakos and Park [16] concerning a variant of the Bessel potentials that involve a logarithmic term. For any $0 < t, \gamma < \infty$ we define

\begin{equation}
\tag{1.9}
\mathcal{H}_{(t,\gamma)}(x) := \frac{1}{(1 + 4\pi^2 |x|^2)^{t/2}} \left( \frac{1}{1 + \ln (1 + 4\pi^2 |x|^2)} \right)^{\gamma/2}.
\end{equation}

We first observe that for any $t, \gamma > 0$

\begin{equation}
\tag{1.10}
\mathcal{H}_{(t,\gamma)}(x - y) \geq \mathcal{H}_{(t,\gamma)}(x) \mathcal{H}_{(t,\gamma)}(y)
\end{equation}
and
\[ \| \mathcal{H}(t,\gamma) \|_{L^p(\mathbb{R}^n)} < \infty \quad \text{if and only if} \quad t > n/p \quad \text{or} \quad t = n/p, \gamma > 2/p. \]

Moreover, it was shown in [16] that
\[ | \hat{\mathcal{H}}(t,\gamma)(\xi) | \lesssim t, \gamma, n \quad n/2 - |\xi|/2 \quad \text{for} \quad |\xi| > 1 \]
and when \(0 < t < n,\)
\[ | \hat{\mathcal{H}}(t,\gamma)(\xi) | \approx t, \gamma, n \quad |\xi| - (n-t)(1 + 2 \ln |\xi|^{-1})^{-\gamma/2} \quad \text{for} \quad |\xi| \leq 1.\]

The estimates imply that
\[ \| \hat{\mathcal{H}}(t,\gamma) \|_{L^p(\mathbb{R}^n)} < \infty \quad \text{if and only if} \quad t > n - n/p \quad \text{or} \quad t = n - n/p, \gamma > 2/p. \]

These properties provide us with tools that allow us to prove the following two propositions:

**Proposition 1.2.** Let \(1 < r < \infty, 0 < p_1, \ldots, p_m \leq \infty, 0 < p < \infty, \) and \(1/p_1 + \cdots + 1/p_m = 1/p.\) Suppose that
\[ s_1 \leq s_2, \ldots, s_m \quad \text{and} \quad s_1 \leq n/r. \]
Then there exists a function \(\sigma\) on \((\mathbb{R}^n)^m\) such that \(L^r_{\mathcal{S}}[\sigma] < \infty,\) but
\[ \| T_\sigma \|_{H^{s_1} \times \cdots \times H^{s_m} \rightarrow L^p} = \infty. \]

**Proposition 1.3.** Let \(1 < r < \infty, 0 < p_1, \ldots, p_m \leq \infty, 0 < p < \infty, \) and \(1/p_1 + \cdots + 1/p_m = 1/p.\) Let \(1 \leq l \leq m.\) Suppose that \(s_1, \ldots, s_m > n/r\) and
\[ \sum_{k=1}^{l} \left( s_k/n - 1/p_k \right) \leq -1/r'. \]
Then there exists a function \(\sigma\) on \((\mathbb{R}^n)^m\) such that \(L^r_{\mathcal{S}}[\sigma] < \infty,\) but
\[ \| T_\sigma \|_{H^{s_1} \times \cdots \times H^{s_m} \rightarrow L^p} = \infty. \]

The necessity part of Theorem 1.1 is a consequence of the preceding two propositions along with a rearrangement argument.

### 1.2. Sufficiency condition

The sufficiency condition part in Theorem 1.1 is a consequence of the following four propositions combined with a rearrangement argument.

**Proposition 1.4.** Let \(1 < r \leq 2, r \leq p_1, \ldots, p_m \leq \infty, \) and \(1/p = 1/p_1 + \cdots + 1/p_m.\) Suppose that
\[ s_1, \ldots, s_m > n/r. \]
If \(\sigma\) satisfies \(L^r_{\mathcal{S}}[\sigma] < \infty,\) then (1.8) holds.

**Proposition 1.5.** Let \(1 < r \leq 2, 1 \leq l \leq m, 0 < p_1, \ldots, p_l \leq 1, p_{l+1}, \ldots, p_m = \infty, \) and \(1/p = 1/p_1 + \cdots + 1/p_l.\) Suppose that
\[ s_{l+1}, \ldots, s_m > n/r, \quad \sum_{k \in J} \left( s_k/n - 1/p_k \right) > -1/r' \]
for every nonempty subset \(J \subset \{1, \ldots, l\}.\) If \(\sigma\) satisfies \(L^r_{\mathcal{S}}[\sigma] < \infty,\) then (1.8) holds.
Proposition 1.6. Let $1 < r < 2$, $1 \leq l < \rho \leq m$, $0 < p_1, \ldots, p_l \leq 1$, $r \leq p_{l+1}, \ldots, p_m < \infty$, $p_{l+1}, \ldots, p_m = \infty$, and $1/p = 1/p_1 + \cdots + 1/p_m$. Suppose that (1.14) holds for every nonempty subset $J \subset \{1, \ldots, l\}$. If $\sigma$ satisfies $L^{r, \psi(m)}_{L^2} [\sigma] < \infty$, then (1.8) holds.

Proposition 1.7. Let $1 < r < 2$ and $1 \leq l \leq m$. Suppose that $\mathcal{L}$ be a subset of $\{1, \ldots, m\}$ with $|\mathcal{L}| = l$, and
\[ 1 < p_i < r \quad \text{for } i \in \mathcal{L} \]
and
\[ 0 < p_i \leq 1 \quad \text{or} \quad r \leq p_i \leq \infty \quad \text{for } i \in \{1, \ldots, m\} \setminus \mathcal{L}. \]
Suppose that (1.7) holds for every nonempty subset $J$ of $\{1, \ldots, m\}$. If the function $\sigma$ satisfies $L^{r, \psi(m)}_{L^2} [\sigma] < \infty$, then (1.8) holds.

The statements in the above propositions can be thought of as extensions of Theorems A and B from $r = 2$ to $1 < r < 2$. However, the ingredients of their proofs are significantly more involved than in the case $r = 2$, in view of the lack of Plancherel’s identity. The proofs we employ depend on the Littlewood-Paley theory for the Hardy space $H^p$, but this certainly does not work for $H^\infty = L^\infty$ or $BMO$, and this is the reason the case $p_i = \infty$ was excluded in Theorem A. It was addressed in the proof of Theorem B by applying a modified version of the Carleson measure estimate related to $BMO$ functions, which is contained in [13]. We provide a new method to deal with this issue, using a generalization of Peetre’s maximal function, saying $\mathcal{M}_p f$, introduced by Park [24]. As we have an $L^\infty(\ell^2)$ characterization of $BMO$ with this maximal function, stated in Lemma 2.2, we may still utilize the Littlewood-Paley theory to obtain $H^p$ bounds for all $0 < p_i \leq \infty$.

The proof of Proposition 1.4 is based on that of Theorem A for which the pointwise estimate in Lemma 2.4 below is essential. In Propositions 1.5 and 1.6 at least one index $p_i$ satisfies $0 < p_i \leq 1$ and the $H^{p_i}$ atomic decomposition is very useful. In this case we need to employ an approximation argument for $\sigma$ as we don’t know that we can interchange infinite sums of atoms and the action of the operator as in
\[
T_{\sigma}(f_1, \ldots, f_m) = \sum_{k_1=1}^{\infty} \cdots \sum_{k_m=1}^{\infty} \lambda_{1,k_1} \cdots \lambda_{l,k_l} T_{\sigma}(a_1,k_1, \ldots, a_l,k_l, f_{l+1}, \ldots, f_m)
\]
for functions $f_i \in H^{p_i}(\mathbb{R}^n)$ with atomic representation $f_i = \sum_{k=1}^{\infty} \lambda_{i,k} a_{i,k}$, $1 \leq i \leq l$. This regularization of the multiplier was also used in [15] but here it is stated in Lemma 2.7. Afterwards, we apply the method of Grafakos and Kalton [12] and a pointwise estimate of the form
\[
(1.15) \quad |T_{\sigma}(a_1,k_1, \ldots, a_l,k_l, f_{l+1}, \ldots, f_m)(x)| \lesssim L^{r, \psi(m)}_{L^2} [\sigma] b_1(x) \cdots b_l(x) F_{l+1}(x) \cdots F_m(x)
\]
where $\|b_i\|_{L^{p_i}(\mathbb{R}^n)} \lesssim 1$ and $\|F_i\|_{L^{p_i}(\mathbb{R}^n)} \lesssim \|f_i\|_{L^{p_i}(\mathbb{R}^n)}$. Since the above estimate separates the left-hand side to $m$ functions of $x$, we may now apply Hölder’s inequality with exponents $1/p = 1/p_1 + \cdots + 1/p_m$. The main idea in the proof of Proposition 1.7 is a multilinear extension of the complex interpolation method of Calderón [1] and Calderón and Torchinsky [2]. Specifically, we apply the interpolation to Propositions 1.4, 1.5, and 1.6 to obtain (1.8) in the entire range $0 < p_1, \ldots, p_m \leq \infty$.

Section 2 contains some preliminary facts that are crucial in the proof of the preceding propositions. The proof of Propositions 1.2 - 1.7 are given in Sections 3 - 8. Some key lemmas that appear in the proofs of the propositions are contained in the last section.
Notation. We denote by $\mathbb{N}$ and $\mathbb{Z}$ the sets of natural numbers and integers, respectively. We use the symbol $A \lesssim B$ to indicate that $A \leq CB$ for some constant $C > 0$ independent of the variable quantities $A$ and $B$, and $A \approx B$ if $A \lesssim B$ and $B \lesssim A$ hold simultaneously. The set of all dyadic cubes in $\mathbb{R}^n$ is denoted by $\mathcal{D}$, and for each $j \in \mathbb{Z}$ we designate $\mathcal{D}_j$ to be the subset of $\mathcal{D}$ consisting of dyadic cubes with side length $2^{-j}$. For each $Q \in \mathcal{D}$, $\chi_Q$ denotes the characteristic function of $Q$. We also use the notation $\bar{\mathbf{v}} := (v_1, \ldots, v_m)$, and $\langle x \rangle := (1 + 4\pi^2|x|^2)^{1/2}$.

2. Preliminaries

Let $\phi$ be a Schwartz function on $\mathbb{R}^n$ with $\hat{\phi}(0) = 1$. For $0 < p \leq \infty$ the Hardy space $H^p(\mathbb{R}^n)$ contains all tempered distributions $f$ on $\mathbb{R}^n$ which satisfy
\[
\|f\|_{H^p(\mathbb{R}^n)} := \left\| \sup_{j \in \mathbb{Z}} |\phi_j \ast f| \right\|_{L^p(\mathbb{R}^n)} < \infty
\]
where $\phi_j := 2^{jn}\phi(2^j \cdot)$. It is known in [6, 28] that the definition of the Hardy space does not depend on the choice of the function $\phi$. In this paper we fix a Schwartz function $\psi$ on $\mathbb{R}^n$ whose Fourier transform is supported in the annulus $1/2 < |\xi| < 2$ and satisfies $\sum_{j \in \mathbb{Z}} \hat{\psi}(\xi/2^j) = 1$ for $\xi \neq 0$. Set $\hat{\psi}(\cdot/2^j) = \hat{\phi}_j$. Then we define a function $\phi \in S(\mathbb{R}^n)$ by
\[
(2.1) \quad \hat{\phi}(\xi) := \begin{cases} \sum_{j \leq 0} \hat{\phi}_j(\xi), & \xi \neq 0 \\ 1, & \xi = 0, \end{cases}
\]
and let $\phi_j := 2^{jn}\phi(2^j \cdot)$ so that $\hat{\phi}_j = \hat{\phi}(\cdot/2^j)$. Note that $H^p(\mathbb{R}^n) = L^p(\mathbb{R}^n)$ for all $1 < p \leq \infty$. A nice feature of the Hardy spaces $H^p$ for $0 < p \leq 1$ is their atomic decomposition. More precisely, when $N$ is a positive integer greater or equal to $\lfloor n/p - n \rfloor + 1$, every $f$ in $H^p(\mathbb{R}^n)$, $0 < p \leq 1$, can be written as $\sum_{k=1}^{\infty} \lambda_k a_k$, where $\lambda_k$ are coefficients satisfying $(\sum_{k=1}^{\infty} |\lambda_k|^p)^{1/p} \lesssim \|f\|_{H^p(\mathbb{R}^n)}$ and $a_k$ are $L^{\infty}$-atoms for $H^p$; this means that there exist cubes $Q_k$ such that $\text{Supp}(a_k) \subset Q_k$, $\|a_k\|_{L^\infty(\mathbb{R}^n)} \leq |Q_k|^{-1/p}$, and $\int_{Q_k} x^\alpha a_k(x) dx = 0$ for all multi-indices $\alpha$ with $|\alpha| \leq N$.

The Hardy space $H^p$ can be characterized in terms of Littlewood-Paley theory. For $0 < p < \infty$ we have
\[
(2.2) \quad \|f\|_{H^p(\mathbb{R}^n)} \approx \left\| \left( \sum_{j \in \mathbb{Z}} |\psi_j \ast f|^2 \right)^{1/2} \right\|_{L^p(\mathbb{R}^n)}
\]
where $\psi_j$ is a Littlewood-Paley function defined above. This property is also independent of the choice of functions $\psi_j$ because of the Calderón reproducing formula and the Fefferman-Stein vector-valued maximal inequality [4] which states that
\[
(2.3) \quad \|\{\mathcal{M}_tf_j\}_{j \in \mathbb{Z}}\|_{L^p(\ell^q)} \lesssim \|\{f_j\}_{j \in \mathbb{Z}}\|_{L^p(\ell^q)} \quad \text{for } t < p, q < \infty
\]
where $\mathcal{M}f(x) := \sup_{Q \ni x} |Q|^{-1} \int_Q |f(y)| dy$ is the Hardy-Littlewood maximal functions and $\mathcal{M}_tf(x) := (\mathcal{M}(|f|^t))^{1/t}$ for $0 < t < \infty$. Note that (2.3) also holds for $0 < p < \infty$, $q = \infty$ or for $p = q = \infty$. For $j \in \mathbb{Z}$, $\sigma > 0$, and $0 < t \leq \infty$ we now define
\[
\mathcal{M}^t_{\sigma,2j} f(x) := 2^{jn/t} \left\| \frac{f(x - \cdot)}{(1 + 2^j |\cdot|)^\sigma} \right\|_{L^t(\mathbb{R}^n)}.
\]
which is a generalization of the Peetre’s maximal function $\mathfrak{M}_{\sigma,2} f(x) := \mathfrak{M}_{\sigma,2}^\infty f(x)$. It is easy to verify that if $0 < t < \infty$ and $\sigma > n/t$, then

\begin{equation}
\mathfrak{M}_{\sigma,2} f(x) \lesssim \mathcal{M}_t f(x), \quad \text{uniformly in } j \in \mathbb{Z}.
\end{equation}

Moreover, for $\sigma > 0$, $0 < t \leq s \leq \infty$, and $j \in \mathbb{Z}$, we have

\begin{equation}
\mathfrak{M}_{\sigma,2}^s \mathfrak{M}_{\sigma,2}^t f(x) \lesssim \mathfrak{M}_{\sigma,2}^t f(x).
\end{equation}

See [24] for more details.

Elementary considerations reveal that for $\sigma > 0$ and $Q \in \mathcal{D}_j$

\[
\sup_{y \in Q} |f(y)| \lesssim \inf_{y \in Q} \mathfrak{M}_{\sigma,2} f(y)
\]

and then it follows from (2.5) that for $0 < t < \infty$

\begin{equation}
\sup_{y \in Q} \mathfrak{M}_{\sigma,2}^t f(y) \lesssim \inf_{y \in Q} \mathfrak{M}_{\sigma,2}^t f(y) \lesssim \inf_{y \in Q} \mathfrak{M}_{\sigma,2}^s f(y).
\end{equation}

In addition, the following maximal inequality holds.

**Lemma 2.1** ([24]). Let $0 < p, q, t \leq \infty$ and $\sigma > n/\min(p, q, t)$. Suppose that the Fourier transform of $f_j$ is supported in a ball of radius $A 2^j$ for some $A > 0$.

1. For $0 < p < \infty$ or $p = q = \infty$, we have

\[
\left\| \{ \mathfrak{M}_{\sigma,2}^t f_j \}_{j \in \mathbb{Z}} \right\|_{L^p(\ell^2)} \lesssim \left\| \{ f_j \}_{j \in \mathbb{Z}} \right\|_{L^p(\ell^2)}.
\]

2. For $p = \infty$, $0 < q < \infty$, and $\mu \in \mathbb{Z}$, we have

\[
\sup_{P \in \mathcal{D}_\mu} \left( \frac{1}{|P|} \int_P \sum_{j=\mu}^{\infty} \left( \mathfrak{M}_{\sigma,2}^t f_j(x) \right)^q dx \right)^{1/q} \lesssim \sup_{P \in \mathcal{D}_\mu} \left( \frac{1}{|P|} \int_P \sum_{j=\mu}^{\infty} |f_j(x)|^q dx \right)^{1/q}
\]

where the constant in the inequality is independent of $\mu$.

Using Lemma 2.1 we can prove the following result.

**Lemma 2.2** ([24]). Let $0 < p \leq \infty$, $0 < t \leq \infty$, $0 < \gamma < 1$, and $\sigma > n/\min(p, 2, t)$. Then for any dyadic cubes $Q \in \mathcal{D}$, there exists a proper measurable subset $S_Q$ of $Q$, depending on $\gamma, \sigma, t, f$, such that $|S_Q| > \gamma|Q|$ and

\[
\|f\|_{X^p} \approx \left\| \left\{ \inf_{y \in Q} \mathfrak{M}_{\sigma,2}^t (\psi_j * f)(y) \right\} \chi_{S_Q} \right\|_{L^p(\ell^2)}
\]

where $X^p = H^p$ for $0 < p < \infty$ and $X^\infty = BMO$.

We observe that if $S_Q$ is a measurable subset of $Q \in \mathcal{D}$ with $|S_Q| > \gamma|Q|$ for some $0 < \gamma < 1$, then we have

\begin{equation}
\chi_Q(x) \lesssim_{\tau, \gamma} \mathcal{M}_\tau (\chi_{S_Q})(x),
\end{equation}

which is due to the fact that for $x \in Q$

\begin{equation}
1 < \frac{1}{\gamma^{1/\tau}} \frac{|S_Q|^{1/\tau}}{|Q|^{1/\tau}} = \frac{1}{\gamma^{1/\tau}} \left( \frac{1}{|Q|} \int_Q \chi_{S_Q}(y) dy \right)^{1/\tau} \leq \gamma^{-1/\tau} \mathcal{M}_\tau (\chi_{S_Q})(x).
\end{equation}

Based on the $L^\infty(\ell^2)$ characterization of $BMO$ from Lemma 2.2, we have the following lemma, which will be essential in obtaining $L^\infty$ bounds in the proof of our main theorem.
Lemma 2.3. Let $0 < p, t < \infty$, $N \geq 3$, and
\[ s_1 > n/\min (p, t), \quad s_i > n/\min (2, t) \quad 2 \leq i \leq N. \]

Let $\varphi_j, \varrho_j \in \mathcal{S} (\mathbb{R}^n)$, $j \in \mathbb{Z}$, satisfy $\text{Supp}(\varphi_j) \subset \{ \xi \in \mathbb{R}^n : |\xi| \leq C 2^j \}$ and $\text{Supp}(\varrho_j) \subset \{ \xi \in \mathbb{R}^n : D^{-1} 2^j \leq |\xi| \leq D 2^j \}$ for some $C, D > 1$. Suppose that $T^1$ and $T^2$ are the bilinear operators and $T^3$ is the $N$-linear operator, defined by
\[ T^1 (f_1, f_2) (x) := \left[ \sum_{j \in \mathbb{Z}} (m_{s_1, 2^j} (\varphi_j * f_1) (x) \}^2 \{ m_{s_2, 2^j} (\varrho_j * f_2) (x) \}^2 \right]^{1/2}, \]
\[ T^2 (f_1, f_2) (x) := \sum_{j \in \mathbb{Z}} m_{s_1, 2^j} (\varphi_j * f_1) (x) m_{s_2, 2^j} (\varrho_j * f_2) (x), \]
\[ T^3 (f_1, \ldots, f_N) (x) := \sum_{j \in \mathbb{Z}} m_{s_1, 2^j} (\varphi_j * f_1) (x) \prod_{i=2}^N m_{s_1, 2^j} (\varrho_j * f_i) (x) \]
for $f_1, \ldots, f_N \in \mathcal{S} (\mathbb{R}^n)$ and $x \in \mathbb{R}^n$. Then we have
\[
\begin{align*}
\| T^1 (f_1, f_2) \|_{L^p (\mathbb{R}^n)} & \lesssim \| f_1 \|_{H^p (\mathbb{R}^n)} \| f_2 \|_{BMO (\mathbb{R}^n)} \\
\| T^2 (f_1, f_2) \|_{L^p (\mathbb{R}^n)} & \lesssim \| f_1 \|_{H^p (\mathbb{R}^n)} \| f_2 \|_{BMO (\mathbb{R}^n)} \\
\| T^3 (f_1, \ldots, f_N) \|_{L^p (\mathbb{R}^n)} & \lesssim \| f_1 \|_{H^p (\mathbb{R}^n)} \prod_{i=2}^N \| f_i \|_{BMO (\mathbb{R}^n)}. \tag{2.9} \tag{2.10} \tag{2.11}
\end{align*}
\]

Proof. We will only be concerned with (2.9) and (2.11) as the proof of (2.10) is very similar to that of (2.11) with $N = 3$.

Since dyadic cubes with the same side length are pairwise disjoint, the left-hand side of (2.9) can be written as
\[
\left\| \left( \sum_{j \in \mathbb{Z}} \sum_{Q \in D_j} (m_{s_1, 2^j} (\varphi_j * f_1) (x) \}^2 \{ m_{s_2, 2^j} (\varrho_j * f_2) (x) \}^2 \chi_Q \right)^{1/2} \right\|_{L^p (\mathbb{R}^n)}
\]
and the estimate (2.6) implies that the preceding expression is dominated by a constant multiple of
\[
\left( \sum_{j \in \mathbb{Z}} \sum_{Q \in D_j} \left( \inf_{y \in Q} m_{s_1, 2^j} (\varphi_j * f_1) (y) \right)^2 \left( \inf_{y \in Q} m_{s_2, 2^j} (\varrho_j * f_2) (y) \right)^2 \chi_Q \right)^{1/2} \right\|_{L^p (\mathbb{R}^n)}.
\]

According to Lemma 2.2, for each $Q \in D$ we can choose a proper measurable subset $S_Q$ of $Q$ such that $|S_Q| > \frac{1}{2} |Q|$ and
\[
\| f_2 \|_{BMO} \approx \left\| \left\{ \sum_{Q \in D_j} \left( \inf_{y \in Q} m_{s_2, 2^j} (\varrho_j * f_2) (y) \right) \chi_{S_Q} \right\} \right\|_{L^\infty (\mathbb{R}^n)} \tag{2.12} \tag{2.13}
\]

Here, we may use $\varrho_j$, instead of $\psi_j$, because of the Calderón reproducing formula and (2.5). Now, using (2.7) with $\tau < \min (p, 2)$ and the vector-valued maximal inequality (2.3) of $M_r$ with the index set $\{ Q \} Q \in D$, $\chi_Q$ can be replaced by $\chi_{S_Q}$ in (2.12) and then Hölder’s inequality yields that (2.12) is less than a constant times
\[
\left\| \sup_{j \in \mathbb{Z}} m_{s_1, 2^j} (\varphi_j * f_1) \right\|_{L^p (\mathbb{R}^n)} \left\{ \sum_{Q \in D_j} \left( \inf_{y \in Q} m_{s_2, 2^j} (\varrho_j * f_2) (y) \right) \chi_{S_Q} \right\} \right\|_{L^\infty (\mathbb{R}^n)}.
\]
The second term is definitely comparable to \( \| f_2 \|_{BMO} \) due to (2.13) and the first one can be estimated by
\[
\left\| \sup_{j \in \mathbb{Z}} | \varphi_j * f_1 | \right\|_{L^p(\mathbb{R}^n)} \approx \| f_1 \|_{H^p(\mathbb{R}^n)}
\]
in view of Lemma 2.1. This proves (2.9).

Similarly, for each \( Q \in \mathcal{D} \) we choose proper measurable subsets \( S_Q^2 \) and \( S_Q^3 \) of \( Q \) such that \( |S_Q^2|, |S_Q^3| > \frac{3}{4} |Q| \) and
\[
\| f_k \|_{BMO} \approx \left\| \sum_{Q \in \mathcal{D}} \left( \inf_{y \in Q} \mathcal{M}_{s_k,2}^t (\varphi_j * f_k)(y) \right) \chi_{S_Q^2} \chi_{S_Q^3} \right\|_{L^p(\mathbb{R}^n)}
\]
\[
\leq \left\| \sup_{j \in \mathbb{Z}} \mathcal{M}_{s_k,2}^t (\varphi_j * f_1) \right\|_{L^p(\mathbb{R}^n)} \prod_{k=2}^3 \left\{ \sum_{Q \in \mathcal{D}} \left( \inf_{y \in Q} \mathcal{M}_{s_k,2}^t (\varphi_j * f_k)(y) \right) \chi_{S_Q^3} \right\}_{j \in \mathbb{Z}} \left\| \chi_{S_Q^3} \right\|_{L^\infty(\ell^2)}
\]
\[
\prod_{k=4}^N \left\{ \mathcal{M}_{s_k,2}^t (\varphi_j * f_k) \right\}_{j \in \mathbb{Z}} \left\| \chi_{S_Q^3} \right\|_{L^\infty(\ell^2)}
\]
\[
\leq \| f_1 \|_{H^p(\mathbb{R}^n)} \prod_{k=2}^N \| f_k \|_{BMO}
\]
as desired. Here, we used the fact that for \( 4 \leq k \leq N \),
\[
\left\| \mathcal{M}_{s_k,2}^t (\varphi_j * f_k) \right\|_{L^\infty(\ell^2)} \approx \left\{ \varphi_j * f_k \right\}_{j \in \mathbb{Z}} \left\| \chi_{S_Q^3} \right\|_{L^\infty(\ell^2)} \approx \| f_k \|_{\tilde{F}^0,2} \approx \| f_k \|_{BMO}
\]
where \( \tilde{F}^0,q_{p,2} \) is the homogeneous Triebel-Lizorkin space, and Lemma 2.1, the embedding \( \tilde{F}^0,2 \hookrightarrow \tilde{F}^0,\infty \), and the characterization \( BMO = \tilde{F}^0,2 \) are applied. We refer to [24] for more details. \[\square\]

The following lemma is the main tool used to derive pointwise estimates like (1.15). In fact, similar results can be found in [13, 14, 15, 17, 23] with the maximal function \( M_t \), but here we replace \( M_t \) by \( \mathcal{M}_{t} \), in order to apply the arguments in Lemmas 2.2 and 2.3.

**Lemma 2.4.** Let \( 1 < t \leq 2 \) and \( s_1, \ldots, s_m > n/t \). Suppose that \( \sigma \) is a bounded function with a compact support in \( (\mathbb{R}^n)^m \). Then we have
\[
\left| T_\sigma \tilde{f}(x) \right| \lesssim \| \sigma(2^j \cdot) \|_{L^p((\mathbb{R}^n)^m)} \prod_{k=1}^m \mathcal{M}_{s_k,2}^t f_k(x), \quad \text{uniformly in } j \in \mathbb{Z}.
\]
Proof. Using the Hölder inequality, we obtain

\[ |T_\sigma \tilde{f}(x)| = \left| \int_{(\mathbb{R}^n)^m} \sigma^\vee(\vec{v}) \prod_{k=1}^{m} f_k(x - v_k) d\vec{v} \right| \leq 2^{-jmn/t} \left( \int_{(\mathbb{R}^n)^m} \left( \prod_{k=1}^{m} (2^{j} v_k)^{s_k t'} \right) |\sigma^\vee(\vec{v})|^{t'} d\vec{v} \right)^{1/t'} \prod_{k=1}^{m} M_{s_k,2j} f_k(x) \]

where we applied the simple inequality that

\[ \| f(x - \cdot)(2^{j} \cdot)^{-s_k} \|_{L^t(\mathbb{R}^n)} \lesssim 2^{-jn/t} M_{s_k,2j} f(x). \]

Then the Hausdorff-Young inequality with \(1 < t \leq 2\) yields that

\[ \left[ \int_{(\mathbb{R}^n)^m} \left( \prod_{k=1}^{m} (2^{j} v_k)^{s_k t'} \right) |\sigma^\vee(\vec{v})|^{t'} d\vec{v} \right]^{1/t'} \lesssim 2^{jmn/t} \| \sigma(2^j \cdot) \|_{L^t_s((\mathbb{R}^n)^m)} \]

and this completes the proof. \(\square\)

The next lemma is a multi-parameter inequality of Kato-Ponce type.

**Lemma 2.5.** Let \(1 < t < \infty\) and \(s_1, \ldots, s_m \geq 0\). Suppose that \(g\) is a function in \(L^t_s((\mathbb{R}^n)^m)\) and \(\Xi \in \mathcal{S}(\mathbb{R}^m)\). Then we have

\[ \| \Xi \cdot g \|_{L^t_s((\mathbb{R}^n)^m)} \lesssim \| g \|_{L^t_s((\mathbb{R}^n)^m)}. \]

The above lemma is clear when \(s_1, \ldots, s_m\) are even integers as the derivatives of \(\Xi\) are bounded functions, using the embedding \(L^t_s(\mathbb{R}^m) \hookrightarrow L^t_{\tilde{s}}(\mathbb{R}^m)\) for \(\tilde{s} := (s_1^{(2)}, \ldots, s_m^{(2)}) \leq s^{(1)} := (s_1^{(1)}, \ldots, s_m^{(1)})\), which means \(s_k^{(2)} \leq s_k^{(1)}\) for each \(1 \leq k \leq m\). Then a complex interpolation technique completes the proof for the general \(s_1, \ldots, s_m \geq 0\). We refer to [9, Section 5] for more details.

We now discuss a regularization of multipliers.

**Lemma 2.6.** Let \(1 < r \leq 2\) and \(\sigma\) satisfy \(L^r_{\tilde{s}}[\sigma^{(m)}] < \infty\) for \(s_k > n/r\), \(1 \leq k \leq m\). Then there exists a family of Schwartz functions \(\{\sigma^\vee\}_{0 < \epsilon < 1/2}\) such that \(\tilde{\sigma}^\vee\) has a compact support in \((\mathbb{R}^n)^m\),

\[ \sup_{0 < \epsilon < 1/2} L^r_{\tilde{s}}[\sigma^{(m)}] \lesssim L^r_{\tilde{s}}[\sigma^{(m)}] \approx \sigma^{(m)} \]

and

\[ \lim_{\epsilon \to 0} \| T_\sigma \tilde{f} - T_{\sigma^\vee} \tilde{f} \|_{L^2(\mathbb{R}^n)} = 0 \]

for Schwartz functions \(f_1, \ldots, f_m\) on \(\mathbb{R}^n\).

The above lemma can be verified with a very similar argument as described in [15, Theorem 3.1], by using Lemma 2.5 and just replacing \(L^2_s\) by \(L^r_s\). Therefore, the proof will not be pursued here. As shown in [15], the \(L^2\) convergence in (2.15) implies the existence of a sequence of positive numbers \(\{\epsilon_j\}_{j \in \mathbb{N}}\), converging to 0 as \(j \to \infty\), such that

\[ \lim_{j \to \infty} T_{\sigma \epsilon_j} \tilde{f}(x) = T_\sigma \tilde{f}(x) \quad \text{a.e. } x \in \mathbb{R}^n. \]
Lemma 2.7 is applied.

\[ f \in \text{Lemma 2.6} \right) \text{Suppose that} |f| \text{be a Schwartz function on} \mathbb{R}^n. \]

In view of this reduction, in the proof of the main theorem we may actually assume that \( \sigma \) is a Schwartz function such that \( \hat{\sigma} \) has a compact support. Our estimates will depend only on \( \mathcal{L}^r \mathcal{V} \) and not on other quantities related to \( \sigma \).

With the regularization in Lemma 2.6, we may apply the following lemma in the case that for at least one \( i \) with \( 1 \leq i \leq m \) we have \( p_i \leq 1 \), so that the \( H^{p_i} \)-atomic decomposition is applied.

**Lemma 2.7 ([14]).** Let \( 1 \leq l \leq m, 0 < p_1, \ldots, p_l \leq 1, \) and \( 1 < p_{l+1}, \ldots, p_m \leq \infty \). Let \( \sigma \) be a Schwartz function on \( \mathbb{R}^n \) whose Fourier transform has compact support (as \( \sigma^\epsilon \) does in Lemma 2.6). Suppose that \( f_i \in H^{p_i}(\mathbb{R}^n), 1 \leq i \leq l, \) have atomic representations \( f_i = \sum_{k_i=1}^\infty \lambda_{i,k_i} a_{i,k_i} \), where \( a_{i,k_i} \) are \( L^\infty \)-atoms for \( H^{p_i} \) and \( \left( \sum_{k_i=1}^\infty |\lambda_{i,k_i}|^{p_i} \right)^{1/p_i} \leq \|f_i\|_{H^{p_i}(\mathbb{R}^n)} \).

Suppose \( f_i \in \mathcal{S}(\mathbb{R}^n) \) for \( l+1 \leq i \leq m \). Then

\[ T_\sigma \mathcal{F}(x) = \sum_{k_1=1}^\infty \cdots \sum_{k_l=1}^\infty \lambda_{1,k_1} \cdots \lambda_{l,k_l} T_\sigma(a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m)(x) \]

for almost all \( x \in \mathbb{R}^n \).

In order to establish an inequality such as (1.15), the vanishing moment condition of \( a_{i,k_i} \) will be exploited in the following way.

**Lemma 2.8.** Suppose that \( a \in L^\infty_0(\mathbb{R}^n) \) is a bounded function with a compact support and has vanishing moments in the sense that there is a \( M \in \mathbb{N} \cup \{0\} \) such that

\[ \int_{\mathbb{R}^n} x^\alpha a(x) dx = 0, \quad |\alpha| \leq M. \]

Then for any \( K \in \mathcal{S}(\mathbb{R}^n) \) and \( c_0 \in \mathbb{R}^n \), we have

\[ |K \ast a(x)| \leq \int_0^1 \int_{\mathbb{R}^n} |y - c_0|^{M+1} \sum_{|\alpha| = M+1} |\partial^\alpha K(x - c_0 - t(y - c_0))| |a(y)| dy dt. \]

**Proof.** We recall Taylor’s formula saying that for any \( x, y \in \mathbb{R}^n \) and \( M \in \mathbb{N} \cup \{0\} \) we have

\[ f(x + y) = \sum_{|\alpha| \leq M} \frac{\partial^\alpha f(x)}{\alpha!} y^\alpha + (M + 1) \sum_{|\alpha| = M+1} \frac{1}{\alpha!} \left( \int_0^1 (1 - t)^M \partial^\alpha f(x + ty) dt \right) y^\alpha. \]

Then (2.16) yields that the left-hand side of (2.17) is dominated by a constant times

\[ \sum_{|\alpha| = M+1} \frac{1}{\alpha!} \int_0^1 (1 - t)^M \int_{\mathbb{R}^n} |\partial^\alpha K(x - c_0 - t(y - c_0))| |y - c_0|^{M+1} |a(y)| dy dt \]

and this is clearly less than the right-hand side of (2.17).
The argument in Lemma 2.8 will help us estimate the $L^{r'}$ norm of the product of $\langle x_1 \rangle^{s_1} \cdots \langle x_m \rangle^{s_m}$ and derivatives of $(\sigma(2^j \cdot) \Psi^{(m)})^\vee$ to obtain the quantity $L_{\vec{g}}^{r,\Psi^{(m)}}[\sigma]$, as the Hausdorff-Young inequality $\|F\|_{L^r((\mathbb{R}^n)^m)} \lesssim \|F\|_{L^r((\mathbb{R}^n)^m)}$ is applicable for $1 < r \leq 2$. The following lemma will play a significant role in this.

**Lemma 2.9** ([14, 23]). Let $1 \leq p \leq q \leq \infty$, and $s_k \geq 0$ for $1 \leq k \leq m$. Let $\sigma$ be a function defined on $(\mathbb{R}^n)^m$ and $K = \sigma^\vee$ be the inverse Fourier transform of $\sigma$. Suppose that $\sigma$ is supported in a ball of a constant radius. Then for $1 \leq l \leq m$ and any multi-index $\vec{\alpha}$ in $(\mathbb{Z}^n)^l$ there exists a constant $C_{\vec{\alpha}}$ such that

$$\|\langle \cdot \rangle^{s_1} \cdots \langle \cdot \rangle^{s_l} \partial^{\vec{\alpha}} K(\cdot, \cdot, \cdot, y_{l+1}, \ldots, y_m)\|_{L^q((\mathbb{R}^n)^l)} \leq C_{\vec{\alpha}} \|\langle \cdot \rangle^{s_1} \cdots \langle \cdot \rangle^{s_l} K(\cdot, \cdot, \cdot, y_{l+1}, \ldots, y_m)\|_{L^p((\mathbb{R}^n)^l)}$$

where $\partial^{\vec{\alpha}}$ denotes $\vec{\alpha}$ derivatives in the first $l$ variables.

We end this section by reviewing the technique of Grafakos and Kalton [12], which will be very useful in estimating the $L^p$ norm of the sum of functions having a compact support for $0 < p \leq 1$.

**Lemma 2.10.** [12, Lemma 2.1] Let $0 < p \leq 1$ and $\{f_Q\}_{Q \in \mathcal{J}}$ be a family of nonnegative integrable functions with $\text{Supp}(f_Q) \subset Q$ for all $Q \in \mathcal{J}$, where $\mathcal{J}$ is a finite or countable family of cubes in $\mathbb{R}^n$. Then we have

$$\left\| \sum_{Q \in \mathcal{J}} f_Q \right\|_{L^p(\mathbb{R}^n)} \leq \left\| \sum_{Q \in \mathcal{J}} \left( \frac{1}{|Q|} \int_Q f_Q(y) \, dy \right) \chi_Q \right\|_{L^p(\mathbb{R}^n)},$$

where the constant in the inequality depends only on $p$.

3. PROOF OF PROPOSITION 1.2

Let $\theta$ and $\tilde{\theta}$ denote Schwartz functions on $\mathbb{R}^n$ having the properties

$$\text{Supp}(\tilde{\theta}) \subset \{ \xi \in \mathbb{R}^n : \frac{999}{1000 \sqrt{m}} \leq |\xi| \leq \frac{1001}{1000 \sqrt{m}} \}$$

$$\text{Supp}(\tilde{\theta}) \subset \{ \xi \in \mathbb{R}^n : \frac{99}{100 \sqrt{m}} \leq |\xi| \leq \frac{101}{100 \sqrt{m}} \}$$

and $\tilde{\theta}(\xi) = 1$ for $\frac{999}{1000 \sqrt{m}} \leq |\xi| \leq \frac{1001}{1000 \sqrt{m}}$. Then it is clear that $\theta * \tilde{\theta} = \theta$.

Choose $2/r < \delta < 2$ and let $N > 0$ be a sufficiently large number to be chosen later. Recall that our fixed Schwartz function $\phi_j$ satisfies $\text{Supp}(\phi_j) \subset \{ \xi \in \mathbb{R}^n : |\xi| \leq 2^{j+1} \}$ and $\tilde{\phi}_j(\xi) = 1$ for $|\xi| \leq 2^j$. We define

$$\mathcal{H}_{(n,\delta)}^{(N)}(x) := \mathcal{H}_{(n,\delta)}(x) \tilde{\phi}_N(x), \quad x \in \mathbb{R}^n$$

and

$$\sigma^{(N)}(\vec{\xi}) := \mathcal{H}_{(n,\delta)}^{(N)}(\xi_1) \tilde{\theta}(\xi_1) \tilde{\theta}(\xi_2) \cdots \tilde{\theta}(\xi_m), \quad \vec{\xi} \in (\mathbb{R}^n)^m,$$

where $\mathcal{H}_{(n,\delta)}$ is defined in (1.9).

It follows from the support of $\tilde{\theta}$ that $\sigma^{(N)}$ is supported in $\{ \vec{\xi} \in (\mathbb{R}^n)^m : \frac{99}{100} \leq |\vec{\xi}| \leq \frac{101}{100} \}$, which implies that $\sigma(2^j \vec{\xi}) \Psi^{(m)}(\vec{\xi})$ vanishes unless $-1 \leq l \leq 1$. Moreover, in view of Lemma 2.5 we have

$$L_{\vec{g}}^{r,\Psi^{(m)}}[\sigma(N)] \lesssim \max_{-1 \leq l \leq 1} \|\sigma^{(N)}(2^{l-1}, \ldots, 2^{l-1}, \delta)\|_{L^r((\mathbb{R}^n)^m)},$$
which can be estimated, via scaling, by a constant times
\begin{equation}
\|\sigma^{(N)}\|_{L^p_x(\mathbb{R}^n)} \lesssim \left\| \frac{\mathcal{H}^{(N)}_{(n,\delta)} \cdot \nabla}{L^{2}} \right\|_{L^p_x(\mathbb{R}^n)} \lesssim \left\| \mathcal{H}^{(N)}_{(n,\delta)} \right\|_{L^p_x(\mathbb{R}^n)},
\end{equation}
where we used Lemma 2.5 in the last inequality. We observe that
\begin{equation}
(I - \Delta)^{s_1/2} \mathcal{H}^{(N)}_{(n,\delta)}(\xi) = \mathcal{H}^{(N)}_{(n-s_1,\delta)}(\xi) = \phi_N * \mathcal{H}^{(n-s_1,\delta)}(\xi)
\end{equation}
and \( \mathcal{H}^{(n-s_1,\delta)} \in L^r(\mathbb{R}^n) \), using (1.12) with \( \delta > 2/r \) and \( s_1 = n/r \). Since \( \{\phi_N\}_{N \in \mathbb{N}} \) is an approximate identity, we have
\begin{equation}
\lim_{N \to \infty} \left\| \phi_N * \mathcal{H}^{(n-s_1,\delta)} - \mathcal{H}^{(n-s_1,\delta)} \right\|_{L^r(\mathbb{R}^n)} = 0,
\end{equation}
which proves
\begin{equation}
\limsup_{N \to \infty} \mathcal{L}^2_{\delta} \left[ \sigma^{(N)} \right] = \limsup_{N \to \infty} \left\| \phi_N * \mathcal{H}^{(n-s_1,\delta)} \right\|_{L^r(\mathbb{R}^n)} \leq \left\| \mathcal{H}^{(n-s_1,\delta)} \right\|_{L^r(\mathbb{R}^n)} < \infty.
\end{equation}
On the other hand, for \( 0 < \epsilon < 1/100 \), let
\begin{equation}
f_j^{(\epsilon)}(x) := \epsilon^{n/p} \theta(\epsilon x), \quad 1 \leq j \leq m.
\end{equation}
Then it is clear, from the Littlewood-Paley theory for Hardy spaces and scaling arguments that for each \( 1 \leq j \leq m \)
\begin{equation}
\left\| f_j^{(\epsilon)} \right\|_{H^p(\mathbb{R}^n)} \approx \left\| f_j^{(\epsilon)} \right\|_{L^p(\mathbb{R}^n)} = \left\| \theta \right\|_{L^p(\mathbb{R}^n)} \lesssim 1,
\end{equation}
uniformly in \( \epsilon \).
Moreover, we observe that \( T_{\sigma^{(N)}}(f_1^{(\epsilon)}, \ldots, f_m^{(\epsilon)})(x) = \epsilon^{n/p} \mathcal{H}^{(N)}_{(n,\delta)} * \left( \theta(\epsilon \cdot) \right)(x) \left\| \theta(\epsilon x) \right\|^{m-1} \) and this, together with scaling, yields that
\begin{equation}
\left\| T_{\sigma^{(N)}}(f_1^{(\epsilon)}, \ldots, f_m^{(\epsilon)}) \right\|_{L^p(\mathbb{R}^n)} = \left\| \left\| \theta \right\|^{m-1} \left( \mathcal{H}^{(N)}_{(n,\delta)} * \left( \theta(\epsilon \cdot) \right) \right) \right\|_{L^p(\mathbb{R}^n)}.
\end{equation}
Applying (3.3) and Fatou’s lemma, we obtain that
\begin{equation}
\left\| T_{\sigma^{(N)}} \right\|_{H^{p_1} \times \cdots \times H^{p_m} \to L^p} \gtrsim \liminf_{\epsilon \to 0} \left\| T_{\sigma^{(N)}}(f_1^{(\epsilon)}, \ldots, f_m^{(\epsilon)}) \right\|_{L^p(\mathbb{R}^n)}
\end{equation}
\begin{equation}
\gtrsim \left\| \left\| \theta \right\|^{m-1} \liminf_{\epsilon \to 0} \int_{\mathbb{R}^n} \theta(x - \epsilon y) \mathcal{H}^{(N)}_{(n,\delta)}(y)dy \right\|_{L^p(\mathbb{R}^n)}.
\end{equation}
Since
\begin{equation}
\left\| \theta(x - \epsilon y) \mathcal{H}^{(N)}_{(n,\delta)}(y) \right\| \lesssim \mathcal{H}^{(N)}_{(n,\delta)}(y) \quad \text{uniformly in } \epsilon > 0, x \in \mathbb{R}^n
\end{equation}
and
\begin{equation}
\left\| \mathcal{H}^{(N)}_{(n,\delta)} \right\|_{L^1(\mathbb{R}^n)} \lesssim \left\| \phi_N \right\|_{L^1(\mathbb{R}^n)} \lesssim N^n < \infty,
\end{equation}
the Lebesgue dominated convergence theorem yields
\begin{equation}
\left(3.4\right) = \left\| \left\| \theta \right\|^{m-1} \int_{\mathbb{R}^n} \mathcal{H}^{(N)}_{(n,\delta)}(y)dy \right\|_{L^p(\mathbb{R}^n)} \approx \int_{\mathbb{R}^n} \mathcal{H}^{(N)}_{(n,\delta)}(y) \phi_N(y)dy.
\end{equation}
Taking \( \liminf_{N \to \infty} \), we finally obtain that
\begin{equation}
\liminf_{N \to \infty} \left\| T_{\sigma^{(N)}} \right\|_{H^{p_1} \times \cdots \times H^{p_m} \to L^p} \gtrsim \left\| \mathcal{H}^{(N)}_{(n,\delta)} \right\|_{L^1(\mathbb{R}^n)} = \infty
\end{equation}
where we applied the monotone convergence theorem and the fact that \( \mathcal{H}^{(n,\delta)} \notin L^1(\mathbb{R}^n) \) for \( \delta \leq 2 \) because of (1.11).
This fact combined with (3.2) completes the proof.

4. PROOF OF PROPOSITION 1.3

We first consider the case $1 \leq l < m$. Let $\mu_1 := (m^{-1/2}, 0, \ldots, 0) \in \mathbb{R}^n$. The condition

$$\sum_{k=1}^{l} (s_k/n - 1/p_k) \leq -1/r'$$

is equivalent to

$$(4.1) \quad s_1 + \cdots + s_l + n/r' \leq n/p_1 + \cdots + n/p_l = n/p - (n/p_{l+1} + \cdots + n/p_m).$$

On the other hand, it follows from the condition $s_j > n/r$, $1 \leq j \leq m$, that

$$s_1 + \cdots + s_l + n/r' > ln/r + n/r',$$

which further implies, combined with (4.1), that

$$2l/r + 2/r' < 2/p - (2/p_{l+1} + \cdots + 2/p_m).$$

Now we choose $\tau, \tau_{l+1}, \ldots, \tau_m > 0$ such that

$$\tau_{l+1} > 2/p_{l+1}, \ldots, \tau_m > 2/p_m$$

and

$$(4.2) \quad 2/r < \tau < 2l/r + 2/r' < 2/p - (\tau_{l+1} + \cdots + \tau_m) < 2/p - (2/p_{l+1} + \cdots + 2/p_m).$$

Let $\varphi, \tilde{\varphi} \in S(\mathbb{R}^n)$ be radial functions having the properties that $\varphi \geq 0$, $\varphi(0) \neq 0$, $\text{Supp}(\tilde{\varphi}) \subset \{ \xi \in \mathbb{R}^n : |\xi| \leq \frac{1}{200m} \}$, $\text{Supp}(\tilde{\varphi}) \subset \{ \xi \in \mathbb{R}^n : |\xi| \leq \frac{1}{100m} \}$, and $\tilde{\varphi}(\xi) = 1$ for $|\xi| \leq \frac{1}{200m}$. In what follows, we denote $\mathcal{H}(s_1, \ldots, s_j + n/r', \tau)$ by $\mathcal{H}$ for notational convenience. We define

$$K^{(l)}(x) := \mathcal{H} * \varphi(x), \quad x \in \mathbb{R}^n,$$

and

$$M^{(l)}(\xi_1, \ldots, \xi_l) := (K^{(l)})^\vee \left( \frac{1}{l} \sum_{k=1}^{l} (\xi_k - \mu_1) \right) \prod_{j=2}^{l} \varphi^\vee \left( \frac{1}{l} \sum_{k=1}^{l} (\xi_k - \xi_j) \right)$$

where $M^{(l)}$ is defined on $(\mathbb{R}^n)^l$. Then the multiplier $\sigma$ on $(\mathbb{R}^n)^m$ is defined by

$$\sigma(\xi_1, \ldots, \xi_m) := M^{(l)}(\xi_1, \ldots, \xi_l) \tilde{\varphi}^\vee(\xi_{l+1} - \mu_1) \cdots \tilde{\varphi}^\vee(\xi_m - \mu_1).$$

To investigate the support of $\sigma$ we first look at the support of $M^{(l)}$. From the support of $\varphi^\vee$, we have

$$|\xi_1 + \cdots + \xi_l - l\mu_1| \leq \frac{1}{200m},$$

and for each $2 \leq j \leq l$

$$(4.3) \quad |\xi_1 + \cdots + \xi_l - l\mu_j| \leq \frac{1}{200m}.$$  

By adding up all of them, we obtain

$$(4.4) \quad |\xi_1 - \mu_1| \leq \frac{1}{200m}$$

and the sum of (4.3) and (4.4) yields that for each $2 \leq j \leq l$

$$|\mu_1 + \xi_2 + \cdots + \xi_l - l\xi_j| \leq \frac{1}{100m}.$$
Let us call the above estimate $\mathcal{E}(j)$. Then for $2 \leq j \leq l$, it follows from

$$\mathcal{E}(j) + \sum_{k=2}^{l} \mathcal{E}(k)$$

that

$$|\xi_j - \mu_1| \leq \frac{1}{100m},$$

which proves, together with (4.4), that

$$\text{(4.5)}$$

$$\text{Supp}(M^{(l)}) \subset \left\{(\xi_1, \ldots, \xi_l) \in (\mathbb{R}^n)^l : |\xi_j - \mu_1| \leq \frac{1}{100m}, 1 \leq j \leq l\right\}.$$  

Since $\hat{\varphi}$ is also supported in $\{\xi \in \mathbb{R}^n : |\xi| \leq \frac{1}{100m}\}$, it is clear that

$$\text{Supp}(\sigma) \subset \left\{(\xi_1, \ldots, \xi_m) \in (\mathbb{R}^n)^m : |\xi_j - \mu_1| \leq \frac{1}{100m}, 1 \leq j \leq m\right\}$$

$$\subset \left\{\tilde{\xi} := (\xi_1, \ldots, \xi_m) \in (\mathbb{R}^n)^m : \frac{99}{100} \leq |\tilde{\xi}| \leq \frac{101}{100}\right\},$$

which shows that $\sigma(2 \tilde{\xi})\hat{\psi}^{(m)}(\tilde{\xi})$ vanishes unless $-1 \leq l \leq 1$. Furthermore, using Lemma 2.5 and the scaling argument in the derivation of (3.1), we have

$$L_{\mathcal{S}^{(m)}}^{r^*}[\sigma] \leq \sup_{-1 \leq l \leq 1} \left\| \sigma(2^l \cdot \hat{\psi}^{(m)}) \right\|_{L_{\mathcal{S}^{(m)}}^{r^*}(\mathbb{R}^n)^m} \lesssim \|\sigma\|_{L_{\mathcal{S}^{(m)}}^{r^*}(\mathbb{R}^n)^m}$$

and this is clearly less than a constant times

$$\left\| M^{(l)} \right\|_{L_{1(\mathbb{R}^n)^l}^r} \prod_{j=l+1}^{m} \left\| \hat{\varphi}^\vee \right\|_{L_{\mathcal{S}^{(m)}}^{r^*}(\mathbb{R}^n)} \lesssim \left\| (I - \Delta_1)^{s_1/2} \cdots (I - \Delta_{l})^{s_l/2} M^{(l)} \right\|_{L_{r^*}((\mathbb{R}^n)^l)}.$$  

We observe that

$$\hat{M}^{(l)}(x_1, \ldots, x_l)$$

$$= \int_{(\mathbb{R}^n)^l} \left( K^{(l)} \right)^\vee \left( \frac{1}{l} \sum_{k=1}^{l} (\xi_k - \mu_1) \right) \left[ \prod_{j=2}^{l} \varphi^\vee \left( \frac{1}{l} \sum_{k=1}^{l} (\xi_k - \xi_j) \right) \right] \left( \prod_{j=1}^{l} e^{-2\pi i (x_j, \xi_j)} \right) d\xi_1 \cdots d\xi_l.$$  

Using a change of variables with

$$\zeta_1 := \frac{1}{l} \sum_{k=1}^{l} (\xi_k - \mu_1), \quad \text{and} \quad \zeta_j := \frac{1}{l} \sum_{k=1}^{l} (\xi_k - \xi_j), \quad 2 \leq j \leq l$$

so that

$$\text{(4.6)}$$

$$\xi_1 = \zeta_1 + \cdots + \zeta_l + \mu_1, \quad \text{and} \quad \xi_j = \zeta_1 - \zeta_j + \mu_1, \quad 2 \leq j \leq l,$$

we see that

$$\hat{M}^{(l)}(x_1, \ldots, x_l) = le^{-2\pi i (\sum_{k=1}^{l} x_k, \mu_1)} \int_{(\mathbb{R}^n)^l} \left( K^{(l)} \right)^\vee (\zeta_1) \left( \prod_{j=2}^{l} \varphi^\vee (\zeta_j) \right) e^{-2\pi i (\sum_{k=1}^{l} x_k, \zeta_1)}$$

$$\times \left( \prod_{j=2}^{l} e^{-2\pi i (x_j, \zeta_j)} \right) d\zeta_1 \cdots d\zeta_l$$  

$$\text{(4.7)}$$

$$= lK^{(l)}(x_1 + \cdots + x_l) \varphi(x_1 - x_2) \cdots \varphi(x_1 - x_l) e^{-2\pi i (x_1 + \cdots + x_l, \mu_1)}.$$
since the Jacobian of the system (4.6) is \( l \). Consequently,
\[
(I - \Delta_1)^{s_1/2} \cdots (I - \Delta_l)^{s_l/2} M^{(l)}(\xi_1, \ldots, \xi_l)
\]
\[
= l \int_{(\mathbb{R}^n)^l} \left( \prod_{j=1}^l (x_j)^{s_j} \right) K^{(l)}(x_1 + \cdots + x_l) \varphi(x_1 - x_2) \cdots \varphi(x_1 - x_l) e^{-2\pi i (x_1 + \cdots + x_l, \mu_1)} e^{2\pi i (x_1, \xi_1)} \cdots e^{2\pi i (x_l, \xi_l)} dx_1 \cdots dx_l
\]
and we perform another change of variables with
\[
y_1 := x_1 + \cdots + x_l, \quad \text{and} \quad y_j := x_1 - x_j, \quad 2 \leq j \leq l,
\]
which is equivalent to
\[
x_1 = \frac{1}{l} \sum_{k=1}^l y_k, \quad \text{and} \quad x_j = \frac{1}{l} \sum_{k=1}^l (y_k - y_j), \quad 2 \leq j \leq l,
\]
to obtain that the last expression is controlled by a constant times
\[
\int_{(\mathbb{R}^n)^l} \left( \frac{1}{l} \sum_{k=1}^l y_k \right)^{s_1} \left( \prod_{j=2}^l \left( \frac{1}{l} \sum_{k=1}^l (y_k - y_j) \right)^{s_j} \right) K^{(l)}(y_1) \left( \prod_{j=2}^l \varphi(y_j) \right) e^{2\pi i (y_1, \frac{1}{l}(\xi_1 + \cdots + \xi_l) - \mu_1)} \left( \prod_{j=2}^l e^{2\pi i (y_j, \xi_j)} \right) dy_1 \cdots dy_l.
\]
In conclusion, using a change of variables, we have
\[
\text{(4.8)} \quad \mathcal{L}_{\tilde{F}_{\omega}}^{r, \psi^{(m)}}[\sigma] \lesssim \left\| \int_{(\mathbb{R}^n)^l} \left( \frac{1}{l} \sum_{k=1}^l y_k \right)^{s_1} \left( \prod_{j=2}^l \left( \frac{1}{l} \sum_{k=1}^l (y_k - y_j) \right)^{s_j} \right) K^{(l)}(y_1) \left( \prod_{j=2}^l \varphi(y_j) \right) e^{2\pi i (y_1, \frac{1}{l}(\xi_1 + \cdots + \xi_l) - \mu_1)} \left( \prod_{j=2}^l e^{2\pi i (y_j, \xi_j)} \right) dy_1 \cdots dy_l \right\|_{L^r(\xi_1, \ldots, \xi_m)}
\]
For sufficiently large \( M > 0 \), let
\[
\mathcal{N}_{(M)}(y_1, \ldots, y_l) := \frac{\left( \frac{1}{l} \sum_{k=1}^l y_k \right)^{s_1} \prod_{j=2}^l \left( \frac{1}{l} \sum_{k=1}^l (y_k - y_j) \right)^{s_j}}{\left( y_1 \right)^{s_1 + \cdots + s_l} \prod_{j=2}^l \left( y_j \right)^M}.
\]
Then the right-hand side of (4.8) can be written as
\[
\text{(4.9)} \quad \left\| T_{\mathcal{N}_{(M)}} \left( (K^{(l)}_{s_1 + \cdots + s_l})^r \otimes (\varphi^{(M)})^r \otimes \cdots \otimes (\varphi^{(M)})^r \right) \right\|_{L^r((\mathbb{R}^n)^l)}
\]
where
\[
K^{(l)}_{(s_1 + \cdots + s_l)}(y_1) := \left( y_1 \right)^{s_1 + \cdots + s_l} K^{(l)}(y_1), \quad \varphi^{(M)}(y) := \left( y \right)^M \varphi(y).
\]
Now we need the following lemma whose proof will be provided in Section 9.

**Lemma 4.1.** Let \( M > s_1 + \cdots + s_l + n + 2 \). Then \( \mathcal{N}_{(M)} \) is an \( L^r \) multiplier on \((\mathbb{R}^n)^l\).
By choosing $M > s_1 + \cdots + s_l + n + 2$ and using Lemma 4.1 and 2.5, we obtain
\begin{align*}
(4.9) & \lesssim \| (K^{(l)}_{s_1+\cdots+s_l})^\varphi (M) \|_{L^1(\mathbb{R}^n)} \\
& \lesssim \| (I - \Delta)^{(s_1+\cdots+s_l)/2} (K^{(l)})^\varphi \|_{L^1(\mathbb{R}^n)} = \| (I - \Delta)^{(s_1+\cdots+s_l)/2} (\mathcal{H}^\varphi)^{\gamma} \|_{L^1(\mathbb{R}^n)}
\end{align*}
and this is finite because of (1.12) with $\tau > 2/r$, which concludes that
\[
\mathcal{L}_{\tilde{a}}^{s,\psi(m)}[\sigma] < \infty.
\]

To achieve
\begin{equation}
(4.10) \quad \| T_\sigma \|_{H^{p_1} \times \cdots \times H^{p_m} \rightarrow L^p} = \infty,
\end{equation}
let
\[
f_l(x) = \cdots = f_l(x) := 2^n \varphi(2x) e^{2\pi i (x, \mu_l)}, \quad f_j(x) := \mathcal{H}(n/p_j, \tau_j^*) \varphi(x) e^{2\pi i (x, \mu_1)}, \quad l + 1 \leq j \leq m.
\]
Clearly, $\| f_j \|_{H^{p_j}(\mathbb{R}^n)} \lesssim 1$ for $1 \leq j \leq l$ and
\[
\| f_j \|_{H^{p_j}(\mathbb{R}^n)} \approx \| f_j \|_{L^{p_j}(\mathbb{R}^n)} \lesssim \| \mathcal{H}(n/p_j, \tau_j^*) \|_{L^{p_j}(\mathbb{R}^n)} \lesssim 1, \quad l + 1 \leq j \leq m
\]
due to (1.11) with $\tau_j > 2/p_j$, where the pointwise estimate $\mathcal{H}(n/p_j, \tau_j^*) \varphi(x) \lesssim \mathcal{H}(n/p_j, \tau_j^*)(x)$ is applied. On the other hand, using (4.5) and the facts that $\varphi \ast \tilde{\varphi} = \varphi$ and
\[
\tilde{f}_j(\xi) = 1 \quad \text{for} \quad |\xi - \mu_1| \leq \frac{1}{100m} \quad \text{and} \quad 1 \leq j \leq l,
\]
we see that
\[
\sigma(\xi_1, \ldots, \xi_m) \tilde{f}_1(\xi_1) \cdots \tilde{f}_m(\xi_m) = M^{(l)}(\xi_1, \ldots, \xi_l) \tilde{f}_{l+1}(\xi_{l+1}) \cdots \tilde{f}_m(\xi_m),
\]
which implies that
\[
| T_\sigma \tilde{f}(x) | = \| (M^{(l)})^\varphi(x, \ldots, x) \| f_{l+1}(x) \cdots f_m(x) | = l \| K^{(l)}(lx) \| \| \varphi(0) \| l-1 \prod_{j=l+1}^m | \mathcal{H}(n/p_j, \tau_j^*) \varphi(x) |
\]
where we applied (4.7) and the fact that $K^{(l)}$ is a radial function. Now, since
\[
\mathcal{H}(s, \gamma) \ast \varphi(x) \gtrsim \mathcal{H}(s, \gamma)(x) \quad \text{for any} \quad s, \gamma > 0,
\]
which follows from the fact that $\varphi, \mathcal{H}(s, \gamma) \geq 0$ and (1.10), we obtain that
\[
\| T_\sigma \tilde{f}(x) \|_{L^p(\mathbb{R}^n)} \gtrsim \| \mathcal{H}(l) \sum_{j=l+1}^m \mathcal{H}(n/p_j, \tau_j^*) \|_{L^p(\mathbb{R}^n)}
\approx \| \mathcal{H}(s_1+\cdots+s_l+n/r', \tau) \prod_{j=l+1}^m \mathcal{H}(n/p_j, \tau_j^*) \|_{L^p(\mathbb{R}^n)}
= \| \mathcal{H}(s_1+\cdots+s_l+n/p_{l+1}+\cdots+n/p_m+n/r', \tau \tau_{l+1} \cdots \tau_m) \|_{L^p(\mathbb{R}^n)}.
\]
Since $s_1 + \cdots + s_l + n/p_{l+1} + \cdots + n/p_m + n/r' \leq n/p$ due to (4.1), the last expression is greater than
\[
\| \mathcal{H}(n/p, \tau \tau_{l+1} \cdots \tau_m) \|_{L^p(\mathbb{R}^n)} = \infty
\]
because of (1.11) with \( \tau + \tau_{l+1} + \cdots + \tau_m < p/2 \), which follows from (4.2). This completes the proof of (4.10).

When \( l = m \), exactly the same argument is applicable with \( 2/r < \tau < 2m/r + 2/r' < 2/p \), \( \sigma := M^{(m)} \), and \( f_j(x) := 2^d \varphi(2x)e^{2\pi i(x,\mu_1)} \) for \( 1 \leq j \leq m \). Since the proof is just a repetition, we omit the details.

5. Proof of Proposition 1.4

Let \( \Theta^{(m)} \) be a Schwartz function on \((\mathbb{R}^n)^m\) such that \( 0 \leq \widehat{\Theta^{(m)}} \leq 1 \), \( \widehat{\Theta^{(m)}}(\xi) = 1 \) for \( 2^{-2m-1/2} \leq |\xi| \leq 2^2m^{1/2} \), and \( \text{Supp}(\widehat{\Theta^{(m)}}) \subseteq \{ \xi \in (\mathbb{R}^n)^m : 2^{-3m-1/2} \leq |\xi| \leq 2^{3m^{1/2}} \} \).

Then using the Littlewood-Paley partition of unity \( \{ 2^{jmn}\psi^{(m)}(2^j \cdot) \}_{j \in \mathbb{Z}} \), the triangle inequality, and Lemma 2.5, we first see that \( \ell_{s_l}^{r_l \psi^{(m)}} \sigma \leq \ell_{s_l}^{r_l \psi^{(m)}} \sigma \). Thus, it suffices to prove the estimate

\[
\|T_{\sigma} \hat{f}\|_{L^p(\mathbb{R}^n)} \lesssim \ell_{s_l}^{r_l \psi^{(m)}} \|\sigma\|_{L^p(\mathbb{R}^n)}
\]

as \( L^{p_l} = H^{p_l} \) for \( 1 < p_l \leq \infty \). We adopt the notation \( \ell_{s}^{r \psi} \sigma := \ell_{s}^{r \psi^{(m)}} \sigma \) for simplicity.

It follows from (1.13) that there exists \( 1 < t < r \) such that \( s_1, \ldots, s_m > n/t > n/r \).

Since \( \sigma(2^j \cdot) \widehat{\Theta^{(m)}} \) has a compact support in an annulus of a constant size, independent of \( j \), we have

\[
(5.1) \quad \ell_{s_l}^{r_l \psi} \sigma \lesssim \ell_{s_l}^{r_l \psi} \sigma
\]

as \( 1 < t < r \). See [9, Section 5] for more details.

Using the Littlewood-Paley partition of unity \( \{ \psi_j \}_{j \in \mathbb{Z}} \), we decompose \( \sigma(\xi) \) as

\[
(5.2) \quad \sigma(\xi) = \sum_{j_1, \ldots, j_m \in \mathbb{Z}} \sigma(\xi) \widehat{\psi_{j_1}}(\xi_1) \cdots \widehat{\psi_{j_m}}(\xi_m)
\]

\[
= \left( \sum_{j_1 \in \mathbb{Z}} \sum_{j_2 \in \mathbb{Z}} \cdots + \left( \sum_{j_2 \in \mathbb{Z}} \sum_{j_3 \in \mathbb{Z}} \cdots \right) + \cdots + \left( \sum_{j_m \in \mathbb{Z}} \sum_{j_{m-1} < j_m \in \mathbb{Z}} \right) \right)
\]

\[
(5.3) \quad =: \sigma^{(1)}(\xi) + \sigma^{(2)}(\xi) + \cdots + \sigma^{(m)}(\xi).
\]

We are only concerned with \( \sigma^{(1)} \) appealing to symmetry for the other cases. Thus, our goal is to show that

\[
\|T_{\sigma^{(1)}} \hat{f}\|_{L^p(\mathbb{R}^n)} \lesssim \ell_{s_l}^{r_l \psi} \|\sigma\|_{L^p(\mathbb{R}^n)}
\]

We write

\[
\sigma^{(1)}(\xi) = \sum_{j \in \mathbb{Z}} \sum_{j_2, \ldots, j_m \leq j} \sigma(\xi) \widehat{\psi_j}(\xi_1) \widehat{\psi_{j_2}}(\xi_2) \cdots \widehat{\psi_{j_m}}(\xi_m)
\]

\[
= \sum_{j \in \mathbb{Z}} \sigma(\xi) \Theta^{(m)}(\xi/2^j) \widehat{\psi_j}(\xi_1) \sum_{j_2, \ldots, j_m \leq j} \widehat{\psi_{j_2}}(\xi_2) \cdots \widehat{\psi_{j_m}}(\xi_m),
\]

since \( \Theta^{(m)}(\xi/2^j) = 1 \) for \( 2^{j-1} \leq |\xi_1| \leq 2^{j+1} \) and \( |\xi_1| \leq 2^{j+1} \) for \( 2 \leq i \leq m \). Let

\[
\sigma_j(\xi) := \sigma(\xi) \Theta^{(m)}(\xi/2^j).
\]
Then we note that
\[
\|\sigma_j(2^j \cdot)\|_{L^p_t(\mathbb{R}^n)^m} \leq \mathcal{L}_g^t[\sigma]
\]
and
\[
\sigma^{(1)}(\tilde{\xi}) = \sum_{j \in \mathbb{Z}} \sigma_j(\tilde{\xi}) \hat{\psi}_j(\xi_1) \sum_{j_2 \ldots j_m \leq j} \hat{\psi}_{j_2}(\xi_2) \cdots \hat{\psi}_{j_m}(\xi_m).
\]
We further decompose \(\sigma^{(1)}\) as
\[
\sigma^{(1)}(\tilde{\xi}) = \sigma^{(1)}_{\text{low}}(\tilde{\xi}) + \sigma^{(1)}_{\text{high}}(\tilde{\xi})
\]
where
\[
\sigma^{(1)}_{\text{low}}(\tilde{\xi}) := \sum_{j \in \mathbb{Z}} \sigma_j(\tilde{\xi}) \hat{\psi}_j(\xi_1) \sum_{j_2 \ldots j_m \leq j \text{ max}_{2 \leq i \leq m} (j_i) \geq j - 3 - \lfloor \log_2 m \rfloor} \hat{\psi}_{j_2}(\xi_2) \cdots \hat{\psi}_{j_m}(\xi_m),
\]
\[
\sigma^{(1)}_{\text{high}}(\tilde{\xi}) := \sum_{j \in \mathbb{Z}} \sigma_j(\tilde{\xi}) \hat{\psi}_j(\xi_1) \sum_{j_2 \ldots j_m \leq j \text{ max}_{2 \leq i \leq m} (j_i) \geq j - 4 - \lfloor \log_2 m \rfloor} \hat{\psi}_{j_2}(\xi_2) \cdots \hat{\psi}_{j_m}(\xi_m).
\]
We refer to \(T_{\sigma^{(1)}_{\text{low}}}\) as the low frequency part and \(T_{\sigma^{(1)}_{\text{high}}}\) as the high frequency part of \(T_{\sigma^{(1)}}\) (due to the Fourier supports of the summands in \(T_{\sigma^{(1)}_{\text{low}}} \hat{f}\) and \(T_{\sigma^{(1)}_{\text{high}}} \hat{f}\)).

5.1. **Low frequency part.** To establish the estimate for the operator \(T_{\sigma^{(1)}_{\text{low}}}\), we first observe that
\[
T_{\sigma^{(1)}_{\text{low}}} \hat{f}(x) = \sum_{j \in \mathbb{Z}} \sum_{j_2 \ldots j_m \leq j \text{ max}_{2 \leq i \leq m} (j_i) \geq j - 3 - \lfloor \log_2 m \rfloor} \sigma_j((f_1)_{j_1}, (f_2)_{j_2}, \ldots, (f_m)_{j_m}) (x)
\]
where \((g)_L := \psi * g\) for \(g \in \mathcal{S}(\mathbb{R}^n)\) and \(l \in \mathbb{Z}\). It suffices to treat only the sum over \(j_3, \ldots, j_m \leq j_2\) and \(j - 3 - \lfloor \log_2 m \rfloor \leq j_2 \leq j\), and we will actually prove that
\[
\sum_{j \in \mathbb{Z}} \sum_{j_2 \ldots j_m \leq j \text{ max}_{2 \leq i \leq m} (j_i) \geq j - 3 - \lfloor \log_2 m \rfloor} \sigma_j((f_1)_{j_1}, (f_2)_{j_2}, \ldots, (f_m)_{j_m}) (x) = \sigma_j((f_1)_{j_1}, (f_2)_{j_2}, (f_3)^{j_3}, \ldots, (f_m)^{j_m}) (x)
\]
Since the sum over \(j_2\) in the left-hand side of (5.6) is a finite sum over \(j_2\) near \(j\), we may consider only the case \(j_2 = j\) and thus our claim is
\[
\sum_{j_3, \ldots, j_m \leq j_2} \sigma_j((f_1)_{j_1}, (f_2)_{j_2}, (f_3)^{j_3}, \ldots, (f_m)^{j_m}) (x) = \sigma_j((f_1)_{j_1}, (f_2)_{j_2}, (f_3)^{j_3}, \ldots, (f_m)^{j_m})(x)
\]
Using Lemma 2.4, (5.4), and (5.1), we obtain the pointwise estimate
\[
|T_{\sigma_j}((f_1)_{j_1}, (f_2)_{j_2}, (f_3)^{j_3}, \ldots, (f_m)^{j_m})(x)| \leq \mathcal{L}_g^t[\sigma] \left( \prod_{i=1}^2 \mathcal{M}_{s_1,2i}^t((f_1)_j)(x) \right) \left( \prod_{i=3}^m \mathcal{M}_{s_1,2i}^t((f_i)^{j})(x) \right).
\]
Since \( s_1, s_2 > n/t = n/\min(p_1, 2, t) = n/\min(p_2, 2, t) \), it follows from Lemma 2.2 that for any dyadic cube \( Q \in \mathcal{D} \) there exists measurable proper subsets \( S_Q^1 \) and \( S_Q^2 \) of \( Q \) such that \( |S_Q^1|, |S_Q^2| > \frac{3}{4}|Q| \) and

\[
\|f_i\|_{X^{p_i}} \approx \left\| \left\{ \sum_{Q \in \mathcal{D}_j} \left( \inf_{y \in Q} \mathcal{M}_t^{x_i, y_j}(f_i)(y) \right) \chi_{S_Q^j} \right\}_{j \in \mathbb{Z}} \right\|_{L^{p_i}(\mathbb{R}^n)}, \quad i = 1, 2.
\]

Note that \( |S_Q^1 \cap S_Q^2| \geq \frac{1}{2}|Q| \) and thus, for any \( \tau > 0 \)

\[
\chi_Q(x) \lesssim_{\tau} \mathcal{M}_{\tau}(\chi_{S_Q^1 \cap S_Q^2})(x) \chi_Q(x),
\]

using the argument in (2.8). Clearly, the constant in the inequality is independent of \( Q \). Now we choose \( \tau = \min(1, p) \), and apply (5.8), (5.10), and (2.3), as in the proof of Lemma 2.3, to obtain

\[
\left\| \sum_{j \in \mathbb{Z}} T_{\tau_j}((f_1)_j, (f_2)_j, (f_3)_j, \ldots, (f_m)_j) \right\|_{L^p(\mathbb{R}^n)} \lesssim L^{p}[\tau]\left( \sum_{k \in \mathbb{Z} \cap \mathcal{D}_j} \left( \prod_{i=1}^{2} \left( \prod_{j=3}^{m} \mathcal{M}_t^{x_i, y_j}(f_i)(y) \right) \chi_{S_Q^j} \right) \right)_{L^{p}(\mathbb{R}^n)}
\]

\[
\lesssim L^{p}[\tau]\left( \sum_{j \in \mathbb{Z} \cap \mathcal{D}_j} \left( \prod_{i=1}^{2} \left( \prod_{j=3}^{m} \mathcal{M}_t^{x_i, y_j}(f_i)(y) \right) \chi_{S_Q^j} \right) \right)_{L^{p}(\mathbb{R}^n)}
\]

\[
\lesssim L^{p}[\tau]\left( \sum_{j \in \mathbb{Z} \cap \mathcal{D}_j} \left( \prod_{i=1}^{2} \left( \prod_{j=3}^{m} \mathcal{M}_t^{x_i, y_j}(f_i)(y) \right) \chi_{S_Q^j} \right) \right)_{L^{p}(\mathbb{R}^n)}
\]

where \( \Omega_{s,t}^1 g := \inf_{y \in Q} \mathcal{M}_t^{x_i, y_j}(g)(y) \) and \( \Omega_{s,t}^2 g := \inf_{y \in Q} \mathcal{M}_t^{x_i, y_j}(g)(y) \) for all \( Q \in \mathcal{D}_j \).

Using Hölder’s inequality and the fact that \( \Omega_{s,t}^2 f_i \leq \mathcal{M}_t^{x_i, y_j}(f_i)(x) \) for all \( x \in \mathcal{D}_j \), the \( L^p \) norm in the last displayed expression is bounded by a constant times

\[
\left( \prod_{i=1}^{2} \left( \sum_{Q \in \mathcal{D}_j} \left( \prod_{j=3}^{m} \mathcal{M}_t^{x_i, y_j}(f_i)(y) \right) \chi_{S_Q^j} \right) \right)_{L^{p}(\mathbb{R}^n)} \left( \prod_{i=3}^{m} \left\{ \mathcal{M}_t^{x_i, y_j}(f_i)(y) \right\}_{j \in \mathbb{Z}} \right)_{L^{p}(\mathbb{R}^n)}
\]

\[
\lesssim \|f_i\|_{X^{p_1}(\mathbb{R}^n)} \|f_i\|_{X^{p_2}(\mathbb{R}^n)} \prod_{i=3}^{m} \|f_i\|_{H^{p_i}(\mathbb{R}^n)},
\]

where the inequality follows from Lemma 2.1, 2.2, and the definition of Hardy space \( H^p \). Since \( H^p = L^p \subset X^p \) when \( 1 < p \leq \infty \), we finally obtain (5.7).

5.2. **High frequency part.** The proof for the high frequency part relies on the fact that if \( \hat{g}_j \) is supported on \( \{ \xi \in \mathbb{R}^n : C^{-1}2^j \leq |\xi| \leq C2^j \} \) for some \( C > 1 \), then

\[
\left\| \left\{ \psi_j \ast \left( \sum_{l=j-h}^{j+h} g_l \right) \right\}_{j \in \mathbb{Z}} \right\|_{L^{p}(\mathbb{R}^n)} \lesssim_{h,C} \|g_j\|_{L^{p}(\mathbb{R}^n)} , \quad 0 < p < \infty
\]

for \( h \in \mathbb{N} \). The proof of (5.11) is elementary and standard, so it is omitted here. Just use the estimate \( |\psi_j \ast g_l(x)| \lesssim_{\sigma} \mathcal{M}_t^{x_i, y_j}(g_l)(x) \) for \( 0 < \sigma < p, q \) and \( j - h \leq l \leq j + h \), and apply Lemma 2.1.
We note that
\[ T_{\sigma_{\text{high}}^{(1)}} \tilde{f}(x) = \sum_{j \in \mathbb{Z}} T_{\sigma_j}((f_1)_j, (f_2)_j^{j,m}, \ldots, (f_m)_j^{j,m})(x) \]
where \( \phi_t \) is defined as in the previous subsection and \( (f_i)_j^{j,m} := \phi_{j-4-\log_2 m} * f_i \) for \( 2 \leq i \leq m \). Observe that the Fourier transform of \( T_{\sigma_j}((f_1)_j, (f_2)_j^{j,m}, \ldots, (f_m)_j^{j,m}) \) is supported in \( \{ \xi \in \mathbb{R}^n : 2^{j-3} \leq |\xi| \leq 2^{j+3} \} \) and thus (5.11) yields that
\[
\| T_{\sigma_{\text{high}}^{(1)}} \tilde{f} \|_{L^p(\mathbb{R}^n)} \lesssim \| \{ T_{\sigma_j}((f_1)_j, (f_2)_j^{j,m}, \ldots, (f_m)_j^{j,m}) \}_{j \in \mathbb{Z}} \|_{L^p(\ell^2)}.
\]
Moreover, it follows from Lemma 2.4, (5.4), and (5.1), that
\[
|T_{\sigma_j}((f_1)_j, (f_2)_j^{j,m}, \ldots, (f_m)_j^{j,m})(x)| \lesssim L^r_{\mathcal{F}}[\sigma] \mathcal{M}^t_{s_1,2j}(f_1)_j(x) \prod_{i=2}^{m} \mathcal{M}^t_{s_i,2j}(f_i)_j^{j,m}(x).
\]

For \( Q \in \mathcal{D} \) let \( S^1_Q \) be a measurable proper subset of \( Q \) such that \( |S^1_Q| > \frac{3}{4}|Q| \) and (5.9) holds for \( i = 1 \) as before, and we proceed the similar arguments to obtain that
\[
\| T_{\sigma_{\text{high}}^{(1)}} \tilde{f} \|_{L^p(\mathbb{R}^n)} \lesssim L^r_{\mathcal{F}}[\sigma] \left\{ \prod_{i=2}^{m} \mathcal{M}^t_{s_i,2j}(f_i)_j^{j,m}(y) \right\} \| f_1 \|_{L^p(\mathbb{R}^n)} \prod_{i=2}^{m} \| f_i \|_{L^p(\mathbb{R}^n)} \lesssim L^r_{\mathcal{F}}[\sigma] \prod_{i=1}^{m} \| f_i \|_{L^p(\mathbb{R}^n)}.
\]

6. PROOF OF PROPOSITION 1.5

We consider only the case \( l < m \) as a similar and simpler procedure is applicable to the case \( l = m \). Let \( 1 \leq l < m \), \( 0 < p_1, \ldots, p_l \leq 1 \), \( p_{l+1} = \cdots = p_m = \infty \), and \( 1/p = 1/p_1 + \cdots + 1/p_l \). For simplicity we assume that \( \|f_{l+1}\|_{L^\infty(\mathbb{R}^n)} = \cdots = \|f_m\|_{L^\infty(\mathbb{R}^n)} = 1 \). Then the aim is to show that
\[
\| T_\sigma \tilde{f} \|_{L^p(\mathbb{R}^n)} \lesssim L^r_{\mathcal{F}}[\sigma] \prod_{i=1}^{l} \| f_i \|_{H^{p_i}(\mathbb{R}^n)}.
\]
Let \( f_i \in H^{p_i}(\mathbb{R}^n) \) for \( 1 \leq i \leq l \). Using atomic representations, we write
\[
f_i = \sum_{k_i=1}^{\infty} \lambda_{i,k_i} a_{i,k_i}, \quad 1 \leq i \leq l,
\]
where \( a_{i,k_i} \) are \( L^\infty \)-atoms for \( H^{p_i} \) satisfying
\[
\text{Supp}(a_{i,k_i}) \subset Q_{i,k_i}, \quad \| a_{i,k_i} \|_{L^\infty(\mathbb{R}^n)} \leq |Q_{i,k_i}|^{-1/p_i}, \quad \int_{Q_{i,k_i}} x_\alpha a_{i,k_i}(x) dx = 0
\]
for $|\alpha| < N_i$ with $N_i$ large enough, and

$$
\left( \sum_{k_i=1}^{\infty} |\lambda_{i,k_i}|^{p_i} \right)^{1/p_i} \lesssim \|f_i\|_{H^{p_i}({\mathbb{R}}^n)}.
$$

By the regularization in Lemma 2.6, we can assume that $\sigma$ is a Schwartz function whose Fourier transform has a compact support in $({\mathbb{R}}^n)^m$. Then Lemma 2.7 yields that

$$
T_\sigma \tilde{f}(x) = \sum_{k_1=1}^{\infty} \cdots \sum_{k_l=1}^{\infty} \lambda_{1,k_1} \cdots \lambda_{l,k_l} T_\sigma (a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m)(x)
$$

for a.e. $x \in {\mathbb{R}}^n$.

For a cube $Q$ we denote by $Q^*$ its concentric dilate by a factor $10\sqrt{n}$. Now we can split $T_\sigma \tilde{f}$ into two parts and estimate

$$
|T_\sigma \tilde{f}(x)| \leq G_1(x) + G_2(x),
$$

where

$$
G_1 := \sum_{k_1=1}^{\infty} \cdots \sum_{k_l=1}^{\infty} |\lambda_{1,k_1}| \cdots |\lambda_{l,k_l}| |T_\sigma (a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m)| \chi_{Q_{1,k_1}^* \cap \cdots \cap Q_{l,k_l}^*},
$$

$$
G_2 := \sum_{k_1=1}^{\infty} \cdots \sum_{k_l=1}^{\infty} |\lambda_{1,k_1}| \cdots |\lambda_{l,k_l}| |T_\sigma (a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m)| \chi((Q_{1,k_1}^* \cap \cdots \cap Q_{l,k_l}^*)^c).
$$

The first part $G_1$ can be dealt with via Lemma 2.10. Suppose that $Q_{1,k_1}^* \cap \cdots \cap Q_{l,k_l}^* \neq \emptyset$, as if this intersection is empty we are done. From these cubes, choose a cube that has the minimum side length, and denote it by $R_{k_1,\ldots,k_l}$. Then

$$
Q_{1,k_1}^* \cap \cdots \cap Q_{l,k_l}^* \subset R_{k_1,\ldots,k_l} \subset Q_{1,k_1}^{**} \cap \cdots \cap Q_{l,k_l}^{**},
$$

where $Q_{i,k_i}^{**} := (Q_{i,k_i}^*)^c$ denotes a dilation of $Q_{i,k_i}^*$. We shall prove

$$
\frac{1}{|R_{k_1,\ldots,k_l}|} \int_{R_{k_1,\ldots,k_l}} |T_\sigma (a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m)(y)| \, dy \lesssim L^r_{\tilde{g}} \frac{1}{|Q_{1,k_1}^*|^{1/2}} \left\| T_\sigma (a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m) \right\|_{L^2({\mathbb{R}}^n)}.
$$

To verify this, we may assume, without loss of generality, $R_{k_1,\ldots,k_l} = Q_{1,k_1}^*$. Using the Cauchy-Schwarz inequality, the left-hand side of (6.5) is majorized by

$$
\frac{1}{|Q_{1,k_1}^*|^{1/2}} \left\| T_\sigma (a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m) \right\|_{L^2({\mathbb{R}}^n)}
$$

and this is less than a constant multiple of

$$
L^r_{\tilde{g}} \frac{1}{|Q_{1,k_1}^*|^{1/2}} \left\| a_{1,k_1} \right\|_{L^2({\mathbb{R}}^n)} \prod_{i=2}^{l} \left\| a_{i,k_i} \right\|_{L^\infty({\mathbb{R}}^n)} \lesssim L^r_{\tilde{g}} \frac{1}{|Q_{1,k_1}^*|^{1/2}} \prod_{i=1}^{l} \left\| Q_{i,k_i} \right\|^{-1/p_i}
$$

in view of Proposition 1.4. This proves (6.5).
We now apply Lemma 2.10, the estimate (6.5), and the Hölder inequality to obtain
\[
\|G_1\|_{L^p(\mathbb{R}^n)} \lesssim \left\| \sum_{k_1=1}^{\infty} \cdots \sum_{k_l=1}^{\infty} \left( \prod_{i=1}^{l} |\lambda_{i,k_i}| \right) \chi_{R_{k_1,\ldots,k_l}} \frac{1}{|R_{k_1,\ldots,k_l}|} \right\|_{L^p(\mathbb{R}^n)} \times \int_{R_{k_1,\ldots,k_l}} |T_{\sigma}(a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m)(y)| \, dy \|_{L^p(\mathbb{R}^n)}
\]
\[
\lesssim \mathcal{L}^{r,\Psi(m)}_g (|\sigma|) \left\| \sum_{k_1=1}^{\infty} \cdots \sum_{k_l=1}^{\infty} \left( \prod_{i=1}^{l} |\lambda_{i,k_i}| \right) \|Q_{i,k_i}\|^{-1/p_i} \chi_{Q_{i,k_i}^*} \right\|_{L^p(\mathbb{R}^n)} \leq \mathcal{L}^{r,\Psi(m)}_g (|\sigma|) \prod_{i=1}^{l} \left\| \sum_{k_i=1}^{\infty} |\lambda_{i,k_i}| \|Q_{i,k_i}\|^{-1/p_i} \chi_{Q_{i,k_i}^*} \right\|_{L^p(\mathbb{R}^n)},
\]
and this clearly implies that
\[
(6.6) \quad \|G_1\|_{L^p(\mathbb{R}^n)} \lesssim \mathcal{L}^{r,\Psi(m)}_g (|\sigma|) \prod_{i=1}^{l} \|f_i\|_{H^{p_i}(\mathbb{R}^n)}
\]
as
\[
\left\| \sum_{k_i=1}^{\infty} |\lambda_{i,k_i}| \|Q_{i,k_i}\|^{-1/p_i} \chi_{Q_{i,k_i}^*} \right\|_{L^{p_i}(\mathbb{R}^n)} \leq \left( \sum_{k_i=1}^{\infty} |\lambda_{i,k_i}|^{p_i} \right)^{1/p_i} \lesssim \|f_i\|_{H^{p_i}(\mathbb{R}^n)}.
\]

To obtain the estimate for $G_2$, we need the following lemma whose proof will be given in Section 9.

**Lemma 6.1.** Let $1 \leq l < m$ and $0 < p_1, \ldots, p_l \leq 1$. Let $a_i$, $1 \leq i \leq l$, be atoms supported in the cube $Q_i$ such that
\[
(6.7) \quad \|a_i\|_{L^\infty(\mathbb{R}^n)} \leq |Q_i|^{-1/p_i}, \quad \int_{Q_i} x^\alpha a_i(x) \, dx = 0
\]
for all $|\alpha| < N_i$ with $N_i$ sufficiently large. Let $\|f_{l+1}\|_{L^\infty(\mathbb{R}^n)} = \cdots = \|f_m\|_{L^\infty(\mathbb{R}^n)} = 1$. Suppose that (1.14) holds for all $J \subset \{1, \ldots, l\}$ and $\sigma$ satisfies $\mathcal{L}^{r,\Psi(m)}_g (|\sigma|) < \infty$. Then for any nonempty subset $J_0$ of $\{1, \ldots, l\}$, there exist nonnegative functions $b_{1,j_0}^{J_0}, \ldots, b_{l,j_0}^{J_0}$ such that
\[
\|b_{i,j_0}^{J_0}\|_{L^{p_i}(\mathbb{R}^n)} \lesssim 1 \quad \text{for} \quad 1 \leq i \leq l,
\]
and
\[
|T_{\sigma}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x)| \lesssim \mathcal{L}^{r,\Psi(m)}_g (|\sigma|) b_{1,j_0}^{J_0}(x) \cdots b_{l,j_0}^{J_0}(x)
\]
for all $x \in (\bigcap_{i \notin J_0} Q_i^*) \setminus (\bigcup_{i \notin J_0} Q_i^*)$.

Let $J_0$ be a nonempty subset of $\{1, \ldots, l\}$. Then Lemma 6.1 ensures the existence of nonnegative functions $b_{1,k_1}^{J_0}, \ldots, b_{l,k_l}^{J_0}$ such that
\[
|T_{\sigma}(a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m)(x)| \lesssim \mathcal{L}^{r,\Psi(m)}_g (|\sigma|) b_{1,k_1}^{J_0}(x) \cdots b_{l,k_l}^{J_0}(x)
\]
for all $x \in (\bigcap_{i \notin J_0} Q_{i,k_i}^*) \setminus (\bigcup_{i \notin J_0} Q_{i,k_i}^*)$ and $\|b_{i,k_i}^{J_0}\|_{L^{p_i}(\mathbb{R}^n)} \lesssim 1$.

Now set
\[
b_{i,k_i} := \sum_{\emptyset \notin J_0 \subset \{1,2,\ldots,l\}} b_{i,k_i}^{J_0},
\]
Since it is finite sum, we first note that \( \|b_{i,k_i}\|_{L^{p_i}(\mathbb{R}^n)} \lesssim 1 \). In addition, we have the pointwise estimate
\[
|T_\sigma(a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m)(x)| \chi(Q_{1,k_1}^* \cap \cdots \cap Q_{l,k_l}^*)^c(x) \lesssim L^{r_i,\Psi(m)}[\sigma]b_{1,k_1}(x) \cdots b_{l,k_l}(x),
\]
which yields that
\[
G_2(x) \lesssim L^{r_i,\Psi(m)}[\sigma] \prod_{k=1}^l \left( \sum_{k_i=1}^\infty |\lambda_i,k_i|b_{i,k_i}(x) \right).
\]

Then we apply Hölder’s inequality to deduce that
\[
\|G_2\|_{L^p(\mathbb{R}^n)} \lesssim L^{r_i,\Psi(m)}[\sigma] \prod_{i=1}^l \|\lambda_i,k_i|b_{i,k_i}\|_{L^{p_i}(\mathbb{R}^n)} \lesssim L^{r_i,\Psi(m)}[\sigma] \prod_{i=1}^l \|f_i\|_{H^{p_i}(\mathbb{R}^n)}
\]
because
\[
\|\sum_{k_i=1}^\infty |\lambda_i,k_i|b_{i,k_i}\|_{L^{p_i}(\mathbb{R}^n)} \leq \left( \sum_{k_i=1}^\infty |\lambda_i,k_i|^{p_i}|b_{i,k_i}|^{p_i}_{L^{p_i}(\mathbb{R}^n)} \right)^{1/p_i} \lesssim \left( \sum_{k_i=1}^\infty |\lambda_i,k_i|^{p_i} \right)^{1/p_i} \lesssim \|f_i\|_{H^{p_i}(\mathbb{R}^n)}.
\]

Combining (6.6) and (6.8), we finally obtain (6.1) as desired. This completes the proof.

7. Proof of Proposition 1.6

Let \( 1 < r \leq 2, 1 \leq l < \rho \leq m \), and
\[
\text{I} := \{1, \ldots, l\}, \quad \text{II} := \{l+1, \ldots, \rho\}, \quad \text{III} := \{\rho+1, \ldots, m\}, \quad \Lambda := \text{I} \cup \text{II} \cup \text{III}.
\]
Assume that \( 0 < p_i \leq 1 \) for \( i \in \text{I} \), \( r \leq p_i < \infty \) for \( i \in \text{II} \), and \( 1/p_1 + \cdots + 1/p_\rho = 1/p \). Let \( \|f_i\|_{L^\infty(\mathbb{R}^n)} = 1 \) for \( i \in \text{III} \). As in (5.2), we write
\[
\sigma(\vec{\xi}) = \sum_{j_1, \ldots, j_m \in \mathbb{Z}} \sigma(\vec{\xi})\hat{\psi}_{j_1}(\xi_1) \cdots \hat{\psi}_{j_m}(\xi_m).
\]

If \( \max(j_1, \ldots, j_m) = j_k \), then there are two cases

**Case 1**
\[
j_k - 3 - \lfloor \log_2 m \rfloor \leq \max_{j \neq j_k} (j_i) \leq j_k,
\]

**Case 2**
\[
\max_{j \neq j_k} (j_i) \leq j_k - 4 - \lfloor \log_2 m \rfloor.
\]

For **Case 1**, we utilize the argument in Section 5.1. That is, we need to prove that for \( 1 \leq \kappa_1 < \kappa_2 \leq m \)
\[
\left\| \sum_{j \in \mathbb{Z}} |T_{\sigma_j}((f_1)j, \ldots, (f_{\kappa_1-1})j, (f_{\kappa_1})j, (f_{\kappa_1+1})j, \ldots) | \right\|_{L^p(\mathbb{R}^n)} \lesssim L^{r_i,\Psi(m)}[\sigma] \prod_{i=1}^l \|f_i\|_{H^{p_i}(\mathbb{R}^n)},
\]

where \((g)_j := \psi_j * g\) and \((g)^j := \phi_j * g\) as before.

We remark that **Case 2** is a high frequency part for which \( T_{\sigma_{\text{high}}}((f_1, \ldots, f_m)) \) is written as the sum, over \( j_k \in \mathbb{Z} \), of terms whose Fourier transform is supported in an annulus of size \( 2^j \) where \( \sigma(\kappa) \) is defined as in (5.3) and \( \sigma_{\text{high}}(\kappa) \) is similarly as in (5.5). Thus, the square
function characterization of $H^p$ will be applied to deal with this case as in (5.12). We will actually prove that for each $1 \leq \kappa \leq m$
\begin{equation}
\left\| \left( \sum_{j \in \mathbb{Z}} \left| T_{\sigma_j}((f_1)^{j,m}, \ldots, (f_{\kappa-1})^{j,m}, (f_\kappa)_{j}, (f_{\kappa+1})^{j,m}, \ldots, (f_m)^{j,m}) \right|^2 \right) \right\|_{L^p(\mathbb{R}^n)}^{1/2}
\end{equation}

\begin{equation}
\lesssim L^*_{\mathcal{A},\eta}[\sigma] \prod_{i \in \mathcal{O}} \| f_i \|_{H^p(\mathbb{R}^n)}
\end{equation}

where $(g)^{j,m} := \phi_{j-4-\log_2 m} \ast g$.

7.1. **Proof of (7.2) for $1 \leq \kappa_1 < \kappa_2 \leq m$.** Let $\tilde{\psi}_j := \psi_{j-1} + \psi_j + \psi_{j+1}$ so that $\tilde{\psi}_j \ast \psi_j = \psi_j$
and for each $1 \leq \kappa_1 < \kappa_2 \leq m$ we define
\begin{align*}
\sigma^{\kappa_1,\kappa_2}_{j,1} := (\underbrace{\phi_j \otimes \cdots \otimes \phi_j}_{{(\kappa_1-1)} \text{ times}} \otimes \underbrace{\phi_j \otimes \cdots \otimes \phi_j}_{{(\kappa_2-\kappa_1-1)} \text{ times}} \otimes \underbrace{\phi_j \otimes \cdots \otimes \phi_j}_{{(m-\kappa_2)} \text{ times}}) \cdot \sigma_j,
\end{align*}

\begin{align*}
\sigma^{\kappa_1,\kappa_2}_{j,2} := (\underbrace{\phi_j \otimes \cdots \otimes \phi_j}_{{(\kappa_1-1)} \text{ times}} \otimes \underbrace{\tilde{\psi}_j \otimes \cdots \otimes \tilde{\psi}_j}_{{(\kappa_2-\kappa_1-1)} \text{ times}} \otimes \underbrace{\tilde{\psi}_j \otimes \cdots \otimes \tilde{\psi}_j}_{{(m-\kappa_2)} \text{ times}}) \cdot \sigma_j.
\end{align*}

Then both $\sigma^{\kappa_1,\kappa_2}_{j,1}$ and $\sigma^{\kappa_1,\kappa_2}_{j,2}$ can be expressed in the form
\begin{equation}
\Xi((\cdot/2^j)) \cdot \sigma_j
\end{equation}
for some $\Xi \in S((\mathbb{R}^n)^m)$ whose support is in a ball of a constant radius in $(\mathbb{R}^n)^m$. We observe that, thanks to Lemma 2.5, for any $1 < t < \infty$
\begin{equation}
\| \Xi \cdot \sigma_j(2^j) \|_{L^t_\mathcal{A}(\mathbb{R}^n)^m} \lesssim \| \sigma_j(2^j) \|_{L^t_\mathcal{A}(\mathbb{R}^n)^m} \lesssim L^*_{\mathcal{A},\eta}[\sigma],
\end{equation}
and
\begin{align*}
\| T_{\sigma^{\kappa_1,\kappa_2}_{j,1}} \tilde{f} \|_{L^t_\mathcal{A}(\mathbb{R}^n)^m} & \lesssim \| \sigma_j(2^j) \|_{L^t_\mathcal{A}(\mathbb{R}^n)^m} \lesssim L^*_{\mathcal{A},\eta}[\sigma],
\end{align*}

\begin{align*}
T_{\sigma^{\kappa_1,\kappa_2}_{j,1}} \tilde{f} & \stackrel{(7.5)}{=} T_{\sigma_1}((f_1)^2, \ldots, (f_{\kappa_1-1})^2, (f_{\kappa_1})^2, (f_{\kappa_1+1})^2, \ldots, (f_{\kappa_2-1})^2, (f_{\kappa_2})^2, (f_{\kappa_2+1})^2, \ldots, (f_m)^2) \\
T_{\sigma^{\kappa_1,\kappa_2}_{j,2}} \tilde{f} & \stackrel{(7.6)}{=} T_{\sigma_1}((f_1, \ldots, f_{\kappa_1}, f_{\kappa_1+1}, \ldots, f_{\kappa_2-1}, f_{\kappa_2}, f_{\kappa_2+1}, \ldots, f_m).
\end{align*}

Furthermore, if $1 \leq \kappa_1 < l + 1 < \kappa_2 \leq m$, $T_{\sigma^{\kappa_1,\kappa_2}_{j,1}} \tilde{f}$ can be also written as
\begin{equation}
T_{\sigma^{\kappa_1,\kappa_2}_{j,1}} \tilde{f} = T_{\sigma_1}((f_1, \ldots, f_{\kappa_1-1}, (f_{\kappa_1})_{j}, f_{\kappa_1+1}, \ldots, f_{\kappa_2-1}, (f_{\kappa_2})_{j}, f_{\kappa_2+1}, \ldots, f_m)
\end{equation}
since $\phi_{j+1} \ast \phi_j = \phi_j$. Similarly, for $l + 1 < \kappa_1 < \kappa_2 \leq m$, we have
\begin{equation}
T_{\sigma^{\kappa_1,\kappa_2}_{j,2}} \tilde{f} = T_{\sigma_1}((f_1, \ldots, f_{l+1})^{j+1}, f_{l+2}, \ldots, f_{\kappa_1-1}, (f_{\kappa_1})_{j}, f_{\kappa_1+1}, \ldots, f_{\kappa_2-1}, (f_{\kappa_2})_{j}, f_{\kappa_2+1}, \ldots, f_m).$
\end{equation}

Now we write, as in (6.4),
\begin{equation}
T_{\sigma^{\kappa_1,\kappa_2}_{j,1}} \tilde{f}(x) = \sum_{k_1=1}^{\infty} \cdots \sum_{k_l=1}^{\infty} \lambda_{l,k_l} \cdots \lambda_{1,k_1} T_{\sigma^{\kappa_1,\kappa_2}_{j,1}} \left( a_{l,k_l}, \ldots, a_{1,k_1}, f_{l+1}, \ldots, f_m \right)(x)
\end{equation}
where $a_{i,k_i}$ are $L^\infty$-atoms for $H^p$ satisfying (6.2) and (6.3). Then we apply the following
lemma that will be proved in Section 9.
Lemma 7.1. Let $1 < r \leq 2$, $1 \leq l < \rho \leq m$, and let $I$, $\Pi$, $\Pi$, and $\Lambda$ be defined as in (7.1). Suppose that $0 < p_i \leq 1$ for $i \in I$, $r \leq p_i < \infty$ for $i \in I$, and $1/p = 1/p_1 + \cdots + 1/p_\rho$. Let $a_i, \kappa \in I$, be atoms supported in the cube $Q_i$ such that (6.7) holds for all $|\alpha| < N_i$ with $N_i$ sufficiently large. Suppose that (1.14) holds for all $J \subset I$. Let $f_i \in L^p(\mathbb{R}^n)$ for $i \in I$ and $\|f_i\|_{L^\infty(\mathbb{R}^n)} = 1$ for $i \in III$. Then there exist nonnegative functions $b_i, i \in I$, and $F_i, i \in II$, on $\mathbb{R}^n$ such that

\begin{equation}
(7.10) \quad \sum_{j \in \mathbb{Z}} |T_{\omega_{j,1}}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x)| \lesssim \mathcal{L}_{\mathbb{R}^n}^{\rho} \left( \prod_{i \in I} b_i(x) \right) \left( \prod_{i \in \Pi} F_i(x) \right),
\end{equation}

\begin{equation}
\|b_i\|_{L^p(\mathbb{R}^n)} \lesssim 1, \quad \|F_i\|_{L^p(\mathbb{R}^n)} \lesssim \|f_i\|_{L^p(\mathbb{R}^n)}.
\end{equation}

Lemma 7.1 proves the existence of functions $b_i, j$ for $i \in I$, $j \in \mathbb{Z}$, and $F_i$ for $i \in II$, having the properties that

\begin{equation}
(7.11) \quad \|b_i\|_{L^p(\mathbb{R}^n)} \lesssim 1, \quad \|F_i\|_{L^p(\mathbb{R}^n)} \lesssim \|f_i\|_{L^p(\mathbb{R}^n)}.
\end{equation}

By using (7.5) and (7.9), the left-hand side of (7.2) is less than

\begin{equation}
\left\| \sum_{k_1 = 1}^{\infty} \cdots \sum_{k_l = 1}^{\infty} \left| \sum_{j \in \mathbb{Z}} |T_{\omega_{j,1}}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x)| \right| \right\|_{L^p(\mathbb{R}^n)}.
\end{equation}

Then (7.11) and Hölder’s inequality yield that the preceding expression is dominated by a constant times

\begin{equation}
\mathcal{L}_{\mathbb{R}^n}^{\rho} \left( \prod_{i \in I} \left\| \sum_{k_1 = 1}^{\infty} \cdots \sum_{k_l = 1}^{\infty} |\lambda_{i,j,k_1} \cdots |\lambda_{i,j,k_l} | \sum_{j \in \mathbb{Z}} |T_{\omega_{j,1}}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x)| \right\|_{L^p(\mathbb{R}^n)} \right).
\end{equation}

It is obvious that $\|F_i\|_{L^p(\mathbb{R}^n)} \lesssim \|f_i\|_{L^p(\mathbb{R}^n)}$, and we also have

\begin{equation}
\left\| \sum_{k_1 = 1}^{\infty} \cdots \sum_{k_l = 1}^{\infty} |\lambda_{i,j,k_1} b_i, j \|_{L^p(\mathbb{R}^n)} \right\| \lesssim \left( \sum_{k_1 = 1}^{\infty} \|\lambda_{i,j,k_1} p_i \right)^{1/p_i} \lesssim \left( \sum_{k_1 = 1}^{\infty} \|\lambda_{i,j,k_1} \right)^{1/p_i} \| f_i \|_{H^p(\mathbb{R}^n)}
\end{equation}

having used (7.12). This proves (7.2).

7.2. Proof of (7.3) for $1 \leq \kappa \leq m$. Let $\tilde{\psi}_j := \psi_{j-1} + \psi_j + \psi_{j+1}$ as above, and for each $1 \leq \kappa \leq m$ we define

\begin{equation}
(7.13) \quad \|\sigma_{\kappa,1}^j\|_{L^p(\mathbb{R}^n)^m}, \|\sigma_{\kappa,2}^j\|_{L^p(\mathbb{R}^n)^m} \lesssim \mathcal{L}_{\mathbb{R}^n}^{\rho} \left[ \omega_j \right].
\end{equation}
Moreover, we note that
\[
T_{\sigma^{*}_{ij}} \tilde{f} = T_{\sigma_{j}}((f_1)^{j,m}, \ldots, (f_{\kappa-1})^{j,m}, (f_{\kappa})_{j}, (f_{\kappa+1})^{j,m}, \ldots, (f_m)^{j,m})
\]
(7.14)
\[
= T_{\sigma^{*}_{ij}}(f_1, \ldots, f_{\kappa-1}, (f_{\kappa})_{j}, f_{\kappa+1}, \ldots, f_m)
\]
and if \( l + 1 < \kappa \leq m \), it can be also written as
\[
T_{\sigma^{*}_{ij}} \tilde{f} = T_{\sigma^{*}_{ij}}(f_1, \ldots, f_{l+1}, (f_{l+1})^{j+1,m}, f_{l+2}, \ldots, f_{\kappa-1}, (f_{\kappa})_{j}, f_{\kappa+1}, \ldots, f_m)
\]
(7.15) since \( \phi_{j-3-|\log_2 m|} * \phi_{j-4-|\log_2 m|} = \phi_{j-4-|\log_2 m|} \). Therefore, (7.3) is reduced to
\[
\| \left( \sum_{j \in \mathbb{Z}} T_{\sigma^{*}_{ij}} \tilde{f}^2 \right)^{1/2} \|_{L^p(\mathbb{R}^n)} \lesssim \mathcal{L}^r_\sigma[\pi] \prod_{i \in \mathcal{I}} \| f_i \|_{H^{p_i}(\mathbb{R}^n)}. \tag{7.16}
\]

Now we write, as in (6.4),
\[
T_{\sigma^{*}_{ij}} \tilde{f}(x) = \sum_{k_1=1}^{\infty} \cdots \sum_{k_l=1}^{\infty} \lambda_{1,k_1}, \ldots, \lambda_{l,k_l} T_{\sigma^{*}_{ij}}(a_{1,k_1}, \ldots, a_{l,k_l}, f_{l+1}, \ldots, f_m)(x)
\]
where \( a_{i,k_i} \) are \( L^\infty \)-atoms for \( H^{p_i} \) satisfying (6.2) and (6.3). Then we need the following lemma whose proof will be given in Section 9.

**Lemma 7.2.** Let \( 1 < r \leq 2, 1 \leq l < \rho \leq m, \) and let \( I, \mathcal{I}, \mathcal{I}_i, \) and \( \Lambda \) be defined as in (7.1). Suppose that \( 0 < p_i \leq 1 \) for \( i \in I \), \( r \leq p_i < \infty \) for \( i \in \mathcal{I} \), and \( 1/p = 1/p_1 + \cdots + 1/p_\rho \). Let \( a_i, i \in I \), be atoms supported in the cube \( Q_i \) such that (6.7) holds for all \( |\alpha| < N_i \) with \( N_i \) sufficiently large. Suppose that (1.14) holds for all \( J \subset I \). Let \( f_i \in L^{p_i}(\mathbb{R}^n) \) for \( i \in I \) and \( \| f_i \|_{L^{\infty}(\mathbb{R}^n)} = 1 \) for \( i \in \mathcal{I} \). Then there exist nonnegative functions \( b_i, i \in I, \) and \( F_i, i \in \mathcal{I}, \) on \( \mathbb{R}^n \) such that
\[
\left( \sum_{j \in \mathbb{Z}} |T_{\sigma^{*}_{ij}}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x)|^2 \right)^{1/2} \lesssim \mathcal{L}^r_\sigma[\pi] \left( \prod_{i \in I} b_i(x) \right) \left( \prod_{i \in \mathcal{I}} F_i (x) \right), \tag{7.18}
\]
\[
\| b_i \|_{L^{p_i}(\mathbb{R}^n)} \lesssim 1, \quad \| F_i \|_{L^{p_i}(\mathbb{R}^n)} \lesssim \| f_i \|_{L^{p_i}(\mathbb{R}^n)}.
\]

According to the above lemma, we can choose nonnegative functions \( b_{i,k_i}, i \in I, \) and \( F_i, i \in \mathcal{I}, \) such that
\[
\left( \sum_{j \in \mathbb{Z}} |T_{\sigma^{*}_{ij}}(a_{1,k_1}, \ldots, a_{l,k_l}, f_{i+1}, \ldots, f_m)(x)|^2 \right)^{1/2} \lesssim \mathcal{L}^r_\sigma[\pi] \left( \prod_{i \in I} b_{i,k_i}(x) \right) \left( \prod_{i \in \mathcal{I}} F_i (x) \right), \tag{7.19}
\]
\[
\| b_{i,k_i} \|_{L^{p_i}(\mathbb{R}^n)} \lesssim 1, \quad \| F_i \|_{L^{p_i}(\mathbb{R}^n)} \lesssim \| f_i \|_{L^{p_i}(\mathbb{R}^n)}.
\]

Using (7.17), a triangle inequality in \( \ell^2 \), (7.19), and the Hölder inequality, the left-hand side of (7.16) is less than
\[
\left\| \sum_{k_1=1}^{\infty} \cdots \sum_{k_l=1}^{\infty} |\lambda_{1,k_1}| \cdots |\lambda_{l,k_l}| \left( \sum_{j \in \mathbb{Z}} |T_{\sigma^{*}_{ij}}(a_{1,k_1}, \ldots, a_{l,k_l}, f_{i+1}, \ldots, f_m)|^2 \right)^{1/2} \right\|_{L^p(\mathbb{R}^n)}
\]
\[
\lesssim \mathcal{L}^r_\sigma[\pi] \left( \sum_{k_1=1}^{\infty} \cdots \sum_{k_l=1}^{\infty} |\lambda_{1,k_1}| \cdots |\lambda_{l,k_l}| \left( \prod_{i \in I} b_{i,k_i} \right) \left( \prod_{i \in \mathcal{I}} F_i \right) \right)_{L^p(\mathbb{R}^n)}
\]
\[
\lesssim \mathcal{L}^r_\sigma[\pi] \left( \prod_{i \in I} \left( \sum_{k_1=1}^{\infty} |\lambda_{i,k_i}| b_{i,k_i} \right)_{L^{p_i}(\mathbb{R}^n)} \right) \left( \prod_{i \in \mathcal{I}} \| F_i \|_{L^{p_i}(\mathbb{R}^n)} \right).
This is clearly majored by the right-hand side of (7.16) and in view of (7.20) and the proof is concluded.

8. Proof of Proposition 1.7

The proof will be based on the following interpolation method for multilinear multipliers.

Lemma 8.1. Let \( 1 < r \leq 2, \ 0 < p_1^0, \ldots, p_m^0 \leq \infty, \ 0 < p_1^1, \ldots, p_m^1 \leq \infty, \ 1/p^0 = 1/p_1^0 + \cdots + 1/p_m^0, \) and \( 1/p^1 = 1/p_1^1 + \cdots + 1/p_m^1. \) Let \( s_1^0, \ldots, s_m^0 \geq 0 \) and \( s_1^1, \ldots, s_m^1 \geq 0. \) Suppose that

\[
\|T_\sigma\|_{H^{p_1^0 \times \cdots \times H^{p_m^0}} \to L^{p^0}} \lesssim L^r_{s_1^0, \ldots, s_m^0}(|\sigma|), \quad l = 0, 1.
\]

Then for any \( 0 < \theta < 1, \ 0 < p, p_1, \ldots, p_m \leq \infty, \) and \( s_1, \ldots, s_m \geq 0 \) satisfying

\[
1/p = (1 - \theta)/p^0 + \theta/p^1, \quad 1/p_k = (1 - \theta)/p_k^0 + \theta/p_k^1 \quad \text{for} \ 1 \leq k \leq m,
\]

we have

\[
\|T_\sigma\|_{H^{p_1} \times \cdots \times H^{p_m} \to L^{p}} \lesssim L^r_{s_1, \ldots, s_m}(|\sigma|).
\]

Proof. Since the proof is more or less standard, we only provide a sketch of it.

Let \( \tilde{\Psi}(m) := 2^{-mn}(\hat{\Psi}(r)/2) + \Psi(m) + 2^{mn}(\hat{\Psi}(\tau/2)) \) so that \( \tilde{\Psi}(m) \ast \Psi(m) = \Psi(m). \) We construct a family of multilinear Fourier multipliers \( \sigma^z \) as

\[
\sigma^z(\xi) := \frac{(1 + \theta)^{mn+1}}{(1 + z)^{mn+1}} \sum_{j \in \mathbb{Z}} (I - \Delta_1)^{-\theta(s_1^0(1 + z) + s_1^1 z)/2} \cdots (I - \Delta_m)^{-\theta(s_m^0(1 + z) + s_m^1 z)/2} \frac{(I - \Delta_1)^{s_1^1/2} \cdots (I - \Delta_m)^{s_m^1/2}(\sigma(2^j \tau)\tilde{\Psi}(m))}{(\xi/2^j)\tilde{\Psi}(m)(\xi/2^j)}.
\]

Note that \( \sigma^0 = \sigma \) and it follows from the interpolation theorem for analytic families of operators that

\[
\|T_\sigma\|_{H^{p_1} \times \cdots \times H^{p_m} \to L^{p}} \leq \left( \sup_{t \in \mathbb{R}} L^r_{s_1^0, \ldots, s_m^0}(\sigma^{it}) \right)^1 - \theta \left( \sup_{t \in \mathbb{R}} L^r_{s_1^1, \ldots, s_m^1}(\sigma^{1+it}) \right)^\theta
\]

by applying (8.1). We refer to [1, 2, 5, 20, 26] for more details.

We now observe that for each \( l = 0, 1, \) due to compact support conditions and Lemma 2.5,

\[
L^r_{s_1^0, \ldots, s_m^0}(\sigma^{1+it}) = \sup_{j \in \mathbb{Z}} \left\| \sigma^{1+it}(2^j \cdot)\tilde{\Psi}(m) \right\|_{L^r_{s_1^0, \ldots, s_m^0}((\mathbb{R}^n)^m)} \lesssim \left( \frac{1}{1 + |t|} \right)^{mn+1} \sup_{j \in \mathbb{Z}} \left( I - \Delta_1 \right)^{-it(s_1^0 s_1^1)/2} \cdots \left( I - \Delta_m \right)^{-it(s_m^0 s_m^1)/2} \frac{(I - \Delta_1)^{s_1^1/2} \cdots (I - \Delta_m)^{s_m^1/2}(\sigma(2^j \tau)\tilde{\Psi}(m))}{L^r_{(\mathbb{R}^n)^m}} \lesssim L^r_{s_1^1, \ldots, s_m^1}(\sigma),
\]

where we applied the Marcinkiewicz multiplier theorem in the last inequality. This proves

\[
(8.2).
\]

We now state the following delicate interpolation result whose proof is based on that of

[14, Lemma 3.7].
Lemma 8.2. Let $1 < r < 2$, $m \in \mathbb{N}$ and $0 < p_1, \ldots, p_m \leq \infty$. For $\vec{p} := (p_1, \ldots, p_m)$ let

$$
\Gamma_m(\vec{p}) := \left\{ \vec{s} : \sum_{k \in J} (s_k/n - 1/p_k) \geq -1/r' \quad \text{for any } J \subset \{1, \ldots, m\} \right\}
$$

and for each $1 \leq u \leq m$

$$
\Lambda^u_m(\vec{p}) := \left\{ \vec{s} : s_u \geq n/p_u - n/r', \quad s_i \geq n/p_i \quad \text{for all } i \neq u \right\}.
$$

Then $\Gamma_m(\vec{p})$ is the convex hull of $\Lambda^u_m(\vec{p})$ for $1 \leq u \leq m$.

Proof. Let $H_m(\vec{p})$ be the convex hull of $\Lambda^u_m(\vec{p})$ for $1 \leq u \leq m$ and then we need to show that $H_m(\vec{p}) = \Gamma_m(\vec{p})$.

We first note that $\Gamma_m(\vec{p})$ is convex as it is the intersection of $2^m - 1$ convex sets. Since $\Gamma_m(\vec{p})$ contains $\Lambda^u_m(\vec{p})$ for all $1 \leq u \leq m$, it is clear that $H_m(\vec{p}) \subset \Gamma_m(\vec{p})$.

We now verify $\Gamma_m(\vec{p}) \subset H_m(\vec{p})$. For this one we restrict the size of $s_i$, $1 \leq i \leq m$. Let $M$ be a sufficiently large number such that $M > mn$. We denote $\Lambda^u_m(\vec{p})$ by $\Lambda^u(M)$.

We first note that $\Lambda^u(M)$ is convex as it is the intersection of 2 convex sets. We now verify $\Lambda^u(M) = \Gamma_M(\vec{p})$ for $1 \leq u \leq m$.

Let $\Lambda^u(M)$ be the convex hull of $\Lambda^u_m(\vec{p})$ for $1 \leq u \leq m$ and let

$$
\Lambda^u(M) := \Lambda^u_m(\vec{p}) \cap \left\{ \vec{s} : s_i \leq M \quad 1 \leq i \leq m \right\},
$$

and we actually prove that

$$
\Lambda^u(M) \subset H_m(\vec{p})
$$

(8.3) from which we obtain the desired result by taking $M \to \infty$. We use an induction argument beginning with the case $m = 2$.

When $m = 2$, it is trivial because $\Lambda^1_2(\vec{p})$ is the convex hull of the five points $(M, M)$, $(n/p_1 - n/r', M)$, $(n/p_1 - n/r', n/p_2)$, $(n/p_1, n/p_2 - n/r')$, and $(M, n/p_2 - n/r')$. Now we fix $m > 2$ and assume that (8.3) holds with $m$ replaced by $m - 1$. We denote

$$
\Lambda^0_m(\vec{p}) := \left\{ \vec{s} \in \Lambda^M_m(\vec{p}) : n/p_l - n/r' \leq s_l \leq n/p_l \quad \text{for all } 1 \leq l \leq m \right\},
$$

$$
\Lambda^M_m(\vec{p}) := \left\{ \vec{s} \in \Lambda^M_m(\vec{p}) : s_l \leq M \quad 1 \leq l \leq m \right\}.
$$

It is easy to see that $\Lambda^M_m(\vec{p}) = \bigcup_{l=0}^{m} \Lambda^l_m(\vec{p})$ and thus it is enough to show that

$$
\Lambda^0_m(\vec{p}) \subset H_m(\vec{p}),
$$

(8.4)

$$
\Lambda^l_m(\vec{p}) \subset H_m(\vec{p})
$$

(8.5) for all $1 \leq l \leq m$.

We note that $\Lambda^0_m(\vec{p})$ is the intersection of the two sets

$$
\left\{ \vec{s} : n/p_l - n/r' \leq s_l \leq n/p_l \quad \text{for all } 1 \leq l \leq m \right\}
$$

and

$$
\left\{ \vec{s} : s_1 + \cdots + s_m \geq n/p_1 + \cdots + n/p_m - n/r' \right\},
$$

which would be a standard $m$-simplex with the $m + 1$ vertices

$$
(n/p_1, \ldots, n/p_m), \quad (n/p_1 - n/r', n/p_2, \ldots, n/p_m), \quad \ldots, \quad (n/p_1, \ldots, n/p_{m-1}, n/p_m - n/r').
$$

Since the vertices of the simplex are contained in the convex set $H_m(\vec{p})$, (8.4) holds.

To achieve (8.5) we consider only the case $l = m$ as the other cases will follow from a rearrangement. We additionally define

$$
\Gamma_{m,1}^M(\vec{p}) := \left\{ \vec{s} \in \Gamma^M_m(\vec{p}) : s_m = n/p_m \right\}, \quad \Gamma_{m,2}^M(\vec{p}) := \left\{ \vec{s} \in \Gamma^M_m(\vec{p}) : s_m = M \right\}
$$
and then (8.5) with \( l = m \) follows once we prove
\[
\Gamma_{m,1}^M(\bar{p}), \Gamma_{m,2}^M(\bar{p}) \subset H_m^M(\bar{p})
\]
as \( H_m^M(\bar{p}) \) is a convex set. Therefore, let us prove (8.6). For simplicity, we denote \( \bar{p}^{sm} := (p_1, \ldots, p_{m-1}) \) and \( \bar{s}^{sm} := (s_1, \ldots, s_{m-1}) \) so that \( \bar{p} = (\bar{p}^{sm}, p_m) \) and \( \bar{s} = (\bar{s}^{sm}, s_m) \). We observe that
\[
\Gamma_{m,1}^M(\bar{p}) = \{ \bar{s} : \bar{s}^{sm} \in \Gamma_{m-1}^M(\bar{p}^{sm}), s_m = n/p_m \}.
\]
By using the induction hypothesis on \( m - 1 \), we obtain
\[
\Gamma_{m,1}^M(\bar{p}) \subset \{ \bar{s} : \bar{s}^{sm} \in H_{m-1}^M(\bar{p}^{sm}), s_m = n/p_m \}
\]
where the right-hand side is the convex hull of the sets
\[
\{ \bar{s} : \bar{s}^{sm} \in \Lambda_{m-1}^u(\bar{p}^{sm}), s_m = n/p_m \} \subset \Lambda_m^u(\bar{p}), \quad 1 \leq u \leq m - 1.
\]
From the definition of \( H_m^M(\bar{p}) \), it follows that \( \Gamma_{m,1}^M(\bar{p}) \subset H_m^M(\bar{p}) \). Similarly, we have
\[
\Gamma_{m,2}^M(\bar{p}) \subset \{ \bar{s} : \bar{s}^{sm} \in H_{m-1}^M(\bar{p}^{sm}), s_m = M \} \subset H_m^M(\bar{p})
\]
because \( M > n/p_m \) is sufficiently large. This proves (8.6). \( \square \)

Now we prove Proposition 1.7 by induction. Assume \( l = 1 \) and treat only the case
\[
1 < p_i < r, \quad 0 < p_1, \ldots, p_p \leq 1, \quad r \leq p_{p+1}, \ldots, p_m \leq \infty.
\]
In this case, condition (1.7) is equivalent to
\[
s_1, s_{p+1}, \ldots, s_m > n/r, \quad \text{and} \quad \sum_{k \in J} (s_k/n - 1/p_k) > -1/r'.
\]
for all nonempty subset \( J \subset \{1, \ldots, \rho\} \). Then Lemma 8.2 yields that \( \bar{s} \) satisfying the above conditions belongs to one of the following sets
\[
\mathcal{G}_u := \{ \bar{s} : s_u > n/p_u - n/r', \quad s_i > n/p_i \quad \text{for } i \neq u, \quad 1 \leq i \leq \rho \}
\]
\[
\cap \{ \bar{s} : s_1, s_{p+1}, \ldots, s_m > n/r \}, \quad 1 \leq u \leq \rho.
\]
\[
\mathcal{G}_0 := \{ \bar{s} : \theta_1 \bar{s}_1 + \cdots + \theta_p \bar{s}_p : \theta_1 + \cdots + \theta_p = 1, \quad 0 < \theta_i < 1, \quad \bar{s}_i \in \mathcal{G}_i, \quad 1 \leq i \leq \rho \}.
\]
It suffices to show that for \( 1 \leq u \leq \rho \), \( \bar{s} \in \mathcal{G}_u \) implies (1.8) because the case when \( \bar{s} \in \mathcal{G}_0 \) can be proved by using Lemma 8.1 at most \( \rho - 1 \) times. If \( \bar{s} \in \mathcal{G}_1 \), then the assumptions in Lemma 8.1 hold with
\[
(p_1^0, \ldots, p_m^0) = (1, p_2, \ldots, p_m), \quad (s_1^0, \ldots, s_m^0) = (s_1, \ldots, s_m)
\]
and
\[
(p_1^1, \ldots, p_m^1) = (r, p_2, \ldots, p_m), \quad (s_1^0, \ldots, s_m^0) = (s_1, \ldots, s_m),
\]
due to Proposition 1.4, 1.5, and 1.6, and now (1.8) follows from Lemma 8.1. Note that \( s_1 > n/r = n - n/r' \).

If \( \bar{s} \in \mathcal{G}_u \) for \( 2 \leq u \leq \rho \), then we choose \( 0 < \theta < 1 \) such that
\[
s_1 > n/p_1 = (1 - \theta)n + \theta n/r.
\]
We also select \( t^0 > n \) and \( t^1 > n/r \) satisfying \( s_1 = (1 - \theta)t^0 + \theta t^1 \). Then we interpolate between the two cases
\[
(p_1^0, \ldots, p_m^0) = (1, p_2, \ldots, p_m), \quad (s_1^0, \ldots, s_m^0) = (t^0, s_2, \ldots, s_m)
\]
and

\[(p_1^1, \ldots, p_m^1) = (r, p_2, \ldots, p_m), \quad (s_1^1, \ldots, s_m^1) = (\ell_1^1, s_2, \ldots, s_m)\]

using Lemma 8.1. Here, the assumptions in Lemma 8.1 with the above two cases follow from Proposition 1.4, 1.5, and 1.6. This finally yields (1.8).

We now consider the cases \(l \geq 2\) and suppose, by induction, that the claimed assertion holds for \(|\mathcal{L}| = l - 1\). Without loss of generality, we may assume that \(1 < p_1, \ldots, p_l < r\), \(0 < p_{l+1}, \ldots, p_\rho \leq 1\), and \(r \leq p_{\rho+1}, \ldots, p_m \leq \infty\), and accordingly, we have

\[s_1, \ldots, s_l, s_{\rho+1}, \ldots, s_m > n/r, \quad \text{and} \quad \sum_{k \in J} (s_k/n - 1/bp_k) > -1/r'\]

for any nonempty subset \(J \subset \{1, \ldots, \rho\}\). Similarly as in the case \(l = 1\), we need to handle only the case that for \(1 \leq u \leq \rho\)

\[s_1, \ldots, s_l, s_{\rho+1}, \ldots, s_m > n/r, \quad s_u > n/p_u - n/r', \quad s_i > n/p_i \quad \text{for} \quad i \neq u, \quad 1 \leq i \leq \rho.\]

Since \(l \geq 2\), we may choose \(1 \leq v \leq l\) such that \(v \neq u\). Clearly,

\[(8.7) \quad s_v > n/p_v (> n/r)\]

since \(1 < p_v < r\), and \(s_u > \max (n/p_u - n/r', n/r)\). Let \(0 < \theta < 1\) be the number satisfying \(1/p_v = (1 - \theta) + \theta/r\) and then there exist \(t^0 > n\) and \(t^1 > n/r\) so that \(s_v = (1 - \theta)t^0 + \theta t^1\) because of (8.7). We apply the induction hypothesis to obtain the boundedness with

\[(p_1^0, \ldots, p_m^0) = (p_1, \ldots, p_{v-1}, 1, p_{v+1}, \ldots, p_m), \quad (s_1^0, \ldots, s_m^0) = (s_1, \ldots, s_{v-1}, t^0, s_{v+1}, \ldots, s_m)\]

and another one with

\[(p_1^1, \ldots, p_m^1) = (p_1, \ldots, p_{v-1}, r, p_{v+1}, \ldots, p_m), \quad (s_1^0, \ldots, s_m^0) = (s_1, \ldots, s_{v-1}, t^1, s_{v+1}, \ldots, s_m).\]

Since these are the assumptions in Lemma 8.1, (1.8) holds as a result of the lemma. This completes the proof of Proposition 1.7.

9. Proofs of the key lemmas

9.1. Proof of Lemma 4.1. Let \(1 \leq l \leq m\). The sufficiently large number \(M > 0\) shall be chosen later. We utilize an argument of the Marcinkiewicz multiplier theorem. Indeed, we will actually show that for any multi-indices \(\alpha_1, \ldots, \alpha_l\) in \(\mathbb{Z}^n\) with \(|\alpha_l| \leq n/2 + 1\) for \(1 \leq j \leq l\),

\[(9.1) \quad |\partial_1^{\alpha_1} \cdots \partial_l^{\alpha_l} N_M(y_1, \ldots, y_l)| \lesssim_{\alpha_1, \ldots, \alpha_l} |y_1|^{-|\alpha_1|} \cdots |y_l|^{-|\alpha_l|}.\]

We first observe that

\[(9.2) \quad |\partial_1^{\alpha_1} \cdots \partial_l^{\alpha_l} N_M(y_1, \ldots, y_l)| \lesssim \sum_{u=1}^l \sum_{\alpha_1(u) + \cdots + \alpha_{l+1}(u) = \alpha(u)} |\partial_1^{\alpha_1(u)} \cdots \partial_l^{\alpha_l(u)} \langle \frac{1}{l} \sum_{k=1}^l y_k \rangle^{s_1}\]

\[\times \left( \prod_{j=2}^l \left| \partial_1^{\alpha_1(j)} \cdots \partial_l^{\alpha_l(j)} \langle \frac{1}{l} \sum_{k=1}^l (y_k - y_j) \rangle^{s_j} \right| \right)\]

\[\times \left| \partial_1^{\alpha_1(s_1 + \cdots + s_l)} (y_1) - (s_1 + \cdots + s_l) \left( \prod_{j=2}^l \left| \partial_j^{\alpha_1(j)} (y_j)^{-M} \right| \right) \right|.\]
Using the argument in [8, p450], we obtain that
\[
\left| \partial_1^{\alpha_1} \cdots \partial_l^{\alpha_l} \left( \frac{1}{t} \sum_{k=1}^{l} y_k \right)^{s_1} \right| \leq \left( \frac{1}{t} \sum_{k=1}^{l} y_k \right)^{s_1 - (|\alpha_1| + \cdots + |\alpha_l|)} ,
\]
\[
\left| \partial_1^{\alpha_1} \cdots \partial_l^{\alpha_l} \left( \frac{1}{t} \sum_{k=1}^{l} (y_k - y_j) \right)^{s_j} \right| \leq \left( \frac{1}{t} \sum_{k=1}^{l} (y_k - y_j) \right)^{s_j - (|\alpha_1| + \cdots + |\alpha_l|)} ,
\]
\[
\left| \partial_1^{\alpha_1} \langle y_1 \rangle^{-(s_1 + \cdots + s_l)} \right| \leq \langle y_1 \rangle^{-(s_1 + \cdots + s_l + |\alpha_1|)} ,
\]
\[
\left| \partial_j^{\alpha_j} \langle y_j \rangle^{-M} \right| \leq \langle y_j \rangle^{-(M + |\alpha_j|)} .
\]

We choose a positive number \( N > n > s_1 + \cdots + s_l + n + 2 \). Since
\[
\left( \frac{1}{t} \sum_{k=1}^{l} y_k \right)^{s_1} \prod_{j=2}^{l} \left( \frac{1}{t} \sum_{k=1}^{l} (y_k - y_j) \right)^{s_j} \left\langle \frac{1}{t} \sum_{k=1}^{l} (y_k - y_j) \right\rangle^{N} \leq 1 ,
\]
we finally obtain that the right-hand side of (9.2) is dominated by a constant times the product of
\[
I_1 := \left( \frac{1}{t} \sum_{k=1}^{l} y_k \right)^{-(|\alpha_1| + \cdots + |\alpha_l|)} , \quad I_2 := \prod_{j=2}^{l} \left( \frac{1}{t} \sum_{k=1}^{l} (y_k - y_j) \right)^{-(|\alpha_1| + \cdots + |\alpha_l|)} ,
\]
\[
I_3 := \langle y_1 \rangle^{-|\alpha_1^j|} , \quad I_4 := \prod_{j=2}^{l} \langle y_j \rangle^{-(M - N + |\alpha_1^j|)} .
\]

If \(|y_1| > 2l|y_j|\) for all \(2 \leq j \leq l\), then
\[
I_1 \lesssim \langle y_1 \rangle^{-|\alpha_1^j|} \quad \text{and} \quad I_2 \lesssim \prod_{j=2}^{l} \langle y_j \rangle^{-|\alpha_1^j|} ,
\]
which implies that
\[
I_1 \times I_2 \times I_3 \times I_4 \lesssim \langle y_1 \rangle^{-|\alpha_1^j|} \prod_{j=2}^{l} \langle y_j \rangle^{-(M - N)} \lesssim |y_1|^{-|\alpha_1^j|} \cdots |y_l|^{-|\alpha_1^j|}
\]
for \(M - N > n + 2 > n/2 + 1\).

Now assume that \(|y_1| \leq 2l \max (|y_2|, \ldots, |y_l|)\) and actually, only the case \(|y_1| \leq 2l|y_2|\) will be considered. In that case, we see that
\[
I_1 \times I_2 \times I_3 \times I_4 \leq I_4 \lesssim \langle y_1 \rangle^{-|\alpha_1^j|} \langle y_2 \rangle^{-(M - N - |\alpha_1^j|)} \prod_{j=3}^{l} \langle y_j \rangle^{-(M - N)}
\]
\[
\lesssim |y_1|^{-|\alpha_1^j|} \cdots |y_l|^{-|\alpha_1^j|}
\]
for \(M - N \geq M - N - |\alpha_1^j| > n + 2 - |\alpha_1^j| \geq |\alpha_1^j| \) for \(2 \leq j \leq l\).

This proves (9.1).
9.2. **Proof of Lemma 6.1.** Without loss of generality, we assume that \( J_0 = \{1, \ldots, v\} \) for some \( 1 \leq v \leq l \), and \( \|f_i\|_{L^\infty(\mathbb{R}^n)} = 1 \) for all \( l + 1 \leq i \leq m \). Fix
\[
x \in \left( \bigcap_{i=v+1}^l Q_i^* \right) \setminus \left( \bigcup_{i=1}^v Q_i^* \right).
\]
(When \( v = l \), just fix \( x \in \mathbb{R}^n \setminus (\bigcup_{i=1}^l Q_i^*) \).) Now we write
\[
T_\sigma(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x) = \sum_{j \in \mathbb{Z}} g_j(x),
\]
where
\[
(9.3) \quad g_j(x) := \int_{(\mathbb{R}^n)^m} 2^j m K_j(2^j(x - y_1), \ldots, 2^j(x - y_m)) \left( \prod_{i=1}^{l} a_i(y_i) \right) \left( \prod_{i=l+1}^{m} f_i(y_i) \right) d\vec{y}
\]
with \( K_j := (\sigma(2^j) \hat{\Psi}(m))^\vee \). Let \( c_i \) be the center of the cube \( Q_i \) (\( 1 \leq i \leq l \)). For \( 1 \leq i \leq v \), since \( x \not\in Q_i^* \), we have \( |x - c_i| \approx |x - y_i| \) for all \( y_i \in Q_i \). Fix \( 1 \leq k \leq v \) and for \( 1 \leq u \leq w \leq m \) denote
\[
K_j^{(u,w)}(x, \vec{y}) := K_j(y_1, \ldots, y_{u-1}, 2^j(x - y_u), \ldots, 2^j(x - y_w), y_{w+1}, \ldots, y_m)
\]
for convenience of notation. We see that
\[
\left( \prod_{i=1}^v (2^j(x - c_i))^{s_i} \right) |g_j(x)| \leq 2^{jm} \left( \prod_{i=1}^{l} \|a_i\|_{L^\infty(\mathbb{R}^n)} \right) \int_{Q_1 \times \cdots \times Q_v \times (\mathbb{R}^n)^{m-v}} \left( \prod_{i=1}^{v} (2^j(x - y_i))^{s_i} \right) |K_j^{(1,m)}(x, \vec{y})| d\vec{y}
\]
and the integral in the preceding expression is less than
\[
\int_{Q_1 \times \cdots \times Q_v \times (\mathbb{R}^n)^{m-v}} \left( \prod_{i=1}^{v} (2^j(x - y_i))^{s_i} \right) |K_j^{(1,v)}(x, \vec{y})| d\vec{y}
\]
\[
= 2^{-jn(m-v)} \int_{Q_1 \times \cdots \times Q_v \times (\mathbb{R}^n)^{m-v}} \left( \prod_{i=1}^{v} (2^j(x - y_i))^{s_i} \right) |K_j^{(1,v)}(x, \vec{y})| d\vec{y}
\]
\[
\leq 2^{-jn(m-v)} \left( \prod_{i=1}^{v} |Q_i| \right) \int_{(\mathbb{R}^n)^{m-v}} \left[ \int_{y_k \in Q_k} |Q_k|^{-1} (2^j(x - y_k))^{s_k} \right. \left. \times \left( \prod_{i=1}^{v} (y_i)^{s_i} \right) K_j^{(k,k)}(x, \vec{y}) \right]_{L^{\infty}(y_1, \ldots, y_{k-1}, y_{k+1}, \ldots, y_m)} dy_{v+1} \cdots dy_m.
\]
Using Lemma 2.9, the integral in the last expression is majored by a constant multiple of
\[
2^{-jn(m-v)} \left( \prod_{i=1}^{v} |Q_i| \right) \int_{y_k \in Q_k} |Q_k|^{-1} (2^j(x - y_k))^{s_k} \times \left[ \int_{(\mathbb{R}^n)^{m-v}} \left( \prod_{i=1}^{v} (y_i)^{s_i} \right) K_j^{(k,k)}(x, \vec{y}) \right]_{L^{\infty}(y_1, \ldots, y_{k-1}, y_{k+1}, \ldots, y_m)} dy_{v+1} \cdots dy_m dy_k
\]
and this is further estimated by
\[
2^{-jn(m-v)} \left( \prod_{i=1}^{v} |Q_i| \right) \int_{y_k \in Q_k} |Q_k|^{-1} \langle 2^j (x - y_k) \rangle^{s_k} \times \left\| \left( \prod_{i=1}^{m} \langle y_i \rangle^{s_i} \right) K_j^{(k,k)}(x, \vec{y}) \right\|_{L^p((\mathbb{R}^n)^{m-1})} dy_k,
\]
by applying Hölder’s inequality, as \( s_i > n/r \) for \( v + 1 \leq i \leq m \). We finally obtain
\[
(9.4) \quad \left( \prod_{i=1}^{v} \langle 2^j (x - c_i) \rangle^{s_i} \right) |g_j(x)| \leq 2^{-jn/m} \left( \prod_{i=1}^{v} |Q_i|^{1-1/p_i} \right) \left( \prod_{i=v+1}^{l} b_i(x) \right) h_j^{(k,0)}(x),
\]
where \( b_i(x) := |Q_i|^{-1/p_i} \chi_{Q_i}(x) \) for \( v + 1 \leq i \leq l \) and
\[
h_j^{(k,0)}(x) := \frac{1}{|Q_k|} \int_{Q_k} \langle 2^j (x - y_k) \rangle^{s_k} \left\| \left( \prod_{i=1}^{m} \langle y_i \rangle^{s_i} \right) K_j^{(k,k)}(x, \vec{y}) \right\|_{L^p((\mathbb{R}^n)^{m-1})} dy_k.
\]
The functions \( b_i, v + 1 \leq i \leq l \), obviously satisfy the estimate \( \|b_i\|_{L^p(\mathbb{R}^n)} \lesssim 1 \) and the Minkowski inequality with \( 1 < r' < \infty \) gives
\[
\left\| h_j^{(k,0)} \right\|_{L^{p'}(\mathbb{R}^n)} \lesssim 2^{-jn/r'} \left( \prod_{i=1}^{v} \langle y_i \rangle^{s_i} \right) K_j \left\| \left( \prod_{i=1}^{m} \langle y_i \rangle^{s_i} \right) K_j \right\|_{L^{p'(\mathbb{R}^n)^{m-1}}} \lesssim 2^{-jn/r'} r^{\Psi(m)} \left\| \sigma \right\|
\]
where we made use of a change of variables and applied the Hausdorff-Young inequality in the preceding inequalities.

On the other hand, using the vanishing moment condition of \( a_k \) and Lemma 2.8, we write
\[
|g_j(x)| \lesssim 2^{-jn/m} \sum_{|\alpha| = N_k + 1} \int_0^1 \left( \int_{\mathbb{R}^n} \langle 2^j (y_k - c_k) \rangle^{N_k+1} \left( \prod_{i=1}^{l} |a_i(y_i)| \right) \times \left| \partial^\alpha K_j \left( 2^j (x - y_1), \ldots, 2^j (x - y_{k-1}), 2^j x_{c_k,y_k}^t, 2^j (x - y_{k+1}), \ldots, 2^j (x - y_m) \right) \right| \right) d\vec{y} dt
\]
where \( x_{c_k,y_k}^t := x - c_k - t(y_k - c_k) \) and \( \partial^\alpha K_j(z_1, \ldots, z_m) := \partial^\alpha_{z_k} K_j(z_1, \ldots, z_m) \). Notice that \( |x_{c_k,y_k}^t| \approx |x - c_k| \) for \( x \notin Q_k, y_k \in Q_k, \) and \( 0 < t < 1 \). Repeating the preceding argument that is used to establish (9.4), we also obtain
\[
(9.6) \quad \left( \prod_{i=1}^{v} \langle 2^j (x - c_i) \rangle^{s_i} \right) |g_j(x)| \lesssim 2^{-jn/m} \left( \prod_{i=1}^{v} |Q_i|^{1-1/p_i} \right) \left( \prod_{i=v+1}^{l} b_i(x) \right) h_j^{(k,1)}(x),
\]
where \( b_i(x) := |Q_i|^{-1/p_i} \chi_{Q_i}(x) \) as before, and
\[
h_j^{(k,1)}(x) := \left( 2^j l(Q_k) \right)^{N_k+1} \sum_{|\alpha| = N_k + 1} \frac{1}{|Q_k|} \int_0^1 \left( \int_{Q_k} \langle 2^j x_{c_k,y_k}^t \rangle^{s_k} \right) \times \left\| \left( \prod_{i=1}^{m} \langle y_i \rangle^{s_i} \right) \partial^\alpha K_j(\tmash{1}, \ldots, k-1, 2^j x_{c_k,y_k}^t, k+1, \ldots, m) \right\|_{L^{p'}((\mathbb{R}^n)^{m-1})} dy_k dt.
\]
Now Minkowski’s inequality and Lemma 2.9 yield that
\[ \|h_{j}^{(k,1)}\|_{L^{q'}(\mathbb{R}^n)} \lesssim 2^{-\frac{j}{r}} (2^j l(Q_k))^{N_k+1} L_r^{\psi(m)} [\sigma]. \]
which is the counterpart of (9.5) for $h_{j}^{(k,1)}$.

Combining (9.4) and (9.6), we obtain
\[ |g_j(x)| \lesssim L_r^{\psi(m)} [\sigma] \left( \prod_{i=1}^{v} u_{i,j}(x) \right) \left( \prod_{i=v+1}^{l} b_{i}(x) \right) \]
for all $x \in (\cap_{i=v+1}^{l} Q_i^*) \setminus (\cup_{i=1}^{v} Q_i^*)$ and all $1 \leq k \leq v$.

Now we will construct nonnegative functions $u_{i,j}$ for $1 \leq i \leq v$ such that
\[ |g_j(x)| \lesssim L_r^{\psi(m)} [\sigma] \left( \prod_{i=1}^{v} u_{i,j}(x) \right) \left( \prod_{i=v+1}^{l} b_{i}(x) \right) \]
for all $x \in (\cap_{i=v+1}^{l} Q_i^*) \setminus (\cup_{i=1}^{v} Q_i^*)$ and
\[ \left\| \sum_{j \in \mathbb{Z}} u_{i,j} \right\|_{L^{p_i}(\mathbb{R}^n)} \lesssim 1. \]
Then the lemma follows by taking
\[ b_i := \sum_{j \in \mathbb{Z}} u_{i,j}, \quad 1 \leq i \leq v. \]
For this, we choose $\lambda_i, 1 \leq i \leq v$, such that
\[ 0 \leq \lambda_i < 1/r', \quad s_i/n > 1/p_i - 1/r' + \lambda_i, \quad \sum_{i=1}^{v} \lambda_i = (v-1)/r'. \]
This is possible since the second condition in (1.14), with $J \subset \{1, \ldots, v\}$, yields
\[ \sum_{i=1}^{v} \min \left( 0, s_i/n - 1/p_i \right) > -1/r', \]
which further implies
\[ \sum_{i=1}^{v} \min \left( 1/r', s_i/n - 1/p_i + 1/r' \right) > (v-1)/r'. \]
We set
\[ (9.11) \quad \alpha_i := 1/p_i - 1/r' + \lambda_i \quad \text{and} \quad \beta_i := 1 - r' \lambda_i. \]
Then we have $\alpha_i > 0$, $\beta_i > 0$, and $\sum_{i=1}^{v} \beta_i = 1$. Letting
\[ u_{i,j}(x) := (L_r^{\psi(m)} [\sigma])^{-\beta_i} 2^{jn} |Q_i|^{1-1/p_i} (2^j (x - c_i))^{-s_i} \chi(Q_i^*) \min \left( h_{j}^{(i,0)}(x), h_{j}^{(i,1)}(x) \right)^{\beta_i}, \]
for $1 \leq i \leq v$, it is easy to see, from (9.8), that
\[ |g_j(x)| \lesssim L_r^{\psi(m)} [\sigma] \left( \prod_{i=1}^{v} u_{i,j}(x) \right) \left( \prod_{i=v+1}^{l} b_{i}(x) \right) \]
for all $x \in (\cap_{i=v+1}^{l} Q_i^*) \setminus (\cup_{i=1}^{v} Q_i^*)$. 
It remains to verify (9.9). Since $1/p_i = \alpha_i + \beta_i/r'$, Hölder's inequality yields
\[
\|u_{i,j}\|_{L^{p_i}(\mathbb{R}^n)} \leq (\mathcal{L}^{r_{\Psi^{(m)}}}_{\mathbb{S}}(\sigma))^{-\beta_i} 2^{j/n} |Q_i|^{1-1/p_i} \left\| \langle 2^j (\cdot - c_i) \rangle - s_i \chi(Q_i^*) \right\|_{L^{1/\alpha_i}(\mathbb{R}^n)} \\
\times \min \left( \|h_j^{(i,0)}\|_{L^{r'}(\mathbb{R}^n)}, \|h_j^{(i,1)}\|_{L^{r'}(\mathbb{R}^n)} \right).
\]

We observe that
\[
\left\| \langle 2^j (\cdot - c_i) \rangle - s_i \chi(Q_i^*) \right\|_{L^{1/\alpha_i}(\mathbb{R}^n)} \approx 2^{-jn\alpha_i} \min \left( 1, (2^j l(Q_i))^{-(s_i - \alpha_i n)} \right)
\]
since $s_i/\alpha_i > n$. In addition, it follows from (9.5) and (9.7) that
\[
\min \left( \|h_j^{(i,0)}\|_{L^{r'}(\mathbb{R}^n)}, \|h_j^{(i,1)}\|_{L^{r'}(\mathbb{R}^n)} \right) \lesssim 2^{-jn\beta_i/r'} \left( \mathcal{L}^{r_{\Psi^{(m)}}}_{\mathbb{S}}(\sigma) \right)^{\beta_i} \min \left( 1, (2^j l(Q_i))^{\beta_i(N_i+1)} \right).
\]

In conclusion, we have
\[
\|u_{i,j}\|_{L^{p_i}(\mathbb{R}^n)} \lesssim \begin{cases} 
(2^j l(Q_i))^{-(n/p_i - n + \beta_i(N_i+1))}, & \text{if } 2^j l(Q_i) \leq 1 \\
(2^j l(Q_i))^{-(n/p_i - n) - (s_i - \alpha_i n)}, & \text{if } 2^j l(Q_i) > 1.
\end{cases}
\]

We choose $N_i$ sufficiently large so that $-(n/p_i - n) + \beta_i(N_i + 1) > 0$, and then (9.9) follows immediately.

The proof of Lemma 6.1 is done.

9.3. **Proof of Lemma 7.1.** It follows from (1.14) that there exists $1 < t < r$ such that
\[
s_1, \ldots, s_m > n/t > n/r, \quad \sum_{k \in J} (s_k/n - 1/p_k) > -1/t > -1/r'
\]
for every nonempty subset $J \subset \{1, \ldots, l\}$. Then (5.1) holds.

For each $J_0 \subset I$, let
\[
E_{J_0} := \left( \bigcap_{i \in \Gamma_{J_0}} Q_i^* \right) \setminus \left( \bigcup_{i \in I_{J_0}} Q_i^* \right)
\]
where $E_0 = \bigcap_{i \in I} Q_i^*$ for $J_0 = \emptyset$, and $E_{J_0} = \left( \bigcup_{i \in I} Q_i^* \right)^c$ for $J_0 = I$. Then we see that the left-hand side of (7.10) can be decomposed as
\[
\sum_{J_0 \subset I} \left( \sum_{j \in \mathbb{Z}} |T_{\sigma_{J_0,i}^{\kappa_1,\kappa_2}}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x)| \right) \chi_{E_{J_0}}(x).
\]

Since it is a finite sum over $J_0$, it suffices to show that for each $J_0 \subset I$, there exist functions $b_i^{J_0}$, $1 \leq i \leq l$, and $F_i^{J_0}$, $l + 1 \leq i \leq \rho$ having the properties that for $x \in E_{J_0}$
\[
\sum_{j \in \mathbb{Z}} |T_{\sigma_{J_0,i}^{\kappa_1,\kappa_2}}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x)| \lesssim \mathcal{L}^{r_{\Psi}(\sigma)}_{\mathbb{S}} \prod_{i \in I} b_i^{J_0}(x) \prod_{i \in \Pi} F_i^{J_0}(x),
\]

\[
\|b_i^{J_0}\|_{L^{p_i}(\mathbb{R}^n)} \lesssim 1, \quad \text{for } i \in I,
\]
\[
\|F_i^{J_0}\|_{L^{p_i}(\mathbb{R}^n)} \lesssim \|f_i\|_{L^{p_i}(\mathbb{R}^n)}, \quad \text{for } i \in \Pi.
\]

We first consider the case $J_0 = \emptyset$ and divide the proof into six cases based on the location of $\kappa_1$ and $\kappa_2$. Let $x \in E_{J_0}$. 
Case1 : \(\kappa_1, \kappa_2 \in I\). By applying (7.6), Lemma 2.4, (7.4), (5.1), and (2.4), we have
\[
|T_{a_j, \kappa_2}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x)| \\
\lesssim L^p_\sigma[\sigma] \mathcal{M}_t(a_{\kappa_1})(x) \mathcal{M}_t(a_{\kappa_2})(x) \left( \prod_{i \in I \setminus \{\kappa_1, \kappa_2\}} \mathcal{M}_t a_i(x) \right) \left( \prod_{i \in \Pi} \mathcal{M}_t f_i(x) \right),
\]
since \(\mathcal{M}_t f_i(x) \leq \|f_i\|_{L^\infty(\mathbb{R}^n)} = 1\) for \(i \in \Pi\). Now we take the sum over \(j \in \mathbb{Z}\) to both sides and apply the Cauchy-Schwarz inequality. Then (9.15) follows from taking
\[
b^i_{j_0}(x) := \left( \sum_{j \in \mathbb{Z}} \left( \mathcal{M}_t(a_i)(j(x))^2 \right)^{1/2} \chi_{Q^*_i(x)} \right), \quad i \in \{\kappa_1, \kappa_2\}
\]
\[
b^i_{j_0}(x) := \mathcal{M}_t a_i(j(x)) \chi_{Q^*_i(x)}, \quad i \in I \setminus \{\kappa_1, \kappa_2\},
\]
\[
F^i_{j_0}(x) := \mathcal{M}_t f_i(x), \quad i \in \Pi.
\]
Moreover, using Hölder’s inequality, (2.3) with \(t < 2\), and (2.2), we obtain
\[
\|b^i_{j_0}\|_{L^p(\mathbb{R}^n)} \leq |Q^*_i|^{1/p_i-1/2} \left\| \left\{ \mathcal{M}_t(a_i) \right\}_{j \in \mathbb{Z}} \right\|_{L^2(\mathbb{R}^n)} \lesssim |Q^*_i|^{1/p_i-1/2} \|a_i\|_{L^2(\mathbb{R}^n)} \lesssim 1, \quad i \in \{\kappa_1, \kappa_2\},
\]
\[
\|b^i_{j_0}\|_{L^p(\mathbb{R}^n)} \leq |Q^*_i|^{1/p_i-1/2} \|\mathcal{M}_t a_i\|_{L^2(\mathbb{R}^n)} \lesssim |Q^*_i|^{1/p_i-1/2} \|a_i\|_{L^2(\mathbb{R}^n)} \lesssim 1, \quad i \in I \setminus \{\kappa_1, \kappa_2\},
\]
\[
\|F^i_{j_0}\|_{L^p(\mathbb{R}^n)} \lesssim \|f_i\|_{L^p(\mathbb{R}^n)}, \quad i \in \Pi,
\]
which completes the proof of (9.16) and (9.17).

Case2 : \(\kappa_1, \kappa_2 \in \Pi\). Similarly, (9.15) holds with
\[
b^i_{j_0}(x) := \mathcal{M}_t a_i(x) \chi_{Q^*_i(x)}, \quad i \in I,
\]
\[
F^i_{j_0}(x) := \left( \sum_{j \in \mathbb{Z}} \left( \mathcal{M}_t(f_i)(j(x))^2 \right)^{1/2} \right)^{1/2}, \quad i \in \{\kappa_1, \kappa_2\},
\]
\[
F^i_{j_0}(x) := \mathcal{M}_t f_i(x), \quad i \in \Pi \setminus \{\kappa_1, \kappa_2\}.
\]

Obviously, (9.16) and (9.17) are clear as (2.2) is applied when \(i \in \{\kappa_1, \kappa_2\}\).

Case3 : \(\kappa_1, \kappa_2 \in \Pi\). In this case, we cannot use the classical Littlewood-Paley theory as \(L^\infty\) norm is not characterized by \(L^\infty\) norm of a square function. Instead, we can benefit from Lemma 2.3, using \(\mathfrak{M}^t_{\sigma, 2j}\) not \(\mathcal{M}_t\). By applying (7.8), Lemma 2.4, (7.4), (5.1), and (2.4), we obtain
\[
|T_{a_j, \kappa_2}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m)(x)| \lesssim L^p_\sigma[\sigma] \left( \prod_{i \in I} \mathcal{M}_t a_i(x) \right) \mathfrak{M}^t_{s_{l+1}, 2j} \left( f_{l+1} \right)^{j+1}(x)
\]
\[
\times \left( \prod_{i \in \Pi \setminus \{l+1\}} \mathcal{M}_t f_i(x) \right) \mathfrak{M}^t_{s_{\kappa_1}, 2j} \left( f_{\kappa_1} \right) j(x) \mathfrak{M}^t_{s_{\kappa_2}, 2j} \left( f_{\kappa_2} \right) j(x).
\]

Now we take
\[
b^i_{j_0}(x) := \mathcal{M}_t a_i(x) \chi_{Q^*_i(x)}, \quad i \in I,
\]
\[
F^i_{l+1}(x) := \sum_{j \in \mathbb{Z}} \mathfrak{M}^t_{s_{l+1}, 2j} \left( f_{l+1} \right)^{j+1}(x) \mathfrak{M}^t_{s_{\kappa_1}, 2j} \left( f_{\kappa_1} \right) j(x) \mathfrak{M}^t_{s_{\kappa_2}, 2j} \left( f_{\kappa_2} \right) j(x),
\]
\[
F^i_{j_0}(x) := \mathcal{M}_t f_i(x), \quad i \in \Pi \setminus \{l + 1\}.
\]
Then (9.15), (9.16), and (9.17) are immediate for \(i \neq l + 1\), and the case \(i = l + 1\) follows from Lemma 2.3.
Case 4: \( \kappa_1 \in I, \kappa_2 \in II \). Using the arguments in Case 1 and Case 2, we are done with the choices
\[
\begin{align*}
b_{\kappa_1}^J(x) & := \left( \sum_{j \in \mathbb{Z}} (\mathcal{M}_t(a_{\kappa_1})_j(x))^2 \right)^{1/2} \chi_{Q_{\kappa_1}}(x), \\
b_i^J(x) & := \mathcal{M}_t a_i(x) \chi_{Q_i^*}(x), \quad i \in I \setminus \{\kappa_1\}, \\
F_{\kappa_2}^J(x) & := \left( \sum_{j \in \mathbb{Z}} (\mathcal{M}_t(f_{\kappa_2})_j(x))^2 \right)^{1/2}, \\
F_i^J(x) & := \mathcal{M}_t f_i(x), \quad i \in II \setminus \{\kappa_2\}.
\end{align*}
\]
Case 5: \( \kappa_1 \in I, \kappa_2 \in III \). It follows from (7.7), Lemma 2.4, (7.4), (5.1), and (2.4) that (9.15) holds with
\[
\begin{align*}
b_{\kappa_1}^J(x) & := \left( \sum_{j \in \mathbb{Z}} (\mathcal{M}_t(a_{\kappa_1})_j(x))^2 \right)^{1/2} \chi_{Q_{\kappa_1}}(x), \\
b_i^J(x) & := \mathcal{M}_t a_i(x) \chi_{Q_i^*}(x), \quad i \in I \setminus \{\kappa_1\}, \\
F_{i+1}^J(x) & := \left( \sum_{j \in \mathbb{Z}} (\mathcal{M}_t^t(f_{\kappa_1})_j(x))(\mathcal{M}_t^t(f_{\kappa_2})_j(x))^2 \right)^{1/2}, \\
F_i^J(x) & := \mathcal{M}_t f_i(x), \quad i \in II \setminus \{l+1\},
\end{align*}
\]
and it is clear that (9.15), (9.16), and (9.17) hold. Especially, (9.17) for \( i = l + 1 \) is due to Lemma 2.3.
Case 6: \( \kappa_1 \in II, \kappa_2 \in III \). The similar arguments can be applied with
\[
\begin{align*}
b_i^J(x) & := \mathcal{M}_t a_i(x) \chi_{Q_i^*}(x), \quad i \in I, \\
F_{\kappa_2}^J(x) & := \sum_{j \in \mathbb{Z}} (\mathcal{M}_t^t(f_{\kappa_1})_j(x))(\mathcal{M}_t^t(f_{\kappa_2})_j(x))^2, \\
F_i^J(x) & := \mathcal{M}_t f_i(x), \quad i \in II \setminus \{\kappa_1\}.
\end{align*}
\]
Note that Lemma 2.3 implies
\[
\|F_{\kappa_1}^J\|_{L^{p_{\kappa_1}}(\mathbb{R}^n)} \lesssim \|f_{\kappa_1}\|_{L^{p_{\kappa_1}}(\mathbb{R}^n)}\|f_{\kappa_2}\|_{BMO} \lesssim \|f_{\kappa_1}\|_{L^{p_{\kappa_1}}(\mathbb{R}^n)}.
\]
Next we consider the case \( J_0 \neq \emptyset \). In this case the proof is based on the idea in the proof of Lemma 6.1. For notational convenience, let
\[
G_j := T_{\nu_{s_j}}^J(a_1, \ldots, a_l, f_{t+1}, \ldots, f_m).
\]
Here, the notation \( G_j \) does not contain two parameters \( \kappa_1 \) and \( \kappa_2 \) as the arguments below are universal for any \( 1 \leq \kappa_1 < \kappa_2 \leq m \). We note that \( G_j \) plays a similar role as \( g_j \) in (9.3).
We shall prove that there exist nonnegative functions \( u_{i,j}^J \), \( i \in J_0 \), such that for \( x \in E_{J_0} \) and \( j \in \mathbb{Z} \),
\[
|G_j(x)| \lesssim \mathcal{L}_x^*[\sigma] \left( \prod_{i \in J_0} u_{i,j}^J(x) \right) \left( \prod_{i \in I \setminus J_0} |Q_i|^{-1/p_i} \chi_{Q_i^*}(x) \right) \left( \prod_{i \in II} \mathcal{M}_t(f_i)(x) \right),
\]
and
\[
\|u_{i,j}^J\|_{L^{p_i}(\mathbb{R}^n)} \leq \min \left( (2^j \ell(Q_i))^{\gamma_i}, (2^j \ell(Q_i))^{-\delta_i} \right)
\]
for some $\gamma_i, \delta_i > 0$, which are the counterparts of (9.12) and (9.13), respectively.

If we have such functions $u_{i,j}^0$, then (9.15) holds with the functions

\begin{equation}
\tag{9.21}
b_{i,j}^0 := \sum_{j \in \mathbb{Z}} u_{i,j}^0 \quad \text{for } i \in J_0, \quad b_{i}^0 = |Q_i|^{-1/p} \chi_{Q_i^c} \quad \text{for } i \in I \setminus J_0,
\end{equation}

\begin{equation}
\tag{9.22}
F_{i}^0 := \mathcal{M}_t(f_i) \quad \text{for } i \in \Pi.
\end{equation}

The estimate (9.16) for $i \in I \setminus J_0$ is obvious and when $i \in J_0$ it follows from (9.20). In addition, (9.17) holds via the $L^p$-boundedness of $\mathcal{M}_t$.

From now on, let us construct $u_{i,j}^0$ having the properties (9.19) and (9.20). Fix $x \in E_{i,j}$ and write

$$
\mathcal{G}_j(x) = \int_{(\mathbb{R}^n)^m} 2^{jm} K_j(2^j(x-y_1), \ldots, 2^j(x-y_m)) \left( \prod_{i \in I} a_i(y_i) \right) \left( \prod_{i \in \Pi \cup \Pi} f_i(y_i) \right) dy
$$

where $K_j := \left( \mathcal{K}_{j,1}^{\alpha_1, \alpha_2} (2^j \cdot) \right)^\vee$. Let $c_i$ denote the center of the cube $Q_i$ and use the notation

$$
K_j^{(u,w)}(x, \bar{y}) := K_j(y_1, \ldots, y_{u-1}, 2^j(x-y_u), \ldots, 2^j(x-y_w), y_{w+1}, \ldots, y_m)
$$

for simplicity, as before.

Since $|x - c_i| \approx |x - y_i|$ for $x \notin Q_i^c$ and $y_i \in Q_i$, we see that

$$
\left( \prod_{i \in J_0} (2^j(x - c_i))^s_i \right) |\mathcal{G}_j(x)| \lesssim 2^{jm} \int_{(\mathbb{R}^n)^m} \left( \prod_{i \in J_0} (2^j(x - y_i))^s_i \right) \left| K_j^{(1,m)}(x, \bar{y}) \right| \left( \prod_{i \in I} |a_i(y_i)| \right) \left( \prod_{i \in \Pi \cup \Pi} |f_i(y_i)| \right) dy.
$$

We now fix $k \in J_0$ and estimate the last integral by

$$
\int_{y_k \in \mathbb{R}^n} \left\| \left( \prod_{i \in J_0 \setminus \{k\}} (2^j(x - y_i))^s_i \right) K_j^{(1,m)}(x, \bar{y}) \right\|_{L^\infty(\bar{y}_j \setminus \{k\}) L^1(\bar{y}_j, \bar{y}_0) L^1(\bar{y}_j, \bar{y}_m)} \times \left\| \prod_{i \in J_0} |Q_i|^{-1/p_i} \chi_{Q_i}(y_i) \right\|_{L^1(\bar{y}_j, \bar{y}_0)} \times \left\| \prod_{i \in J_0 \setminus \{k\}} |Q_i|^{-1/p_i} \chi_{Q_i}(y_i) \right\|_{L^\infty(\bar{y}_j \setminus \{k\})} \times \left\| \prod_{i \in \Pi} (2^j(x - y_i))^{-s_i} f_i(y_i) \right\|_{L^p(\bar{y}_j)} dy_k,
$$

where we used the notations $\bar{y}_J := \otimes_{i \in J} y_i$ for all $J$ (for example, $\bar{y}_I = (y_1, \ldots, y_t)$, $\bar{y}_{II} = (y_{t+1}, \ldots, y_p)$, and so on), and

$$
\|F(z_1, z_2)\|_{L^p(z_1) L^q(z_2)} := \left\| \left\|F(z_1, z_2)\right\|_{L^p(z_1)} \right\|_{L^q(z_2)}.
$$
Using a change of variables we write
\[
\left\| \left( \prod_{i \in J_0 \cup I} \left\langle 2^j (x - y_i) \right\rangle^{s_i} \right) K_j^{(1,m)} (x, \vec{y}) \right\|_{L^\infty(\vec{y}_{J_0 \setminus (k)}) L^1(\vec{y}_{I \cup J_0}) L^{t'}(\vec{y}_{I I}) L^1(\vec{y}_{I I I})} = 2^{-jn \text{Card}(I \setminus J_0)} 2^{-(jn/t') \text{Card}(I) \text{Card}(I I)} 2^{-jn \text{Card}(I I)}
\times \left\| \left( \prod_{i \in J_0 \cup I \setminus \{k\}} \left\langle y_i \right\rangle^{s_i} \right) K_j^{(k,k)} (x, \vec{y}) \right\|_{L^\infty(\vec{y}_{J_0 \setminus (k)}) L^1(\vec{y}_{I \cup J_0}) L^{t'}(\vec{y}_{I I}) L^1(\vec{y}_{I I I})}.
\]

Now Hölder's inequality with \( s_i > n/t \) and Lemma 2.9 yield
\[
\left\| \left( \prod_{i \in J_0 \cup I \setminus \{k\}} \left\langle y_i \right\rangle^{s_i} \right) K_j^{(k,k)} (x, \vec{y}) \right\|_{L^\infty(\vec{y}_{J_0 \setminus (k)}) L^1(\vec{y}_{I \cup J_0}) L^{t'}(\vec{y}_{I I}) L^1(\vec{y}_{I I I})} \lesssim \left\| \left( \prod_{i \in I \setminus J_0 \setminus \{k\}} \left\langle y_i \right\rangle^{s_i} \right) K_j^{(k,k)} (x, \vec{y}) \right\|_{L^\infty(\vec{y}_{I \setminus J_0}) L^1(\vec{y}_{I I}) L^{t'}(\vec{y}_{I I I})},
\]

Morover, we have
\[
\left\| \prod_{i \in J_0} |Q_i|^{-1/p_i} \chi_{Q_i}(y_i) \right\|_{L^1(\vec{y}_{J_0 \setminus (k)})} \lesssim \left( \prod_{i \in J_0} |Q_i|^{-1/p_i} \right) \chi_{Q_k}(y_k)|Q_k|^{-1},
\]
\[
\left\| \prod_{i \in I \setminus J_0} |Q_i|^{-1/p_i} \chi_{Q_i}(y_i) \right\|_{L^\infty(\vec{y}_{I \setminus J_0})} \lesssim \prod_{i \in I \setminus J_0} |Q_i|^{-1/p_i},
\]
\[
\left\| \prod_{i \in I} \left( 2^j (x - y_i) \right)^{-s_i} f_i(y_i) \right\|_{L^{t'}(\vec{y}_{I I})} \lesssim 2^{-(jn/t) \text{Card}(I I)} \prod_{i \in I} \mathcal{M}_{t'}(f_i)(x) \lesssim 2^{-(jn/t) \text{Card}(I I)} \prod_{i \in I} \mathcal{M}_{t}(f_i)(x),
\]

where the last inequality follows from (2.4) with \( s_i > n/t \).

Combining the above inequalities, we obtain that for \( x \in E_{J_0} \),
\[
\left( \prod_{i \in J_0} (2^j (x - c_i)^{s_i}) \right) |g_j(x)| \lesssim 2^{jn \text{Card}(J_0)} H_j^{(k,0)}(x) \left( \prod_{i \in J_0} |Q_i|^{-1/p_i} \right) \times \left( \prod_{i \in I \setminus J_0} |Q_i|^{-1/p_i} \right) \prod_{i \in I} \mathcal{M}_{t}(f_i)(x)
\]

where \( H_j^{(k,0)} \) is defined as
\[
H_j^{(k,0)}(x) := \frac{1}{|Q_k|} \int_{Q_k} \left( 2^j (x - y_k) \right)^{s_k} \left\| \left( \prod_{i \in I \setminus J_0 \setminus \{k\}} \left\langle y_i \right\rangle^{s_i} \right) K_j^{(k,k)} (x, \vec{y}) \right\|_{L^{t'}(\vec{y}_{I \setminus J_0 \setminus (k)})} dy_k,
\]

which is the counterpart of \( h_j^{(k,0)} \) in the proof of Lemma 6.1. Then the argument that led to (9.5), with (5.1), proves that
\[
(9.23) \quad \| H_j^{(k,0)} \|_{L^{t'}(\mathbb{R}^n)} \lesssim 2^{-jn/t'} L^{t'}_{\sigma}[\sigma].
\]
On the other hand, applying the vanishing moment condition of $a_k$ and Lemma 2.8, we write

$$\left| G_j(x) \right| \lesssim 2^{jn_{MN}} \sum_{|\alpha| = N_{k+1}} \int_{\mathbb{R}^n} \left( 2^j |y_k - c_k| \right)^{N_{k+1}} \left( \prod_{i \in I} |Q_i|^{-1/p_i} \chi_{Q_i}(y_k) \right)$$

$$\times \left| \partial_k^\alpha K_j(2^j(x - y_1), \ldots, 2^j(x - y_{k-1}), 2^j x_{c_k,y_k}, \ldots, 2^j(x - y_m)) \right|$$

$$\times \left( \prod_{i \in J_0} |f_i(y_i)| \right) \, dy_k \, dt$$

where $x_{c_k,y_k} := x - c_k - t(y_k - c_k)$. Since $|x_{c_k,y_k}| \approx |x - c_k|$ for $x \not\in Q_k^*$, $y_k \in Q_k$, and $0 < t < 1$, arguing as in (9.6), we obtain that for $x \in E_{J_0}$,

$$\left( \prod_{i \in J_0} \langle 2^j(x - c_i) \rangle^{s_i} \right) |G_j(x)|$$

$$\lesssim 2^{jn_{MN}} \langle 2^j l(Q_k) \rangle^{N_{k+1}} \sum_{|\alpha| = N_{k+1}} \int_{\mathbb{R}^n} \left( 2^j x_{c_k,y_k} \right)^{s_k} \left( \prod_{i \in J_0 \cup I \setminus \{k\}} \langle 2^j(x - y_i) \rangle^{s_i} \right)$$

$$\times \partial_k^\alpha K_j(2^j(x - y_1), \ldots, 2^j(x - y_{k-1}), 2^j x_{c_k,y_k}, \ldots, 2^j(x - y_m))$$

$$\times \left\| \prod_{i \in J_0} |Q_i|^{-1/p_i} \chi_{Q_i}(y_i) \right\|_{L^1(\mathbb{R}^n)} \left\| \prod_{i \in I \setminus J_0} |Q_i|^{-1/p_i} \chi_{Q_i}(y_i) \right\|_{L^1(\mathbb{R}^n)}$$

$$\times \left\| \prod_{i \in I} \langle 2^j(x - y_i) \rangle^{s_i} f_i(y_i) \right\|_{L^1(\mathbb{R}^n)} \, dy_k \, dt$$

$$\lesssim 2^{jn_{\text{Card}(J_0)} H_j^{(k,1)}(x)} \left( \prod_{i \in J_0} \langle Q_i \rangle^{1/p_i} \right) \left( \prod_{i \in I \setminus J_0} \langle Q_i \rangle^{1/p_i} \right) \left( \prod_{i \in I} M_t(f_i)(x) \right)$$

where

$$H_j^{(k,1)}(x) := \langle 2^j l(Q_k) \rangle^{N_{k+1}} \sum_{|\alpha| = N_{k+1}} \frac{1}{|Q_k|} \int_{Q_k} \left( 2^j x_{c_k,y_k} \right)^{s_k}$$

$$\times \left\| \prod_{i \in \Lambda \setminus \{k\}} \langle \cdot \rangle^{s_i} \partial_k^\alpha K_j(\cdot, \ldots, \cdot, 2^j x_{c_k,y_k}, \cdot, \ldots, \cdot, 2^j(x - y_m)) \right\|_{L^1(\mathbb{R}^n}) \, dy_k \, dt.$$

Using Minkowski’s inequality, Lemma 2.9 and (5.1), we deduce

$$\| H_j^{(k,1)} \|_{L^{1'}(\mathbb{R}^n)} \lesssim 2^{-jn_{\text{Card}(J_0)}} \langle 2^j l(Q_k) \rangle^{N_{k+1}} L_{\tilde{R}}^r[\sigma].$$

So far, we have proved that for $x \in E_{J_0}$ and $k \in J_0$,

$$|G_j(x)| \lesssim 2^{jn_{\text{Card}(J_0)}} \left( \prod_{i \in J_0} \langle 2^j(x - c_i) \rangle^{s_i} |Q_i|^{1/p_i} \chi_{Q_i^c}(x) \right)$$

$$\times \left( \prod_{i \in I \setminus J_0} |Q_i|^{-1/p_i} \chi_{Q_i^c}(x) \right) \left( \prod_{i \in I} M_t(f_i)(x) \right) \min \{ H_j^{(k,0)}(x), H_j^{(k,1)}(x) \}.$$
We choose \( \{\alpha_i\}_{i \in I_0} \) and \( \{\beta_i\}_{i \in I_0} \) as in (9.11) by replacing \( \{1, \ldots, v\} \) and \( r' \) by \( J_0 \) and \( t' \), respectively, which is possible since
\[
\sum_{i \in J_0} \min \left( 0, s_i / n - 1/p_i \right) > -1/t'
\]
by virtue of condition (9.14). Then we have
\[
\alpha_i, \beta_i > 0, \quad s_i / n > 1/p_i - \beta_k / t' = \alpha_i, \quad \sum \beta_i = 1.
\]
Now if we set
\[
u_{i,j}^{J_0}(x) := (L^p_\#[\sigma])^{-\beta_i} 2^{jn_0} |Q_i|^{1-1/p} \langle 2^j(x - c_i) \rangle^{-s_i} \chi(Q_i^*)^c(x) \left( \min \left( H_j^{(i,0)}(x), H_j^{(i,1)}(x) \right) \right)^{\beta_i},
\]
(9.19) is immediate from (9.25) since \( \sum_{i \in I_0} \beta_i = 1 \).

It remains to verify (9.20). Hölder’s inequality with \( 1/p_i = \beta_i / r' + \alpha_i \) yields that
\[
\| \nu_{i,j}^{J_0} \|_{L^{p_i}(\mathbb{R}^n)} \leq (L^p_\#[\sigma])^{-\beta_i} 2^{jn_0} (Q_i)^{(1-1/p_i)} \left( \langle 2^j(-c_i) \rangle^{-s_i} \chi(Q_i^*)^c \right) \left( \min \left( H_j^{(i,0)}(x), H_j^{(i,1)}(x) \right) \right)^{\beta_i}.
\]

Since \( s_i > \alpha_i n \), we have
\[
\left\| \langle 2^j(-c_i) \rangle^{-s_i} \chi(Q_i^*)^c \right\|_{L^{1/\alpha_i}(\mathbb{R}^n)} \lesssim 2^{-jn_0} \min \left( 1, (2^j l(Q_i))^\gamma \right),
\]
and the estimates (9.23) and (9.24) prove
\[
\min \left( \| H_j^{(i,0)}(x) \|_{L^{r'(\mathbb{R}^n)}}, \| H_j^{(i,1)}(x) \|_{L^{r'(\mathbb{R}^n)}}, \right) \lesssim 2^{-jn_0} \min \left( 1, (2^j l(Q_i))^\gamma \right).
\]

Thus,
\[
\| \nu_{i,j}^{J_0} \|_{L^{p_i}(\mathbb{R}^n)} \lesssim \left\{ \begin{array}{ll}
(2^j l(Q_i))^{-\gamma}, & \text{if } 2^j l(Q_i) > 1 \\
(2^j l(Q_i))^{-\gamma} \left( 1/n - (s_i - \alpha_i n) \right), & \text{if } 2^j l(Q_i) \leq 1
\end{array} \right.
\]
since \( 1 - \alpha_i - \beta_i / t' = 1 / p_i \). This implies (9.20) with \( \gamma_j = -\left( n/p_i - n \right) + \beta_i (N_i + 1) \) and \( \delta_i = n/p_i - n + s_i - \alpha_i n \). We have \( \gamma_k, \delta_k > 0 \) as \( N_k \) is sufficiently large and \( s_i > \alpha_i n \).

This completes the proof of Lemma 7.1.

9.4. **Proof of Lemma 7.2.** The proof is similar to that of Lemma 7.1. As in the proof of Lemma 7.1, we choose \( 1 < t < r \) such that
\[
s_1, \ldots, s_m > d/t > d/r, \quad \sum_{k \in J} \left( s_k / n - 1/p_k \right) > -1/t' > -1/r'
\]
for every nonempty subset \( J \subset I \), and observe that (5.1) holds.

For each \( J_0 \subset I \), let
\[
E_{J_0} := \left( \bigcap_{i \in I \setminus J_0} Q_i^* \right) \setminus \left( \bigcup_{i \in J_0} Q_i^* \right)
\]
and we decompose the left-hand side of (7.18) as
\[
\sum_{J_0 \subset I} \left( \sum_{j \in \mathbb{Z}} |T_{a_1, \ldots, a_t, f_{i+1}, \ldots, f_m}(x)|^2 \right)^{1/2} \chi_{E_{J_0}(x)}.
\]
Since it is a finite sum over $J_0$, we need to prove that for each $J_0 \subset I$, there exist nonnegative functions $b_i^{J_0}$, $i \in I$, and $F_i^{J_0}$, $i \in \Pi$ satisfying that for all $x \in E_{J_0}$

$$\sum_{j \in \mathbb{Z}} \left| T_{\sigma_j}^{\gamma_1}(a_1, \ldots, a_t, f_{l+1}, \ldots, f_m)(x) \right|^2 \lesssim \mathcal{L}_b^\gamma[\sigma]( \Pi b_i^{J_0}(x) \left( \prod_{i \in I} F_i^{J_0}(x) \right),$$

$$(9.26) \quad \left\| b_i^{J_0} \right\|_{L^{p_1}(\mathbb{R}^n)} \lesssim 1, \quad \text{for } i \in I,$$

$$(9.27) \quad \left\| F_i^{J_0} \right\|_{L^{p_1}(\mathbb{R}^n)} \lesssim \left\| f_i \right\|_{L^{p_1}(\mathbb{R}^n)}, \quad \text{for } i \in \Pi.$$

Let us first assume $J_0 = \emptyset$. In this case, the proof consists of three cases.

**Case 1:** $\kappa \in I$. Using (7.14), Lemma 2.4, (2.4), (7.13), and (5.1), we obtain

$$\left| T_{\sigma_j}^{\gamma_1}(a_1, \ldots, a_t, f_{l+1}, \ldots, f_m)(x) \right| \lesssim \mathcal{L}_b^\gamma[\sigma]\mathcal{M}_t(a_\kappa)_j(x) \left( \prod_{i \in I \setminus \{\kappa\}} \mathcal{M}_t a_i(x) \left( \prod_{i \in \Pi} \mathcal{M}_t f_i(x) \right),$$

where we applied $\mathcal{M}_t f_i(x) \leq \left\| f_i \right\|_{L^\infty(\mathbb{R}^n)} = 1$ for $i \in \Pi$. We now take

$$b_\kappa^{J_0}(x) := \left( \sum_{j \in \mathbb{Z}} \left( \mathcal{M}_t(a_\kappa)_j(x) \right)^2 \right)^{1/2} \chi_{Q_\kappa}(x),$$

$$b_i^{J_0}(x) := \mathcal{M}_t a_i(x) \chi_{Q_i}(x), \quad i \in I \setminus \{\kappa\},$$

$$F_i^{J_0}(x) := \mathcal{M}_t f_i(x), \quad i \in \Pi$$

and then (9.26) holds. Furthermore, (9.27) and (9.28) follow from Hölder’s inequality, (2.3) with $t < 2$, and (2.2). To be specific, the estimates for $i \in I \setminus \{\kappa\}$ or for $i \in \Pi$ are clear, and

$$\left\| b_\kappa^{J_0} \right\|_{L^{p_1}(\mathbb{R}^n)} \lesssim |Q_\kappa|^{1/p_\kappa-1/2} \left\| \mathcal{M}_t(a_\kappa)_j \right\|_{L^{2}(\mathbb{R}^n)} \lesssim |Q_\kappa|^{1/p_\kappa-1/2} \left\| a_\kappa \right\|_{L^2(\mathbb{R}^n)} \lesssim 1.$$

**Case 2:** $\kappa \in \Pi$. It can be proved in a similar way. Indeed, (9.26) holds with

$$b_i^{J_0}(x) := \mathcal{M}_t a_i(x) \chi_{Q_i}(x), \quad i \in I,$$

$$F_\kappa^{J_0}(x) := \left( \sum_{j \in \mathbb{Z}} \left( \mathcal{M}_t(f_\kappa)_j(x) \right)^2 \right)^{1/2},$$

$$F_i^{J_0}(x) := \mathcal{M}_t f_i(x), \quad i \in \Pi \setminus \{\kappa\}.$$

It is also obvious that (9.27) and (9.28) hold as (2.2) is applied in the case $i = \kappa$.

**Case 3:** $\kappa \in \Pi$. We utilize Lemma 2.3 as we did in **Case 3** that appeared in the proof of Lemma 7.1. Using (7.15), Lemma 2.4, (2.4), (7.13), and (5.1), we obtain that

$$\left| T_{\sigma_j}^{\gamma_1+1}(a_1, \ldots, a_t, f_{l+1}, \ldots, f_m)(x) \right| \lesssim \mathcal{L}_b^\gamma[\sigma]\mathcal{M}_t a_i(x) \mathcal{M}_t f_i(x)$$

$$\prod_{i \in I \setminus \{l+1\}} \mathcal{M}_t f_i(x).$$

Now we take

$$b_i^{J_0}(x) := \mathcal{M}_t a_i(x) \chi_{Q_i}(x), \quad i \in I,$$

$$F_{l+1}^{J_0}(x) := \left( \sum_{j \in \mathbb{Z}} \left( \mathcal{M}_t f_{l+1} \right)^{j+1,m}(x)^2 \left( \mathcal{M}_t f_i(x) \right)^{2j}(x)^2 \right)^{1/2}$$

$$F_i^{J_0}(x) := \mathcal{M}_t f_i(x), \quad i \in \Pi \setminus \{l+1\}.$$
Then (9.26), (9.27), and (9.28) are all true for $i \neq l + 1$, and (9.28) for $i = l + 1$ follows from Lemma 2.3.

Now we consider the case $J_0 \neq \emptyset$. The proof is immediate from the argument in the proof of Lemma 7.1. We define, like (9.18),
\[ G_j := T_{\sigma_j,1}(a_1, \ldots, a_l, f_{l+1}, \ldots, f_m). \]
Then (9.19) still holds in the present case with (9.20). Let $b^{J_0}_i$, $i \in I$, and $F^{J_0}_i$, $i \in II$, be defined as in (9.21) and (9.22), and apply the embedding $\ell^1 \hookrightarrow \ell^2$ to obtain that the left-hand side of (9.26) is bounded by
\[
\sum_{j \in \mathbb{Z}} |G_j(x)| \lesssim \mathcal{L}_\sigma^r \left[ \prod_{i=1}^l b^{J_0}_i(x) \right] \left( \prod_{i=l+1}^\rho F^{J_0}_i(x) \right),
\]
which proves (9.26). In addition, (9.27) and (9.28) are obvious from (9.16) and (9.17), respectively.

This completes the proof.

10. Final remarks

We note that the direction (1.8) $\Rightarrow$ (1.7) is valid even for $2 < r < \infty$, in view of Propositions 1.2 and 1.3. Thus, under the assumption $\mathcal{L}_\sigma^r, \Psi^{(m)}[\sigma] < \infty$ conditions (1.7) are necessary for the boundedness of $T_\sigma$ for all $r$ in the range $1 < r < \infty$. However the sufficiency of (1.7) for the boundedness of $T_\sigma$, i.e., the direction (1.7) $\Rightarrow$ (1.8) is missing in the case $r > 2$. It seems that our techniques are not applicable in this case. We hope to address this problem in the future but we welcome interested researchers to investigate this topic as well.

Acknowledgment: We would like to thank Professors M. Mastylo and N. Tomita for providing us important references related to complex interpolation.
