ON $C^{1+\alpha}$ REGULARITY OF SOLUTIONS OF ISAACS PARABOLIC EQUATIONS WITH VMO COEFFICIENTS

N.V. KRYLOV

Abstract. We prove that boundary value problems for fully nonlinear second-order parabolic equations admit $L_p$-viscosity solutions, which are in $C^{1+\alpha}$ for an $\alpha \in (0,1)$. The equations have a special structure that the “main” part containing only second-order derivatives is given by a positive homogeneous function of second-order derivatives and as a function of independent variables it is measurable in the time variable and, so to speak, VMO in spatial variables.

1. Introduction

In this article we take a function $H(u, t, x)$,

$$u = (u', u''), \quad u' = (u'_0, u'_1, \ldots, u'_d) \in \mathbb{R}^{d+1}, \quad u'' \in \mathcal{S}, \quad (t, x) \in \mathbb{R}^{d+1},$$

where $\mathcal{S}$ is the set of symmetric $d \times d$ matrices, and we are dealing with the parabolic equation

$$\partial_t v(t, x) + H[v](t, x)$$

$$:= \partial_t v(t, x) + H(v(t, x), Dv(t, x), D^2v(t, x), t, x) = f \quad (1.1)$$

in subdomains of $(0, T) \times \mathbb{R}^d$, where $T \in (0, \infty)$,

$$\mathbb{R}^d = \{x = (x_1, \ldots, x_d) : x_1, \ldots, x_d \in \mathbb{R}\},$$

$$\partial_t = \frac{\partial}{\partial t}, \quad D^2 u = (D_{ij} u), \quad Du = (D_i u), \quad D_i = \frac{\partial}{\partial x_i}, \quad D_{ij} = D_i D_j.$$

Our main goal is to establish the existence of $L_p$-viscosity solutions of boundary value problems associated with (1.1), solutions, which are in $C^{1+\alpha}$ for an $\alpha \in (0,1)$.

Let us briefly discuss what the author was able to find in the literature concerning this kind of regularity. The articles cited below contain a very large amount of information concerning all kinds of issues in the theory of fully nonlinear elliptic and parabolic equations, but we will focus only on one of them. Trudinger [12], [13] and Caffarelli [1] were the first authors who proved $C^{1+\alpha}$ regularity for fully nonlinear elliptic equations of type

$$F(u, Du, D^2 u, x) = f$$

2010 Mathematics Subject Classification. 35B65, 35D40.
Key words and phrases. Fully nonlinear equations, Hölder regularity of derivatives, viscosity solutions.

The author was partially supported by NSF Grant DMS-1160569.
without convexity assumptions on $F$. The assumptions in these papers are different. In [1] the function $F$ is independent of $u'$ and, for each $u''$ uniformly sufficiently close to a function which is continuous with respect to $x$. In [12] and [13] the function $F$ depends on all arguments but is Hölder continuous in $(u'_0, x)$. Next step in what concerns $C^{1+\alpha}$-estimates for the elliptic case was done by Świȩch [11], who considered general $F$, imposed the same condition as in [1] on the $x$-dependence, which is much weaker than in [12] and [13], but also imposed the Lipschitz condition on the dependence of $F$ on $u'_1, \ldots, u'_d$. In [12] and [13] only continuity with respect to $u'_1, \ldots, u'_d$ is assumed.

In case of parabolic equations interior $C^{1+\alpha}$-regularity was established by Wang [14] under the same kind of assumption on the dependence of $H$ on $(t, x)$ as in [1] and assuming that $H$ is almost independent of $u'_1, \ldots, u'_d$. Then Crandall, Kocan, and Świȩch [2] generalized the result of [14] to the case of full equation again as in [11] assuming that $H$ is uniformly sufficiently close to a function which is continuous with respect to $(t, x)$ and assuming the Lipschitz continuity of $H$ with respect to $u'_1, \ldots, u'_d$ and the continuity with respect to $u'_0$.

On the one hand, our class of equations is more narrow than the one in [2] because we require the “main” part of $H$, called $F$, be positive homogeneous of degree one. On the other hand, we do not require $H$ to be Lipschitz with respect to $u'_1, \ldots, u'_d$, the continuity with respect to $u'$ suffices. Also we only need $F$ to be measurable in $t$ and VMO in $x$, say, independent of $x$ and measurable in $t$.

Our methods are absolutely different from the methods of above cited articles. We do not use any ideas or facts from the theory of viscosity solutions. Instead we rely on the methodology brought into the theory of fully nonlinear equations by Safonov [9], [10] and on an idea behind the proof of the main Lemma 4.3 inspired by a probabilistic interpretation of solutions of (1.1). We only focus on interior estimates of solutions in smooth domains leaving to the interested reader investigation of the same issues in nonsmooth domains or near the boundary of sufficiently regular ones.

The article is organized as follows. Section 2 contains main results and some comments on them. In Section 3 we use a theorem from [8] to approximate the equations with $H$ and with its main part $F$ by those for which the solvability is known. We also leave to the interested reader carrying our results over to elliptic equations.

In Section 4 we show that the approximate principal equation with $F$ admits solutions locally well approximated in the sup norm by affine functions. This is the most important part of the article. Section 5 contains estimates of $C^{1+\alpha}$-norms of approximate equation with full $H$ and in Section 6 we give the proof of our main Theorem 2.1. The last Section 7 is actually an appendix, which we need in order to be able to represent positive homogeneous of order one functions depending on parameters, such as $F$, as supinf’s of affine...
functions whose coefficients inherit the regularity properties of the original function with respect to the parameters.

2. Main results

To state our main results, we introduce a few notation and assumptions. Fix a constant \( \delta \in (0, 1] \), and set
\[
\mathcal{S}_\delta = \{ a \in \mathbb{S} : \delta |\xi|^2 \leq a_{ij} \xi_i \xi_j \leq \delta^{-1} |\xi|^2, \quad \forall \xi \in \mathbb{R}^d \},
\]
where and everywhere in the article the summation convention is enforced.

**Assumption 2.1.** (i) The function \( H(u, t, x) \) is measurable with respect to \((t, x)\) for any \( u \) and Lipschitz continuous in \( u' \) for every \( u', (t, x) \in \mathbb{R}^{d+1} \).

(ii) For any \((t, x)\), at all points of differentiability of \( H(u, t, x) \) with respect to \( u'' \), we have \((H_{u''}) \in \mathcal{S}_\delta \).

(iii) There is a function \( \bar{H}(t, x) \) and a constant \( K_0 \geq 0 \) such that
\[
|H(u', 0, t, x)| \leq K_0 |u'| + \bar{H}(t, x).
\]

(iv) There is an increasing continuous function \( \omega(r), r \geq 0 \), such that
\[
|H(u', u'', t, x) - H(v', u'', t, x)| \leq \omega(|u' - v'|)
\]
for all \( u, v, t, \) and \( x \).

For \( R \in (0, \infty) \) and \((t, x) \in \mathbb{R}^{d+1} \) introduce
\[
B_R = \{ x \in \mathbb{R}^d : |x| < R \}, \quad B_R(x) = x + B_R,
\]
\[
C_R = (0, R^2) \times B_R, \quad C_R(t, x) = (t, x) + C_R.
\]
For a Borel set \( \Gamma \) in \( \mathbb{R}^{d+1} \) by \( |\Gamma| \) we denote its Lebesgue measure. Also for a function \( f \) on \( \Gamma \) we set
\[
\int_{\Gamma} f(t, x) \, dx \, dt = \frac{1}{|\Gamma|} \int_{\Gamma} f(t, x) \, dx \, dt
\]
in case \( \Gamma \) has a nonzero Lebesgue measure in \( \mathbb{R}^{d+1} \). Similar notation is used in case of functions \( f(x) \) on \( \mathbb{R}^d \).

We fix a constant \( R_0 \in (0, 1] \) and for \( \kappa \in (0, 2] \) and measurable \( f(t, x) \) introduce
\[
f_\kappa = \sup_{R \leq R_0, t, x} R^{2-\kappa} \left( \int_{C_R(t, x)} |f(s, y)|^{d+1} \, dy \, ds \right)^{1/(d+1)}.
\]

**Remark 2.1.** By Hölder’s inequality for \( p \geq d + 1 \)
\[
( \int_{C_R(t, x)} |f(s, y)|^{d+1} \, dy \, ds )^{1/(d+1)} \leq NR^{-(d+2)/p} \left( \int_{\mathbb{R}^{d+1}} |f(s, y)|^p \, dy \, ds \right)^{1/p},
\]
which shows that \( f_\kappa < \infty \) if \( f \in L_p(\mathbb{R}^{d+1}) \) and \( \kappa \leq 2 - (d+2)/p \). It is useful to observe that one can take \( \kappa > 1 \) if \( f \in L_p(\mathbb{R}^{d+1}) \) for \( p > d + 2 \).
In the following assumption there are three objects $\kappa_1 = \kappa(d, \delta) \in (1, 2)$, any $\kappa \in (1, \kappa_1]$, and $\theta = \theta(\kappa, d, \delta) \in (0, 1]$. The values of $\kappa_1$ and $\theta$ are specified later in the proof of Lemma 5.3.

**Assumption 2.2.** We have a representation

$$H(u, t, x) = F(u'', t, x) + G(u, t, x).$$

(i) The functions $F$ and $G$ are measurable functions of their arguments.

(ii) For all values of the arguments

$$|G(u, t, x)| \leq K_0 |u'| + \bar{H}(t, x)$$

and there exists a $\kappa \in (1, \kappa_1]$ such that $\bar{H}_\kappa < \infty$.

(iii) The function $F$ is positive homogeneous of degree one with respect to $u''$, is Lipschitz continuous with respect to $u''$, and at all points of differentiability of $F$ with respect to $u''$ we have $F_{u''} \in S_{\delta}$.

(iv) For any $R \in (0, R_0]$, $(t, x) \in \mathbb{R}^{d+1}$, and $u'' \in S$ with $|u''| = 1$ ($|u''| := (\text{tr} u'' u'')^{1/2}$), we have

$$\theta_{R,t,x} := \int_{C_R(t,x)} |F(u'', s, y) - \bar{F}_{R,x}(u'', s)| ds dy \leq \theta,$$

where

$$\bar{F}_{R,x}(u'', s) = \int_{B_R(x)} F(u'', s, y) dy.$$

**Remark 2.2.** Assumption 2.2 (ii) is stronger than Assumption 2.1 (iii) which is singled out for methodological purposes.

Also observe that one can take $\theta = 0$ in Assumption 2.2 (iv) if $F$ is independent of $x$.

Fix a $T \in (0, \infty)$ and for domains $\Omega \in \mathbb{R}^d$ define

$$\Omega_T = (0, T) \times \Omega, \quad \partial^\prime \Omega_T = \tilde{\Omega}_T \setminus \{0\} \times \Omega.$$  

For $\kappa \in (0, 1]$ and functions $\phi(t, x)$ on $\tilde{\Omega}_T$ set

$$[\phi]_{C^\kappa(\tilde{\Omega}_T)} = \sup_{(t, x), (s, y) \in \Omega_T} \frac{|\phi(t, x) - \phi(s, y)|}{|t - s|^{\kappa/2} + |x - y|^{\kappa}}, \quad \|\phi\|_{C^1(\Omega_T)} = \sup_{\Omega_T} |\phi|,$n

$$\|\phi\|_{C^\kappa(\tilde{\Omega}_T)} = \|\phi\|_{C^1(\Omega_T)} + [\phi]_{C^\kappa(\tilde{\Omega}_T)}.$$  

For $\kappa \in (1, 2]$ and sufficiently regular $\phi$ set

$$[\phi]_{C^\kappa(\tilde{\Omega}_T)} = \sup_{t, s \in [0, T], x \in \mathbb{R}^d} \frac{|\phi(t, x) - \phi(s, x)|}{|t - s|^{\kappa/2}} + \sup_{x, y \in \Omega, t \in [0, T]} \frac{|D\phi(t, x) - D\phi(t, y)|}{|x - y|^{\kappa-1}}, \quad \|\phi\|_{C^\kappa(\tilde{\Omega}_T)} = \|\phi\|_{C^1(\Omega_T)} + [\phi]_{C^\kappa(\tilde{\Omega}_T)}.$$  

The set of functions with finite norm $\|\cdot\|_{C^\kappa(\tilde{\Omega}_T)}$ is denoted by $C^\kappa(\tilde{\Omega}_T)$. 

Remark 2.3. According to the above notation $C^2(\bar{\Omega}_T)$ is not what is usually meant. Therefore, we are going to use the symbol $W^{1,2}_\infty(\Omega_T) \cap C(\bar{\Omega}_T)$ instead for the space provided with norm $\| \cdot \|_{C^2(\bar{\Omega}_T)}$. One should keep this in mind when we consider all $\kappa \in (0, 2]$ at once.

For sufficiently regular functions $\phi(t, x)$ we set

$$H[\phi](t, x) = H(\phi(t, x), D\phi(t, x), D^2\phi(t, x), t, x).$$

(2.1)

Similarly we introduce $F[\phi]$ and other operators if we are given functions of $u, t, x$.

Everywhere below $\Omega$ is a bounded $C^2$ domain in $\mathbb{R}^d$ and $T \in (0, \infty)$. The following is the main result of the paper. We refer the reader to [2] for the definition of $L^p$-viscosity solutions and their numerous properties.

Theorem 2.1. Let $g \in W^{1,2}_\infty(\Omega_T) \cap C(\bar{\Omega}_T)$. Then there is a function $v \in C^\kappa_{\text{loc}}(\Omega_T) \cap C(\bar{\Omega}_T)$ which, for any $p > d + 2$, is an $L^p$-viscosity solution of the equation

$$\partial_t v + H[v] = 0$$

(2.2)

in $\Omega_T$ (a.e.) with boundary condition $v = g$ on $\partial \Omega_T$.

Furthermore, for any $r, R \in (0, R_0]$ satisfying $r < R$ and $(t, x) \in \Omega_T$ such that $C_R(t, x) \subset \Omega_T$ we have

$$[v]_{C^\kappa(C_r(t,x))} \leq N(R-r)^{-\kappa} \sup_{C_R(t,x)} |v| + N\bar{H}_{\kappa},$$

(2.3)

where $N$ depend only on $d, \delta, K_0$, and $\kappa$ (in particular, independent of $\omega$).

Remark 2.4. A typical example of applications of Theorem 2.1 arises in connection with the theory of stochastic differential games where the so-called Isaacs equations play a major role. To describe a particular case of these equations, assume that we are given countable sets $A$ and $B$, and, for each $\alpha \in A$ and $\beta \in B$, we have an $S_\delta$-valued function $a^{\alpha\beta}(t, x)$ defined on $\mathbb{R}^{d+1}$ and a real-valued function $G^{\alpha\beta}(u', t, x)$ defined for $u', (t, x) \in \mathbb{R}^{d+1}$. Suppose that these functions are measurable and Assumption 2.2 (ii) is satisfied with $\bar{G}^{\alpha\beta}$ in place of $G$ for any $\alpha \in A$ and $\beta \in B$ (and $\bar{H}$ independent of $\alpha \in A$ and $\beta \in B$). Also suppose that Assumption 2.1 (iv) is satisfied with the same function $\omega$ and with $G^{\alpha\beta}$ in place of $H$ for any $\alpha \in A$ and $\beta \in B$. Finally, suppose that for any $R \in (0, R_0]$ and $(t, x) \in \mathbb{R}^{d+1}$

$$\int_{C_R(t,x)} \sup_{\alpha \in A} \sup_{\beta \in B} |a^{\alpha\beta}(s, y) - \bar{a}^{\alpha\beta}(s)| dsdy \leq \theta,$$

where

$$\bar{a}^{\alpha\beta}(s) = \int_{B_R} a^{\alpha\beta}(s, y) dy.$$

Upon introducing

$$F(u'', t, x) = \sup_{\alpha \in A} \inf_{\beta \in B} a^{\alpha\beta}_{ij}(t, x) u''_{ij},$$
\[ G(u, t, x) = \sup_{\alpha \in A} \inf_{\beta \in B} \left[ a_{ij}^{\alpha \beta}(t, x) u''_{ij} + G^{\alpha \beta}(u', t, x) \right] - F(u'', t, x) \]

one easily sees that Theorem 2.1 is applicable to the equation
\[ \partial_t v + \sup_{\alpha \in A} \inf_{\beta \in B} \left[ a_{ij}^{\alpha \beta}(t, x) D^2_{ij} v + G^{\alpha \beta}(v, Dv, t, x) \right] = 0. \]

This example is close to the one from the introduction in [2] and is more general, because \( G^{\alpha \beta} \) are not assumed to be linear in \( u' \). On the other hand, we suppose that Assumption 2.2 (ii) is satisfied with \( G^{\alpha \beta} \) in place of \( G \) uniformly in \( \alpha, \beta \). In the situation of [2] only
\[ \left( \sup_{\alpha \in A} \inf_{\beta \in B} G^{\alpha \beta}(0, \cdot, \cdot) \right)_{\kappa} < \infty \]

is required.

Remark 2.5. Assumption 2.2 (iii), (iv) can be replaced with the following which turns out to be basically weaker (cf. (3.3)): There exist countable sets \( A \) and \( B \) and functions \( a_{ij}^{\alpha \beta}(t, x) \) satisfying the conditions of Remark 2.4 and there are numbers \( f^{\alpha \beta} \) (independent of \( (t, x) \)) such that
\[ F(u'', t, x) = \sup_{\alpha \in A} \inf_{\beta \in B} \left[ a_{ij}^{\alpha \beta}(t, x) u''_{ij} + f^{\alpha \beta} \right] \quad \text{and} \quad F(0, t, x) \equiv 0. \]

3. Auxiliary equations

In the first result of this section only Assumptions 2.1 is used. By Theorem 2.1 of [8] there exists a convex positive homogeneous of degree one function \( P(u'') \) such that at all points of differentiability of \( P \) with respect to \( u'' \) we have \( P_{u''}(u'') \in \mathbb{S}_\delta \), where \( \delta = \delta(d, \delta) \in (0, \delta/4) \) and such that the following fact holds in which by \( P[v] \) we mean a differential operator constructed as in (2.1).

**Theorem 3.1.** Let \( K \geq 0 \) be a fixed constant, \( g \in W^{1,2}_{\infty}(\Omega_T) \cap C(\overline{\Omega_T}) \). Assume that \( \bar{H} \) is bounded. Then the equation
\[ \partial_t v + \max(\bar{H}[v], P[v] - K) = 0 \]

in \( \Omega_T \) with boundary condition \( v = g \) on \( \partial \Omega_T \) has a solution \( v \in C(\overline{\Omega_T}) \cap W^{1,2}_{\infty, loc}(\Omega_T) \). In addition,
\[ |v|, |Dv|, \rho|D^2v|, |\partial_t v| \leq N(\sup_{\Omega_T} \bar{H} + K + \|g\|_{C^{1,1}(\Omega_T)}) \quad \text{in} \quad \Omega_T \quad (\text{a.e.}), \]

where \( \rho = \rho(x) = \text{dist}(x, \mathbb{R}^d \setminus \Omega) \) and \( N \) is a constant depending only on \( \Omega, T, K_0, \) and \( \delta \) (in particular, independent of \( \omega \)).

Theorem 3.1 is applicable to the equation
\[ \partial_t u + \max(F[u], P[u] - K) = 0, \]

which we want to rewrite in a different form.
First we observe that if in Section 7 we take \( B = \{0\} \times S_\delta \), take a strictly convex open set \( B'_0 \) in \( S \) such that \( S_\delta \subset B'_0 \subset S_{\delta/2} \), and set \( B_0 = \{0\} \times B'_0 \), then by Theorem 7.2 we have

\[
F(u''(t, x)) = \sup_{\alpha \in A_1} \inf_{\beta \in B} a_{ij}^{\alpha \beta}(t, x)u''_{ij}, \quad \bar{F}(u''(t)) = \sup_{\alpha \in A_1} \\inf_{\beta \in B} \bar{a}_{ij}^{\alpha \beta}(t)u''_{ij},
\]

where \( A_1 = S \), for \( \alpha \in A_1 \) and \( \beta = (0, \beta') \in B \),

\[
a^{\alpha \beta}(t, x) = \lambda^{\alpha \beta}(t, x)\beta' + (1 - \lambda^{\alpha \beta}(t, x))G(u'^{(\alpha)}),
\]

\[
\bar{a}^{\alpha \beta}(t) = \bar{\lambda}^{\alpha \beta}(t, x)\beta' + (1 - \bar{\lambda}^{\alpha \beta}(t, x))G(u'^{(\alpha)}),
\]

\[
G(u'') = \sup_{\beta \in B_0} \beta''_{ij}u''_{ij},
\]

\[
\lambda^{\alpha \beta}(t, x) = 1 - G(\alpha) - F(\alpha, t, x)\left(\frac{0}{0} = 1\right),
\]

and \( \bar{\lambda}^{\alpha \beta}(t) \) is defined similarly. From Section 7 we also know that, for a constant \( \mu > 0 \), we have \( G(\alpha) - \beta''_{ij}^{\alpha \beta} \geq \mu |\alpha| \) if \( \beta = (0, \beta') \in B \) and \( \alpha \in A_1 \).

Next, since \( P(u'') \) is positive homogeneous, convex, and \( P_{u''} \in S_\delta \), there exists a closed set \( A_2 \subset S_\delta \) such that

\[
P(u'') = \sup_{\alpha \in A_2} \alpha^{\alpha \beta}u''_{ij}.
\]

For uniformity of notation introduce \( \bar{A} \) as a disjoint union of \( A_1 \) and \( A_2 \) and for \( \beta \in B \) and \( \alpha \in A_2 \) set

\[
a^{\alpha \beta}(t, x) = \bar{a}^{\alpha \beta}(t) = \alpha, \quad f^{\alpha \beta} = 0.
\]

Also for \( \alpha \in \bar{A} \) and \( \beta \in B \) introduce \( \sigma^{\alpha \beta}(t, x) = [a^{\alpha \beta}(t, x)]^{1/2}, \quad \bar{\sigma}^{\alpha \beta}(t) = [\bar{a}^{\alpha \beta}(t)]^{1/2}, \quad L^{\alpha \beta}v(t, x) = a_{ij}^{\alpha \beta}(t, x)D_{ij}v(t, x) \), \( \bar{L}^{\alpha \beta}v(t, x) = \bar{a}_{ij}^{\alpha \beta}(t, x)D_{ij}v(t, x) \).

Next we have the following which is essentially Remark 3.1 of [3] with the proof based on the positive homogeneity and Lipschitz continuity of \( F \) with respect to \( u'' \).

**Lemma 3.2.** There is a function \( \theta = \theta(\mu) = \theta(\mu, d, \delta) > 0 \) defined for \( \mu > 0 \) such that Assumptions 2.2 (i), (iii), (iv) being satisfied with this \( \theta(\mu) \) implies that for any \( R \in (0, R_0] \) and \( (t, x) \in \mathbb{R}^{d+1} \)

\[
\int_{C_{R}(t, x) \setminus \partial C_{R}(t, x)} \frac{|F(u''(s, y)) - \bar{F}_{R,x}(u''(s))|}{u''} d\sigma dy \leq \mu.
\]

Note that by Lemma 3.2 and Theorem 7.3 for any \( R \in (0, R_0] \) and \( (t, x) \in \mathbb{R}^{d+1} \)

\[
\mu_{R,t,x} := \int_{C_{R}(t, x)} \sup_{\alpha \in \bar{A}, \beta \in B} |a^{\alpha \beta}(s, y) - \bar{a}^{\alpha \beta}(s)| d\sigma dy \leq N\mu,
\]

where the constant \( N \) depends only on \( d \) and \( \delta \). On \( S_\delta \) the function \( a^{1/2} \) is Lipschitz continuous and therefore (3.3) also holds if we replace \( a \) with \( \sigma \).
Finally, observe that equation (3.2) is easily rewritten as
\[ \partial_t u + \sup_{\alpha \in A} \inf_{\beta \in B} \left[ L^{\alpha\beta} u(t, x) + f^{\alpha\beta}_K \right] = 0, \]  
(3.4)
where \( f^{\alpha\beta}_K = -KI_{\alpha \in A_2} \).

4. MAIN ESTIMATE FOR SOLUTIONS OF (3.2)

Take \( R, K \in (0, \infty) \) and \( g \in W^{1,2}_\infty(\mathbb{C}_R) \cap C(\mathbb{C}_R) \). By Theorem 3.1 there exists \( u \in W^{1,2}_\infty,loc(\mathbb{C}_R) \cap C(\mathbb{C}_R) \) such that \( u = g \) on \( \partial \mathbb{C}_R \) and equation (3.2) holds (a.e.) in \( \mathbb{C}_R \). By the maximum principle such \( u \) is unique.

Here is the main result of this section.

**Theorem 4.1.** There exist constants \( \kappa_0 \in (1, 2] \) and \( N \in (0, \infty) \) depending only on \( d \) and \( \delta \) such that for each \( r \in (0, R] \) one can find an affine function \( \hat{u} = \hat{u}(x) \) such that
\[ |u - \hat{u}| \leq N(\mu_R^0(6d+6) \vee \mu_R^1(6d+6))|g|_{C^{\kappa}(\mathbb{C}_R)}R^\kappa + Nr^{\kappa_0}(R-r)^{-\kappa_0 \text{osc} \left( g - \hat{g} \right)} \]
in \( \overline{\mathbb{C}}_r \) for any \( \kappa \in (0, 2) \), where \( \mu_R = \mu_{R, 0, 0} \) and \( \hat{g} = \hat{g}(x) \) is any affine function of \( x \).

By using parabolic dilations one easily sees that one may take \( R = 1 \). In that case we first prove a few auxiliary results. Introduce \( \bar{u} \) as a unique solution of (3.2) (in \( C_1 \)) with \( \bar{F} \) in place of \( F \) and the same boundary condition on \( \partial \mathbb{C}_1 \). Below by \( N \) with occasional subscripts we denote various constants depending only on \( d \) and \( \delta \).

**Lemma 4.2.** Let \( \kappa \in (0, 2) \) and
\[ |g|_{C^{\kappa}(\mathbb{C}_1)} = 1. \]  
(4.1)
Then for any \( \varepsilon > 0 \) there exists an infinitely differentiable function \( g^\varepsilon \) on \( \mathbb{R}^{d+1} \) such that in \( \mathbb{C}_1 \)
\[ |g - g^\varepsilon| \leq N\varepsilon^\kappa, \quad |\partial g^\varepsilon| + |D^2 g^\varepsilon| + \varepsilon|D^3 g^\varepsilon| + \varepsilon|D\partial g^\varepsilon| \leq N\varepsilon^{\kappa-2}, \]  
(4.2)
where \( N \) depends only on \( d \). Furthermore, for \( w = u, \bar{u} \) in \( \mathbb{C}_1 \) we have
\[ |w(t, x) - g^\varepsilon(t, x)| \leq N\varepsilon^{\kappa-2}(1 - |x|^2)^{\kappa/2} + N\varepsilon^\kappa. \]  
(4.3)

Proof. The first assertion is well known and is obtained by first continuing \( g(t, x) \) as a function of \( t \) to \( \mathbb{R} \) to become an even 2-periodic function, then continuing thus obtained function across \( |x| = 1 \) almost preserving (4.1) in the whole space and then taking convolutions with \( \delta \)-like kernels.

Then, since \( K \geq 0 \), for \( w^\varepsilon = u - g^\varepsilon \) we have
\[ \partial_t w^\varepsilon + \partial g^\varepsilon + \max\left[ F(D^2 w^\varepsilon + D^2 g^\varepsilon), P(D^2 w^\varepsilon + D^2 g^\varepsilon) \right] \geq 0, \]
which in light of (4.2) implies that
\[ \partial_t w^\varepsilon + \max\left[ F[w^\varepsilon], P[w^\varepsilon] \right] \geq -N_1\varepsilon^{\kappa-2}. \]
Next, it is easily seen that there is a constant $N (= N(d, \delta))$ such that for $\varphi^\varepsilon(t, x) = N N_1 \varepsilon^{\kappa-2}(1 - |x|^2)$ we have
\[
\partial_t \varphi^\varepsilon + \max\{F[\varphi^\varepsilon], P[\varphi^\varepsilon]\} \leq -N_1 \varepsilon^{\kappa-2}
\]
in $C_1$. It follows by the parabolic Alexandrov maximum principle that in $C_1$
\[
w^\varepsilon \leq \varphi^\varepsilon + \sup_{\partial^c C_1}(w^\varepsilon - \varphi^\varepsilon), \quad u \leq g^\varepsilon + N_1 \varepsilon^{\kappa-2}(1 - |x|^2) + N_2 \varepsilon^\kappa,
\]
where $N$ depends only on $d$ and $\delta$.

On the other hand,
\[
\partial_t w^\varepsilon + \partial_t g^\varepsilon + F(D^2 w^\varepsilon + D^2 g^\varepsilon) \leq 0,
\]
and with perhaps different constant in the formula for $\varphi^\varepsilon$
\[
w^\varepsilon \geq -\varphi^\varepsilon + \inf_{\partial^c C_1}(\varphi^\varepsilon + w^\varepsilon), \quad u \geq g^\varepsilon - N_1 \varepsilon^{\kappa-2}(1 - |x|^2) - N_2 \varepsilon^\kappa,
\]
which along with (4.4) yields (4.3) for $w = u$. The proof of (4.3) for $w = \tilde{u}$ is identical and the lemma is proved.

**Lemma 4.3.** For any $\kappa \in (0, 2]$ in $\bar{C}_1$ we have
\[
|u - \tilde{u}| \leq N(\mu_1^{\kappa/(6d+6)} \vee \mu_1^{1/(d+1)})[g]_{C^\kappa(\bar{C}_1)}.
\]

Proof. To simplify some formulas observe that if $[g]_{C^\kappa(\bar{C}_1)} = 0$, then $g$ is an affine function of $x$ independent of $t$, so that $u = \tilde{u} = g$ and we have nothing to prove. However, if $[g]_{C^\kappa(\bar{C}_1)} > 0$, we can divide equation (3.2) by this quantity, and, since our assertion means, in particular, that $N$ in (4.5) is independent of $K$, we can reduce the general situation to the one in which (4.1) holds. Therefore, below we assume (4.1).

On sufficiently regular functions $u(t, x, \bar{x})$, $t \in \mathbb{R}$, $x, \bar{x} \in \mathbb{R}^d$, introduce
\[
\Phi[u](t, x, \bar{x}) = \sup_{\alpha \in \Lambda} \inf_{\beta \in B} \left[\mathcal{L}^{\alpha\beta}u(t, x, \bar{x}) + f_K\right],
\]
where
\[
\mathcal{L}^{\alpha\beta}u(t, x, \bar{x}) = a^{\alpha\beta}_{ij}(t, x)D_{ij}^x u(t, x, \bar{x}) + \tilde{a}^{\alpha\beta}_{ij}(t, x, \bar{x})D_{ij}^\bar{x} u(t, x, \bar{x})
\]
\[
+ \hat{\alpha}^{\alpha\beta}(t, x, \bar{x})D_{ij}^\bar{x} u(t, x, \bar{x}) + \tilde{a}^{\alpha\beta}_{ij}(t)D_{ij}^\bar{x} u(t, x, \bar{x}),
\]
\[
D_{ij}^x = \frac{\partial^2}{\partial x_i \partial x_j}, \quad D_{ij}^\bar{x} = \frac{\partial^2}{\partial \bar{x}_i \partial x_j}, \quad D_{ij}^{\bar{x} \bar{x}} = \frac{\partial^2}{\partial \bar{x}_i \partial \bar{x}_j}, \quad D_{ij}^\bar{x} = \frac{\partial^2}{\partial x_i \partial \bar{x}_j}.
\]

Observe that for $\lambda, \bar{\lambda} \in \mathbb{R}^d$ we have
\[
a_{ij}^{\alpha\beta} \lambda_i \lambda_j + a_{ij}^{\alpha\beta} \lambda_i \bar{\lambda}_j + \tilde{a}_{ij}^{\alpha\beta} \lambda_i \lambda_j + \hat{\alpha}_{ij}^{\alpha\beta} \lambda_i \bar{\lambda}_j = |\sigma^{\alpha\beta} \lambda + \tilde{\sigma}^{\alpha\beta} \bar{\lambda}|^2 \geq 0,
\]
so that $\Phi$ is a (degenerate) elliptic operator.

Next let $w \in W^{1,2}_{d+1}(C_1) \cap C(\overline{C}_1)$ be a solution of the equation

$$\partial_t w + \sup_{\alpha \in A} \sup_{\beta \in B} L^{\alpha \beta} w = - \sup_{\alpha \in A} \sup_{\beta \in B} |a^{\alpha \beta} - \bar{a}^{\alpha \beta}| =: -h$$

in $C_1$ with zero boundary condition on $\partial^* C_1$. Such a unique solution exists by Theorem 1.1 of [3] and by the parabolic Alexandrov estimate and (3.3) we have in $C_1$ that

$$0 \leq w \leq N \mu_1^{1/(d+1)}. \quad (4.6)$$

One of reasons we need the function $w$ is that, as is easy to see, there is a $\lambda > 0$ depending only on $d$ and $\delta$ such that for all $\alpha, \beta$ on $C_1$ we have

$$\partial_t (\lambda w(t, x) + |x - \bar{x}|^2) + L^{\alpha \beta}(t, x, \bar{x})(\lambda w(t, x) + |x - \bar{x}|^2)$$

$$= \lambda(\partial_t w + L^{\alpha \beta} w)(t, x) + 2|\sigma^{\alpha \beta}(t, x) - \sigma^{\alpha \beta}(t)| \leq 0,$$

where the inequality follows from the fact that $a^{1/2}$ is a Lipschitz continuous function on $\bar{S}_\delta$, so that $|\sigma^{\alpha \beta} - \sigma^{\alpha \beta}| \leq N |a^{\alpha \beta} - \bar{a}^{\alpha \beta}| \leq N |a^{\alpha \beta} - \bar{a}^{\alpha \beta}|$.

After that we proceed in two steps.

**Step 1. Estimate of $u - \bar{u}$ from above.** According to Lemma 4.2 for $|\bar{x}| = 1$ and $|x| \leq 1$ we have

$$u(t, x) \leq g_\varepsilon(t, x) + N \varepsilon^{\kappa-2}(1 - |x|^2) + N \varepsilon^{\kappa}$$

$$\leq g_\varepsilon(t, x) + N \varepsilon^{\kappa-2}|x - \bar{x}| + N \varepsilon^{\kappa},$$

where

$$\varepsilon^{\kappa-2}|x - \bar{x}| \leq \varepsilon^{\kappa-4}|x - \bar{x}|^2 + \varepsilon^{\kappa},$$

so that

$$u(t, x) \leq g_\varepsilon(t, x) + N \varepsilon^{\kappa-4}|x - \bar{x}|^2 + N \varepsilon^{\kappa}.$$

This inequality also obviously holds if $|x| = 1$, $|\bar{x}| \leq 1$ or if $t = 1$ and $|x|, |\bar{x}| \leq 1$. This shows that for $\varepsilon \in (0, 1)$

$$u^\varepsilon(t, x, \bar{x}) := u(t, x) - g_\varepsilon(t, x) - g_\varepsilon(t, \bar{x}) + N \varepsilon^{\kappa-6}e^{-t}|x - \bar{x}|^2 + N \varepsilon^{\kappa} \leq g_\varepsilon(t, \bar{x})$$

on $\partial'(0, 1) \times C^2_\varepsilon$. Actually, above we could have replaced $\varepsilon^{\kappa-6}$ with $\varepsilon^{\kappa-4}$ but later on we will need to deal with terms of order $\varepsilon^{\kappa-6}|x - \bar{x}|^2$ anyway. Also observe that for $\varepsilon \in (0, 1)$,

$$I^\varepsilon(t, x, \bar{x}) := \partial_t u^\varepsilon(t, x, \bar{x}) + \Phi[u^\varepsilon](t, x, \bar{x}) = \partial_t u(t, x) + \partial_t g_\varepsilon(t, x) - \partial_t g_\varepsilon(t, x)$$

$$+ N \varepsilon^{\kappa-6}e^{-t}|x - \bar{x}|^2 + \sup_{\alpha \in A} \inf_{\beta \in B} \left[ a^{\alpha \beta}_{ij} D_{ij} u(t, x) + \bar{a}^{\alpha \beta}_{ij} D_{ij} g_\varepsilon(t, \bar{x}) - a^{\alpha \beta}_{ij} D_{ij} g_\varepsilon(t, x) \right]$$

$$- N \varepsilon^{\kappa-6}e^{-t}|\sigma^{\alpha \beta}(t, x) - \bar{\sigma}^{\alpha \beta}(t)|^2 + f^{\alpha \beta}_K,$$

where

$$|a^{\alpha \beta}_{ij} D_{ij} g_\varepsilon(t, \bar{x}) - a^{\alpha \beta}_{ij} D_{ij} g_\varepsilon(t, x)| \leq |\bar{a}^{\alpha \beta}(t) - a^{\alpha \beta}(t, x)| |D^2 g_\varepsilon(t, x)|$$
+N|D^2g^\varepsilon(t, x) - D^2g^\varepsilon(t, \bar{x})| \leq N\varepsilon^{-2}h(t, x) + N\varepsilon^\kappa|x - \bar{x}|,

|\partial_t g^\varepsilon(t, \bar{x}) - \partial_t g^\varepsilon(t, x)| \leq N\varepsilon^{-\kappa}|x - \bar{x}|,

-N\varepsilon^{-\kappa}|x - \bar{x}| + N\varepsilon^{-\kappa^2}|x - \bar{x}|^2 \geq -N\varepsilon^\kappa.

It follows that for \varepsilon \in (0, 1),

$$I^\varepsilon(t, x, \bar{x}) \geq \partial_t u(t, x) + \sup_{\alpha \in A} \inf_{\beta \in B} \left[ L^{\alpha \beta} u(t, x) + f^{\alpha \beta}_K \right]$$

$$-N\varepsilon^{-\kappa} h - N\varepsilon^\kappa = -N_1\varepsilon^{-\kappa} h - N_1\varepsilon^\kappa$$
in (0, 1) \times C_1^2.

On the other hand,

$$\bar{u}(t, \bar{x}) \geq g^\varepsilon(t, \bar{x}) - N\varepsilon^{-\kappa}(1 - |\bar{x}|^2) - N\varepsilon^\kappa,$$

which implies that

$$\bar{u}^\varepsilon(t, x, \bar{x}) := \bar{u}(t, \bar{x}) + N\varepsilon^{-\kappa}((1 + \lambda)w(t, x) + |x - \bar{x}|^2)$$

$$+N_2(2 - t)\varepsilon^\kappa \geq g^\varepsilon(t, \bar{x})$$
on \partial'(0, 1) \times C_1^2. It is also easily seen that by increasing N_2 if needed (which does not violate the above inequality) we may assume that in (0, 1) \times C_1^2

$$\partial_t \bar{u}^\varepsilon(t, x, \bar{x}) + \Phi[\bar{u}^\varepsilon](t, x, \bar{x}) \leq -N_1\varepsilon^{-\kappa} h - N_1\varepsilon^\kappa.$$

Hence, by the maximum principle (see, for instance, Theorem 2.1 of [5] or Theorem 3.4.2 of [6]) in [0, 1] \times C_1^2 we have

$$\bar{u}(t, x) + N\varepsilon^{-\kappa} h(t, x) + |x - \bar{x}|^2) + N\varepsilon^\kappa \geq u(t, x)$$

$$-g^\varepsilon(t, x) - g^\varepsilon(t, \bar{x}) + N\varepsilon^{-\kappa} |x - \bar{x}|^2 + N\varepsilon^\kappa,$$

which for \( x = \bar{x} \) in light of (4.6) yields

$$u(t, x) - \bar{u}(t, \bar{x}) \leq N(\varepsilon^\kappa + \varepsilon^{-\kappa} h_{1/(d-1)}).$$

If \( \mu_1 \leq 1 \), then for \( \varepsilon = \mu_1^{1/(6d+6)} (\leq 1) \) we get \( u - \bar{u} \leq N\mu_1^{1/(6d+6)} \) and if \( \mu_1 \geq 1 \), then for \( \varepsilon = 1 \) we obtain \( u - \bar{u} \leq N\mu_1^{1/(d+1)} \), so that generally

$$u - \bar{u} \leq N(\mu_1^{1/(6d+6)} \lor \mu_1^{1/(d+1)}).$$

Step 2. Estimate of \( u - \bar{u} \) from below. Notice that

$$\bar{v}^\varepsilon(t, x, \bar{x}) := \bar{u}(t, \bar{x}) - N\varepsilon^{-4}((\lambda w(t, x) + |x - \bar{x}|^2) - N\varepsilon^\kappa \leq g^\varepsilon(t, \bar{x})$$
on \partial'(0, 1) \times C_1^2. It is also easily seen that in (0, 1) \times C_1^2

$$\partial_t \bar{v}^\varepsilon(t, x, \bar{x}) + \Phi[\bar{v}^\varepsilon](t, x, \bar{x}) \geq 0.$$

On the other hand,

$$v^\varepsilon(t, x, \bar{x}) := u(t, x) - [g^\varepsilon(t, x) - g^\varepsilon(t, \bar{x})]$$
we conclude

$$+ N \varepsilon^{\kappa - 6} e^{1-t} \left( (1 + \lambda) w(t, x) + |x - \bar{x}|^2 \right) + N(2 - t) \varepsilon^\kappa \geq g^\varepsilon(t, \bar{x})$$
onumber

on \( \partial'[(0, 1) \times C^2_1] \) and the above computations show that (for sufficiently large \( N \))

$$\partial_t v^\varepsilon(t, x, \bar{x}) + \Phi[v^\varepsilon](t, x, \bar{x}) \leq 0$$

in \((0, 1) \times C^2_1\). By the maximum principle \( \bar{v}^\varepsilon \leq v^\varepsilon \), which leads to the desired estimate of \( u - \bar{u} \) from below and the lemma is proved.

**Lemma 4.4.** There exist constants \( \kappa_0 \in (1, 2) \) and \( N \in (0, \infty) \) depending only on \( d \) and \( \delta \) such that for any \( r \in (0, 1) \)

$$[\hat{u}]_{C^{\kappa_0}(\bar{C}_r)} \leq N(1 - r)^{-\kappa_0} \sup_{\bar{C}_1} (g - \hat{g}), \quad (4.7)$$

where \( \hat{g} = \hat{g}(x) \) is an affine function of \( x \).

**Proof.** First observe that \( \bar{u} - \hat{g} \) satisfies the same equation as \( \bar{u} \) and the \( C^\kappa(\bar{C}_r) \)-seminorms of these functions coincide if \( \kappa \in (1, 2) \). It follows that we may concentrate on \( \hat{g} \equiv 0 \).

For any \( \rho \in (0, 1) \) the function \( \delta_\rho \bar{u} \) satisfies an equation of type

$$\partial_t \delta_{\rho, l,h} \bar{u} + a_{ij} D_{ij} \delta_{\rho, l,h} \bar{u} = 0$$

in \( C_\rho \) with some \( (a_{ij}) \) taking values in \( S_\delta \) if \( h \) is sufficiently small. By Corollary 4.3.6 of [6] for such \( h \) and \( r \in (0, \rho) \) we have

$$[\delta_{\rho, l,h} \bar{u}]_{C^\gamma(\bar{C}_r)} \leq N(\rho - r)^{-\gamma} \sup_{\bar{C}_\rho} |\delta_{\rho, l,h} \bar{u}|,$$

where \( N \) and \( \gamma \in (0, 1) \) depend only on \( \delta \) and \( d \). By letting \( h \to 0 \) we conclude

$$[D\bar{u}]_{C^\gamma(\bar{C}_r)} \leq N(\rho - r)^{-\gamma} \sup_{\bar{C}_\rho} |D\bar{u}|. \quad (4.8)$$

Next observe that for any function \( f(x) \) of one variable \( x \in [0, \varepsilon] \), \( \varepsilon > 0 \), we have

$$|f'(0)| \leq |f'(0) - (f(\varepsilon) - f(0)/\varepsilon) + \varepsilon^{-1} \text{osc } f| \leq \varepsilon^\gamma |f'|_{C^\gamma[0, \varepsilon]} + \varepsilon^{-1} \text{osc } f.$$ 

By applying this fact to functions \( v(x) \) given in \( B_1 \) we obtain that for any \( r_{n+1} < r_{n+2} \leq 1 \) and any \( \varepsilon \in (0, 1) \)

$$|Dv| \leq \varepsilon^\gamma (r_{n+2} - r_{n+1}) \gamma |Dv|_{C^\gamma(B_{r_{n+2}})} + \varepsilon^{-1} (r_{n+2} - r_{n+1})^{-1} \text{osc } v \quad (4.9)$$
in \( B_{r_{n+1}} \).

Coming back to (4.8) and setting

$$r_0 = r, \quad r_n = r + (1 - r) \sum_{k=1}^{n} 2^{-k}, \quad n \geq 1,$$ 

we conclude

$$A_n := \sup_{[0, r_n^2]} [D\bar{u}(t, \cdot)]_{C^\gamma(\bar{B}_{r_n})} \leq N(r_{n+1} - r_n)^{-\gamma} \sup_{\bar{C}_{r_{n+1}}} |D\bar{u}|$$
\[
\leq N_1 \varepsilon^\gamma A_{n+2} + N_2 (1 - r)^{-(1+\gamma)} \varepsilon^{-1} 2^{(1+\gamma)n} \text{osc } \bar{u}, \quad (4.10)
\]
where the constants \( N_i \) are different from the one in (4.8) but still depend only on \( \delta \) and \( d \). We first take \( \varepsilon \) so that
\[
N_1 \varepsilon^\gamma = 2^{-5},
\]
then take \( n = 2k, k = 0, 1, \ldots, \), multiply both parts of (4.10) by \( 2^{-5k} \) and sum up with respect to \( k \). Then upon observing that \( (1 + \gamma)2k \leq 4k \) we get
\[
\sum_{k=0}^{\infty} A_{2k} 2^{-5k} \leq \sum_{k=1}^{\infty} A_{2k} 2^{-5k} + N(1 - r)^{-(1+\gamma)} \sum_{k=0}^{\infty} 2^{-k} \text{osc } \bar{u}.
\]
By canceling (finite) like terms we find
\[
\sup_{[0,r]^2} [D\bar{u}(t, \cdot)]_{C^\gamma(B_r)} \leq N(1 - r)^{-(1+\gamma)} \text{osc } \bar{u}. \quad (4.11)
\]
Next, we use the fact that \( \bar{u} \) itself satisfies the equation
\[
0 = \partial_t \bar{u} + \max (\bar{F}[\bar{u}], \bar{P}[\bar{u}] - K) - \max (0, -K) = \partial_t \bar{u} + a_{ij} D_{ij} \bar{u}
\]
with some \( (a_{ij}) \) taking values in \( S_4 \). Furthermore, for any \( T \in (0, r^2] \) and \( |x_0| \leq r \) the function \( v(t, x) := \bar{u}(t, x) - (x_i - x_{0i}) D_i \bar{u}(T, x_0) \) satisfies the same equation and
\[
|v(T, x) - v(T, x_0)| \leq [D\bar{u}(T, \cdot)]_{C^\gamma(B_r)} |x - x_0|^{1+\gamma}
\]
for \( |x - x_0| \leq \rho - r \), where \( \rho = (1 + r)/2 \). Therefore, by Lemma 4.4.2 of [6], applied with \( R = \rho - r = (1 - r)/2 \) there, for \( t \in [0, T] \) we have
\[
|\bar{u}(t, x_0) - \bar{u}(T, x_0)| \leq N[\bar{u}(T, \cdot)]_{C^\gamma(B_r)} (T-t)^{(1+\gamma)/2} \leq N(1 - r)^{-(1+\gamma)} (T-t)^{(1+\gamma)/2} \text{osc } \bar{u}.
\]
This provides the necessary estimate of the oscillation of \( \bar{u} \) in the time variable and along with (4.11) shows that
\[
[\bar{u}]_{C^{1+\gamma}(C_1)} \leq N(1 - r)^{-(1+\gamma)} \text{osc } \bar{u}.
\]
Now the assertion of the lemma follows from the fact that
\[
\text{osc } \bar{u} = \text{osc } g.
\]
The lemma is proved.

**Proof of Theorem 4.1.** Take \( \hat{u}(t, x) = \bar{u}(0, 0) + x_i D_i \bar{u}(0, 0) \) and observe that in \( C_r \)
\[
|u - \hat{u}| \leq |u - \bar{u}| + |\bar{u} - \hat{u}| \leq N(\mu_1^{n/(6d+6)} \vee \mu_1^{1/(6d+6)}) [g]_{C^\gamma(C_1)} + I,
\]
where
\[
I = |\bar{u} - \hat{u}| \leq 2r^\kappa_0 [\bar{u}]_{C^{\kappa_0}(C_r)} \leq N r^\kappa_0 (1 - r)^{-\kappa_0} \text{osc } (g - \hat{g})
\]
so that the theorem is proved.
5. Estimating $C^\kappa$-norm of solutions of (3.1)

In this section we assume that $\bar{H}$ is bounded and investigate solutions of (3.1) which exist by Theorem 3.1. We take $\kappa_0 \in (1, 2)$ from Theorem 4.1, take a $\mu \in (0, 1)$, and suppose that Assumption 2.2 (iv) is satisfied with $\theta = \theta(\mu)$ so that (3.3) holds for any $R \in (0, R_0]$ and $(t, x) \in \mathbb{R}^{d+1}$.

**Lemma 5.1.** Let $R \in (0, R_0]$ and let $v \in W^{1,2}_\infty(\bar{C}_R) \cap C(\bar{C}_R)$ be a solution of (3.1) in $\bar{C}_R$. Then for each $r \in (0, R)$ one can find an affine function $\hat{v}(x)$ such that in $C_r$ for any $\kappa \in [1, 2]$

$$|v - \hat{v}| \leq N\mu^{\kappa/(6d+6)}[v]_{C^{\kappa}(\bar{C}_R)} R^\kappa + N\kappa_0 R^{-\kappa_0} [v]_{C^{\kappa}(\bar{C}_R)}$$

$$+ N\kappa_0 R^2 \sup_{\bar{C}_R}(|v| + |Dv|) + NR^\kappa \bar{H}_\kappa,$$

where the constants $N$ depend only on $d$ and $\delta$.

Proof. Observe that

$$\max(H[v], P[v] - K) = \max(F[v], P[v] - K) + h$$

where $h$ defined by the above equality satisfies

$$|h| \leq |H[v] - F[v]| \leq K_0(|v| + |Dv|) + \bar{H}.$$

Next define $u \in W^{1,2}_{d+1}(C_R) \cap C(\bar{C}_R)$ as a unique solution

$$\partial_t u + \max(F[u], P[u] - K) = 0$$

with boundary data $u = v$ on $\partial C_R$. Then there exists an $S_\delta$-valued function $a$ such that in $C_R$ we have

$$\partial_t(u - v) + a_{ij} D_{ij}(v - u) + h = 0.$$

By the parabolic Alexandrov estimate (cf. our comment concerning this estimate in a more general situation in the proof of Lemma 6.1)

$$|v - u| \leq N R^{d/d+1} \|h\|_{L^{d+1}(C_R)} = N R^2 \left( \int_{C_R} |h|^{d+1} dxdt \right)^{1/(d+1)}$$

$$\leq N\kappa_0 R^2 \sup_{\bar{C}_R}(|v| + |Dv|) + NR^\kappa \bar{H}_\kappa.$$

After that our assertion follows from Theorem 4.1 and the lemma is proved.

Here is a result, which can be easily extracted from the proof of Theorem 2.1 of [10].

**Lemma 5.2.** Let $r_0 \in (0, \infty)$, $\kappa \in (1, 2)$, $\phi \in C^{\kappa}(\bar{C}_{r_0})$ and assume that there is a constant $N_0$ such that for any $(t, x) \in C_{r_0}$ and $r \in (0, 2r_0]$ there exists an affine function $\hat{\phi} = \hat{\phi}(x)$ such that

$$\sup_{\bar{C}_r(t, x) \cap \bar{C}_{r_0}} |\phi - \hat{\phi}| \leq N_0 r^\kappa.$$

Then

$$[\phi]_{C^{\kappa}(C_{r_0})} \leq N N_0,$$
where $N$ depends only on $d$ and $\kappa$.

Lemma 5.3. Take $r_1 \in (0, R_0]$, $r_0 \in (0, r_1)$, and define

$$\kappa_1 = \frac{1 + \kappa_0}{2}.$$ 

Let $v \in W^{1,2}_\infty(C_{r_1}) \cap C(\bar{C}_{r_1})$ be a solution of (3.1) in $C_{r_1}$ and let $\kappa \in (1, \kappa_1]$. Then there exists $\theta = \theta(\kappa, d, \delta) \in (0, 1]$ such that, if Assumption 2.2 (iv) is satisfied with this $\theta$, then

$$[v]_{C^\kappa(C_{r_0})} \leq (1/2)[v]_{C^\kappa(C_{r_1})} + N(K_0 + 1)(r_1 - r_0)^{-\kappa}\sup_{C_{r_1}} |v|$$

$$+ N(K_0 + 1)(r_1 - r_0)^{-\kappa-1}\sup_{C_{r_1}} |Dv| + N \bar{H}_\kappa,$$  \hspace{1cm} (5.1)

where $N = N(d, \delta, \kappa)$.

Proof. To specify $\theta$ we first take a $\mu \in (0, 1]$ and suppose that Assumption 2.2 (iv) is satisfied with $\theta = \theta(\mu)$ so that (3.3) holds for any $R \in (0, R_0]$ and $(t, x) \in \mathbb{R}^{d+1}$.

Then take $(t_0, x_0) \in C_{r_0}$, $\varepsilon \in (0, 1)$, define

$$r'_0 = \frac{\varepsilon}{3}(r_1 - r_0),$$

and notice that for any $(t, x) \in C_{r'_0}(t_0, x_0)$, $r \in (0, 2r'_0)$, and $R = \varepsilon^{-1}r$, we have

$$C_R(t, x) \subset C_{r_1}.$$ 

Therefore, by Lemma 5.1 we can find an affine function $\hat{v}(x)$ such that

$$\sup_{C_{r}(t,x) \cap C_{r'_0}(t_0,x_0)} |v - \hat{v}| \leq \sup_{C_{r}(t,x)} |v - \hat{v}|$$

$$\leq N \mu^{\kappa/(6d+6)} [v]_{C^\kappa(C_R(t,x), x)} \varepsilon^{-\kappa}\kappa^\kappa + N \varepsilon^{\kappa_0-\kappa}(1 - \varepsilon)^{-\kappa_0}\kappa^\kappa [v]_{C^\kappa(C_R(t,x))}$$

$$+ NK_0\varepsilon^{-2}r_2 \sup_{C_R(t,x)} (|v| + |Dv|) + N \varepsilon^{-\kappa}\kappa^\kappa \bar{H}_\kappa \leq Nr^\kappa I(\varepsilon, r_1),$$

where the constants $N$ depend only on $d$ and $\delta$ and

$$I(\varepsilon, r_1) := \left(\mu^{\kappa/(6d+6)} \varepsilon^{-\kappa} + \varepsilon^{\kappa_0-\kappa}(1 - \varepsilon)^{-\kappa_0}\right)[v]_{C^\kappa(\bar{C}_{r_1})}$$

$$+ \varepsilon^{-2}K_0 \sup_{\bar{C}_{r_1}} (|v| + |Dv|) + \varepsilon^{-\kappa}\kappa^\kappa \bar{H}_\kappa.$$ 

It follows by Lemma 5.2 that

$$[v]_{C^\kappa(C_{r'_0}(t_0,x_0))} \leq N_1 I(\varepsilon, r_1),$$

where $N_1$ depends only on $d, \kappa$, and $\delta$. We can now specify $\theta$ and $\varepsilon$. First we chose $\varepsilon \in (0, 1)$ so that

$$N_1 \varepsilon^{\kappa_0-\kappa}(1 - \varepsilon)^{-\kappa_0} = 1/4.$$
Since \( \kappa_0 - \kappa \geq (\kappa_0 - 1)/2 > 0 \) and \( \kappa_0 \) depends only on \( d \) and \( \delta \) and \( N_1 \) depends only on \( d, \kappa, \) and \( \delta, \varepsilon \) also depends only on \( d, \kappa, \) and \( \delta. \) After that we take \( \mu = \mu(d, \kappa, \delta) \in (0, 1] \) so that

\[
N_1 \mu^{1/(6d+6)} \varepsilon^{-2} \leq 1/4
\]

and set \( \theta = \theta(\mu(d, \kappa, \delta)). \) Then

\[
[v]_{C^\kappa(C_{t_0}'(t_0, x_0))} \leq (1/2)[v]_{C^\kappa(C_{r_1})} + NJ,
\]

where \( N = N(d, \delta, \kappa) \) and

\[
J = K_0 \sup_{C_{r_1}} (|v| + |Dv|) + \bar{H}_\kappa.
\]

Now observe that if \((t, x), (s, x) \in C_{r_0} \) and \( t > s, \) then either \( |t-s| \leq (r_0')^2, \)

in which case \((t, x) \in C'_{r_0}(s, x) \) and

\[
|v(t, x) - v(s, x)| \leq (1/2)[v]_{C^\kappa(C_{r_1})} + NJ
\]

owing to (5.2), or \( |t-s| \geq (r_0')^2 \) when

\[
|v(t, x) - v(s, x)| \leq 2(t-s)^{\kappa/2} (r_0')^{-\kappa} \sup_{C_{r_1}} |v| \leq N(t-s)^{\kappa/2} (r_1 - r_0)^{-\kappa} \sup_{C_{r_1}} |v|.
\]

Next if \((t, x), (t, y) \in C_{r_0} \) and \( x \neq y, \) then either \( |x-y| < r_0', \)

in which case \((t, y) \in C'_{r_0}(t, x) \) and

\[
|x-y|^{-(\kappa-1)} |Dv(t, x) - Dv(t, y)| \leq (1/2)[v]_{C^\kappa(C_{r_1})} + NJ,
\]

or else \( |x-y| \geq r_0' \) and

\[
|Dv(t, x) - Dv(t, y)| \leq 2|x-y|^{\kappa-1} (r_0')^{-(\kappa-1)} \sup_{C_{r_1}} |Dv|
\]

\[
\leq N|x-y|^{\kappa-1} (r_1 - r_0)^{-(\kappa-1)} \sup_{C_{r_1}} |Dv|.
\]

This proves (5.1) and the lemma.

**Theorem 5.4.** Take \( 0 < r < R \leq R_0 \) and take \( \kappa_1, \kappa \in (1, \kappa_1], \) and \( \theta \) from Lemma 5.3. Let \( v \in W^{1,2}_{\infty}(C_R) \cap C(C_R) \) be a solution of (3.1) in \( C_R. \) Then

\[
[v]_{C^\kappa(C_{\bar{r}})} \leq N(R-r)^{-\kappa} \sup_{C_{\bar{r}}} |v| + N\bar{H}_\kappa,
\]

where \( N \) depends only on \( d, \delta, K_0, \) and \( \kappa. \)

Proof. We proceed as in the proof of Lemma 4.4. Fix a number \( c \in (0, 1) \) such that \( c^4 > 3/4 \) and introduce

\[
r_0 = r, \quad r_n = r + c_0(R-r) \sum_{k=1}^{n} c^k, \quad n \geq 1,
\]
where $c_0$ is chosen in such a way that $r_n \to R$ as $n \to \infty$. Then Lemma 5.3 and (4.9) allow us to find constants $N_1$ and $N$ depending only on $d, \delta, K_0$, and $\kappa$ such that for all $n$ and $\varepsilon \in (0, 1)$

$$A_n := [v]_{C^\kappa(C_{r_n})} \leq (2^{-1} + N_1 \varepsilon^{\kappa - 1})A_{n+2}$$

$$+ N(R - r)^{-\kappa}c^{-\kappa}(1 + \varepsilon^{-1}) \sup_{C_{r}}|v| + N \tilde{H}_\kappa.$$

we choose $\varepsilon < 1$ so that $2^{-1} + N_1 \varepsilon^{\kappa - 1} \leq 3/4$ and then recalling that $\kappa \leq 2$ conclude that

$$\sum_{k=0}^{\infty} (3/4)^k A_{2k} \leq \sum_{k=1}^{\infty} (3/4)^k A_{2k} + N \tilde{H}_\kappa$$

$$+ N(R - r)^{-\kappa} \sup_{C_{r}}|v| \sum_{k=0}^{\infty} (3/4)^k c^{-4k},$$

where the last series converges since $3c^{-4}/4 < 1$. By canceling like terms we come to (5.3) and the theorem is proved.

### 6. Proof of Theorem 2.1

First assume that $\tilde{H}$ is bounded. For $K > 0$ denote by $v_K$ the solution of (3.1) with boundary condition $v = g$ on $\partial\Omega_T$. By Theorem 3.1 such a solution exists is continuous in $\bar{\Omega}_T$ and has locally bounded derivatives.

Then the beginning of the proof of Lemma 5.1 shows that for an $S_{\hat{g}}$-valued function $(a_{ij})$ we have

$$|\partial_t v_K + a_{ij} D_{ij} v_K| \leq K_0(|v_K| + |Dv_K| + \tilde{H}),$$

and the parabolic Alexandrov estimate shows that

$$|v_K| \leq N(\|g\|_{C(\Omega_T)} + \|\tilde{H}\|_{L^{d+1}(\Omega_T)}), \tag{6.1}$$

where $N$ depends only on $d, \delta, K_0$, and the diameter of $\Omega$.

Also

$$|\partial_t (v_K - g) + a_{ij} D_{ij} (v_K - g)|$$

$$\leq K_0(|v_K| + |D(v_K - g)|) + \tilde{H} + N(|\partial_t g| + |D^2 g| + |D g|), \tag{6.2}$$

which, after we continue $(v - g)(t,x)$ for $t \geq T$ as zero, by Theorem 4.2.6 of [6] yields that there exists an $\alpha = \alpha(d, \delta) \in (0, 1)$ such that for any domain $\Omega' \subset \Omega' \subset \Omega$

$$|v_K|_{C^\alpha(\Omega')} \leq N, \tag{6.3}$$

where $N$ depends only on the distance between the boundaries of $\Omega'$ and $\Omega$ and on $T, d, \delta, K_0$, the diameter of $\Omega$, and the $L^{d+1}(\Omega_T)$-norms of $\tilde{H}$ and $|\partial_t g| + |D^2 g| + |D g|$.

Now we are going to use one more piece of information available thanks to Theorem 2.1 of [8] which is that $v_K \in W^{1,2}_{d+1}(\Omega_T)$ for any $p$. Then treating (6.2) near $(0, T) \times \partial\Omega$ we can flatten $\partial\Omega$ near any given point, then continue $v - g$ (in the new coordinates) across the flat boundary in an odd way. We will then have a function of class $W^{1,2}_{d+1}$ to which Theorem 4.2.6 of [6] is
applicable. In this way we estimate the \( C^\alpha \)-norm of \( v \) near the boundary of \( \Omega \) and in combination with (6.3) obtain that
\[
|v_K|_{C^\alpha(\Omega_T)} \leq N_0, \tag{6.4}
\]
where \( N_0 \) depends only on \( T, d, \delta, K_0 \), the diameter of \( \Omega \), and the \( L_{d+1}(\Omega_T) \)-norms of \( H \) and \( |\partial_t g| + |D^2 g| + |Dg| \).

It follows that there is a sequence \( K_n \to \infty \) and a function \( v \) such that \( v^n := v_{K_n} \to v \) uniformly in \( \Omega_T \). Of course, (2.3) holds, owing to Theorem 5.4. Furthermore, (6.4) holds with the same constants and \( v \) in place of \( v_K \) and \( Dv^n \to Dv \) locally uniformly in \( \Omega_T \).

Next, we need an analog of Lemma 6.1 of [8]. Introduce
\[
H_0(u'', t, x) = H(v(t, x), Dv(t, x), u'', t, x).
\]

**Lemma 6.1.** There is a constant \( N \) depending only on \( d \) and \( \delta \) such that for any \( C_r(t, x) \) satisfying \( C_r(t, x) \subset \Omega_T \) and \( \phi \in W^{1,2}_{d+1}(C_r(t, x)) \cap C(C_r(t, x)) \) we have on \( C_r(t, x) \) that
\[
v \leq \phi + N r^{d/(d+1)} \left\| (\partial_t \phi + H_0[\phi])^+ \right\|_{L_{d+1}(C_r(t, x))} + \max_{\partial^r C_r(t, x)} (v - \phi)^+. \tag{6.5}
\]
\[
v \geq \phi - N r^{d/(d+1)} \left\| (\partial_t \phi + H_0[\phi])^- \right\|_{L_{d+1}(C_r(t, x))} - \max_{\partial^r C_r(t, x)} (v - \phi)^-. \tag{6.6}
\]

**Proof.** Observe that
\[
-\partial_t \phi - \max(H_0[\phi], P[\phi] - K_n) = -\partial_t \phi - \max(H_0[\phi], P[\phi] - K_n)
\]
\[
+ \partial_t v^n + \max(H_0[v^n], P[v^n] - K_n) + I_n
\]
\[
= \partial_t (v^n - \phi) + a_{ij} D_{ij} (v^n - \phi) + I_n,
\]
where \( a = (a_{ij}) \) is an \( S_\delta \)-valued function and
\[
I_n = \max \left( H[v^n], P[v^n] - K_n \right) - \max \left( H_0[v^n], P[v^n] - K_n \right).
\]
Notice that
\[
\sup_{C_r(t, x)} |I_n| \leq \omega \left( \sup_{C_r(t, x)} (|v - v^n| + |Dv - Dv^n|) \right) \to 0
\]
as \( n \to \infty \).

It follows by Theorem 3.1 of [5] or Theorem 3.3.9 of [6] that for \( r \in (0, 1] \)
\[
v^n \leq \phi + \max_{\partial^r C_r(t, x)} (v^n - \phi)^+
\]
\[
+ N r^{d/(d+1)} \left\| (\partial_t \phi + I_n + \max(H[\phi], P[\phi] - K_n))^+ \right\|_{L_{d+1}(C_r(t, x))}, \tag{6.7}
\]
where the constant \( N = N(d, \delta) \). Actually the above references only say that (6.7) holds with \( N = N(r, d, \delta) \) in place of \( N r^{d/(d+1)} \). However, the way this constant depends on \( r \) is easily discovered by using parabolic dilations. We obtain (6.5) from (6.7) by letting \( n \to \infty \). In the same way (6.6) is established. The lemma is proved.
After that the proof of Theorem 2.1 in our particular case of bounded $H$ is achieved in the following way. Using (6.5) and repeating the proof of Theorem 2.3 of [8] (see Section 6 there), we easily obtain that, if $(t_0, x_0) \in \Omega_T$ and $\phi \in W^{1,2}_{d+1,\text{loc}}(\Omega_T)$ are such that $v - \phi$ attains a local maximum at $(t_0, x_0)$ and $v(t_0, x_0) = \phi(t_0, x_0)$, then

$$\lim \inf_{r \to 0} \sup_{C_r(t_0, x_0)} \left[ \partial_t \phi(t, x) + H(v(t, x), Dv(t, x), D^2 \phi(t, x), t, x) \right] \geq 0. \quad (6.8)$$

Here $v(t, x), Dv(t, x)$ can be replaced with $v(t_0, x_0), Dv(t_0, x_0)$. Furthermore, if $\phi \in W^{1,2}_{p,\text{loc}}(\Omega_T)$ with $p > d + 2$, then by embedding theorems $\phi \in C^{1+\alpha}_{\text{loc}}(\Omega_T)$, where $\alpha \in (0, 1)$, and hence

$$(v(t_0, x_0), Dv(t_0, x_0)) = (\phi(t_0, x_0), D\phi(t_0, x_0)).$$

It follows that one can replace $v(t, x), Dv(t, x)$ with $\phi(t, x), D\phi(t, x)$ in (6.8) and then, by definition $v$, is an $L_p$-viscosity subsolution.

The fact that it is also an $L_p$-viscosity supersolution is proved similarly on the basis of (6.6).

In case of general $H$ we introduce $u_n$ as the solutions found according to Theorem 2.1 of (2.2) in $\Omega_T$ with

$$H(u, t, x)I_{H(t,x) \leq n} + F(u^n, t, x)I_{H(t,x) > n} = F(u^n, t, x) + G(u, t, x)I_{H(t,x) \leq n}$$

in place of $H(u, t, x)$ and with the same boundary condition $u_n = g$ on $\partial' \Omega_T$. From the above we see that the estimates of $|u_n|_{C^{\alpha}(\Omega_T)}$ and $|u_n|_{C^{\alpha}(\partial_r(t, x))}$ are uniform with respect to $n$. This allows us to repeat what was said about $v^n$ with obvious changes and brings the proof of Theorem 2.1 to an end.

7. A MINIMAX REPRESENTATION OF NONLINEAR FUNCTIONS

Here we complement the results of [7] which originated in [4] by providing a formula better suited for viewing nonlinear PDEs as Isaacs equations.

Let $d_1 \geq 1$ be an integer. Fix a closed bounded subset $B$ of $\mathbb{R}^{d_1+1}$. Let $H(u)$ be a real-valued Lipschitz continuous function given on $\mathbb{R}^{d_1}$. As a Lipschitz continuous function $H$ is differentiable on a set $D'_H \subset \mathbb{R}^{d_1}$ of full measure. We introduce

$$\mathcal{L}(H) := \{(H(u) - \langle u, DH(u) \rangle, DH(u)) : u \in D'_H \}, \quad (7.1)$$

where $\langle \cdot, \cdot \rangle$ is the scalar product in $\mathbb{R}^{d_1}$, and assume that $\mathcal{L}(H) \subset B$. Observe that for $u \in D'_H$ we have

$$H(u) - \langle u, DH(u) \rangle = \frac{\partial}{\partial t} \left[ tH(u/t) \right]_{t=1},$$

so that, owing to the boundedness of $B$, $H$ is boundedly inhomogeneous.

Here is Remark 2.1 of [7] (in which we correct an obvious misprint).

**Theorem 7.1.** Under the above assumptions we have on $\mathbb{R}^{d_1}$ that

$$H(u) = \max_{y \in \mathbb{R}^d} \min_{(f,l) \in B, f+\langle l, u \rangle \geq H(y)} \left[ f + \langle l, u \rangle \right]$$
and the sets \( \{(f, l) \in B : f + \langle l, y \rangle \geq H(y) \} \) are nonempty and closed for any \( y \in \mathbb{R}^d \).

Next, let \( B_0 \) be a relatively strictly convex closed bounded set in \( \mathbb{R}^{d_1+1} \) such that \( B_0 \supset B \) and the distance between the relative boundaries of \( B \) and \( B_0 \) is strictly positive. Then introduce \( A := \mathbb{R}^{d_1} \) and for \( \alpha \in A \) define
\[
G(\alpha) = \sup_{(f, l) \in B_0} (f + \langle l, \alpha \rangle).
\]

Next, let \( \mathcal{P} \) be the smallest hyperplane containing \( B_0 \), and, by using the assumption about the boundaries of \( B \) and \( B_0 \), define \( \Gamma \) as a closed (in the topology of \( \mathcal{P} \)) convex subset of \( \mathcal{P} \) with the origin lying in the relative (in the topology of \( \mathcal{P} \)) interior of \( \Gamma \) such that \( (f, l) + \Gamma \subset B_0 \) for any \( (f, l) \in B \).

Define
\[
\gamma(u) = \sup_{(f, l) \in \Gamma} [f + \langle l, u \rangle]
\]
and observe that since \( \mu(\pm B_0) \subset \Gamma \) for a constant \( \mu > 0 \) we have that \( \mu|G(\alpha)| \leq \gamma(\alpha), \quad \mu|H(\alpha)| \leq \gamma(\alpha). \)

Furthermore, since \( (f, l) + \Gamma \subset B_0 \) for any \( (f, l) \in B \) we have that for any \( (f, l) \in B \)
\[
f + \langle l, \alpha \rangle + \gamma(\alpha) \leq \sup_{(f', l') \in B_0} (f' + \langle l', \alpha \rangle), \quad G(\alpha) - [f + \langle l, \alpha \rangle] \geq \gamma(\alpha), \quad (7.2)
\]
which shows that
\[
\lambda_\alpha^{\beta} := 1 \wedge \frac{G(\alpha) - H(\alpha)}{G(\alpha) - [f + \langle l, \alpha \rangle]} \left( \begin{array}{c} 0 \\ 0 = 1 \end{array} \right)
\]
is well defined for \( \alpha \in A \) and \( \beta = (f, l) \in B \) and, of course, \( \lambda_\alpha^{\beta} \in [0, 1] \).

Next, observe that the graph of
\[
G(\xi, \alpha) := \sup_{(f, l) \in B_0} (f\xi + \langle l, \alpha \rangle)
\]
is a cone with respect to \( (\xi, \alpha) \) which is once continuously differentiable with respect to \( (\lambda, \alpha) \) everywhere apart from the origin due to the strict convexity of \( B_0 \). Since the plane \( \xi = 1 \) does not pass through the origin, \( G(\alpha) \) is once continuously differentiable.

Now for \( \alpha \in A \) and \( \beta = (f, l) \in B \) set
\[
\begin{align*}
\bar{f}_H^{\alpha\beta} &= \lambda_\alpha^{\beta} f + (1 - \lambda_\alpha^{\beta})[G(\alpha) - \langle \alpha, DG(\alpha) \rangle], \\
\bar{l}_H^{\alpha\beta} &= \lambda_\alpha^{\beta} l + (1 - \lambda_\alpha^{\beta})DG(\alpha).
\end{align*}
\]

Obviously \( (\bar{f}_H^{\alpha\beta}, \bar{l}_H^{\alpha\beta}) \in B_0 \). In this way on the set \( \mathcal{H}(B) \) of functions \( H \) satisfying the assumptions stated in the beginning of the section we constructed a mapping sending each \( H \in \mathcal{H}(B) \) into the function \( (\bar{f}_H^{\alpha\beta}, \bar{l}_H^{\alpha\beta}) \) defined on \( A \times B \)
Theorem 7.2. For any \( H \in \mathcal{H}(B) \) and any \( u \in \mathbb{R}^{d_1} \) we have

\[
H(u) = \sup_{\alpha \in A} \inf_{\beta \in B} \left[ f_H^{\alpha \beta} + \langle l_H^{\alpha \beta}, u \rangle \right].
\]

Furthermore, if \( H, F \in \mathcal{H}(B) \), then for any \( \alpha \in A \) and \( \beta = (f, l) \in B \) we have

\[
|f_H^{\alpha \beta} - f_F^{\alpha \beta}| \leq \frac{|H(\alpha) - F(\alpha)|}{\gamma(\alpha)} |f + \langle \alpha, DG(\alpha) \rangle - G(\alpha)| \left( \begin{array}{c} 0 \\ 0 = 0 \end{array} \right),
\]

\[
|l_H^{\alpha \beta} - l_F^{\alpha \beta}| \leq \frac{|H(\alpha) - F(\alpha)|}{\gamma(\alpha)} |l - DG(\alpha)| \left( \begin{array}{c} 0 \\ 0 = 0 \end{array} \right).
\]

Proof. Observe that, for \( \beta = (f, l) \in B \), if \( f + \langle l, \alpha \rangle \geq H(\alpha) \), then \( G(\alpha) - H(\alpha) \geq G(\alpha) - [f + \langle l, \alpha \rangle] \) and \( \lambda_H^{\alpha \beta} = 1 \) (no matter \( \gamma(\alpha) = 0 \) or \( \gamma(\alpha) > 0 \)) and \( f = f_H^{\alpha \beta} \) and \( l = l_H^{\alpha \beta} \). It follows that

\[
\min_{\beta = (f, l) \in B, \ f + \langle l, \alpha \rangle \geq H(\alpha)} \left[ f + \langle l, u \rangle \right] \geq \inf_{\beta \in B, \ \lambda_H^{\alpha \beta} = 1} \left[ f_H^{\alpha \beta} + \langle l_H^{\alpha \beta}, u \rangle \right] \geq \inf_{\beta \in B} \left( f_H^{\alpha \beta} + \langle l_H^{\alpha \beta}, u \rangle \right).
\]

Furthermore, for \( \beta = (f, l) \in B \), if \( \lambda_H^{\alpha \beta} = 1 \), then \( G(\alpha) - H(\alpha) \geq G(\alpha) - [f + \langle l, \alpha \rangle] \), so that \( (f_H^{\alpha \beta}, l_H^{\alpha \beta}) = (f, l) \in B_0 \) and

\[
f_H^{\alpha \beta} + \langle l_H^{\alpha \beta}, \alpha \rangle \geq H(\alpha).
\]

In addition, for \( \beta = (f, l) \in B \), if \( \lambda_H^{\alpha \beta} < 1 \), then as always \( (f_H^{\alpha \beta}, l_H^{\alpha \beta}) \in B_0 \) and

\[
f_H^{\alpha \beta} + \langle l_H^{\alpha \beta}, \alpha \rangle = \lambda_H^{\alpha \beta} [f + \langle l, \alpha \rangle] + (1 - \lambda_H^{\alpha \beta})G(\alpha) = H(\alpha).
\]

Hence,

\[
\min_{\beta = (f, l) \in B, \ f + \langle l, \alpha \rangle \geq H(\alpha)} \left[ f + \langle l, u \rangle \right] \geq \inf_{\beta \in B} \left( f_H^{\alpha \beta} + \langle l_H^{\alpha \beta}, u \rangle \right) \geq \min_{(f, l) \in B_0, \ f + \langle l, \alpha \rangle \geq H(\alpha)} \left[ f + \langle l, u \rangle \right]
\]

and the first assertion of the theorem follows from Theorem 7.1.

To prove the second assertion it suffices to note that, for instance.

\[
f_H^{\alpha \beta} - f_F^{\alpha \beta} = (\lambda_H^{\alpha \beta} - \lambda_F^{\alpha \beta}) \left[ f + \langle \alpha, DG(\alpha) \rangle - G(\alpha) \right],
\]

where the right-hand side is zero if \( \gamma(\alpha) = 0 \), and after that use (7.2). The theorem is proved.

Theorem 7.3. Let \( H \) also depend on parameters \( (t, x) \in \mathbb{R}^{d+1} \) and let it satisfy the assumptions in the beginning of the section for each \( (t, x) \). Assume that \( H(u, t, x) \) is measurable with respect to \( (t, x) \) and there is a function \( \bar{H}(u, t) \) also satisfying the assumptions in the beginning of the section for each \( t \) and measurable with respect to \( t \). Denote

\[
\theta = \int_{C_{\gamma(u) \neq 0}} \frac{|H(u, t, x) - \bar{H}(u, t)|}{\gamma(u)} \, dx \, dt.
\]
Also let \((f^{\alpha\beta}(t, x), l^{\alpha\beta}(t, x))\) correspond to \(H(u, t, x)\) and \((\bar{f}^{\alpha\beta}(t), \bar{l}^{\alpha\beta}(t))\) correspond to \(\bar{H}(u, t)\) constructed as before Theorem 7.2. Then
\[
\int_{C_{1,1}} \sup_{\alpha \in A, \beta \in B} \left( |f^{\alpha\beta}(t, x) - \bar{f}^{\alpha\beta}(t)| + |l^{\alpha\beta}(t, x) - \bar{l}^{\alpha\beta}(t)| \right) \, dx \, dt \leq N\theta,
\]
where the constant \(N\) depends only on \(B\) and \(B_0\).

Proof. Let \(\lambda^{\alpha\beta}(t, x)\) correspond to \(H(u, t, x)\) and \(\bar{\lambda}^{\alpha\beta}(t)\) correspond to \(\bar{H}(u, t)\) constructed as before Theorem 7.2. Then it suffices to prove that
\[
\int_{C_{1,1}} \sup_{\alpha \in A, \beta \in B} |\lambda^{\alpha\beta}(t, x) - \bar{\lambda}^{\alpha\beta}(t)| \, dx \, dt \leq N\theta.
\]
For \(\beta = (f, l) \in B\) we have
\[
|\lambda^{\alpha\beta}(t, x) - \bar{\lambda}^{\alpha\beta}(x)| \leq \frac{|G(\alpha) - H(\alpha, t, x)| - |G(\alpha) - \bar{H}(\alpha, t)|}{G(\alpha) - |f + \langle l, \alpha \rangle|}\%
\]
(with 0/0 = 0) and our assertion follows. The theorem is proved.
