ABSTRACT

Interval-valued dual hesitant fuzzy set (IVDHFS) as an extended structure of hesitant fuzzy set (HFS), interval-valued HFS and dual hesitant fuzzy set (DHFS) has been developed and applied in multi-attribute decision-making (MADM) problem. While deciding the membership degree (MD) and nonmembership degree (NMD) in $q$-rung orthopair fuzzy condition, decision makers perhaps hesitant among a lot of values, and the $q$-rung orthopair dual hesitant fuzzy sets ($q$-RODHFSs) were proposed. Decision makers prefer to utilize interval values, instated of crisp numbers, to represent MD and NMD in MADM problems. In this paper, we propose the novel idea of interval-valued $q$-rung orthopair dual hesitant fuzzy graphs, in the light of Hamacher operator, called interval-valued $q$-rung orthopair dual hesitant fuzzy Hamacher graphs (IV $q$-RODHFHG) and determine its energy. Further, we develop the new concepts of Zagreb energy and Harmonic energy of IV $q$-RODHFHGs. Moreover, we apply the proposed concept of IV $q$-RODHFHG to solve the MADM problems with IV $q$-RODHF information. Finally, a numerical model relating to the evaluation of the performance of search and rescue robots is presented to show the utilization of the developed technique. To interpret the effectiveness and the validity of the proposed method, a comparison analysis with the established approaches is conducted.

1. INTRODUCTION

Yager [1,2] developed Pythagorean fuzzy set (PFS) described by a MD and a NMD, which fulfills the condition that the square sum of its MD and NMD is confined to 1. It is somewhat bigger than that of intuitionistic fuzzy set (IFS) [3]. Both IFS and PFS are failed to depict the assessment data such as (0.8, 0.7) or (0.6, 0.9). In such manner, Yager [4] further characterized the $q$-rung orthopair fuzzy set ($q$-ROFS) $Q = \{(r, (\varphi_Q(r), \delta_Q(r)))| r \in \Theta\}$, where $0 \leq \varphi_Q(r) + \delta_Q(r) \leq 1$. If $q = 1$ and $q = 2$, the $q$-ROFS is compacted to the IFS and PFS, respectively. Expanding estimation of $q$ represents the more substantial orthopairs, which has larger opportunity for experts in portraying their preferences on alternatives. Due to the immense uncertainty of practical decision-making problems, decision making approaches with $q$-ROFS causes DM’s to be highly reluctant while determining the value of attributes in $q$-ROFS. Torra [5] introduced the definition of the hesitant fuzzy set (HFS), in which the MD is denoted by multiple discrete values rather than of a single value. The HFS is more notable for the MD functions while defining IFS and any other extended FS, which makes it easy to describe the opinion of a group of experts, especially when the experts are relatively independent. Zhu et al. [6] mentioned the lack of NMD in HFSs and originated the concept of dual hesitant fuzzy sets (DHFSs) that contain both of the MD and NMD. DHFS supports a more flexible and versatile access to assign values for each element in the domain, and can handle two kinds of hesitancy in this situation. Later, Wei and Lu [7] generalized DHFS to PFS and presented the concept of dual hesitant Pythagorean fuzzy set (DHPFS). However, DM’s may feel that it is difficult to evaluate MD and NMD by single value, because they prefer to use several values in $q$-ROFSs to represent them. Wang et al. [8] incorporate the DHFSs into $q$-ROFSs, and designed another tool to manage ambiguity, called DH $q$-ROFSs and developed the weighted average operator and weighted geometric operator in DH $q$-ROF conditions, using Hamacher operator. In contrast to DHPSs, the proposed DH $q$-ROF allows the sum and qth sum of MD and NMD to be not greater than one, providing DM’s more flexibility to express their opinions. A group of DH $q$-ROF based on Heroian mean operators was defined by Xu et al. [9] and a MADM approach was developed using the recently proposed aggregation operators. Wang et al. [10] built up some $q$-RODHF Miurhead mean (MM) operators to combine the $q$-RODHF information more successfully. Xu et al. [11] extended $q$-RODHFSSs to IV $q$-RODHFSSs and proposed a lot of new aggregation operators such as the MM,
weighted MM, the dual MM, and the dual weighted MM operators in IV $q$-RODH uncertain linguistic sets. Most recently, Xu et al. \cite{12} put forward the concept of IV $q$-RODH uncertain linguistic sets by extending the IV $q$-RODHFS to linguistic environment. Further, they developed a series of new aggregation operators of IV $q$-RODH linguistic sets on the basis of the powerful MM and dual MM operator. Recently, many researchers developed several decision making approaches under hesitant and its generalized scenario \cite{13–21}.

Complicated relationships between entities are frequently represented by a graph. Graphs are mathematical structures used to study pairwise connections among objects or entities. The Data Science and Analytic field additionally utilized graphs to model different structures and problems. The study of the graph characteristics in relation to the characteristic polynomial and graph related matrices eigenvalues, such as its adjacency matrix, Randić matrix, Laplacian matrix or signless Laplacian matrix is known as Spectral graph theory. Gutman \cite{22} proposed the idea of the graph energy in chemistry, because of its pertinence to the total $\pi$-electron energy of certain molecules and discovered lower and upper limits for the graphs energy. The Zagreb matrix $Z(G) = [z_{ij}]$ of a graph $G$ whose vertex $f_i$ has degree $d_i$ is defined by $z_{ij} = d_i d_j$ if the vertices $f_i$ and $f_j$ are adjacent and $z_{ij} = 0$ otherwise. The Zagreb energy \cite{23} is the sum of absolute values of the eigenvalues of $Z(G)$. The Harmonic matrix $H(G) = [r_{ij}]$ of a graph $G$ whose vertex $f_i$ has degree $d_i$ is defined by $r_{ij} = \frac{2}{d_i + d_j}$ if the vertices $f_i$ and $f_j$ are adjacent and $r_{ij} = 0$ otherwise. The Harmonic energy \cite{24} is the sum of absolute values of the eigenvalues of $H(G)$.

To deal uncertainties in objects and connections, in graphs, Rosenfeld \cite{25} proposed the idea of fuzzy graphs (FG) and set out its structure. Naz et al. set forward the concepts of Pythagorean fuzzy graphs (PFGs) \cite{26} and complex Pythagorean fuzzy graphs \cite{27} along its pertinent applications in decision making. The PFGs are more flexible and more reasonable than FGs and IFGs. Akram et al. \cite{28} set forward the new concept of $q$-rung orthopair fuzzy graphs $(q$-ROFGs) and provide its application in the soil ecosystem. Akram et al. \cite{29,30} presented numerous new concepts of graphs in generalized fuzzy circumstances. Akram et al. \cite{31,32} defined trapezoidal picture fuzzy numbers along with its graphical representation and proposed the idea of formation of granular structures based on fuzzy soft graphs. Karaaslan \cite{33} proposed hesistant fuzzy graph (HFG) and introduced some of its concepts. Naz and Akram \cite{34} designed another decision-making approach for dealing with the MADM problems on the basis of graph theory, in which decision information is presented by hesitant fuzzy elements. Recently, Akram and Shahzadi \cite{35} developed some novel concepts of graph theory under Pythagorean Dombi fuzzy soft environment. Akram and Zafar \cite{36} presented their work to deal with different sets of data and complex problems through hybrid models. Apart from this, more recently, some novel concepts of energy based on well-known molecular descriptors geometric-arithmetic and the atom bond connectivity of DH $q$-ROFGs have been presented by Akram et al. \cite{37}.

Due to the deficiency in accessible data from some practical decision making problems with the interrelated criteria, it might be tough for the specialist to precisely quantify their judgment with a classical number, but can represent them by an interval number in $[0, 1]$. In this manner, it is very significant to present the idea of IV $q$-RODHFHFs, which allows the MD and the NMD of an element in the given set of vertices and edges to have an interval value in hesitant state. To achieve this goal, utilizing IVDFHSs into $q$-ROFGs, we generalize the innovative concept of IV $q$-RODHFHFs and discuss its spectra. As in most MADM problems \cite{38–40}, there is a strong interrelation between attributes. Subsequently, in the process of decision making, it is not just essential to aggregate the attribute values themselves but also to collect the interrelation between them. The main contributions of this research are:

1. to incorporate the theory of IVDFHSs into $q$-ROFGs and propose a novel, effective tool for describing interrelated uncertain phenomena, called IV $q$-RODHFHFs;
2. to determine the Zagreb energy of IV $q$-RODHFHG;
3. to present Harmonic energy of IV $q$-RODHFHG and
4. to apply the novel definition of IV $q$-RODHFHG to MADM.

The newly developed IV $q$-RODHFHFs show extraordinary flexibility and effectiveness relative to many existing generalized fuzzy graph theories and can efficiently exhibit the decision making opinions of decision experts in a very hesitant state.

The rest of the work is listed as follows. Some basic concepts are briefly recalled in section 2. Section 3 introduces the concept of IV $q$-RODHFHFs and determines its energy. In Section 4, Zagreb energy of IV $q$-RODHFHFs and its upper and lower bounds are determined. Section 5 determines the Harmonic energy of IV $q$-RODHFHFs and its properties. Section 6 develops a novel decision making approach to solve the MADM problems based on the developed concepts of IV $q$-RODHFHFs and a numerical example is provided to demonstrate the superiority and validity of the proposed concepts of IV $q$-RODHFHFs in decision making. Finally, in Section 7, we summarize the paper.

2. PRELIMINARIES

In order to facilitate the further sections, the basic concepts of IV $q$-RODHFHFs and t-norms are given below.

**Definition 2.1.** \cite{11} Let $\delta$ be a fixed set. An interval-valued $q$-rung orthopair dual hesitant fuzzy set (IV $q$-RODHFS) $\tilde{\Omega}$ defined on $\delta$ is

$$\tilde{\Omega} = \{(p, \tilde{h}_{\Omega}(p), \tilde{g}_{\Omega}(p)) | p \in \delta\},$$
where

\[ \tilde{h}_\Omega(p) = \bigcup_{\lfloor\phi_{\tilde{h}, \tilde{g}}\rfloor \in \tilde{h}_\Omega(p)} \{[\tilde{\phi}_{\tilde{h}}, \tilde{\phi}_{\tilde{g}}]\}, \quad \text{and} \quad \tilde{g}_\Omega(p) = \bigcup_{\lfloor\phi_{\tilde{h}, \tilde{g}}\rfloor \in \tilde{g}_\Omega(p)} \{[\tilde{\delta}_{\tilde{h}}, \tilde{\delta}_{\tilde{g}}]\} \]

are two sets of some interval values in \([0, 1]\), representing the MD and NMD of the element \(p \in \Omega\) to the set \(\Omega\), respectively, such that

\[ [\tilde{\phi}_{\tilde{h}}, \tilde{\phi}_{\tilde{g}}] \subseteq [0, 1], \]

and

\[ 0 \leq (\sup(\tilde{\phi}_{\tilde{h}}))^q + (\sup(\tilde{\phi}_{\tilde{g}}))^q \leq 1, \quad q \geq 1, \]

where

\[ [\tilde{\phi}_{\tilde{h}}, \tilde{\phi}_{\tilde{g}}] \in \tilde{h}_\Omega(p), \quad [\tilde{\delta}_{\tilde{h}}, \tilde{\delta}_{\tilde{g}}] \in \tilde{g}_\Omega(p), \]

\[ \sup(\tilde{\phi}_{\tilde{h}}) \in \sup(\tilde{h}_\Omega) = \bigcup_{\lfloor\phi_{\tilde{h}, \tilde{g}}\rfloor \in \tilde{h}_\Omega} \max\{\tilde{\phi}_{\tilde{h}}\}, \]

and

\[ \sup(\tilde{\delta}_{\tilde{h}}) \in \sup(\tilde{g}_\Omega) = \bigcup_{\lfloor\phi_{\tilde{h}, \tilde{g}}\rfloor \in \tilde{g}_\Omega} \max\{\tilde{\delta}_{\tilde{h}}\} \]

for all \(p \in \Omega\). For convenience, we call \(\tilde{d}(p) = (\tilde{h}_\Omega(p), \tilde{g}_\Omega(p))\) an interval-valued \(q\)-rung orthopair dual hesitant fuzzy element (IV \(q\)-RODHFE) represented by \(\tilde{d} = (\tilde{h}, \tilde{g})\). Especially, if \(\tilde{d} = \tilde{\phi}_{\tilde{h}}^{\tilde{g}}\) and \(\tilde{d} = \tilde{\delta}_{\tilde{h}}^{\tilde{g}}\), then \(\Omega\) shortens to \(q\)-RODHFFS [9]. Evidently, when \(q = 1\), then \(\Omega\) shortens to IVDHFS [41] and when \(q = 2\), then \(\Omega\) shortens to interval-valued Pythagorean dual hesitant fuzzy set (IVPDHFS) [42].

**Definition 2.2.** [43] Let \(\tilde{h} = \{\tilde{\phi}_1, \tilde{\phi}_2, \ldots, \tilde{\phi}_l\}\) be an IVHFE, where \(\tilde{\phi}_j = [\tilde{\varphi}_{j-1}, \tilde{\varphi}_j](j = 1, 2, \ldots, l)\), then its expected value is

\[ \tilde{\mathbb{E}}(\tilde{h}) = \frac{1}{l-1} \sum_{\tilde{\varphi} \in \tilde{h}} (1-\zeta) \tilde{\varphi}_{\sigma(1)} + \tilde{\varphi}_{\sigma(2)} + \cdots + \tilde{\varphi}_{\sigma(l-1)} + \zeta \tilde{\varphi}_{\sigma(l)}, \quad (2.1) \]

where \(\zeta \in [0, 1]\), \(\tilde{\varphi}_{\sigma(i)}\) is the \(i\)-th largest number of \(\tilde{\varphi}\) and \(\tilde{\varphi}_j = \frac{\tilde{\varphi}_{j-1} + \tilde{\varphi}_j}{2} (j = 1, 2, \ldots, l)\). \(\tilde{\varphi}_{\sigma(1)}, \tilde{\varphi}_{\sigma(2)}, \ldots, \tilde{\varphi}_{\sigma(l)}\) represent the expert’s most optimistic and pessimistic attitude. The value of \(\zeta\) is based upon the risk attitude of the expert. If \(\zeta > 0.5\), \(\zeta = 0.5\) and \(\zeta < 0.5\), the expert prefers to risk, risk-neutral and risk-averse, respectively.

Hamacher [44] set forward the Hamacher product and Hamacher sum as generalizations of \(t\)-norms and \(t\)-conorms, in order to expand the existing operations of \(t\)-norm and \(t\)-conorm [45], respectively. The description of Hamacher product \(t\)-norm and the Hamacher sum \(t\)-conorm are as follows:

\[ T^H_{\tilde{\varphi}}(r, s) = \begin{cases} \frac{rs}{\varphi + (1-\varphi)(1-r/s)} & \text{if } \varphi > 0, \\ \frac{rs}{r+s-rs} & \text{if } \varphi = 0, \end{cases} \]

\[ (T^H_{\tilde{\varphi}})^H(r, s) = \begin{cases} \frac{rs}{1-1-\varphi + (1-\varphi)(1-r/s)} & \text{if } \varphi > 0, \\ \frac{rs}{1-1-\varphi + (1-\varphi)(1-r/s)} & \text{if } \varphi = 0. \end{cases} \]

**Theorem 2.1.** [46] (Chebishev’s inequality) Let \(l_1 \leq l_2 \leq \ldots \leq l_n\) and \(m_1 \leq m_2 \leq \ldots \leq m_n\) be real numbers, then

\[ \left( \sum_{i=1}^n l_i \right) \left( \sum_{i=1}^n m_i \right) \leq n \sum_{i=1}^n l_i m_i. \]

Equality holds if and only if \(l = m, i = 1, 2, \ldots, n\).

**Theorem 2.2.** [46] For non-negative \(y_1, y_2, \ldots, y_n\) and \(k \geq 2\),

\[ \sum_{i=1}^n (y_i)^k \leq \left( \sum_{i=1}^n y_i^2 \right)^{\frac{k}{2}}. \]
3. INTERVAL-VALUED q-RUNG ORTHOPAIR DUAL HESITANT FUZZY HAMACHER GRAPHS

In this section, an innovative concept of interval-valued q-rung orthopair dual hesitant fuzzy graph based on Hamacher operator is put forward called IV q-RODHFHG. The energy of IV q-RODHFHG is determined and its pertinent properties are provided.

**Definition 3.1.** Let $\delta$ be the universe of discourse. An IV q-RODHF $\tilde{\Omega}$ in $\delta \times \delta$ is called an interval-valued q-rung orthopair dual hesitant fuzzy relation (IV q-RODHRF) in $\delta$, represented by

$$\tilde{\mathcal{R}} = \{(p_s, \tilde{h}_\mathcal{R}(p_s), \tilde{g}_\mathcal{R}(p_s)) \mid p_s \in \delta \times \delta\},$$

where $\tilde{h}_\mathcal{R} : \delta \times \delta \to [0, 1]$ and $\tilde{g}_\mathcal{R} : \delta \times \delta \to [0, 1]$ indicate the membership and non-membership function of $\tilde{\mathcal{R}}$, respectively, such that $0 \leq \tilde{h}_\mathcal{R}(p_s) + \tilde{g}_\mathcal{R}(p_s) \leq 1$ for all $p_s \in \delta \times \delta$.

**Definition 3.2.** An interval-valued q-rung orthopair dual hesitant Hamacher graph (IV q-RODHFHG) on a non-empty set $\delta$ is a pair $\tilde{\mathcal{G}} = (\tilde{\mathcal{V}}, \tilde{\mathcal{R}})$, where $\tilde{\mathcal{V}}$ is an IV q-RODHF on $\delta$ and $\tilde{\mathcal{R}}$ is an IV q-RODHF on $\delta$ such that:

$$\xi(\tilde{h}_\mathcal{R}(p_s)) \leq \frac{\xi(\tilde{h}_\mathcal{R}(p)) \xi(\tilde{h}_\mathcal{R}(s))}{\xi(\tilde{h}_\mathcal{R}(p)) + \xi(\tilde{h}_\mathcal{R}(s)) - \xi(\tilde{h}_\mathcal{R}(p)) \xi(\tilde{h}_\mathcal{R}(s))},$$

$$\xi(\tilde{g}_\mathcal{R}(p_s)) \leq \frac{\xi(\tilde{g}_\mathcal{R}(p)) + \xi(\tilde{g}_\mathcal{R}(s)) - 2\xi(\tilde{g}_\mathcal{R}(p)) \xi(\tilde{g}_\mathcal{R}(s))}{1 - \xi(\tilde{g}_\mathcal{R}(p)) \xi(\tilde{g}_\mathcal{R}(s))},$$

where $\xi(\tilde{h}_\mathcal{R}(p))$, $\xi(\tilde{g}_\mathcal{R}(p))$, and $\xi(\tilde{h}_\mathcal{R}(ps))$, $\xi(\tilde{g}_\mathcal{R}(ps))$ represent the expected values of vertices and edges, respectively, and $0 \leq \xi(\tilde{h}_\mathcal{R}(ps)) + \xi(\tilde{g}_\mathcal{R}(ps)) \leq 1$ for all $p, s \in \delta$. We call $\tilde{\mathcal{G}}$ and $\tilde{\mathcal{R}}$ the IV q-RODHF of vertices and the IV q-RODHF of edges in $\tilde{\mathcal{G}}$, respectively. Here, $\tilde{\mathcal{R}}$ is a symmetric IV q-RODHF on $\tilde{\mathcal{G}}$. If $\tilde{\mathcal{R}}$ is not symmetric on $\tilde{\mathcal{G}}$, then $\mathcal{D}(\tilde{\mathcal{G}}, \tilde{\mathcal{R}})$ is called an IV q-RODHF Hamacher digraph (IV q-RODHFHDG).

**Example 3.1.** A transport company uses graph to represent their routes. The stations are represented by vertices $V = \{f_1, f_2, f_3, f_4\}$ and the routes that connect between a pair of stations are represented by edges $E = \{f_1f_2, f_2f_3, f_3f_4\}$ in the graph. Transport company usually give some choices of route when their customer looks for a ride to a certain destination. There will be several choices which include a connecting (transit-included) ride and direct ride (non-transit ride), as in Figure 1.

![An IV3-RODHFHG.](image-url)
Clearly, $\tilde{\mathbf{e}} = (\tilde{\mathbf{g}}, \tilde{\mathcal{R}})$ is an IV3-RODHFHG. Tabular representation of IV3-RODHFHG is in Table 1:

Now we represent the graph energy under IV q-RODHFH circumstances and investigate its characteristics.

**Definition 3.3.** The adjacency matrix $A(\tilde{\mathbf{e}}) = (A(\tilde{\mathbf{h}}(p, p_j)), A(\tilde{\mathbf{g}}(p, p_j)))$ of an IV q-RODHFHG $\tilde{\mathbf{e}} = (\tilde{\mathbf{g}}, \tilde{\mathcal{R}})$ is a square matrix $A(\tilde{\mathbf{e}}) = [a_{ij}]$, $a_{ij} = \langle \tilde{\mathbf{h}}(p, p_i), \tilde{\mathbf{g}}(p, p_j) \rangle$, where $\tilde{\mathbf{h}}(p, p_j)$ and $\tilde{\mathbf{g}}(p, p_j)$ indicate the relationship strength and non-relationship strength between $p_i$ and $p_j$ respectively.

**Definition 3.4.** The adjacency matrix spectrum of an IV q-RODHFHG $A(\tilde{\mathbf{e}})$ is described as $(Y, Z)$, where $Y$ and $Z$ are the sets of eigenvalues of $\xi(A(\tilde{\mathbf{h}}(p, p_j)))$ and $\xi(A(\tilde{\mathbf{g}}(p, p_j)))$ respectively.

**Definition 3.5.** The energy of an IV q-RODHFHG $\tilde{\mathbf{e}} = (\tilde{\mathbf{g}}, \tilde{\mathcal{R}})$ is defined as:

$$E(\tilde{\mathbf{e}}) = (E(\tilde{\mathbf{h}}(p, p_j)), E(\tilde{\mathbf{g}}(p, p_j))) = \left( \sum_{i=1}^{n} |\gamma_i|, \sum_{i=1}^{n} |\gamma_i| \right).$$

**Theorem 3.1.** Let $\tilde{\mathbf{e}} = (\tilde{\mathbf{g}}, \tilde{\mathcal{R}})$ be an IV q-RODHFHG and $A(\tilde{\mathbf{e}})$ be its adjacency matrix. If $\gamma_1 \geq \gamma_2 \geq \ldots \geq \gamma_n$ and $\gamma_1 \geq \gamma_2 \geq \ldots \geq \gamma_n$ are the eigenvalues of $\xi(A(\tilde{\mathbf{h}}(p, p_j)))$ and $\xi(A(\tilde{\mathbf{g}}(p, p_j)))$ respectively, then:

i. $\left( \sum_{i=1}^{n} \frac{\gamma_i}{\xi(\tilde{\mathbf{h}}(p, p_j))}, \sum_{i=1}^{n} \frac{\gamma_i}{\xi(\tilde{\mathbf{g}}(p, p_j))} \right) = (0, 0),$

ii. $\left( \sum_{i=1}^{n} \frac{\gamma_i^2}{\xi(\tilde{\mathbf{h}}(p, p_j))}, \sum_{i=1}^{n} \frac{\gamma_i^2}{\xi(\tilde{\mathbf{g}}(p, p_j))} \right) = 2 \left( \sum_{1 \leq i \leq n} \xi^2(\tilde{\mathbf{h}}(p, p_j)), \sum_{1 \leq i \leq n} \xi^2(\tilde{\mathbf{g}}(p, p_j)) \right).$

**Proof.**

i. Obvious.

ii. By the trace properties of a matrix,

$$tr(A^2(\tilde{\mathbf{h}}(p, p_j))) = \sum_{i=1}^{n} \gamma_i^2.$$

| $\tilde{\mathbf{h}}_3$ | $\tilde{\mathbf{g}}_3$ | $\tilde{\mathbf{h}}(\mathcal{R})$ | $\tilde{\mathbf{g}}(\mathcal{R})$ |
|-------------------|-------------------|-------------------|-------------------|
| $f_1$ | $f_2$ | $f_3$ | $f_4$ |
|-------------------|-------------------|-------------------|-------------------|
| $[0.2, 0.3], [0.4, 0.5], [0.5, 0.6]$ | $[0.3, 0.4], [0.4, 0.7]$ | $[0.2, 0.3], [0.4, 0.5], [0.7, 0.8]$ | $[0.5, 0.6], [0.6, 0.9]$ |
| $[0.3, 0.5], [0.8, 0.9]$ | $[0.2, 0.4], [0.7, 0.8]$ | $[0.2, 0.4], [0.6, 0.7]$ | $[0.1, 0.2], [0.3, 0.5]$ |
| $0.6250$ | $0.6250$ | $0.4500$ | $0.5250$ |
| $0.4250$ | $0.4500$ | $0.4750$ | $0.6500$ |
| $0.6250$ | $0.4500$ | $0.4750$ | $0.6500$ |
| $0.7250$ | $0.7250$ | $0.6438$ | $0.6550$ |
Figure 2 | An interval-valued 4-rung orthopair dual hesitant fuzzy Hamacher graph.

where:

\[
\text{tr}(A^2(\tilde{h}_{\mathcal{R}}(p_i,p_j))) = (0 + \xi^2(\tilde{h}_{\mathcal{R}}(p_1p_2))) + \ldots + \xi^2(\tilde{h}_{\mathcal{R}}(p_1p_n)) + (\xi^2(\tilde{h}_{\mathcal{R}}(p_2p_1)) + 0 + \ldots + \xi^2(\tilde{h}_{\mathcal{R}}(p_2p_n))) \\
\ldots \\
+ (\xi^2(\tilde{h}_{\mathcal{R}}(p_np_1)) + \xi^2(\tilde{h}_{\mathcal{R}}(p_np_2)) + \ldots + 0) \\
= 2 \sum_{1 \leq i < j \leq n} \xi^2(\tilde{h}_{\mathcal{R}}(p_i,p_j)).
\]

Therefore

\[
\sum_{i = 1}^{n} \xi_i^2 = 2 \sum_{1 \leq i < j \leq n} \xi^2(\tilde{h}_{\mathcal{R}}(p_i,p_j)). \quad \text{Analogously,} \quad \sum_{i = 1}^{n} \xi_i^2 = 2 \sum_{1 \leq i < j \leq n} \xi^2(\tilde{g}_{\mathcal{R}}(p_i,p_j)).
\]

Hence

\[
\left( \sum_{i = 1}^{n} \xi_i^2, \sum_{i = 1}^{n} \xi_i^2 \right) = 2 \left( \sum_{1 \leq i < j \leq n} \xi^2(\tilde{h}_{\mathcal{R}}(p_i,p_j)), \sum_{1 \leq i < j \leq n} \xi^2(\tilde{g}_{\mathcal{R}}(p_i,p_j)) \right).
\]

**Example 3.2.** Let \( \Xi = (\mathcal{G}, \mathcal{R}) \) be an IV4-RODHFHG on \( V = \{f_1, f_2, f_3, f_4\} \) and \( E = \{f_1f_2, f_2f_3, f_3f_4, f_4f_1\} \) as shown in Figure 2, defined by:

The adjacency matrix of an IV4-RODHFHG given in Figure 2 is:

\[
A(\Xi) = \begin{pmatrix}
(0, 0) & ([0.10, 0.19], [0.17, 0.20], [0.20, 0.21]),
([0.61, 0.62], [0.75, 0.79]) \\
([0.10, 0.19], [0.17, 0.20], [0.20, 0.21]),
([0.61, 0.62], [0.75, 0.79]) & (0, 0) \\
([0.21, 0.23], [0.27, 0.29]),
([0.67, 0.69], [0.72, 0.75]) & (0, 0)
\end{pmatrix}
\]
Let shown in Figure 3, defined by:

\[
\sum_{ij} \text{Spec}\left(\hat{X}_4(p_i, p_j)\right) = \sum_{ij} \left(\hat{X}_4(p_i, p_j) + \hat{X}_4(p_j, p_i)\right) = \sum_{ij} \left(d_{ij}(p_i) + d_{ij}(p_j)\right)^2.
\]

Definition 4.1. Let \( \bar{G} = (\mathcal{G}, \mathcal{R}) \) be an IV \( q \)-RODHFHG on \( n \) vertices. The first Zagreb matrix, \( Z_4^1(\bar{G}) = (Z_4^1(p_i, p_j)) = [z_{ij}^1] \) of \( \bar{G} \) is a \( n \times n \) matrix defined as:

\[
z_{ij}^1 = \begin{cases} 
0 & \text{if } i = j, \\
 d_{ij}(p_i) + d_{ij}(p_j) & \text{if the vertices } p_i \text{ and } p_j \text{ of the IV}_q \text{-RODHFHG } \bar{G} \text{ are adjacent,} \\
0 & \text{if the vertices } p_i \text{ and } p_j \text{ of the IV}_q \text{-RODHFHG } \bar{G} \text{ are non-adjacent.}
\end{cases}
\]

Definition 4.2. The first Zagreb energy of an IV \( q \)-RODHFHG \( \bar{G} = (\mathcal{G}, \mathcal{R}) \) is defined as:

\[
Z_{E1}(\bar{G}) = \left(ZE_1(\hat{X}_4(p_i, p_j)), ZE_1(\hat{X}_4(p_i, p_j)) \right) = \left(\sum_{i=1}^{n} |\Phi_{i}^{(1)}|^{2}, \sum_{j=1}^{n} |\Psi_{j}^{(1)}|^{2}\right).
\]

where \( Y_{Z^{(1)}} \) and \( Z_{E^{(1)}} \) are the sets of Zagreb eigenvalues of \( Z_4^1(\hat{X}_4(p_i, p_j)) \) and \( Z_4^1(\hat{X}_4(p_i, p_j)) \), respectively.

Example 4.1. Consider an IV5-RODHFHG \( \bar{G} = (\mathcal{G}, \mathcal{R}) \) on \( V = \{1, 2, 3, 4, 5\} \) and \( E = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15\} \) as shown in Figure 3, defined by:
The adjacency matrix of an IV5-RODHFHG given in Figure 3 is:

\[
A(\Xi) = \\
\begin{bmatrix}
(0, 0) & \{[0.35, 0.40], [0.45, 0.50]\}, \\
\{[0.35, 0.40], [0.45, 0.50]\}, & (0, 0) \\
\{[0.65, 0.70], [0.77, 0.80]\}, & \{[0.20, 0.22], [0.30, 0.31]\}, \\
(0, 0) & \{[0.20, 0.22], [0.30, 0.31]\}, \\
\{[0.0, 0.15], [0.18, 0.22]\}, & (0, 0) \\
\{[0.0, 0.15], [0.18, 0.22]\}, & \{[0.61, 0.66], [0.68, 0.72], [0.72, 0.76]\} \\
\{0.24, 0.28\}, [0.32, 0.37]\}, & \{[0.21, 0.24], [0.27, 0.29]\}, \\
\{0.57, 0.61\}, [0.67, 0.70], [0.75, 0.78]\}, & \{[0.65, 0.66], [0.70, 0.72]\} \\
\{0.22, 0.25\}, [0.27, 0.30]\}, & (0, 0) \\
\{0.60, 0.63\}, [0.69, 0.71], [0.73, 0.75]\}, & (0, 0) \\
\{0.20, 0.22\}, [0.30, 0.31]\}, & \{[0.10, 0.15], [0.18, 0.22]\}, \\
\{0.70, 0.73\}, [0.81, 0.85]\}, & \{[0.61, 0.66], [0.68, 0.72], [0.72, 0.76]\} \\
\{0.19, 0.21\}, [0.21, 0.23], [0.25, 0.26]\}, & \{[0.19, 0.21], [0.21, 0.23], [0.25, 0.26]\}, \\
\{0.76, 0.78\}, [0.79, 0.81]\}, & \{[0.76, 0.78], [0.79, 0.81]\} \\
\{0.20, 0.22\}, [0.30, 0.31]\}, & \{[0.25, 0.27], [0.31, 0.33]\}, \\
\{0.70, 0.73\}, [0.81, 0.85]\}, & \{[0.65, 0.67], [0.74, 0.75]\} \\
\{0.24, 0.28\}, [0.32, 0.37]\}, & \{[0.25, 0.27], [0.31, 0.33]\}, \\
\{0.57, 0.61\}, [0.67, 0.70], [0.75, 0.78]\}, & \{[0.22, 0.25], [0.27, 0.30]\}, \\
\{0.21, 0.24\}, [0.27, 0.29]\}, & \{[0.60, 0.63], [0.69, 0.71], [0.73, 0.75]\} \\
\{0.65, 0.66\}, [0.70, 0.72]\}, & (0, 0) \\
\{0.25, 0.27\}, [0.31, 0.33]\}, & (0, 0) \\
\{0.65, 0.67\}, [0.74, 0.75]\}, & (0, 0) \\
\{0.12, 0.14\}, [0.19, 0.23]\}, & (0, 0) \\
\{0.65, 0.69\}, [0.71, 0.74]\}, & (0, 0)
\end{bmatrix}
\]

Figure 3 | Interval-valued 5-rung orthopair dual hesitant fuzzy Hamacher graph.
The expected value matrix of IV5-RODFHG shown in Figure 3 is calculated as:

\[
\xi(\tilde{\Xi}) = \begin{bmatrix}
(0, 0) & (0, 0) & (0, 0) & (0, 0) & (0.3025, 0.6813) & (0.2600, 0.6888) \\
(0.4250, 0.7300) & (0, 0) & (0.2575, 0.7725) & (0.1625, 0.6938) & (0.2525, 0.6825) & (0, 0) \\
(0, 0) & (0, 0) & (0, 0) & (0, 0) & (0, 0) & (0, 0) \\
(0.0) & (0, 0) & (0, 0) & (0, 0) & (0, 0) & (0, 0) \\
(0.3025, 0.6813) & (0.2525, 0.6825) & (0, 0) & (0, 0) & (0, 0) & (0.1700, 0.6975) \\
(0.2600, 0.6888) & (0, 0) & (0, 0) & (0, 0) & (0, 0) & (0, 0)
\end{bmatrix}
\]

The first Zagreb IV5-RODFHG of Figure 3 is given as:

\[
Z(\xi(\tilde{\Xi})) = \begin{bmatrix}
(0, 0) & (2.0850, 4.9789) & (0, 0) & (0, 0) & (2.0025, 4.8639) & (1.4175, 3.4864) \\
(2.0850, 4.9789) & (0, 0) & (1.5788, 4.4363) & (1.7738, 5.0601) & (2.1125, 5.6426) & (0, 0) \\
(0, 0) & (1.5788, 4.4363) & (0, 0) & (1.1576, 3.7388) & (0, 0) & (0, 0) \\
(0, 0) & (1.7738, 5.0601) & (1.1576, 3.7388) & (0, 0) & (1.6913, 4.9451) & (0, 0) \\
(2.0025, 4.8639) & (2.1125, 5.6426) & (0, 0) & (1.6913, 4.9451) & (0, 0) & (1.4450, 4.1501) \\
(1.4175, 3.4864) & (0, 0) & (0, 0) & (0, 0) & (1.4450, 4.1501) & (0, 0)
\end{bmatrix}
\]

Then, the spectrum and the energy of a first Zagreb IV5-RODFHG \(\tilde{\Xi}\) are as follows:

\[
\text{Spec}(\tilde{\Xi}) = \{-3.1410, -8.3621, -2.7774, -7.5091, -0.7434, -2.0608, -0.6468, -1.8929, 1.6226, 4.6157, 5.6860, 15.2092\}
\]

Now, \(ZE(\tilde{\Xi}) = 14.6171\) and \(ZE(\tilde{\Xi}) = 39.6498\). Therefore, \(ZE(\tilde{\Xi}) = (14.6171, 39.6498)\).

For the sake of simplicity, the indicator first will be omitted and we denote the (first) Zagreb matrix by \(Z(\tilde{\Xi})\), its (i, j)-element by \(z_{ij}\), its eigenvalues by \((\Phi_1, \Psi_1), (\Phi_2, \Psi_2), \ldots (\Phi_n, \Psi_n)\) and its energy by \(ZE\). Thus, firstly, we put forward the trace of the Zagreb matrices \(Z(\tilde{\Xi}), Z(\tilde{\Xi}), Z(\tilde{\Xi}), Z(\tilde{\Xi})\), i.e., \(\text{tr}(Z(\tilde{\Xi})), \text{tr}(Z(\tilde{\Xi})), \text{tr}(Z(\tilde{\Xi})), \text{tr}(Z(\tilde{\Xi}))\). Moreover, the lower and upper bounds for Zagreb energy are obtained by using these equalities.

**Lemma 4.1.** Let \(\tilde{\Xi} = (\tilde{\Xi}, \tilde{\Phi})\) be an IV \(q\)-RODFHG on \(n\) vertices and \(Z(\tilde{\Xi}) = (Z(\tilde{\Xi}(p, p))), Z(\tilde{\Xi}(p, p)))\) be the Zagreb matrix of \(\tilde{\Xi}\). Then

1. \(\text{tr}(Z(\tilde{\Xi})) = 0\),
2. \(\text{tr}(Z(\tilde{\Xi})) = 2HM(\tilde{\Xi})\),
3. \(\text{tr}(Z(\tilde{\Xi})) = 2HM(\tilde{\Xi})\) \(\sum_{i, j, k \in \{1, 2, \ldots, n\}} d_{\tilde{\Xi}}(p_k)\), \(i \sim j \sim k, i \sim k\)
4. \(\text{tr}(Z(\tilde{\Xi})) = n(HM(\tilde{\Xi}))^2 + \sum_{i, j \in \{1, 2, \ldots, n\}} d_{\tilde{\Xi}}(p_i) + d_{\tilde{\Xi}}(p_j))^2 \left( \sum_{i, j \sim k \sim j} d_{\tilde{\Xi}}(p_k) \right)^2 \),

**Proof.**

1. Obvious.
2. For matrix \(Z(\tilde{\Xi})\). The diagonal elements of \(Z(\tilde{\Xi})\) are

\[
Z(\tilde{\Xi}(p, p)) = \sum_{j=1}^{n} \sum_{j=1}^{n} (z(\tilde{\Xi}(p, p)))^2
\]

\[
= \sum_{j=1}^{n} (z(\tilde{\Xi}(p, p)))^2
\]

\[
= \sum_{j=1}^{n} (d_{\tilde{\Xi}}(p_i) + d_{\tilde{\Xi}}(p_j))^2.
\]
Therefore, $tr(Z^2(\hat{h}(p, p))) = \sum_{i,j=1}^{n} (d_1(p_i) + d_2(p_j))^2 = 2 \sum_{i,j \in \{1, 2, ..., n\}} (d_1(p_i) + d_2(p_j))^2 = 2HM(\hat{h}(p, p))$. Similarly, $tr(Z^2(\hat{g}(p, p))) = 2 \sum_{i,j \in \{1, 2, ..., n\}} (d_1(p_j) + d_2(p_i))^2 = 2HM(\hat{g}(p, p))$. Hence $tr(Z^2(\tilde{Z})) = 2HM(\tilde{Z})$. In addition, if $i \neq j$

\[
Z^2(\hat{h}(p, p)) = \sum_{j=1}^{n} \sum_{i \sim j} (d_1(p_i) + d_2(p_j))^2 = \sum_{j=1}^{n} \sum_{i \sim j} (d_1(p_i) + d_2(p_j))^2.
\]

3. The diagonal elements of $Z^3(\tilde{Z})$ are

\[
Z^3(\hat{h}(p, p)) = \sum_{j=1}^{n} z(\hat{h}(p, p))z(\hat{h}(p, p))z(\hat{h}(p, p)) = \sum_{j=1}^{n} (d_1(p_i) + d_2(p_j))^2 \sum_{k \in \{1, 2, ..., n\}} (d_1(p_k))^2 .
\]

Therefore

\[
tr(Z^3(\hat{h}(p, p))) = \sum_{i,j=1}^{n} (d_1(p_i) + d_2(p_j))^2 \sum_{k \in \{1, 2, ..., n\}} (d_1(p_k))^2 .
\]

\[
= 2 \sum_{i,j \in \{1, 2, ..., n\}} (d_1(p_i) + d_2(p_j))^2 \sum_{k \in \{1, 2, ..., n\}} (d_1(p_k))^2 .
\]

\[
= 2HM(\hat{h}(p, p)) \sum_{i,j,k \in \{1, 2, ..., n\}} (d_1(p_k))^2 .
\]

Similarly, $tr(Z^3(\hat{g}(p, p))) = 2HM(\hat{g}(p, p)) \sum_{i,j,k \in \{1, 2, ..., n\}} (d_2(p_k))^2$.

4. Now we determine $tr(Z^4(\hat{h}(p, p)))$. Because $tr(Z^4(\hat{h}(p, p))) = \| Z^2(\hat{h}(p, p)) \|^2_f$, where $\| Z^2(\hat{h}(p, p)) \|^2_f$ indicates the Frobenius norm of $Z(\hat{h}(p, p))^2$, we obtain

\[
tr(Z^4(\hat{h}(p, p))) = \sum_{i,j=1}^{n} \| Z^2(\hat{h}(p, p)) \|^2_f
\]

\[
= \sum_{i,j=1}^{n} (\sum_{i,j} (d_1(p_i) + d_2(p_j))^2)^2 .
\]

\[
= \sum_{i,j=1}^{n} (\sum_{i,j} (d_1(p_i) + d_2(p_j))^2)^2 .
\]
4.1.1. Bounds for first Zagreb energy of an IV q-RODHFHG

**Theorem 4.1.** Let \( \Xi = (\overline{\mathcal{S}}, \overline{\mathcal{R}}) \) be an IV q-RODHFHG on \( n \) vertices and hyper-Zagreb index \( HM(\Xi) \). Let \( Z(\Xi) = (Z(\overline{\mathcal{R}}(p_i, p_j)), Z(\overline{\mathcal{R}}(p_i, p_j))) \) be the first Zagreb matrix of \( \Xi \). Then

1. \( \sqrt{2HM(\Xi)} \leq ZE(\Xi) \leq \sqrt{2nHM(\Xi)} \).

2. \( ZE(\Xi) \geq \sqrt{2HM(\Xi) + n(n-1)|\text{det}Z(\Xi)|^n} \).

3. \( ZE(\Xi) \geq \sqrt[1]{|\text{det}Z(\Xi)|} \).

**Theorem 4.2.** Let \( \Xi = (\overline{\mathcal{S}}, \overline{\mathcal{R}}) \) be an IV q-RODHFHG on \( n \) vertices with hyper-Zagreb index \( HM(\Xi) \). Then

\[
e^{-\sqrt{2HM(\Xi)}} \leq ZE(\Xi) \leq e^{\sqrt{2HM(\Xi)}}.
\]

**Proof.** For the sake of simplicity, we write \( \xi_i = |\Phi_i| \).

**Lower bound:** By definition of the Zagreb energy and by the arithmetic-geometric mean inequality,

\[
\begin{align*}
Z E(\overline{\mathcal{R}}(p_i, p_j)) &= n \left( \frac{1}{n} \sum_{i=1}^{n} \xi_i \right)^2 \geq n \left( \frac{1}{\sqrt{n}} \sum_{i=1}^{n} \xi_i \right)^2 \\
&\geq n \left( \frac{1}{\sqrt{n}} \sum_{i=1}^{n} \xi_i \right)^2 \geq n \left( \frac{1}{n} \sum_{i=1}^{n} \xi_i \right)^2 \quad \text{(by Theorem 2.1)} \\
&\geq n \left( \frac{1}{n} \sum_{i=1}^{n} \xi_i \right)^2 > n \left( \frac{1}{n} \sum_{i=1}^{n} \xi_i \right)^2 = \frac{1}{n} \sum_{i=1}^{n} (\xi_i)^k \\
&= \frac{1}{n} \sum_{k=0}^{\infty} \left( \sum_{i=1}^{n} (\xi_i)^k \right) \geq \frac{1}{n} \sum_{k=0}^{\infty} \left( \sum_{i=1}^{n} \xi_i^k \right)^{\frac{k}{2}} \quad \text{(by Theorem 2.2)}
\end{align*}
\]
By definition of the Zagreb energy and by the arithmetic-geometric mean inequality, we have

\[ \sum_{k \geq 0} \frac{1}{k!} \left( \sum_{i=1}^{n} (\xi_i)^2 \right)^{\frac{k}{2}} = \sum_{k \geq 0} \frac{1}{k!} \left( \sqrt{2HM(\mathcal{R}(p,p))} \right)^{\frac{k}{2}} \]

So, \( ZE(\mathcal{R}(p,p)) \geq e^{-\sqrt{2HM(\mathcal{R}(p,p))}} \).

Upper bound: Utilizing definition of the Zagreb energy, we have

\[ ZE(\mathcal{R}(p,p)) = \sum_{i=1}^{n} \zeta_i \leq \sum_{i=1}^{n} e^{\xi_i} = \sum_{i=1}^{n} \sum_{k \geq 0} \frac{1}{k!} \left( \sum_{i=1}^{n} (\xi_i)^2 \right)^{\frac{k}{2}} \]

\[ \leq \sum_{k \geq 0} \frac{1}{k!} \left( \sum_{i=1}^{n} (\xi_i)^2 \right)^{\frac{k}{2}} \]

Thus \( e^{-\sqrt{2HM(\mathcal{R}(p,p))}} \leq ZE(\mathcal{R}(p,p)) \leq e^{\sqrt{2HM(\mathcal{R}(p,p))}} \). Analogously, \( e^{-\sqrt{2HM(\mathcal{B}(p,p))}} \leq ZE(\mathcal{B}(p,p)) \leq e^{\sqrt{2HM(\mathcal{B}(p,p))}} \).

Hence \( e^{-\sqrt{2HM(\Xi)}} \leq ZE(\Xi) \leq e^{\sqrt{2HM(\Xi)}} \).

**Theorem 4.3.** Let \( \Xi = (\mathcal{G}, \mathcal{R}) \) be an IV q-RODHFHG on \( n \) vertices with hyper-Zagreb index \( HM(\Xi) \). Then

\[ ZE(\Xi) \geq \frac{1}{2HM(\Xi)} \]

**Proof.** By definition of the Zagreb energy and by the arithmetic-geometric mean inequality,

\[ ZE(\mathcal{R}(p,p)) = \sum_{i=1}^{n} \zeta_i = \sum_{i=1}^{n} \left( \frac{1}{n} \sum_{i=1}^{n} \zeta_i \right) \geq n \left( \sqrt[n]{\zeta_1 \zeta_2 \cdots \zeta_n} \right) \]

\[ n \left( \sqrt[n]{\zeta_1 \zeta_2 \cdots \zeta_n} \right) \geq n \left( \frac{n}{\sum_{i=1}^{n} \xi_i^2} \right) \geq n \left( \frac{n}{\left( \sum_{i=1}^{n} \frac{1}{\zeta_i} \right)^2} \right) \quad \text{(by Theorem 2.1)} \]

\[ \geq n \left( \frac{n}{\sum_{i=1}^{n} \xi_i^2} \right) \geq \frac{1}{\sum_{i=1}^{n} (\xi_i)^k} \geq \frac{1}{\left( \sum_{i=1}^{n} (\xi_i)^2 \right)^{\frac{k}{2}}} \quad \text{(by Theorem 2.2)} \]

\[ = \frac{1}{\left( \sum_{i=1}^{n} (\xi_i)^2 \right)^{\frac{k}{2}}} = \frac{1}{\left( 2HM(\mathcal{R}(p,p)) \right)^{\frac{k}{2}}} \]

When \( k=2 \), we get result \( ZE(\mathcal{R}(p,p)) \geq \frac{1}{2HM(\mathcal{R}(p,p))} \). Analogously, \( ZE(\mathcal{B}(p,p)) \geq \frac{1}{2HM(\mathcal{B}(p,p))} \). Hence \( ZE(\Xi) \geq \frac{1}{2HM(\Xi)} \).
4.2. Second Zagreb Index and Second Zagreb Energy of an IV $q$-RODHFHG

The second Zagreb index, generally denoted by $M_2(\Xi)$, is defined as:

\[ M_2(\Xi) = \sum_{p, p' \in \Xi} d_2(p_j) d_2(p_j) \]

**Definition 4.3.** Let $\Xi = (\Xi, R)$ be an IV $q$-RODHFHG on $n$ vertices. The second Zagreb matrix, $Z^{2i}(\Xi) = (Z^{2i}(h_R(p_j, p_j)), Z^{2i}(g_R(p_j, p_j))) = [z^{(2)}_{ij}]$, of $\Xi$ is represented by a $n \times n$ matrix as:

\[
\begin{vmatrix}
0 & d_2(p_j) \quad & d_2(p_j) \\
\vdots & \ddots & \vdots \\
0 & d_2(p_j) & 0 \\
\end{vmatrix}
\]

if $i = j$,

\[
\begin{vmatrix}
0 & \frac{d_2(p_j)}{d_2(p_j) + d_2(p_j)} \\
\vdots & \ddots & \vdots \\
0 & \frac{d_2(p_j)}{d_2(p_j) + d_2(p_j)} & 0 \\
\end{vmatrix}
\]

if the vertices $p_j$ and $p_j$ of the IV $q$-RODHFHG $\Xi$ are adjacent,

\[
\begin{vmatrix}
0 \\
\vdots \\
0 \\
\end{vmatrix}
\]

if the vertices $p_j$ and $p_j$ of the IV $q$-RODHFHG $\Xi$ are non-adjacent.

**Definition 4.4.** The second Zagreb energy of an IV $q$-RODHFHG $\Xi = (\Xi, R)$ is characterized as:

\[
ZE_{2i}(\Xi) = (ZE_{2i}(h_R(p_j, p_j)), ZE_{2i}(g_R(p_j, p_j))) = \left[ \sum_{i = 1}^{n} |\Phi^{(2)}_{i}|, \sum_{i = 1}^{n} |\Psi^{(2)}_{i}| \right],
\]

where $Y_{Z^{2i}}$ and $Z_{Z^{2i}}$ are the second Zagreb eigenvalues sets of $Z^{2i}(h_R(p_j, p_j))$ and $Z^{2i}(g_R(p_j, p_j))$, respectively.

**Example 4.2.** The second Zagreb energy of an IV5-RODHFHG $\Xi$, given in Fig. 3, is calculated as

\[
Z^{2i}(\Xi) = \begin{bmatrix}
(0, 0) & (0, 0) & (0, 0) & (0, 0) & (0, 0) \\
(0.0383, 6.0458) & (0, 0) & (0, 0) & (0, 0) & (0, 0) \\
(0.0383, 6.0458) & (0, 0) & (0, 0) & (0, 0) & (0, 0) \\
(0, 0) & (0.0666, 6.0287) & (0, 0) & (0, 0) & (0, 0) \\
(0.0666, 6.0287) & (0, 0) & (0, 0) & (0, 0) & (0, 0) \\
\end{bmatrix}.
\]

Then, the spectrum and the energy of a second Zagreb IV5-RODHFHG $\Xi$ are as follows:

\[
Spec(\Xi) = \{(-1.4115, -9.9309), (-1.2188, -8.7260), (-0.2471, -2.0350), (-0.1454, -1.4658), (0.4466, 3.9473), (2.5762, 18.2103)\}.
\]

Now, $ZE_{2i}(h_R(f_j)) = 6.0455$ and $ZE_{2i}(g_R(f_j)) = 44.3152$. Therefore, $ZE_{2i}(\Xi) = (6.0455, 44.3152)$.

5. HARMONIC ENERGY OF AN IV $q$-RODHFHG

This section investigates and defines the Harmonic energy of an IV $q$-RODHFHG and related properties are provided in detail.

**Definition 5.1.** Let $\Xi = (\Xi, R)$ be an IV $q$-RODHFHG on $n$ vertices. The Harmonic matrix, $H(\Xi) = (H(h_R(p_j, p_j)), H(g_R(p_j, p_j))) = [h_{ij}]$, of $\Xi$ is a square matrix defined as:

\[
h_{ij} = \begin{cases} 
0 & \text{whenever } i = j, \\
d_2(p_j) & \text{whenever the vertices } p_j \text{ and } p_j \text{ of the IV } q \text{-RODHFHG } \Xi \text{ are adjacent,} \\
\frac{2}{d_2(p_j) + d_2(p_j)} & \text{whenever the vertices } p_j \text{ and } p_j \text{ of the IV } q \text{-RODHFHG } \Xi \text{ are non-adjacent.}
\end{cases}
\]

**Definition 5.2.** The Harmonic energy of an IV $q$-RODHFHG $\Xi = (\Xi, R)$ is defined as:

\[
HE(\Xi) = (HE(h_R(p_j, p_j)), HE(g_R(p_j, p_j))) = \left[ \sum_{j = 1}^{n} |\gamma_j|, \sum_{j = 1}^{n} |\Theta_j| \right],
\]

where $Y_H$ and $Z_H$ are the sets of Harmonic eigenvalues of $H(h_R(p_j, p_j))$ and $H(g_R(p_j, p_j))$, respectively.
Example 5.1. The Harmonic energy of an IV5-RODHFHG given in Fig. 3 can be calculated as:

\[
H(\tilde{\mathbf{G}}) = \begin{pmatrix}
(0, 0) & (0.9592, 0.4017) & (0, 0) & (0, 0) & (0.9988, 0.4112) & (1.4109, 0.5737) \\
(0.9592, 0.4017) & (0, 0) & (1.2668, 0.4508) & (1.1275, 0.3952) & (0.9467, 0.3544) & (0, 0) \\
(0, 0) & (1.2668, 0.4508) & (0, 0) & (1.7277, 0.5349) & (0, 0) & (0, 0) \\
(0, 0) & (1.1275, 0.3952) & (1.7277, 0.5349) & (0, 0) & (1.1825, 0.4044) & (0, 0) \\
(0.9988, 0.4112) & (0.9467, 0.3544) & (0, 0) & (1.1825, 0.4044) & (0, 0) & (1.3841, 0.4819) \\
(1.4109, 0.5737) & (0, 0) & (0, 0) & (0, 0) & (1.3841, 0.4819) & (0, 0)
\end{pmatrix}.
\]

\[
\text{Spec}(\tilde{\mathbf{G}}) = \{(-2.3917, -0.8301), (-1.8250, -0.6969), (-0.9342, -0.3210), (-0.5101, -0.1959), (1.8946, 0.6694), (3.7665, 1.3744)\}.
\]

Now, \(HE(\tilde{\mathbf{G}}) = 11.3221\) and \(HE(\tilde{\mathbf{R}}) = 4.0877\). Therefore, \(HE(\tilde{\mathbf{G}}) = (11.3221, 4.0877)\).

First of all, we establish the trace of the Harmonic matrices \(H(\tilde{\mathbf{G}})\), \(H^2(\tilde{\mathbf{G}})\), \(H^3(\tilde{\mathbf{G}})\), and \(H^4(\tilde{\mathbf{G}})\), i.e., \(tr(H(\tilde{\mathbf{G}}))\), \(tr(H^2(\tilde{\mathbf{G}}))\), \(tr(H^3(\tilde{\mathbf{G}}))\), and \(tr(H^4(\tilde{\mathbf{G}}))\). Furthermore, the lower and upper bounds for Harmonic energy are determined using these equalities.

**Lemma 5.1.** Let \(\tilde{\mathbf{G}} = (\tilde{\mathbf{G}}, \tilde{\mathbf{R}})\) be an IV \(q\)-RODHFHG on \(n\) vertices and \(H(\tilde{\mathbf{G}}) = (H(\tilde{\mathbf{R}}(p, p)), H(\tilde{\mathbf{R}}(p, p)))\) be the Harmonic matrix of \(\tilde{\mathbf{G}}\). Then

1. \(tr(H(\tilde{\mathbf{G}})) = 0\),
2. \(tr(H^2(\tilde{\mathbf{G}})) = 8 \sum_{i<j} \frac{1}{(d_{\tilde{\mathbf{G}}}(p_i) + d_{\tilde{\mathbf{G}}}(p_j))^2}\),
3. \(tr(H^3(\tilde{\mathbf{G}})) = 16 \sum_{i<j} \frac{1}{d_{\tilde{\mathbf{G}}}(p_i) + d_{\tilde{\mathbf{G}}}(p_j)} \left( \sum_{k \sim i, k \sim j} \frac{1}{d_{\tilde{\mathbf{G}}}(p_i) + d_{\tilde{\mathbf{G}}}(p_j)} \right)^2\),
4. \(tr(H^4(\tilde{\mathbf{G}})) = 16 \sum_{i=1}^{n} \left( \sum_{i<j} \frac{1}{(d_{\tilde{\mathbf{G}}}(p_i) + d_{\tilde{\mathbf{G}}}(p_j))^2} \right)^2 + 16 \sum_{k \sim i, k \sim j} \left( \sum_{k \sim i} \frac{1}{d_{\tilde{\mathbf{G}}}(p_i) + d_{\tilde{\mathbf{G}}}(p_j)} \right)^2 \).

**Proof.**

1. Obvious.
2. For matrix \(H^2(\tilde{\mathbf{G}})\). If \(i = j\)

\[
H^2(\tilde{\mathbf{R}}(p, p)) = \sum_{j=1}^{n} (H(\tilde{\mathbf{R}}(p, p)))^2 = \sum_{j=1}^{n} (H(\tilde{\mathbf{R}}(p, p)))^2 = \sum_{i<j} (H(\tilde{\mathbf{R}}(p, p)))^2 = \frac{4}{(d_{\tilde{\mathbf{R}}}(p_i) + d_{\tilde{\mathbf{R}}}(p_j))^2}.
\]

Whereas if \(i \neq j\)

\[
H^2(\tilde{\mathbf{R}}(p, p)) = \sum_{k=1}^{n} (H(\tilde{\mathbf{R}}(p, p)))^2 = \sum_{k=1}^{n} (H(\tilde{\mathbf{R}}(p, p)))^2 = \sum_{k \sim i, k \sim j} \frac{1}{d_{\tilde{\mathbf{R}}}(p_i) + d_{\tilde{\mathbf{R}}}(p_j)} \left( \sum_{k \sim i} \frac{1}{d_{\tilde{\mathbf{R}}}(p_i) + d_{\tilde{\mathbf{R}}}(p_j)} \right)^2.
\]
Therefore

\[ \text{tr}(H^2(\bar{h}(p_i,p_j))) = 8 \sum_{i,j=1}^{n} \frac{1}{(d_h(p_i) + d_h(p_j))^2}, \]

Analogously,

\[ \text{tr}(H^2(\bar{g}(p_i,p_j))) = 8 \sum_{i,j=1}^{n} \frac{1}{(d_g(p_i) + d_g(p_j))^2}. \]

Hence \( \text{tr}(H^2(\bar{\Xi})) = 8 \sum_{i,j=1}^{n} \frac{1}{(d_{\Xi}(p_i) + d_{\Xi}(p_j))^2} \).

3. Now, we define the matrix \( H^3(\Xi) \). The elements of diagonal are

\[ H^3(h(\bar{h}(p_i,p_j))) = \sum_{i=1}^{n} (H(h(\bar{h}(p_i,p_j)))H^2(h(\bar{h}(p_i,p_j)))) \]

\[ = 2 \sum_{i=1}^{n} \frac{1}{d_h(p_i) + d_h(p_j)} - \frac{1}{d_h(p_i) + d_h(p_j)} \sum_{k \sim j} \frac{1}{d_h(p_k) + d_h(p_j)} \frac{1}{d_h(p_k) + d_h(p_i)} \]

Therefore

\[ \text{tr}(H^3(\bar{h}(p_i,p_j))) = 16 \sum_{i,j=1}^{n} \frac{1}{d_h(p_i) + d_h(p_j)} \frac{1}{d_h(p_i) + d_h(p_j)} \sum_{k \sim j} \frac{1}{d_h(p_k) + d_h(p_j)} \frac{1}{d_h(p_k) + d_h(p_i)} \]

Analogously,

\[ \text{tr}(H^3(\bar{g}(p_i,p_j))) = 16 \sum_{i,j=1}^{n} \frac{1}{d_g(p_i) + d_g(p_j)} \frac{1}{d_g(p_i) + d_g(p_j)} \sum_{k \sim j} \frac{1}{d_g(p_k) + d_g(p_j)} \frac{1}{d_g(p_k) + d_g(p_i)} \]

Hence \( \text{tr}(H^3(\Xi)) = 16 \sum_{i,j=1}^{n} \frac{1}{d_{\Xi}(p_i) + d_{\Xi}(p_j)} \frac{1}{d_{\Xi}(p_i) + d_{\Xi}(p_j)} \sum_{k \sim j} \frac{1}{d_{\Xi}(p_k) + d_{\Xi}(p_j)} \frac{1}{d_{\Xi}(p_k) + d_{\Xi}(p_i)} \).

4. Since \( \text{tr}(H^4(\bar{h}(p_i,p_j))) = \| H^2(\bar{h}(p_i,p_j)) \|_F^2 \), where \( \| H^2(\bar{h}(p_i,p_j)) \|_F \) represents the Frobenius norm of \( H^2(\bar{h}(p_i,p_j)) \), we obtain

\[ \text{tr}(H^4(\bar{h}(p_i,p_j))) = \sum_{i,j=1}^{n} |H^2(\bar{h}(p_i,p_j))|^2 = \sum_{i=1}^{n} |H^2(\bar{h}(p_i,p_j))|^2 + \sum_{i \neq j} |H^2(\bar{h}(p_i,p_j))|^2 \]

\[ = 16 \sum_{i,j=1}^{n} \left( \frac{1}{d_h(p_i) + d_h(p_j)} \right)^2 + 16 \sum_{k \sim j} \frac{1}{d_h(p_k) + d_h(p_j)} \frac{1}{d_h(p_k) + d_h(p_i)} \]
Analogously,

$$tr(H^4(\tilde{\mathcal{g}}(p,p))) = 16 \sum_{i=1}^{n} \left( \sum_{i \sim j} \frac{1}{d_{\mathcal{g}}(p_i) + d_{\mathcal{g}}(p_j)} \right)^2 + 16 \sum_{k \sim i, j} \left( \sum_{k \sim j} \frac{1}{d_{\mathcal{g}}(p_k) + d_{\mathcal{g}}(p_j)} \frac{1}{d_{\mathcal{g}}(p_k) + d_{\mathcal{g}}(p_i)} \right)^2.$$

Hence $$tr(H^4(\tilde{\Xi})) = 16 \sum_{i=1}^{n} \left( \sum_{i \sim j} \frac{1}{d_{\Xi}(p_i) + d_{\Xi}(p_j)} \right)^2 + 16 \sum_{k \sim i, j} \left( \sum_{k \sim j} \frac{1}{d_{\Xi}(p_k) + d_{\Xi}(p_j)} \frac{1}{d_{\Xi}(p_k) + d_{\Xi}(p_i)} \right)^2.$$

**Theorem 5.1.** Let $$\tilde{\Xi} = (\tilde{\mathcal{S}}, \tilde{\mathcal{R}})$$ be an IV q-RODFHG on n vertices. Then

$$HE(\tilde{\Xi}) \leq 2 \sqrt{2n \sum_{i \sim j} \frac{1}{d_{\Xi}(p_i) + d_{\Xi}(p_j)^2}}.$$

Furthermore, $$HE(\tilde{\Xi}) = \sqrt{2n \sum_{i \sim j} \frac{1}{d_{\Xi}(p_i) + d_{\Xi}(p_j)}}$$ if and only if $$\tilde{\Xi}$$ is a graph with only isolated vertices, or end vertices.

**Proof.** The variance of the numbers $$|Y_i| = \frac{1}{n} \sum_{i=1}^{n} Y_i^2 - \left( \frac{1}{n} \sum_{i=1}^{n} |Y_i| \right)^2 \geq 0, \ i = 1, 2, \ldots, n,$$ Now,

$$\sum_{i=1}^{n} |Y_i|^2 = \sum_{i=1}^{n} Y_i^2 = tr(H^2(\tilde{\mathcal{g}}(p,p)))$$

defining therefore

$$\frac{1}{n} tr(H^2(\tilde{\mathcal{g}}(p,p))) - \left( \frac{1}{n} HE(\tilde{\mathcal{g}}(p,p)) \right)^2 \geq 0$$

$$\iff \frac{1}{n} tr(H^2(\tilde{\mathcal{g}}(p,p))) \geq \left( \frac{1}{n} HE(\tilde{\mathcal{g}}(p,p)) \right)^2$$

$$\iff HE(\tilde{\mathcal{g}}(p,p)) \leq \sqrt{n tr(H^2(\tilde{\mathcal{g}}(p,p)))}$$

$$\iff HE(\tilde{\mathcal{g}}(p,p)) \leq \sqrt{8n \sum_{i \sim j} (d_{\mathcal{g}}(p_i) + d_{\mathcal{g}}(p_j))^2}$$

$$\iff HE(\tilde{\mathcal{g}}(p,p)) \leq 2 \sqrt{2n \sum_{i \sim j} (d_{\mathcal{g}}(p_i) + d_{\mathcal{g}}(p_j))^2}.$$
Theorem 5.2. Let $\hat{G} = (\hat{\Sigma}, \hat{R})$ be an IV $q$-RODHFHG on $n$ vertices. If $\hat{\Xi}$ is regular of degree $(p, q)$, $p, q > 0$, then

$$HE(\hat{\Xi}) = \frac{1}{(p, q)}E(\hat{\Xi}).$$

Proof. Suppose that $\hat{\Xi}$ is a regular IV $q$-RODHFHG of degree $(p, q)$ $(p, q > 0)$, i.e., $d_{\hat{\Xi}}(p_1) = d_{\hat{\Xi}}(p_2) = \ldots = d_{\hat{\Xi}}(p_n) = p$. Then all non zero entries of $H(\hat{\xi}_{\hat{\Xi}}(p, p_i))$ are equal to $\frac{1}{p}$, implying that $H(\hat{\xi}_{\hat{\Xi}}(p, p_i)) = \frac{1}{p}\lambda(\hat{\xi}_{\hat{\Xi}}(p, p_i))$. Therefore, for all $1 \leq i \leq n$

$$\gamma_i = \frac{1}{p}2,$$

$$\sum_{i=1}^{n} \gamma_i = \frac{1}{p} \sum_{i=1}^{n} 2,$$

$$HE(\hat{\xi}_{\hat{\Xi}}(p, p_i)) = \frac{1}{p}E(\hat{\xi}_{\hat{\Xi}}(p, p_i)).$$

Similarly, $HE(\hat{\xi}_{\hat{\Xi}}(p, p_j)) = \frac{1}{q}E(\hat{\xi}_{\hat{\Xi}}(p, p_j))$. Hence $HE(\hat{\Xi}) = \frac{1}{(p, q)}E(\hat{\Xi}), \Xi$

Definition 5.3. Let $\hat{\Xi} = (\hat{\Sigma}, \hat{R})$ be an IV $q$-RODHFHG on $n$ vertices. The Randić matrix, $R(\hat{\Xi}) = (R(\hat{\xi}_{\hat{\Xi}}(p, p_i)), R(\hat{\xi}_{\hat{\Xi}}(p, p_j))) = [p_{ij}]$, of $\hat{\Xi}$ is a square matrix represented as:

$$p_{ij} = \begin{cases} 0 & \text{if } i = j, \\ \frac{1}{\sqrt{d_{\hat{\Xi}}(p_i)d_{\hat{\Xi}}(p_j)}} & \text{if the vertices } p_i \text{ and } p_j \text{ of the IV }q\text{-RODHFHG }\hat{\Xi}\text{ are adjacent}, \\ 0 & \text{if the vertices } p_i \text{ and } p_j \text{ of the IV }q\text{-RODHFHG }\hat{\Xi}\text{ are non-adjacent}. \end{cases}$$

Definition 5.4. The Randić energy of an IV $q$-RODHFHG $\hat{\Xi} = (\hat{\Sigma}, \hat{R})$ is represented as:

$$RE(\hat{\Xi}) = (RE(\hat{\xi}_{\hat{\Xi}}(p, p_i)), RE(\hat{\xi}_{\hat{\Xi}}(p, p_j))) = \left( \sum_{j=1}^{n} |\psi_j|, \sum_{j=1}^{n} |\eta_j| \right),$$

where $Y_R$ and $Z_R$ are the Randić eigenvalues sets of $R(\hat{\xi}_{\hat{\Xi}}(p, p_i))$ and $R(\hat{\xi}_{\hat{\Xi}}(p, p_j))$, respectively.

Definition 5.5. Let $\hat{\Xi} = (\hat{\Sigma}, \hat{R})$ be an IV $q$-RODHFHG on $n$ vertices. The general Randić matrix, $R_{\alpha}(\hat{\Xi}) = (R_{\alpha}(\hat{\xi}_{\hat{\Xi}}(p, p_i)), R_{\alpha}(\hat{\xi}_{\hat{\Xi}}(p, p_j))) = [p_{ij}]$, of $\hat{\Xi}$ is a square matrix characterized as:

$$p_{ij} = \begin{cases} 0 & \text{if } i = j, \\ (d_{\hat{\Xi}}(p_i)d_{\hat{\Xi}}(p_j))^2 & \text{if the vertices } p_i \text{ and } p_j \text{ of the IV }q\text{-RODHFHG }\hat{\Xi}\text{ are adjacent}, \\ 0 & \text{if the vertices } p_i \text{ and } p_j \text{ of the IV }q\text{-RODHFHG }\hat{\Xi}\text{ are non-adjacent}. \end{cases}$$

Definition 5.6. The general Randić energy of an IV $q$-RODHFHG $\hat{\Xi} = (\hat{\Sigma}, \hat{R})$ is characterized as:

$$RE_{\alpha}(\hat{\Xi}) = (RE_{\alpha}(\hat{\xi}_{\hat{\Xi}}(p, p_i)), RE_{\alpha}(\hat{\xi}_{\hat{\Xi}}(p, p_j))) = \left( \sum_{j=1}^{n} |\psi_j|, \sum_{j=1}^{n} |\eta_j| \right),$$

where $Y_R$ and $Z_R$ are the general Randić eigenvalues sets of $R_{\alpha}(\hat{\xi}_{\hat{\Xi}}(p, p_i))$ and $R_{\alpha}(\hat{\xi}_{\hat{\Xi}}(p, p_j))$, respectively.
Example 5.2. The one-forth Randic energy of an IV $q$-RODHFHG given in Fig. 3 can be calculated as:

$$R^{[1/4]}(\tilde{\Xi}) = \left[ \begin{array}{cccccc} (0,0) & (1.0203, 1.5681) & (0,0) & (0,0) & (1.0006, 1.5522) & (0.8072, 1.3062) \\
(1.0203, 1.5681) & (0,0) & (0.8525, 1.4552) & (0.9282, 1.5830) & (1.0273, 1.6795) & (0,0) \\
(0,0) & (0.8525, 1.4552) & (0,0) & (0.7553, 1.3576) & (0,0) & (0,0) \\
(0,0) & (0.9282, 1.5830) & (0.7553, 1.3576) & (0,0) & (0.9102, 1.5670) & (0,0) \\
(1.0006, 1.5522) & (1.0273, 1.6795) & (0,0) & (0.9102, 1.5670) & (0,0) & (0.8128, 1.3991) \\
(0.8072, 1.3062) & (0,0) & (0,0) & (0,0) & (0.8128, 1.3991) & (0,0) \end{array} \right].$$

$$\text{Spec}(\tilde{\Xi}) = \{(-1.6141, -2.6859), (-1.4803, -2.4251), (-0.4275, -0.7581), (-0.4016, -0.6638), (0.9725, 1.6696), (2.9510, 4.8632)\}.$$

Now, $RE_{[1/4]}(\tilde{\Xi}) = 7.8469$ and $RE_{[1/4]}(\tilde{\Xi}) = 13.0657$. Therefore, $RE_{[1/4]}(\tilde{\Xi}) = (7.8469, 13.0657)$.

Theorem 5.3. Let $\tilde{\Xi} = (\tilde{\Xi}, \tilde{\mathcal{R}})$ be an IV $q$-RODHFHG on $n$ vertices. If $\tilde{\Xi}$ is regular of degree $(s, t)$, $s, t > 0$, then

$$RE(\tilde{\Xi}) = HE(\tilde{\Xi}).$$

Proof. Suppose that $\tilde{\Xi}$ is a regular IV $q$-RODHFHG of degree $(s, t)$ ($s, t > 0$), i.e., $d_{\tilde{\Xi}}(p_1) = d_{\tilde{\Xi}}(p_2) = ... = d_{\tilde{\Xi}}(p_n) = s$. Then all non zero entries of $R(\tilde{\Xi})$ are equal to $\frac{1}{t}$, implying that $R(\tilde{\Xi}) = \frac{1}{s}A(\tilde{\Xi})$. Therefore, for all $1 \leq i \leq n$

$$\varpi_i = \frac{1}{s} \mathcal{H}_i,$$

$$\sum_{i=1}^{n} \varpi_i = \frac{1}{s} \sum_{i=1}^{n} \mathcal{H}_i,$$

$$RE(\tilde{\Xi}) = \frac{1}{s}E(\tilde{\Xi}).$$

Analogously, $RE(\tilde{\Xi}) = HE(\tilde{\Xi})$. Hence $RE(\tilde{\Xi}) = HE(\tilde{\Xi})$.

6. MADM APPROACH BASED ON IV $q$-RODHFGs

On the base of the theory of graphs, in this section, we develop a MADM approach with IV $q$-RODHFNs. Let $\mathcal{X} = \{x_1, x_2, ..., x_n\}$ be a discrete set of alternatives, and $\mathcal{Q} = \{Q_1, Q_2, ..., Q_n\}$ be the set of attributes. Suppose that $\tilde{\mathcal{S}} = (\tilde{d}_{ij})_{m \times n} = (\tilde{d}_{ij}, \tilde{g}_{ij})_{m \times n}$ is the IV $q$-RODHF decision matrix, where $\tilde{d}_{ij}$ represents a set of degrees that the alternative $x_i$ meets the attribute $Q_j$, and $\tilde{g}_{ij}$ represents a set of degrees that the alternative $x_i$ does not meet the expert's $Q_j$ attribute.

The score and accuracy functions based on expected value of IV $q$-RODHFNs are defined as:

Definition 6.1. Suppose $\tilde{d} = (\tilde{d}, \tilde{g})$ is an IV $q$-RODHFHN. $\tilde{S}(\tilde{d}) = \frac{1}{2} \left( 1 + (\tilde{h}(\tilde{d}))^q - (\tilde{g}(\tilde{d}))^q \right)$ is the score function of $\tilde{d} = (\tilde{d}, \tilde{g})$ and $\tilde{H}(\tilde{d}) = (\tilde{h}(\tilde{d}))^q + (\tilde{g}(\tilde{d}))^q$ is the accuracy function of $\tilde{d} = (\tilde{d}, \tilde{g})$, where

$$\tilde{h}(\tilde{d}) = \frac{1}{t-1} \left[ (1-\xi)\varphi_{\sigma(t)} + \varphi_{\sigma(t-1)} + ... + \varphi_{\sigma(2)} + \xi \varphi_{\sigma(1)} \right].$$
\[ \bar{g}^{i(1)} = \frac{1}{l-1} [(1-\zeta)\delta_{\sigma(i)} + \delta_{\sigma(i-l)} + \cdots + \delta_{\sigma(2)} + \zeta \delta_{\sigma(1)}]. \]

Let \( \bar{d}_i = (\bar{h}_i, \bar{g}_i)(i = 1, 2) \) be any two IV \( q \)-RODHFNs, then

1. if \( \bar{S}(\bar{d}_1) > \bar{S}(\bar{d}_2) \), then \( \bar{d}_1 > \bar{d}_2 \);
2. if \( \bar{S}(\bar{d}_1) = \bar{S}(\bar{d}_2) \), then: (a) if \( \bar{H}(\bar{d}_1) = \bar{H}(\bar{d}_1) \), then \( \bar{d}_1 = \bar{d}_2 \); (b) if \( \bar{H}(\bar{d}_1) > \bar{H}(\bar{d}_2) \), then \( \bar{d}_1 > \bar{d}_2 \).

In the following, based on the introduced IV \( q \)-RODHF Gs, a novel MADM approach is proposed to solve this problem.

Step 1. Determine the scores (based on expected values) utilizing Def. (6.1) of IV \( q \)-RODHF Es in an IV \( q \)-RODHF decision matrix.

Step 2. Suppose \( \bar{H} = (\bar{d}_{ij})_{n \times n} \) is an IV \( q \)-RODHFPR via pairwise comparisons over the attributes \( \bar{Q}_j \), \( j = 1, 2, \ldots, n \), given by the experts. Construct a matrix of an IV \( q \)-RODHFPR \( \bar{H} = (\bar{d}_{ij})_{n \times n} \) as:

where \( \bar{d}_{ij} \) represents the preference of the attribute \( \bar{Q}_i \) to the attribute \( \bar{Q}_j \) for all \( i, j = 1, 2, \ldots, n \).

\[
\begin{bmatrix}
Q_1 & \bar{d}_{12} & \bar{d}_{13} & \cdots & \bar{d}_{1n} \\
\bar{d}_{21} & Q_2 & \bar{d}_{23} & \cdots & \bar{d}_{2n} \\
\bar{d}_{31} & \bar{d}_{32} & Q_3 & \cdots & \bar{d}_{3n} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
\bar{d}_{n1} & \bar{d}_{n2} & \bar{d}_{n3} & \cdots & Q_n
\end{bmatrix}
\]

Step 3. Construct an IV \( q \)-RODHFPR \( \bar{S}(\bar{H}) \) with scores, as follows:

\[
\bar{S}(\bar{H}) = \begin{bmatrix}
\bar{S}(\bar{d}_{12}) & \bar{S}(\bar{d}_{13}) & \cdots & \bar{S}(\bar{d}_{1n}) \\
\bar{S}(\bar{d}_{21}) & \bar{S}(\bar{d}_{22}) & \cdots & \bar{S}(\bar{d}_{2n}) \\
\bar{S}(\bar{d}_{31}) & \bar{S}(\bar{d}_{32}) & \bar{S}(\bar{d}_{33}) & \cdots & \bar{S}(\bar{d}_{3n}) \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
\bar{S}(\bar{d}_{n1}) & \bar{S}(\bar{d}_{n2}) & \bar{S}(\bar{d}_{n3}) & \cdots & \bar{S}(\bar{d}_{nn})
\end{bmatrix}.
\]

Step 4. Draw the most favourable digraph for alternative selection attributes whose vertices and directed edges (arcs) portray the considered attributes and the attribute preference, respectively.

Step 5. Define an appropriate matrix of alternative selection attributes with all of the attributes \( \bar{Q}_i \), as diagonal elements and their preference \( \bar{S}(\bar{d}_{ij}) \) as off-diagonal elements.

where \( \bar{Q}_i \) is the \( i \)-th attribute defined by vertex and \( \bar{S}(\bar{d}_{ij}) \) is the preference of the \( i \)-th attribute over the \( j \)-th attribute denoted by

\[
\begin{bmatrix}
\bar{S}(\bar{d}_{12}) & \bar{S}(\bar{d}_{13}) & \cdots & \bar{S}(\bar{d}_{1n}) \\
\bar{S}(\bar{d}_{21}) & \bar{S}(\bar{d}_{22}) & \cdots & \bar{S}(\bar{d}_{2n}) \\
\bar{S}(\bar{d}_{31}) & \bar{S}(\bar{d}_{32}) & \bar{S}(\bar{d}_{33}) & \cdots & \bar{S}(\bar{d}_{3n}) \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
\bar{S}(\bar{d}_{n1}) & \bar{S}(\bar{d}_{n2}) & \bar{S}(\bar{d}_{n3}) & \cdots & \bar{S}(\bar{d}_{nn})
\end{bmatrix}.
\]

Step 6. To find an alternative selection index, substitute the values \( \bar{S}(\bar{d}_{ij}) \) and \( \bar{Q}_j \) in the alternative selection attributes function.

Step 7. Rank \( \lambda_i \) (\( i = 1, 2, \ldots, m \)) alternatives as per the alternative index of the selection and pick the best one(s).

The specific steps of this proposed approach to MADM is depicted in Fig. 4.

### 6.1. Numerical Example and Comparative Analysis

#### 6.1.1. Assessment of the Performance of search and rescue robots (PSRR)

We use the proposed MADM methodology in this section to determine the PSRR. The PSRR is excellent in emergency cases. In emergency situations, rescue robots took place of the respondents as they were able to take pictures of the scenes and capture certain online streams...
that can help a lot to understand the seriousness of the situation. Search and rescue robots may be useful to locate casualties or a possible threat in caves, tunnels and the wilderness. The incentive to use these robots of search and rescue is their apediency and completeness of the mission without risks to victims or rescuer.

6.1.2. Numerical example

In this example, we address the problem of assessing the PSRR. This example is extracted from [47] where search and rescue robots’ output was tested under IF information. However, only two facts of human opinion have been studied in this environment which leads to lack of information as the degree of abstinence and denial of human opinion is ignored. On the basis of the existing literature [47], the attributes that play an important role in the evaluation of search and rescue robots include $Q_1$: feasibility, $Q_2$: athleticism, $Q_3$: ability to work and $Q_4$: processing and communication ability. Let $\lambda_i (i = 1, 2, ..., 6)$ denote the number of search and rescue robots that need to be evaluated. Here the evaluation involves the personal views of the experts that they provide in the manner of a decision matrix that reflects the four attributes. Suppose the experts evaluate the performance of six search and rescue robots $\lambda_i (i = 1, 2, ..., 6)$ according to the four attributes, based on IV$^q$-RODHFNs and the corresponding decision matrix is constructed in Table 2. Figure 5 represents the hierarchical structure of the discussed MADM problem.

6.1.3. Decision making process

Step 1. Determine the score functions $\tilde{S}(\tilde{d}_{ij})(i = 1, 2, ..., 6, j = 1, 2, 3, 4)$, as shown in Table 3, of the IV$^q$-RODHFNs $\tilde{d}_{ij}(i = 1, 2, ..., 6, j = 1, 2, 3, 4)$ in IV$^q$-RODHF decision matrix.

Step 2. Preference of attributes is also assigned [48]. Assume the specialists choose the following assignments:

![Figure 4: The specific steps of the proposed approach to MADM.](image-url)
Step 3. Determine the score functions \( \hat{S}(\hat{w})_{ij}(i, j = 1, 2, 3, 4) \) of the IV4-RODHFES \( \hat{d}_y(i, j = 1, 2, 3, 4) \) in IV4-RODHFPR \( \hat{H} \).

\[
\hat{S}(\hat{H}) = \begin{bmatrix}
- & - & 0.4971 & 0.5237 & 0.5628 \\
- & - & 0.5029 & 0.4954 & 0.5067 \\
0.4763 & 0.5046 & - & - & - \\
0.4732 & 0.4933 & 0.3970 & - & - \\
\end{bmatrix}.
\]

Step 4. The directed network of the assessment of the PSRR given in Fig. 6, and the directed network of assessment of the PSRR with scores in Fig. 7, indicate the preference of four attributes (digraph’s vertices) \( Q_1, Q_2, Q_3 \) and \( Q_4 \). The assessment of the PSRR attributes matrix is attained based on \( Q_j(j = 1, 2, 3, 4) \) and \( \hat{d}_y \) for each alternative PSRR, where \( Q_j \) is the value of \( j \)-th attribute indicated by the PSRR \( \lambda_y \) and \( \hat{d}_y \) is the preference of the \( i \)-th attribute over \( j \)-th attribute.

|     | \( Q_1 \)                                      | \( Q_2 \)                                      | \( Q_3 \)                                      | \( Q_4 \)                                      |
|-----|-----------------------------------------------|-----------------------------------------------|-----------------------------------------------|-----------------------------------------------|
| \( \lambda_1 \) | \([0.1, 0.2], [0.3, 0.4], [0.5, 0.6], [0.6, 0.7], [0.7, 0.8]\) | \([0.2, 0.3], [0.3, 0.4], [0.4, 0.5]\)       | \([0.2, 0.3], [0.3, 0.4], [0.4, 0.5]\)       | \([0.2, 0.3], [0.3, 0.4], [0.4, 0.5]\)       |

|     | \( Q_1 \)                                      | \( Q_2 \)                                      | \( Q_3 \)                                      | \( Q_4 \)                                      |
|-----|-----------------------------------------------|-----------------------------------------------|-----------------------------------------------|-----------------------------------------------|
| \( \lambda_1 \) | 0.3875                                         | 0.4942                                         | 0.5165                                         | 0.5164                                         |
| \( \lambda_2 \) | 0.5000                                         | 0.4824                                         | 0.3875                                         | 0.4954                                         |
| \( \lambda_3 \) | 0.3426                                         | 0.4581                                         | 0.4845                                         | 0.5072                                         |
| \( \lambda_4 \) | 0.5019                                         | 0.4968                                         | 0.5293                                         | 0.5640                                         |
| \( \lambda_5 \) | 0.5135                                         | 0.3828                                         | 0.4766                                         | 0.5192                                         |
| \( \lambda_6 \) | 0.5108                                         | 0.5058                                         | 0.5032                                         | 0.5135                                         |
Step 5. Substitute the values of \( \hat{Q}_1, \hat{Q}_2, \hat{Q}_3 \) and \( \hat{Q}_4 \) in above matrix \( \tilde{H} \), for six search and rescue robots \( \lambda_i \) \((i = 1, 2, \ldots, 6)\) and get

\[
\hat{S}(\tilde{H}^{(1)}) = \begin{bmatrix}
0.3875 & 0.4971 & 0.5237 & 0.5628 \\
0.5029 & 0.4942 & 0.4954 & 0.5067 \\
0.4763 & 0.5046 & 0.5165 & 0.6030 \\
0.4372 & 0.4933 & 0.3970 & 0.5164
\end{bmatrix}, \quad \hat{S}(\tilde{H}^{(2)}) = \begin{bmatrix}
0.5000 & 0.4971 & 0.5237 & 0.5628 \\
0.5029 & 0.4982 & 0.4954 & 0.5067 \\
0.4763 & 0.5046 & 0.3875 & 0.6030 \\
0.4372 & 0.4933 & 0.3970 & 0.4954
\end{bmatrix}.
\]
Step 6. Determine the permanent function values of $\tilde{H}(i) (i = 1, 2, ..., 6)$, that is, $\text{per}(\tilde{H}(1)) = 1.4209$, $\text{per}(\tilde{H}(2)) = 1.3864$, $\text{per}(\tilde{H}(3)) = 1.3356$, $\text{per}(\tilde{H}(4)) = 1.5555$, $\text{per}(\tilde{H}(5)) = 1.4051$ $\text{per}(\tilde{H}(6)) = 1.5107$. The search and rescue robots index values of different search and rescue robots are: $\lambda_1 = 1.4209$, $\lambda_2 = 1.3864$, $\lambda_3 = 1.3356$, $\lambda_4 = 1.5555$, $\lambda_5 = 1.4055$, $\lambda_6 = 1.5107$.

Step 7. Rank the search and rescue robots $\lambda_4 > \lambda_6 > \lambda_1 > \lambda_5 > \lambda_2 > \lambda_3$. The search and rescue robot number $\lambda_4$ is therefore the best choice for dealing with emergencies.

6.2. Comparative Analysis

To illustrate the superiority and advantage of our proposed approach, we compare the proposed approach with some existing methods in literature with IV $q$-RODHFSs. Xu et al. [11] proposed the decision making approach based on MM and dual MM operators with IV $q$-RODHF information. Wei et al. [49] set forward the decision making method based on Maclaurin symmetric mean (MSM) and dual MSM operators based on $q$-ROFS. Wei et al. [50] developed the MADM model utilizing Hamy mean (HM) and dual HM operators under DHPF circumstances. We have utilized these approaches to the above illustrative instance and compared the decision results with the developed method of this paper for IV $q$-RODHFGs. The results of these approaches are summarised in Table 4 and the effects of different methods on the score function and ranking results is shown in Figure 8.

Xu et al.'s [11], and Wei et al.'s [49] methods are based on IV $q$-RODFHSs and $q$-ROFSs, respectively. Wei et al.'s [50] method is based on DHPFSSs. As DHFSSs is a special case of $q$-RODHS. That is, when $q = 2$, then $q$-RODHS is converted to DHFSSs. Obviously, IV $q$-RODHS is progressively more general, and contains more information in the MADM process. Therefore, our developed method provides more general, and powerful information in MADM.

From this comparative study, the outcomes acquired by the proposed approach match with the existing ones which approve the created approach. Subsequently, to tackle the MADM problems, the proposed approach can be reasonably used. The curiosity of this DM approach is that we have built up a MADM model with the interrelated attributes and depicted various connections among the attributes by using the graphical structures with IV $q$-RODHF data. Our established approach’s merits are summarised as follows:

1. Evidently, the approach proposed is straightforward and has less data loss and therefore can be easily used in the IVF environment for other MAM problems.
2. Using graph theory is one of the advantages of the established approach.
3. More general decision-making scenarios can be accessibly represented by the IV $q$-RODHFSs of the established technique.
4. The permanent function has been used to describe the degree to which each alternative is preferred or even more awful than other alternatives.

Table 4  Comparative analysis.

| Methods                      | Score of Alternatives | Ranking of Alternatives |
|------------------------------|-----------------------|-------------------------|
| 1. Xu et al. [11] MM operator $(\lambda = (0.2, 0.3, 0.3, 0.2))$ | 0.4756 0.4640 0.4434 0.5224 0.4698 0.5077 | $\lambda_4 > \lambda_6 > \lambda_1 > \lambda_5 > \lambda_2 > \lambda_3$ |
| 2. Xu et al. [11] Dual MM operator | 0.4871 0.4728 0.4604 0.5253 0.4820 0.5078 | $\lambda_4 > \lambda_6 > \lambda_1 > \lambda_5 > \lambda_2 > \lambda_3$ |
| 3. Wei et al. [49] MSM operator $(x = 3)$ | 0.4806 0.4677 0.4512 0.5232 0.4749 0.5078 | $\lambda_4 > \lambda_6 > \lambda_1 > \lambda_5 > \lambda_2 > \lambda_3$ |
| 4. Wei et al. [49] Dual MSM operator $(x = 3)$ | 0.4863 0.4722 0.4593 0.5249 0.4811 0.5078 | $\lambda_4 > \lambda_6 > \lambda_1 > \lambda_5 > \lambda_2 > \lambda_3$ |
| 5. Wei et al. [50] Hamy mean operator $(x = 3)$ | 0.4771 0.4651 0.4457 0.5226 0.4714 0.5077 | $\lambda_4 > \lambda_6 > \lambda_1 > \lambda_5 > \lambda_2 > \lambda_3$ |
| 6. Wei et al. [50] Dual Hamy mean operator $(x = 3)$ | 0.4863 0.4722 0.4593 0.5249 0.4812 0.5078 | $\lambda_4 > \lambda_6 > \lambda_1 > \lambda_5 > \lambda_2 > \lambda_3$ |
| 7. Our developed method | 1.4214 1.3871 1.3361 1.5561 1.4061 1.5096 | $\lambda_4 > \lambda_6 > \lambda_1 > \lambda_5 > \lambda_2 > \lambda_3$ |
7. CONCLUSIONS

The IV \( q \)-RODHFHGs can not just manage decision maker’s hesitancy while deciding the MD and NMDs yet in addition gives decision makers more opportunity to express their assessments. The innovative concept of an interval-valued \( q \)-rung orthopair dual hesitant fuzzy graphs based on Hamacher operator called IV \( q \)-RODHFHGs is put forward in this paper. Certain novel concepts of energy such as Zagreb energy (Zagreb I energy and Zagreb II energy) and Harmonic energy of IV \( q \)-RODHFHGs are proposed. We originally modified the existing score function to score function for IV \( q \)-RODHFNs, to include the risk preference of the decision maker. Moreover, the proposed concepts of IV \( q \)-RODHFHGs were applied to solve the MADM problems with IV \( q \)-RODHF information. Finally, we applied the newly proposed concept of IV \( q \)-RODHFHGs to the PSRR to demonstrate its effectiveness and validity. Analysis of the comparison has been performed and the superiorities have been shown. The IV \( q \)-RODHFHG is a strong method for communicating the hesitation of decision-makers in the MADM process and can explain the fuzziness of networks well. In future, our research work will be extended to: (1) Complex hesitant fuzzy graphs; (2) Complex \( q \)-rung orthopair dual hesitant fuzzy graphs; and (3) Complex interval-valued \( q \)-rung orthopair dual hesitant fuzzy graphs.
