Mixed problem with an pure integral two-space-variables condition for a third order fractional parabolic equation

SOAMPA Bangan\textsuperscript{1} and DJIBIBE Moussa Zakari\textsuperscript{2,*}

Abstract
In this paper, we establish sufficient conditions for the existence and uniqueness of a solution, in a functional weighted Sobolev space, for Caputo fractional differential equations with integral conditions. The proof uses a functional analysis method presented, which it based on energy inequality and the density of the range of operator generated by the problem.

Keywords
Fractional differential equations, fractional Caputo derivative, Energy inequality, density of operator, the rang of operator.

1. Introduction
Fractional differential equations (FDEs) are generalizations of differential equations of integer order to an arbitrary order. These generalization play a crucial role in engineering, physics and applied mathematics. Therefore, they have generated a lot of interest from engineers and scientist in recent years. Since FDEs have memory, nonlocal relations in space and time, and complex phenomena can be modeled by using these equations. Indeed, we can find numerous applications in viscoelasticity, electro-chemistry, control theory, porous media, fluid flow, rheology, diffusive transport, electrocal network, electromagnetic theory, probability, signal processing, and many other physical processes.

Problem which combine local and integral conditions for a second order parabolic equations is investigated by the potential method by Ionkin [24] and by energy inequality method in [30] and [5].

Existence and uniqueness of solution to parabolic fractional differential equations with integral conditions have been studied by Ossaif Taki-Eddine and Bouziani Abdelfatah [29].

Mixed problem with an integral two space-variables condition for a third order parabolic equation has been studied by Ossaif Taki-Eddine and Bouziani Abdelfatah [28].

Our work is a generalization on a third order parabolic Fractional Differential Equations with the Caputo derivative.

2. Preliminaries and formulation of the problem

Let $\Gamma(\cdot)$ denote the gamma function. For any positive integer $0 < \alpha < 1$, the Caputo derivative is defined as follow

$$D_t^\alpha v(x,t) = \frac{1}{\Gamma(1-\alpha)} \int_0^t \frac{\partial v(x,\tau)}{\partial \tau} \times \frac{1}{(t-\tau)^\alpha} d\tau. \quad (2.1)$$

In the rectangle $\Omega = (0,1) \times (0,T)$, with $T < +\infty$, we con-
sider the third order linear fractional parabolic equation

$$\mathbb{D}_t^\alpha u - \frac{\partial^2}{\partial x^2} \left( a(x,t) \frac{\partial u}{\partial x} \right) = F(x,t),$$  \hspace{1cm} \text{(2.2)}

with the initial condition

$$lu = u(x,0) = \phi(x), \quad x \in (0,1),$$  \hspace{1cm} \text{(2.3)}

local boundary conditions

$$\frac{\partial u}{\partial x} \big|_{x=0} = 0, \quad i \in \{0, \alpha, \beta, 1\}, \quad t \in (0,T),$$  \hspace{1cm} \text{(2.4)}

$$\frac{\partial^2 u}{\partial x^2} \big|_{x=0} = 0, \quad t \in (0,T),$$  \hspace{1cm} \text{(2.5)}

$$\frac{\partial^2 u}{\partial x^2} \big|_{x=1} = 0, \quad t \in (0,T),$$  \hspace{1cm} \text{(2.6)}

and the weighted integral conditions:

$$\int_0^\alpha u(x,t)dx + \int_1^\beta u(x,t)dx = E(t), \quad t \in (0,T),$$  \hspace{1cm} \text{(2.7)}

$$\int_0^\alpha xu(x,t)dx + \int_1^\beta xu(x,t)dx = G(t), \quad t \in (0,T).$$  \hspace{1cm} \text{(2.8)}

$F(x,t), \phi(x)$ are the known functions and $a(x,t), E(t)$ and $G(t)$ satisfy the following conditions:

**Condition 1**
The coefficient $a(x,t)$ is a real-value belonging to $C^2(\Omega)$ such that

1. $c_0 \leq a(x,t) \leq c_1$;
2. $\frac{1}{2}a(x,t) - \frac{\partial a(x,t)}{\partial x} \geq 0$;
3. $a(x,t) - 3\frac{\partial a(x,t)}{\partial x} \geq 0$.

In condition 1 and the rest of the paper, $c_i, i = 1, \ldots, 6$, denote strictly positive constants.

**Condition 2**

1. $0 < \alpha < \beta < 1, \quad \alpha + \beta = 1$;
2. $G(t) = \frac{1}{2} \left( \alpha^2 + 1 - \beta^2 \right) E(t) = \alpha E(t)$;
3. $\alpha^2 + 1 - \beta^2 = \alpha + 1 - \beta = 2\alpha$.

In this paper, sufficient conditions for existence and uniqueness of solution in a functional weighted Sobolev space for Caputo fractional equations are established.

Since the boundary conditions are inhomogeneous, we construct a function

$$w(x,t) = \frac{-6(\alpha^2 + 1 - \beta^2)x + 4(\alpha^2 + 1 - \beta^3)}{4(\alpha^2 - \beta^2) - 3(\alpha^2 - \beta^3) + 1} E(t)$$

$$+ \frac{2(\alpha^2 - \beta^2)}{4(\alpha^2 - \beta^3) - 3(\alpha^2 - \beta^2) + 1} G(t),$$

and we introduce a new function $\tilde{u}(x,t) = u(x,t) - w(x,t)$.

Then problem (2.2) - (2.8) can be formulated as

$$\mathbb{D}_t^\alpha \tilde{u} - \frac{\partial^2}{\partial x^2} \left( a(x,t) \frac{\partial \tilde{u}}{\partial x} \right) = g(x,t),$$  \hspace{1cm} \text{(2.9)}

$$l\tilde{u} = \tilde{u}(x,0) = \psi(x), \quad x \in (0,1),$$  \hspace{1cm} \text{(2.10)}

$$\frac{\partial \tilde{u}}{\partial x} \big|_{x=0} = 0, \quad i \in \{0, \alpha, \beta, 1\}, \quad t \in (0,T),$$  \hspace{1cm} \text{(2.11)}

$$\frac{\partial^2 \tilde{u}}{\partial x^2} \big|_{x=0} = 0, \quad t \in (0,T),$$  \hspace{1cm} \text{(2.12)}

$$\frac{\partial^2 \tilde{u}}{\partial x^2} \big|_{x=1} = 0, \quad t \in (0,T),$$  \hspace{1cm} \text{(2.13)}

$$\int_0^\alpha \tilde{u}(x,t)dx + \int_1^\beta \tilde{u}(x,t)dx = 0, \quad t \in (0,T),$$  \hspace{1cm} \text{(2.14)}

$$\int_0^\alpha x\tilde{u}(x,t)dx + \int_1^\beta x\tilde{u}(x,t)dx = 0, \quad t \in (0,T),$$  \hspace{1cm} \text{(2.15)}

where

$$g(x,t) = F(x,t) - \mathbb{D}_t^\alpha w(x,t) + \frac{\partial^2}{\partial x^2} \left( a(x,t) \frac{\partial w(x,t)}{\partial x} \right),$$

$$\psi(x) = \phi(x) - w(x,0).$$

And, introducing a new function $v = \tilde{u} - \tilde{u}(x,0) = \tilde{u} - \psi(x)$, problem (2.9) - (2.15) can be formulated as

$$\mathbb{D}_t^\alpha v - \frac{\partial^2}{\partial x^2} \left( a(x,t) \frac{\partial v}{\partial x} \right) = f(x,t),$$  \hspace{1cm} \text{(2.16)}

$$lv = v(x,0) = 0, \quad x \in (0,1),$$  \hspace{1cm} \text{(2.17)}
\[ \frac{\partial v}{\partial x_{i=1}} = 0, \quad i \in \{0, \alpha, \beta, 1\}, \quad t \in (0, T), \quad (2.18) \]

\[ \frac{\partial^2 v}{\partial x^2} \big|_{x=0} = 0, \quad t \in (0, T), \quad (2.19) \]

\[ \frac{\partial^2 v}{\partial x^2} \big|_{x=1} = 0, \quad t \in (0, T), \quad (2.20) \]

\[ \int_0^1 v(x,t)dx + \int_1^\alpha v(x,t)dx = 0, \quad t \in (0, T), \quad (2.21) \]

\[ \int_0^\alpha xv(x,t)dx + \int_1^\beta xv(x,t)dx = 0, \quad t \in (0, T), \quad (2.22) \]

where

\[ f(x,t) = g(x,t) + \frac{\partial^2 a(x,t)}{\partial x^2} \frac{\partial \psi}{\partial x} \]

\[ = F(x,t) + \frac{\partial^2 a(x,t)}{\partial x^2} \frac{\partial \psi}{\partial x} + \frac{\partial^2 a(x,t)}{\partial x^2} \frac{\partial w(x,t)}{\partial x} , \]

\[ \frac{\partial \psi}{\partial x} = \frac{\partial \Phi}{\partial x} - \frac{\partial \nu(x,0)}{\partial x}. \]

Hence, instead of looking for the function \( u \), we seek the function \( v \). The solution of problem (2.2), (2.3), (2.4), (2.5), (2.6), (2.7) and (2.8) will be simply given by the formula

\[ u(x, t) = \tilde{u}(x, t) + w(x, t) = v(x, t) + w(x, t) + \tilde{u}(x, 0) \]

\[ = v(x, t) + w(x, t) + \psi(x) \]

The solution of problem (2.16) - (2.22) can be considered as a solution of the operator equation

\[ L v = f. \quad (2.23) \]

The operator \( L \) maps from \( E \) to \( F \), where \( E \) is the Banach space consisting of functions \( v \in L^2(\Omega) \) such that

\[ D^a_v, \quad \frac{\partial v}{\partial x}, \quad \frac{\partial^2 v}{\partial x^2}, \quad \frac{\partial^3 v}{\partial x^3}, \quad D^a_v \frac{\partial^2 v}{\partial x^2} \in L^2(\Omega). \]

The norm in \( E \) is defined by

\[ \| v \|_E^2 = \int_0^T \int_0^\alpha \left( \int_\xi^\alpha D^a_vvd\xi \right) dxdt \]

\[ + \int_0^T \int_\beta^\alpha \left( \int_x^\beta D^a_vvd\xi \right) dxdt \]

\[ + \sup_{0 \leq t \leq T} \left( \int_0^\alpha (5-x) \left( D^a_v \frac{\partial v}{\partial x} \right) ^2 dx \right) \]

\[ + \int_\beta^\alpha \left( \frac{\xi}{4} - x \right) \left( D^a_v \frac{\partial v}{\partial x} \right) ^2 dx \]

\[ + \int_\alpha^\beta (\beta - \alpha) \left( D^a_v \frac{\partial v}{\partial x} \right) ^2 dx \]

\[ = \int_\Omega f^2 dx dt. \quad (2.24) \]

and \( F \) is the Hilbert space with the finite norm

\[ \| L v \|_F^2 = \int_\Omega f^2 dx dt. \quad (2.25) \]

**Theorem 2.1.** Let conditions 1 and 2 be fulfilled. Then for any function \( v \in D(L) \), we have the inequality

\[ \| v \|_E \leq c \| L v \|_F, \quad (2.26) \]

where \( c \) is a positive constant independent of \( v \).

**Proof:** Multiplying the equation (2.16) by

\[ M v = \begin{cases} M_1 v, & 0 \leq x \leq \alpha, \\ M_2 v, & \alpha \leq x \leq \beta, \\ M_3 v, & \beta \leq x \leq 1, \end{cases} \]

where

\[ M_1 v = 4 \int_x^\alpha D^a_vvd\xi \]

\[ = \int_x^\alpha \left( \int_\xi^\alpha D^a_vvd\eta - (1 - \xi)D^a_vvd\xi \right) dx \]

\[ \int_x^\alpha D^a_vvd\eta - (1 - \xi)D^a_vvd\xi, \quad (2.27) \]

\[ M_2 v = (x - \alpha) \int_x^\beta D^a_vvd\xi + (x - \beta) \int_\alpha^\beta D^a_vvd\xi, \quad (2.28) \]

\[ M_3 v = - \frac{1}{4} \int_\beta^\alpha D^a_vvd\xi \]

\[ - \int_\beta^\alpha \left( \int_\xi^\beta D^a_vvd\eta + (1 - \xi)D^a_vvd\xi \right) dx \]

\[ - \int_\beta^\alpha \left( \int_\xi^\beta D^a_vvd\eta + (1 - \xi)D^a_vvd\xi \right) dx, \quad (2.29) \]

and integrating over \( \Omega^T = (0, 1) \times (0, T) \).

1. On the interval \((0, \alpha)\), we denote \( \Omega^T_{\alpha} = (0, \alpha) \times (0, T) \), we get

\[ \int_\Omega f(x,t)M_1 vdxdt = \int_{\Omega_{\alpha}} D^a_vvd\xi \]

\[ + \frac{1}{4} \int_\alpha^\beta (\beta - \alpha) \left( D^a_v \frac{\partial v}{\partial x} \right) ^2 dx \]

\[ \times \left( \int_x^\alpha D^a_vvd\eta - (1 - \xi)D^a_vvd\xi \right) dxdt. \quad (2.30) \]

Integrating by parts each term of the right hand-side of
Mixed problem with a pure integral two-space-variables condition for a third order fractional parabolic equation —

(2.30) and using the conditions (2.17)-(2.22), we get

\[ \int_{\Omega_a} \mathcal{D}_x^\alpha v \left( 4 \int_x^\alpha \mathcal{D}_\xi^\alpha v d\xi \right) dx dt \\
- \int_x^\alpha \left( \int_\xi^\alpha \mathcal{D}_\eta^\alpha v d\eta - (1 - \xi) \mathcal{D}_x^\alpha v \right) d\xi \right) dx dt \\
= \frac{5}{2} \int_0^T \left( \int_0^\alpha \mathcal{D}_x^\alpha v dx \right)^2 dt \\
- 2 \int_x^\alpha \left( \int_0^\alpha \mathcal{D}_x^\alpha v dx \right) \left( \int_0^\alpha x \mathcal{D}_x^\alpha v dx \right) dt \\
+ \frac{3}{2} \int_{\Omega_a} \left( \int_x^\alpha \mathcal{D}_x^\alpha v d\xi \right)^2 dx dt, \quad (2.31) \]

Integrating by parts the last term of the right-hand side of (2.35), we have

\[ -2 \int_{\Omega_a} f \int_x^\alpha \left( \int_\xi^\alpha \mathcal{D}_\eta^\alpha v d\eta \right) d\xi dx dt \\
+ 2 \int_0^T \left( \int_0^\alpha x \mathcal{D}_x^\alpha v dx \right) \left( \int_0^\alpha f(x) dx \right) dt \\
+ 2 \int_{\Omega_a} \left( \int_x^\alpha \mathcal{D}_x^\alpha v d\xi \right) \left( \int_x^\alpha f(x) d\xi \right) d\xi dx dt. \quad (2.36) \]

Putting, (2.36) into (2.35) and using the Cauchy inequality, we can estimate

\[ \int_{\Omega_a} fM_1 v dx dt \]
\[ \leq \frac{4}{2\varepsilon_1} \int_{\Omega_a} \left( \int_x^\alpha \mathcal{D}_x^\alpha v d\xi \right)^2 dx dt \\
+ \frac{4\varepsilon_1}{2} \int_{\Omega_a} f^2 dx dt \\
+ \varepsilon_2 \int_{\Omega_a} f(x) dx \left( \int_0^\alpha f(x) dx \right) dt \\
+ \frac{1}{\varepsilon_3} \int_0^T \left( \int_0^\alpha x \mathcal{D}_x^\alpha v dx \right)^2 dt \\
+ \varepsilon_4 \int_{\Omega_a} \left( \int_x^\alpha f d\xi \right)^2 dx dt \\
+ \frac{1}{\varepsilon_4} \int_{\Omega_a} \left( \int_x^\alpha \mathcal{D}_x^\alpha v d\xi \right)^2 dx dt, \quad (2.37) \]

where

\[ \int_{\Omega_a} \left( \int_x^\alpha f d\xi \right)^2 dx dt \]
\[ \leq 4 \int_{\Omega_a} (1-x)^2 f^2 dx dt \\
+ 2 \int_0^T \left( \int_0^\alpha f d\xi \right)^2 dt \\
\leq 4 \int_{\Omega_a} f^2 dx dt \\
+ 2 \int_0^T \left( \int_0^\alpha f d\xi \right)^2 dt, \]
Consequently, (2.37) becomes

\[\int_{\Omega} f \cdot M_1 v dxdt + 2\varepsilon_1 \int_{\Omega} f_2^2 dxdt + \frac{1}{2\varepsilon_2} \int_{\Omega} f_2^2 dxdt + \frac{1}{2} \int_{\Omega} \frac{\partial^2 f}{\partial x^2} dxdt \]

\[+ 2\varepsilon_4 \int_{\Omega} f_2^2 dxdt + \frac{1}{\varepsilon_1} \int_{\Omega} f_2^2 dxdt \]

\[+ \frac{1}{\varepsilon_1} \int_{\Omega} f_2^2 dxdt \]

\[= \int_{\Omega} f M_2 v dxdt \]

\[= \int_{\Omega} f \left( (x - \alpha) \int_x^\beta D^\alpha_\beta v d\xi \right) dxdt \]

\[+ (\beta - x) \int_\alpha^\beta D^\alpha_\beta v d\xi dxdt \]

By virtue of Cauchy inequality, from (2.42), we obtain

\[\int_{\Omega} f M_2 v dxdt \leq \int_{\Omega} f_2^2 dxdt \]

\[+ 1 \int_{\Omega} \frac{\partial^2 f}{\partial x^2} dxdt \]

\[+ \frac{1}{2} \int_{\Omega} (x - \alpha)^2 f_2^2 dxdt \]

\[+ \frac{1}{2} \int_{\Omega} \left( \int_x^\beta D^\alpha_\beta v d\xi \right)^2 dxdt \]

(2.43)

3. On the interval \((\beta, 1)\), we denote \(\Omega^T_{\alpha, \beta} = \Omega_{\beta} = (\beta, 1) \times (0, T)\), we get

\[\int_{\Omega} f M_2 v dxdt = \int_{\Omega} f_2^2 dxdt \]

\[+ \frac{1}{2} \int_{\Omega} \frac{\partial^2 f}{\partial x^2} dxdt \]

\[+ \frac{1}{2} \int_{\Omega} \left( \int_x^\beta D^\alpha_\beta v d\xi \right)^2 dxdt \]

(2.44)
Mixed problem with an pure integral two-space-variables condition for a third order fractional parabolic equation

Integrating by parts each integral of the right hand-side of (2.44) and using the conditions (2.17)-(2.22), we obtain

\[
\begin{align*}
\int_{\Omega_\beta} D^\alpha_t u & \left( - \frac{1}{4} \int_{\beta} D^\alpha_t u d\xi \right. \\
& - \int_{\beta}^x \left( \int_{\beta}^r D^\alpha_t u d\eta \right) (1 - \xi) D^\alpha_t u \left. d\xi \right) d\xi dxt \\
= \frac{3}{2} \int_{\Omega_\beta} \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 d\xi dxt \\
& + 2 \int_0^T \left( \int_{\beta}^r D^\alpha_t v d\xi \right) \left( \int_{\beta}^r x D^\alpha_t v d\xi \right) dt \\
& - \frac{17}{8} \int_0^T \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 dt, \quad (2.45)
\end{align*}
\]

Replacing \( M_3 \) in (2.44) by its representation (2.29), and integrating by parts the terms of the right-hand, we obtain

\[
\begin{align*}
\int_{\Omega_\beta} f.M_3 v d\xi dx dt &= \int_{\Omega_\beta} f \left( - \frac{1}{4} \int_{\beta}^r D^\alpha_t v d\xi \right. \\
& - \int_{\beta}^x \left( \int_{\beta}^r D^\alpha_t v d\eta \right) (1 - \xi) D^\alpha_t v \left. d\xi \right) d\xi dxt \\
& = \int_{\Omega_\beta} f \left( - \frac{1}{4} \int_{\beta}^r D^\alpha_t v d\xi \right. \\
& - \int_{\Omega_\beta} f \left( (1 - x) \int_{\beta}^r D^\alpha_t v d\xi \right) d\xi dxt \\
& - 2 \int_{\Omega_\beta} f \left( \int_{\beta}^x \int_{\beta}^r D^\alpha_t v d\eta d\xi \right) d\xi dxt. \quad (2.47)
\end{align*}
\]

Integrating by parts the last integral of the right-hand-side of (2.47), we have

\[
\begin{align*}
-2 \int_{\Omega_\beta} f \left( \int_{\beta}^x \int_{\beta}^r D^\alpha_t v d\eta d\xi \right) d\xi dxt \\
= -2 \int_0^T \left( \int_{\beta}^r f d\xi \right) \left( \int_{\beta}^r D^\alpha_t v d\xi - \int_{\beta}^x x D^\alpha_t v d\xi \right) d\xi dxt \\
+ 2 \int_{\Omega_\beta} \left( \int_{\beta}^x D^\alpha_t v d\xi \right) \left( \int_{\beta}^x f d\xi \right) d\xi dxt. \quad (2.48)
\end{align*}
\]

Substituting (2.48) into (2.47), and using Cauchy’s \( \epsilon \) inequality. Observe that

\[
\begin{align*}
\int_{\Omega_\beta} f.M_3 v d\xi dx dt \\
& \leq \frac{1}{8\epsilon_5} \int_{\Omega_\beta} \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 d\xi dxt \\
& + \frac{\epsilon_5}{8} \int_{\beta}^r f^2 d\xi dxt + \frac{\epsilon_5}{2} \int_{\Omega_\beta} (1 - x)^2 f^2 d\xi dxt \\
& + \frac{1}{2\epsilon_5} \int_{\Omega_\beta} \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 d\xi dxt \\
& + \epsilon_7 \int_0^T \left( \int_{\beta}^r f d\xi \right)^2 d\xi dxt \\
& + \frac{1}{\epsilon_7} \int_0^T \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 d\xi dxt \\
& + \frac{\epsilon_8}{\epsilon_5} \int_0^T \left( \int_{\beta}^r f d\xi \right)^2 d\xi dxt \\
& + \frac{1}{\epsilon_8} \int_{\Omega_\beta} \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 d\xi dxt \\
& + \epsilon_9 \int_{\Omega_\beta} \left( \int_{\beta}^r f d\xi \right)^2 d\xi dxt. \quad (2.49)
\end{align*}
\]

Estimated the last integral of the right-hand-side of (2.49)

\[
\begin{align*}
\int_{\Omega_\beta} \left( \int_{\beta}^r f d\xi \right)^2 d\xi dxt & \leq 4 \int_{\Omega_\beta} (x - \beta) f^2 d\xi dxt \\
& \leq 4 \int_{\Omega_\beta} f^2 d\xi dxt. \quad (2.50)
\end{align*}
\]

Therefore, by formulas (2.49) and (2.50), we have

\[
\begin{align*}
\int_{\Omega_\beta} f.M_3 v d\xi dx dt & \leq \frac{\epsilon_5}{8} \int_{\Omega_\beta} f^2 d\xi dxt \\
& + \frac{1}{8\epsilon_5} \int_{\Omega_\beta} \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 d\xi dxt + \frac{\epsilon_5}{2} \int_{\Omega_\beta} f^2 d\xi dxt \\
& + \frac{1}{2\epsilon_5} \int_{\Omega_\beta} \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 d\xi dxt \\
& + 2\epsilon_1 \int_0^T \left( \int_{\beta}^r f d\xi \right)^2 d\xi dxt \\
& + \frac{2}{\epsilon_1} \int_0^T \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 d\xi dxt \\
& + \frac{1}{\epsilon_1} \int_{\Omega_\beta} \left( \int_{\beta}^r D^\alpha_t v d\xi \right)^2 d\xi dxt \\
& + 4\epsilon_1 \int_{\Omega_\beta} f^2 d\xi dxt, \quad (2.51)
\end{align*}
\]
Mixed problem with an pure integral two-space-variables condition for a third order fractional parabolic equation —

(2.40)

Substituting \( \alpha \), we obtain

\[
\frac{5}{2} \int_0^T \left( \int_0^\alpha D_t^\alpha v dx \right)^2 \, dt - 2 \int_0^T \left( \int_0^\alpha D_t^\alpha v dx \right) \times \left( \int_0^\alpha x D_t^\alpha v dx \right) \, dt + \frac{3}{2} \int_\Omega a \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + \int_\Omega (5 - x) a(x, t) \frac{\partial v}{\partial x} \frac{\partial \psi}{\partial x} D_t^\alpha v dx dt \\
\leq 2 \epsilon_1 \int_0^T f^2 dx dt + \epsilon_1 \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + \epsilon_2 \int_0^T \left( \int_0^\alpha f dx \right)^2 \, dt + \frac{1}{\epsilon_4} \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + 4 \epsilon_4 \int_0^T f^2 dx dt + 2 \epsilon_4 \int_0^T \left( \int_0^\alpha f dx \right)^2 \, dt + \frac{1}{\epsilon_4} \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt.
\]

So, we get

\[
\frac{5}{2} \int_0^T \left( \int_0^\alpha D_t^\alpha v dx \right)^2 \, dt - 2 \int_0^T \left( \int_0^\alpha D_t^\alpha v dx \right) \times \left( \int_0^\alpha x D_t^\alpha v dx \right) \, dt + \frac{3}{2} \int_\Omega \left( \int_0^\alpha D_t^\alpha v dx \right)^2 \, dx dt + \int_\Omega (5 - x) a(x, t) \frac{\partial v}{\partial x} \frac{\partial \psi}{\partial x} D_t^\alpha v dx dt \\
\leq \left( 2 \epsilon_1 + \frac{\epsilon_2}{2} + 4 \epsilon_4 \right) \int_0^T f^2 dx dt + \left( \frac{2}{\epsilon_1} + \frac{1}{2 \epsilon_2} + \frac{1}{\epsilon_4} \right) \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + (\epsilon_3 + 2 \epsilon_4) \int_0^T \left( \int_0^\alpha f dx \right)^2 \, dt + \frac{1}{\epsilon_4} \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt.
\]

(2.53)

(2.54)

With

\[
\int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt \leq \int_\Omega \left( \int_0^\beta D_t^\alpha v dx \right)^2 \left( \int_x D_t^\beta v dx \right) \, dx dt.
\]

(2.55)

That implies

\[
\int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + \frac{1}{2} (\beta - \alpha) \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + c_0 (\beta - \alpha) \int_\Omega a(x, t) D_t^\beta \left( \frac{\partial v}{\partial x} \right)^2 \, dx dt \\
\leq \frac{1}{2 \epsilon} \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + \frac{\epsilon}{2} \int_\Omega (x - \alpha) f^2 \, dx dt + \frac{1}{2 \epsilon} \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + \frac{\epsilon}{2} \int_\Omega (\beta - x) f^2 \, dx dt.
\]

(2.56)

Combining the same terms of (2.56), we have

\[
\left( 1 - \frac{1}{2 \epsilon} \right) \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + \left( \frac{1}{2} (\beta - \alpha) - \frac{1}{2 \epsilon} \right) \int_\Omega \left( \int_x D_t^\alpha v dx \right)^2 \, dx dt + c_0 \int_\Omega (\beta - \alpha) D_t^\beta \left( \frac{\partial v}{\partial x} \right)^2 \, dx dt
\]

where \( \epsilon_0 = \epsilon_1 + \epsilon_8 \).
Substituting a mixed problem with a pure integral two-space-variables condition for a third order fractional parabolic equation

\[ \frac{\varepsilon_1}{2} + \frac{\varepsilon_2}{2} \int_{\Omega_{1, \beta}} f^2 \, dx \, dt. \]  

(2.57)

If we put \( \varepsilon = 1 \), \( \varepsilon' = \frac{1}{\beta - \alpha} + 1 \),

\[ c_1 = \left( \frac{1}{2} (\beta - \alpha) - \frac{1}{2}\varepsilon' \right) = \frac{\varepsilon - \alpha}{2(1 + \beta - \alpha)} \quad \text{and} \quad c_2 = \frac{\varepsilon}{2} + \varepsilon' \],

the inequality (2.57) implies

\[
\frac{1}{2} \int_{\Omega_{1, \beta}} \left( \int_{{\mathbf{x}}} D^{\alpha} v \, d\xi \right)^2 \, dx \, dt \\
+ c_0 \int_{\Omega_{1, \beta}} (\beta - \alpha) D^{\alpha}_x \left( \frac{\partial v}{\partial x} \right)^2 \, dx \, dt \\
+ c_1 \int_{\Omega_{1, \beta}} \left( \int_{{\mathbf{x}}} D^{\alpha} v \, d\xi \right)^2 \, dx \, dt \\
\leq c_2 \int_{\Omega_{1, \beta}} f^2 \, dx \, dt. \quad (2.58)
\]

We are adding between (2.53) and (2.60), we obtain

\[
\frac{3}{2} \int_{\Omega_{1, \beta}} \left( \int_{\beta} \int_{\beta} D^{\alpha} v \, d\xi \right)^2 \, dx \, dt - \frac{17}{8} \int_{0}^{T} \left( \int_{\beta} D^{\alpha} v \, dx \right)^2 \, dt \\
+ 2 \int_{0}^{T} \left( \int_{\beta} D^{\alpha} v \, dx \right) \left( \int_{\beta} x D^{\alpha} v \, dx \right) \, dt \\
+ \int_{\beta}^{1} \frac{5}{4 - x} \int_{0}^{T} a(x, t) \frac{\partial v}{\partial x} \frac{\partial v}{\partial x} \, dx \, dt \\
\leq \left( \frac{1}{8\varepsilon} + \frac{1}{2\varepsilon_0} + \frac{1}{4\varepsilon_0} \right) \int_{\Omega_{1, \beta}} \left( \int_{\beta} D^{\alpha} v \, d\xi \right)^2 \, dx \, dt \\
+ 2\varepsilon_1 \int_{0}^{T} \left( \int_{\beta} D^{\alpha} v \, dx \right)^2 \, dt \\
+ \frac{2}{\varepsilon_1} \int_{0}^{T} \left( \int_{\beta} D^{\alpha} v \, dx \right)^2 \, dt \\
+ \frac{\varepsilon_5}{8} \int_{\Omega_{1, \beta}} f^2 \, dx \, dt.
\]  

(2.59)
That implies

\[
\frac{3}{2} \int_{\Omega_a} \left( \int_x^\alpha D_t^\alpha v d\xi \right)^2 dx dt \\
+ \frac{3}{2} \int_{\Omega_\beta} \left( \int_\beta^x D_t^\alpha v d\xi \right)^2 dx dt \\
+ \frac{3}{8} \int_0^T \left( \int_\beta^x D_t^\alpha v dx \right)^2 dt \\
+ \int_{\Omega_a} (5 - x) a(x,t) D_t^\alpha \left( \frac{\partial v}{\partial x} \right)^2 dx dt \\
+ \int_{\Omega_\beta} \left( \frac{5}{4} - x \right) D_t^\alpha \left( \frac{\partial v}{\partial x} \right)^2 dx dt \\
\leq \left( 2 \varepsilon_1 + \frac{\varepsilon_2}{2} + 4 \varepsilon_4 \right) \int_{\Omega_a} f^2 dx dt \\
+ \left( \frac{2}{\varepsilon_1} + \frac{2}{\varepsilon_2} + \frac{1}{\varepsilon_6} \right) \int_{\Omega_a} \left( \int_x^\alpha D_t^\alpha v d\xi \right)^2 dx dt \\
+ (\varepsilon_3 + 2 \varepsilon_1) \int_0^T \left( \int_0^1 f dx \right)^2 dt \\
+ \left( \frac{\varepsilon_3}{8} + \frac{\varepsilon_6}{2} + 4 \varepsilon_9 \right) \int_{\Omega_\beta} f^2 dx dt \\
+ \left( \frac{1}{8 \varepsilon_5} + \frac{1}{8 \varepsilon_6} + \frac{1}{\varepsilon_9} \right) \int_{\Omega_\beta} \left( \int_x^\alpha D_t^\alpha v d\xi \right)^2 dx dt \\
+ 2 \varepsilon_{10} \int_0^T \left( \int_\beta^x f dx \right)^2 dt.
\] (2.62)

If we put \( \varepsilon_1 = 4, \varepsilon_2 = 2, \varepsilon_3 = 8, \varepsilon_4 = 2, \varepsilon_5 = \varepsilon_6 = 1, \varepsilon_9 = 2 \) and \( \varepsilon_{10} = 4 \), we get

\[
\frac{1}{4} \int_{\Omega_a} \left( \int_x^\alpha D_t^\alpha v d\xi \right)^2 dx dt \\
+ \frac{3}{8} \int_{\Omega_\beta} \left( \int_\beta^x D_t^\alpha v d\xi \right)^2 dx dt \\
+ c_0 \int_{\Omega_a} (5 - x) D_t^\alpha \left( \frac{\partial v}{\partial x} \right)^2 dx dt \\
+ c_0 \int_{\Omega_\beta} \left( \frac{5}{4} - x \right) D_t^\alpha \left( \frac{\partial v}{\partial x} \right)^2 dx dt \\
\leq 17 \int_{\Omega_a} f^2 dx dt + \frac{69}{8} \int_{\Omega_\beta} f^2 dx dt \\
12 \int_0^T \left( \int_0^1 f dx \right)^2 dt + 8 \int_0^T \left( \int_\beta^1 f dx \right)^2 dt.
\] (2.63)

We are adding between (2.58) and (2.63), we get

\[
\int_{\Omega_a} \left( \int_x^\alpha D_t^\alpha v d\xi \right)^2 dx dt \\
+ \int_{\Omega_\beta} \left( \int_\beta^x D_t^\alpha v d\xi \right)^2 dx dt \\
+ \int_{\Omega_a} (5 - x) D_t^\alpha \left( \frac{\partial v}{\partial x} \right)^2 dx dt \\
+ \int_{\Omega_\beta} \left( \frac{5}{4} - x \right) D_t^\alpha \left( \frac{\partial v}{\partial x} \right)^2 dx dt \\
+ \int_{\Omega_a} \left( \int_x^\alpha D_t^\alpha v d\xi \right)^2 dx dt \\
+ \int_{\Omega_\beta} \left( \int_\beta^x D_t^\alpha v d\xi \right)^2 dx dt \\
\leq \frac{c_4}{c_3} \left( \int_{\Omega_a} f^2 dx dt + \int_{\Omega_\beta} f^2 dx dt + \int_0^T \left( \int_0^1 f dx \right)^2 dt \right) \\
+ \int_0^T \left( \int_0^1 f dx \right)^2 dt + \int_{\Omega_a} f^2 dx dt + \int_{\Omega_\beta} f^2 dx dt \right) \\
\leq c_3 \left( \int_{\Omega_a} f^2 dx dt + \int_{\Omega_\beta} f^2 dx dt + \int_{\Omega_a} f^2 dx dt + \int_{\Omega_\beta} f^2 dx dt \right) \\
+ \int_0^T \left( \left( \int_0^1 f dx \right)^2 + \left( \int_\beta^1 f dx \right)^2 \right) dt.
\] (2.64)

With \( c_3 = \min \left( \frac{1}{4}, c_0, c_1 \right) \), \( c_4 = \max(17, c_2) \) et \( c_5 = \frac{c_4}{c_3} \).

Therefore, we get

\[
\int_{\Omega_a} \left( \int_x^\alpha D_t^\alpha v d\xi \right)^2 dx dt \\
+ \int_{\Omega_\beta} \left( \int_\beta^x D_t^\alpha v d\xi \right)^2 dx dt \\
+ \int_{\Omega_a} (5 - x) D_t^\alpha \left( \frac{\partial v}{\partial x} \right)^2 dx dt \\
+ \int_{\Omega_\beta} \left( \frac{5}{4} - x \right) D_t^\alpha \left( \frac{\partial v}{\partial x} \right)^2 dx dt \\
+ \int_{\Omega_a} \left( \int_x^\alpha D_t^\alpha v d\xi \right)^2 dx dt \\
+ \int_{\Omega_\beta} \left( \int_\beta^x D_t^\alpha v d\xi \right)^2 dx dt \\
\leq \frac{c_4}{c_3} \left( \int_{\Omega_a} f^2 dx dt + \int_{\Omega_\beta} f^2 dx dt + \int_0^T \left( \int_0^1 f dx \right)^2 dt \right) \\
+ \int_0^T \left( \int_0^1 f dx \right)^2 dt + \int_{\Omega_a} f^2 dx dt + \int_{\Omega_\beta} f^2 dx dt \right) \\
\leq c_3 \left( \int_{\Omega_a} f^2 dx dt + \int_{\Omega_\beta} f^2 dx dt + \int_{\Omega_a} f^2 dx dt + \int_{\Omega_\beta} f^2 dx dt \right) \\
+ \int_0^T \left( \left( \int_0^1 f dx \right)^2 + \left( \int_\beta^1 f dx \right)^2 \right) dt.
\] (2.64)
The right-hand side of (2.65) is independent of $\tau$, hence replacing the left-hand side by its upper bound with respect to $\tau$ from 0 to $T$. Thus inequality (2.66) holds, where $c = (c_5)^2$.

**Proposition 2.2.** The operator $L$ from $E$ to $F$ is closable.

**Proof.** Suppose that $v_n \in D(L)$ is a sequence such that

$$ v_n \xrightarrow{n \to +\infty} 0 \quad \text{in} \quad E, \quad (2.66) $$

$$ Lv_n \xrightarrow{n \to +\infty} f \quad \text{in} \quad F, \quad (2.67) $$

We must show $f \equiv 0$. Equation (2.66) implies that

$$ v_n \xrightarrow{n \to +\infty} 0 \quad \text{in} \quad D'(\Omega). \quad (2.68) $$

By virtue of the continuity of derivation of $D'(\Omega)$ in $D'(\Omega)$, we have

$$ \mathcal{L} v_n \xrightarrow{n \to +\infty} 0 \quad \text{in} \quad D'(\Omega). \quad (2.69) $$

We see via (2.67) that

$$ \mathcal{L} v_n \xrightarrow{n \to +\infty} f \quad \text{in} \quad L_2(\Omega), \quad (2.70) $$

then

$$ \mathcal{L} v_n \xrightarrow{n \to +\infty} f \quad \text{in} \quad D'(\Omega). \quad (2.71) $$

By virtue of the uniqueness of the limit in $D'(\Omega)$, (2.69) and (2.71) imply that $f \equiv 0$. $\square$

**Definition 2.3.** A solution of the equation

$$ Lv = f, \quad (2.72) $$

is called a strong solution of problem (2.16), (2.17), (2.18), (2.19), (2.20), (2.21) and (2.22).

Since points of the graph of $\mathcal{L}$ are limits of sequences of points of the graph of $L$, we extend (2.26) to apply to strong solutions by taking the limits.

**Corollary 2.4.** Under the conditions of Theorem 2.1, there is a constant $C > 0$ independent of $v$ such that

$$ \|v\|_E \leq \|\mathcal{L}v\|_F, \quad v \in D'(\Omega). \quad (2.73) $$

**Corollary 2.5.** Assert that, if a strong solution exists, it is unique and depends continuously on $f$, if $v$ is considered in the topology of $E$ and $f$ is considered in the topology of $F$.

**Corollary 2.6.** The range $R(\mathcal{L})$ of the operator $\mathcal{L}$ is closed in $F$ and $R(\mathcal{L}) = \overline{R(L)}$, where $R(L)$ is the range of $L$.

### 3. Solvability of the problem

To show the existence of solutions, we prove that $R(L)$ is dense in $F$ for all $v \in D(L)$ and for all arbitrary $f \in F$.

**Theorem 3.1.** Suppose the conditions of Theorem 2.1 are satisfied. Then the problem (2.16)-(2.22) admits a unique strong solution $v = L^{-1} f = \mathcal{L}^{-1} f$.

**Proof.** First we prove that $R(L)$ is dense in $F$ for all $v \in D(L)$. $\square$

**Proposition 3.2.** Let the conditions of Theorem (3.1) be satisfied, if, for $\omega \in L^2(\Omega)$ and for all $v \in D(L)$, we have

$$ \int_{\Omega} Lv_0 \omega dx dt = 0, \quad (3.1) $$

then $\omega$ vanishes almost everywhere in $\Omega$.

**Proof.** The scalar product of $F$ is defined by

$$ (Lv, \omega)_F = \int_{\Omega} Lv \omega dx dt, \quad (3.2) $$

then, equality (3.1) can be written as

$$ \int_{\Omega} \mathbb{D}^\alpha z \omega dx dt = \int_{\Omega} \frac{\partial^2}{\partial x^2} \left( a(x,t) \frac{\partial v}{\partial x} \right) \omega dx dt. \quad (3.3) $$

If we put

$$ v = \mathfrak{f}(z(x,\tau)) = \int_0^\tau z(x,\tau) d\tau, $$

where

$$ z, \quad \frac{\partial z}{\partial x}, \quad \frac{\partial}{\partial x} \left( a(x,t) \frac{\partial \mathfrak{f}(z(x,\tau))}{\partial x} \right), \quad \mathbb{D}^\alpha z, \quad \frac{\partial^2}{\partial x^2} \left( a(x,t) \frac{\partial \mathfrak{f}(z(x,\tau))}{\partial x} \right) \in L^2(\Omega). $$

As a result of (3.3), we obtain

$$ \int_{\Omega} \mathbb{D}^\alpha \mathfrak{f}(z(x,\tau)) \omega dx dt = \int_{\Omega} \frac{\partial^2}{\partial x^2} \left( a(x,t) \frac{\partial \mathfrak{f}(z(x,\tau))}{\partial x} \right) \omega dx dt. \quad (3.4) $$

In terms of the given function $\omega$, and from the equality (3.4) we give the function $\omega$ in terms of $z$ as

$$ \omega = \begin{cases} 
\omega_1, & 0 \leq x \leq \alpha, \\
\omega_2, & \alpha \leq x \leq \beta, \\
\omega_3, & \beta \leq x \leq 1,
\end{cases} \quad (3.5) $$

where

$$ \omega_1 = \int_x^\alpha \int_0^\xi \mathfrak{f}(z(\eta,\tau)) d\eta d\xi, \quad (3.6) $$

$$ \omega_2 = \int_x^\beta \int_0^\xi \mathfrak{f}(z(\eta,\tau)) d\eta d\xi, \quad (3.7) $$

$$ \omega_3 = \int_x^1 \int_0^\xi \mathfrak{f}(z(\eta,\tau)) d\eta d\xi. \quad (3.8) $$
So, \( \omega \in L^2(\Omega) \), and \( z \) satisfy the same conditions of the function \( v \) and \( \frac{\partial^2z}{\partial x^2} \big|_{x=a} = 0, \quad \frac{\partial^2z}{\partial x^2} \big|_{x=b} = 0. \)

Replacing \( \omega \) in (3.4) by its representation (3.5) and integrating by parts each term of (3.4) with the use of conditions of \( z \), we obtain

- On the interval \( \Omega_{\alpha} = (0, \alpha) \times (0, T) \), we have

\[
\int_{\Omega_{\alpha}} \partial^2 \frac{\partial}{\partial x^2} \left( a(x,t) \frac{\partial}{\partial x} \right) \omega_1 \, dx \, dt.
\]

Integrating by parts each integral of (3.9) and by using the conditions of the function \( z \), we get

\[
\int_{\Omega_{\alpha}} \partial^2 \frac{\partial}{\partial x^2} \left( a(x,t) \frac{\partial}{\partial x} \right) \omega_1 \, dx \, dt = \int_{\Omega_{\alpha}} \frac{\partial^2}{\partial x^2} \left( a(x,t) \frac{\partial}{\partial x} \right) \omega_1 \, dx \, dt.
\]

(3.10)

Substituting (3.10) and (3.11), we have

\[
\int_{\Omega_{\alpha}} \frac{\partial^2}{\partial x^2} \left( a(x,t) \frac{\partial}{\partial x} \right) \omega_1 \, dx \, dt \leq \int_{0}^{\tau} \left( - \frac{1}{2} a(x,t) + \frac{\partial a}{\partial x} \right) \left( \frac{\partial}{\partial x} \right) \omega_1 \, dx \, dt.
\]

(3.12)

- On the interval \( \Omega_{\alpha,\beta} = (\alpha, \beta) \times (0, T) \), we obtain

\[
\int_{\Omega_{\alpha,\beta}} \partial^2 \frac{\partial}{\partial x^2} \left( a(x,t) \frac{\partial}{\partial x} \right) \omega_2 \, dx \, dt.
\]

(3.13)

Integrating by parts each term of (3.14) and taking acount conditions of the function \( z \)

\[
\int_{\Omega_{\alpha,\beta}} \partial^2 \frac{\partial}{\partial x^2} \left( a(x,t) \frac{\partial}{\partial x} \right) \omega_2 \, dx \, dt
\]

\[
= \int_{\Omega_{\alpha,\beta}} \partial^2 \frac{\partial}{\partial x^2} \left( a(x,t) \frac{\partial}{\partial x} \right) \omega_2 \, dx \, dt.
\]

(3.15)

Then

\[
\int_{\Omega_{\alpha,\beta}} \partial^2 \frac{\partial}{\partial x^2} \left( a(x,t) \frac{\partial}{\partial x} \right) \omega_2 \, dx \, dt
\]

\[
= \int_{\Omega_{\alpha,\beta}} \partial^2 \left( \frac{\partial}{\partial x} \omega_2 \right) \, dx \, dt.
\]

(3.16)

Combining the above expression and (3.16), we arrive at

\[
\int_{\Omega_{\alpha,\beta}} \partial^2 \left( \frac{\partial}{\partial x} \omega_2 \right) \, dx \, dt
\]

\[
= - \frac{1}{2} \int_{0}^{\tau} a \left( \frac{\partial}{\partial x} \omega_2 \right) \, dx \, dt
\]

\[
+ \frac{1}{2} \int_{\Omega_{\alpha,\beta}} \partial^2 \left( \frac{\partial}{\partial x} \omega_2 \right) \, dx \, dt.
\]

(3.17)

Estimated the right-hand side of (3.17), we get

\[
\int_{\Omega_{\alpha,\beta}} \partial^2 \left( \frac{\partial}{\partial x} \omega_2 \right) \, dx \, dt
\]

\[
= - \frac{1}{2} \int_{0}^{\tau} a \left( \frac{\partial}{\partial x} \omega_2 \right) \, dx \, dt
\]

\[
+ \frac{1}{2} \int_{\Omega_{\alpha,\beta}} \partial^2 \left( \frac{\partial}{\partial x} \omega_2 \right) \, dx \, dt.
\]

(3.18)
Hence, if \( a(x, t) - 3 \frac{\partial a(x, t)}{\partial x} \geq 0 \), we have
\[
\int_{\Omega_{a, \beta}} \left( D_t^\alpha \left( \int_a^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt \leq 0. 
\] (3.19)

• On the interval \( \Omega_{\beta} = (\beta, 1) \times (0, \tau) \), we obtain
\[
\int_{\Omega_{\beta}} D_t^\alpha \mathcal{F}_{\beta}(z(x, \tau)) \omega_\beta \omega x dt dx = 
\int_{\Omega_{\beta}} \frac{\partial^2}{\partial x^2} \left( a(x, t) \frac{\partial \mathcal{F}_{\beta}(z(x, \tau))}{\partial x} \right) \omega_\beta dx dt. 
\] (3.20)

Integrating by parts each term of (3.20) and using the conditions of the function \( z \), we have
\[
\int_{\Omega_{\beta}} D_t^\alpha \mathcal{F}_{\beta}(z(x, \tau)) \omega_\beta \omega x dx dt = \int_{\Omega_{\beta}} D_t^\alpha \left( \mathcal{F}_{\beta}(z(\eta, \tau)) \right) dx dt,
\]
\[
\times \left( \int_1^x \mathcal{F}_{\beta}(z(\eta, \tau)) d\eta d\xi \right) dx dt,
\]
hence
\[
\int_{\Omega_{\beta}} D_t^\alpha \mathcal{F}_{\beta}(z(x, \tau)) \omega_\beta \omega x dx dt = 
\int_{\Omega_{\beta}} \left( D_t^\alpha \left( \int_\beta^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt. 
\] (3.21)

By combining (3.21) and (3.24), we arrive at
\[
\int_{\Omega_{\beta}} \left( D_t^\alpha \left( \int_\beta^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt 
\leq \int_0^\tau \left( -\frac{1}{2} a + \frac{\partial a}{\partial x} \left( \mathcal{F}_{\beta}(z(\xi, \tau)) \right) \right)^2 dt. 
\] (3.25)

Using that \( \frac{1}{2} a(x, t) - \frac{\partial a(x, t)}{\partial x} \geq 0 \), we have following estimated
\[
\int_{\Omega_{\beta}} \left( D_t^\alpha \left( \int_\beta^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt \leq 0. 
\] (3.26)

A summation of (3.13), (3.19) and (3.26) leads to
\[
\int_{\Omega_{\alpha}} \left( D_t^\alpha \left( \int_\alpha^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt 
+ \int_{\Omega_{\alpha, \beta}} \left( D_t^\alpha \left( \int_\alpha^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt 
+ \int_{\Omega_{\beta}} \left( D_t^\alpha \left( \int_\beta^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt \leq 0. 
\] (3.27)

Since
\[
\int_{\Omega_{\alpha}} \left( D_t^\alpha \left( \int_\alpha^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt 
+ \int_{\Omega_{\alpha, \beta}} \left( D_t^\alpha \left( \int_\alpha^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt 
+ \int_{\Omega_{\beta}} \left( D_t^\alpha \left( \int_\beta^x \mathcal{F}_{\beta}(z(x, \tau) d\xi) \right) \right)^2 dx dt = 0, 
\] (3.28)
we conclude that \( z = 0 \); hence \( \omega = 0 \), which ends the proof of the proposition 3.2.

We return to the proof of Theorem 3.1. We have already noted that it is sufficient to prove that the set \( R(L) \) is dense in \( F \).

Suppose that, for some \( \omega \in R(L)^\perp \) and for all \( v \in D(L) \), we have
\[
(Lv, \omega)_{L^2(\Omega)} = \int_{\Omega} Lv\omega dx dt = 0.
\]

Hence Proposition 3.2 implies that \( \omega = 0 \).

We have just proved that \( R(L)^\perp = \{0_F\} \), then \( R(L) \) is dense in \( F \).
