Abstract

For the description of the Universe expansion, compatible with observational data, a model of modified gravity — Lovelock gravity with dilaton — is investigated. D-dimensional space with 3- and (D-4)-dimensional maximally symmetric subspaces is considered. Space without matter and space with perfect fluid are under test. In various forms of the theory under way (third order without dilaton and second order — Einstein-Gauss-Bonnet gravity — with dilaton and without it) stationary, power-law, exponential and exponent-of-exponent form cosmological solutions are obtained. Last two forms include solutions which are clear to describe accelerating expansion of 3-dimensional subspace. Also there is a set of solutions describing cosmological expansion which does not tend to isotropization in the presence of matter.

Introduction

At present time there are numerous observational data known to be incompatible with Standard Cosmological Model. On the one hand, accelerating expansion observations from supernovae type Ia [1] and gravitational lensing [2] allow us to calculate metric tensor. On the other hand, evaluating of amount of visible matter, energy-momentum tensor can be obtained. However, it is impossible to satisfy Einstein equations by plugging in these values. Then there are two possibilities: there is a great amount of invisible matter or Einstein equations is not true. These possibilities point out two approaches to the problem: to develop theories of dark matter and dark energy or to modify theory of gravity.

In the present article we are engaged in the second approach. At that we will give attention exclusively to obtaining cosmological acceleration in the space with extra dimensions or without them, with perfect fluid or without matter, and to obtaining cosmological solutions which do not tend to isotropization. The latter are important for the reason that extra dimensions should be small and then they should not expand such as visible ones. We will not deal with gravitational lensing, galaxy moving in clusters, rotating curves of galaxies and so on in the framework of theory under investigation. Also we are not dealing with any issues related to quantization.

Modified gravity has its beginning in 1920-th. The most popular theories are Brans-Dicke theory [3, 4], Lovelock gravity [5] and $f(R)$-gravity (see, e. g. [6]). However, for a long time these theories were not useful for explanation of experimental data incompatible with general relativity.

Here we will investigate a scalar-tensor extension of Lovelock gravity — Lovelock gravity with dilaton which might have its origin in low-energy limit of string theory. Lovelock

\[ e-mail: ikirnos@mail.ru \]
\[ e-mail: andre@tspu.edu.ru \]
gravity with dilaton contains scalar field \( \varphi \) (dilaton), metric tensor \( g_{\mu\nu} \), matter fields \( \Phi^I \) and is described (in \( D \)-dimensional space-time) by Lagrangian

\[
\mathcal{L} = \sum_{p=1}^{m} \alpha_p(\varphi) \delta_{\sigma_1 \cdots \sigma_2p}^\mu R_{\lambda_1}^\sigma_1 R_{\lambda_2}^\sigma_2 \cdots R_{\lambda_{2p}}^\sigma_2 R_{\lambda_{2p-1}}^{\sigma_2 \sigma_{2p}} R_{\lambda_{2p-1}}^{\sigma_{2p-1} \sigma_{2p}} + g_{\mu\nu} \partial_{\mu} \varphi \partial_{\nu} \varphi - V(\varphi) + \mathcal{L}_M(\Phi^I, g_{\mu\nu}),
\]

where

\[
m = \frac{1}{2} D, \quad \text{if } D \text{ is even},
\]

\[
m = \frac{1}{2} (D - 1), \quad \text{if } D \text{ is odd},
\]

\( \alpha_p(\varphi), V(\varphi) \) are arbitrary functions of dilaton, \( \delta_{\mu_1 \cdots \mu_k}^{\nu_1 \cdots \nu_k} \) is the generalized Kronecker delta and is equal to 1 if \( \nu_1 \cdots \nu_k \) is even transposition of \( \mu_1 \cdots \mu_k \), to \(-1\) if odd one, and to zero otherwise; \( \mathcal{L}_M(\Phi^I, g_{\mu\nu}) \) is the matter Lagrangian. We shall call terms

\[
\mathcal{L}_p = 2 \delta_{\sigma_1 \cdots \sigma_2p}^\mu R_{\lambda_1}^{\sigma_1} R_{\lambda_2}^{\sigma_2} \cdots R_{\lambda_{2p-1}}^{\sigma_{2p-1} \sigma_{2p}}
\]

as Lovelock Lagrangians of \( p \)-th order.

Theory under investigation is outstanding by the fact that its field equations are nonlinear with respect to second derivatives of metric tensor but does not involve higher derivatives.

Now say a few words on the researches in the framework of the theory under consideration, which have already been done. Usually (see, e.g. [7, 8, 9]) only 2-nd order (i.e. \( \alpha_p = 0 \) \( \forall p > 2 \)) of Lovelock gravity without dilaton (so-called Einstein-Gauss-Bonnet gravity) is investigated. Solutions for more complicated variants of the theory are not large in number. Investigations of third order Lovelock gravity (without dilaton) can be found in [10, 11, 12], studies of the second order with dilaton can be found in [13, 14]. Moreover, C. C. Briggs obtains explicit formulae for the 4-th and 5-th Lovelock tensors. Also we should draw attention to researches in \( f(R, \mathcal{L}_2) \)-gravity [13, 17] and to works in the 3-rd and 4-th orders of theory which is similar to Lovelock gravity and obtained from string theory low-energy limit as well as the latter [18, 19].

In the present paper a set of solutions in second order with dilaton and without it, also in third order without dilaton are obtained. In the most of solutions extra spatial dimensions are assumed to exist. Unobservability of them is explained by Kaluza-Klein approach (see, e.g. [20, p. 186] and references therein) which is briefly the following: extra dimensions are compactified on so small scale that it is impossible to observe them (by present day device).

In the first section seven-dimensional third order Lovelock gravity without dilaton is considered. Second section is devoted to the second order with dilaton in spaces with various number of dimensions.

### 1 Third order Lovelock gravity without dilaton

Because it seems impossible to consider general case of Lovelock gravity in a space with great number of dimensions, let us now discuss third order Lovelock gravity without dilaton...
and without cosmological constant: fields are $g_{\mu\nu}$ and $\Phi^I$, Lagrangian is

$$\mathcal{L}_{\text{Lovelock}3} = R + \alpha_2 \mathcal{L}_2 + \alpha_3 \mathcal{L}_3 + \mathcal{L}_M(\Phi^I, g_{\mu\nu}).$$

Here $\alpha_2, \alpha_3$ are constants. General expressions for 2-nd and 3-rd Lovelock Lagrangians are:

$$\mathcal{L}_2 = R_{\mu\nu\alpha\beta} R^{\mu\nu\alpha\beta} - 4 R_{\mu\nu} R^{\mu\nu} + R^2$$

is Gauss-Bonnet Lagrangian,

$$\mathcal{L}_3 = 2 R_{\mu\nu\sigma\kappa} R^{\mu\nu\sigma\kappa} + 8 R_{\mu\nu} R^{\mu\nu} R_{\sigma\kappa\rho} R^{\sigma\kappa\rho} +$$

$$+ 3 R_{\mu\nu\sigma\kappa} R_{\mu\nu\sigma\kappa} + 24 R_{\mu\nu\sigma\kappa} R_{\sigma\mu\nu\kappa} + 16 R_{\mu\nu} R_{\nu\sigma} R^{\sigma}_{\mu} - 12 R_{\mu\nu} R_{\mu\nu} + R^3$$

is third Lovelock Lagrangian.

By variation of action $S = \int \mathcal{L}_{\text{Lovelock}3} d^D x$ one may obtain

$$G^{(1)}_{\mu\nu} + \alpha_2 G^{(2)}_{\mu\nu} + \alpha_3 G^{(3)}_{\mu\nu} = \frac{8 \pi G}{c^4} T_{\mu\nu},$$

where

$$G^{(1)}_{\mu\nu} = R_{\mu\nu} - \frac{1}{2} R g_{\mu\nu},$$

$$G^{(2)}_{\mu\nu} = 2(-R_{\mu\nu\kappa\sigma} R^{\kappa\sigma\mu\nu} - 2 R_{\mu\nu\sigma\rho} R^{\sigma\rho} - 2 R_{\mu\sigma} R^{\sigma}_{\nu} + R R_{\mu\nu}) - \frac{1}{2}(R_{\sigma\rho\alpha\beta} R^{\sigma\rho\alpha\beta} - 4 R_{\alpha\beta} R^{\alpha\beta} + R^2) g_{\mu\nu},$$

and $G^{(3)}_{\mu\nu}$ is written down according to [15]:

$$G^{(3)}_{\mu\nu} = \frac{1}{2}(-g_{\mu\nu} R^3 + 12 g_{\mu\nu} R R_{\alpha\beta} R^{\alpha\beta} - 3 g_{\mu\nu} R R_{\alpha\beta\sigma\kappa} R^{\alpha\beta\sigma\kappa} - 16 g_{\mu\nu} R_{\alpha\beta} R^{\alpha\beta} R_{\sigma}^{\sigma} +$$

$$+ 24 g_{\mu\nu} R_{\alpha\beta} R_{\sigma\kappa} R^{\sigma\beta\alpha\kappa} + 24 g_{\mu\nu} R_{\alpha}^{\beta\gamma\kappa} R_{\gamma\kappa\rho} R_{\beta\sigma\kappa} + 2 g_{\mu\nu} R_{\alpha\beta}^{\sigma\kappa} R_{\sigma\kappa}^{\rho\lambda} R_{\rho\lambda}^{\alpha\beta} -$$

$$- 8 g_{\mu\nu} R_{\alpha\beta}^{\sigma\kappa} R_{\sigma\rho}^{\alpha\lambda} R_{\rho\kappa}^{\beta\lambda} + 6 R_{\mu\nu} R^2 - 24 R R_{\mu}^{\sigma} R_{\sigma\nu} - 24 R_{\mu\nu} R_{\alpha\beta} R^{\alpha\beta} +$$

$$+ 48 R_{\mu}^{\alpha} R_{\alpha}^{\beta\gamma\rho} R^{\gamma\rho}_{\beta\mu} + 48 R_{\mu}^{\alpha} R^{\beta\gamma\sigma} R^{\sigma\gamma}_{\alpha\beta} + 6 R_{\mu\nu} R_{\alpha\beta\sigma\kappa} R^{\alpha\beta} R_{\sigma\kappa} - 24 R_{\mu\alpha} R_{\nu\beta\sigma\kappa} R^{\alpha\beta} R_{\rho\lambda} R^{\sigma\kappa}_{\rho\lambda} +$$

$$+ 24 R_{\mu\alpha\nu\kappa} R^{\kappa\sigma}_{\nu\mu} + 12 R R_{\mu\nu\alpha\beta} R^{\alpha\beta}_{\nu\mu} - 48 R_{\mu\alpha\nu\beta} R^{\alpha\beta}_{\sigma} R_{\sigma\gamma} - 48 R_{\mu\alpha\beta} R_{\gamma}^{\alpha\beta} R^{\gamma}_{\beta\alpha} +$$

$$+ 48 R_{\mu\alpha\nu\beta} R^{\alpha\beta}_{\sigma\kappa\nu} R_{\sigma\kappa\nu} + 24 R_{\mu\nu\alpha\beta} R^{\alpha\beta}_{\sigma\kappa\rho} R_{\sigma\kappa\rho} + 12 R_{\mu}^{\alpha\beta\kappa\rho} R_{\beta\gamma\kappa\rho} R_{\gamma\sigma\kappa\rho} +$$

$$+ 48 R_{\mu\alpha}^{\beta\gamma\rho} R_{\beta\rho\lambda}^{\gamma\lambda} R^{\lambda\rho}_{\sigma}).$$
1.1 Cosmological equations

Now consider seven-dimensional flat space and assume metric tensor to get the form
\[ g_{\mu\nu} = \text{diag}\{-1, a^2(t), a^2(t), a^2(t), b^2(t), b^2(t), b^2(t)\}. \]  

Furthermore, let \( T_{\mu\nu} = 0 \).

From such a metric one can obtain nonzero Christoffel symbols:
\[ \Gamma^0_00 = a \dot{a}, \quad \Gamma^0_0a = \dot{b}, \quad \Gamma^0_0i = \frac{\dot{a}}{a}, \quad \Gamma^0_{0c} = \dot{b} b \]

(Latin indexes from the middle of alphabet i,j,k,... run over visible subspace, and Latin indexes from the beginning of alphabet a,b,c,... run over extra subspace; index 0 notice the time coordinate; Greek indexes run over all the space). Nonzero components of Riemann tensor are
\[
\begin{align*}
R^0_000 &= \dot{a}^2(t) - \frac{\dot{a}^2(t)}{a(t)}; \\
R^i_00i &= \frac{\dot{a}}{a} b(t); \\
R^i_0ji &= \frac{\dot{a}}{a} b(t); \\
R^i_0ic &\quad i \neq j; \\
R^i_0cc &\quad c \neq d; \\
R^i_0ci &\quad c \neq d; \\
R^i_0ci &\quad c \neq d.
\end{align*}
\]

Now the field equations (5) are
\[
\begin{align*}
H^2 + 3 H h + h^2 + 12 \alpha_2 H^3 h + 36 \alpha_2 H^2 h^2 + 12 \alpha_2 H^3 h^3 - 240 \alpha_3 H^3 h^3 &= 0, \\
\dot{H} (2 + 24 \alpha_2 H h + 24 \alpha_2 h^2 - 288 \alpha_3 H^3 h^3) + \dot{h} (3 + 48 \alpha_2 H h + 12 \alpha_2 H^2 + 12 \alpha_2 h^2 - 432 \alpha_3 H^2 h^2) + 3 H^2 + 6 H h + 6 h^2 + 72 \alpha_2 H^2 h^2 + 72 \alpha_2 H^3 h^3 + 24 \alpha_2 H^2 h^2 + 12 \alpha_2 h^4 - 432 \alpha_3 H^2 h^4 - 288 \alpha_3 H^3 h^3 &= 0, \\
\dot{H} (3 + 48 \alpha_2 H h + 12 \alpha_2 h^2 + 12 \alpha_2 H^2 - 432 \alpha_3 H^3 h^3) + \dot{h} (2 + 24 \alpha_2 H h + 24 \alpha_2 H^2 - 288 \alpha_3 H^3 h^3) + 3 h^2 + 6 H h + 6 H^2 + 72 \alpha_2 H^2 h^2 + 72 \alpha_2 H^3 h^3 + 24 \alpha_2 H^2 h^2 + 12 \alpha_2 h^4 - 432 \alpha_3 H^2 h^4 - 288 \alpha_3 H^3 h^3 &= 0.
\end{align*}
\]

Here
\[ H(t) = \frac{\dot{a}(t)}{a(t)}, \quad h(t) = \frac{\dot{b}(t)}{b(t)} \]

are Hubble parameters for visible and extra dimensions respectively.

Note that third equation is consequence of two other equations. A reader is asked to verify this correlation by himself.

\(^3\)We elected 7-dimensional space for two reasons. First, just in such a space nonzero third order of Lovelock gravity arises. Second, in such a space we obtain general exact solution of the present form for the second order theory (see below).
It seems reasonable to begin consideration of system (11) with allowing $\alpha_2 = \alpha_3 = 0$ and solving therefore 7-dimensional Einstein equations. But all solutions of them are only particular cases of generalized Kasner solution (see [21] and [22, §117] for 4-dimensional case). Particularly, in our case (9) there is a solution

$$a(t) = a^{(0)} \frac{1}{(t_0 - t)^{\frac{3 - \sqrt{5}}{6(\sqrt{5} + 2)}}} \approx a^{(0)} \frac{1}{(t_0 - t)^{0.206}},$$

$$b(t) = b^{(0)}(t_0 - t)^{\frac{3 - \sqrt{5}}{6(\sqrt{5} - 2)}} \approx b^{(0)}(t_0 - t)^{0.539},$$

(13)

where $a(t)$ describes accelerated expansion of visible subspace.

1.2 General solution in the second order

Assume $\alpha_3 = 0$ in (11). Then we have

$$\begin{align*}
H^2 + 3Hh + h^2 + 12\alpha_2 H^3 h + 36\alpha_2 H^2 h^2 + 12\alpha_2 H h^3 &= 0, \\
\dot{H}(2 + 24\alpha_2 H h + 24\alpha_2 h^2) + \dot{h}(3 + 48\alpha_2 H h + 12\alpha_2 H^2 + \\
+ 12\alpha_2 h^2) + 3H^2 + 6Hh + 6h^2 + 72\alpha_2 H^2 h^2 + \\
+ 72\alpha_2 H h^3 + 24\alpha_2 H^3 h + 12\alpha_2 h^4 &= 0, \\
\dot{H}(3 + 48\alpha_2 H h + 12\alpha_2 h^2 + 12\alpha_2 H^2) + \dot{h}(2 + 24\alpha_2 H h + \\
+ 24\alpha_2 H^2) + 3h^2 + 6Hh + 6H^2 + 72\alpha_2 H^2 h^2 + \\
+ 72\alpha_2 H^3 h + 12\alpha_2 H^4 &= 0.
\end{align*}$$

(14)

From the first equation there are 3 possibilities:

$$H = -\frac{1}{12\alpha_2 h}, \quad H = -\frac{3 - \sqrt{5}}{2} h, \quad H = -\frac{3 + \sqrt{5}}{2} h.$$ 

Second and third possibilities are satisfied in all cases ($H > 0$ if $h < 0$), first one — under $\alpha_2 > 0$. Consider them one by one.

1. $H = -\frac{1}{12\alpha_2 h}$. Plugging into the second equation we have

$$\dot{h} = -\frac{1728\alpha_2^3 h^6 + 1}{12\alpha_2(12\alpha_2 h^2 + 144\alpha_2^2 h^4 + 1)}.$$ 

Then

$$h = \frac{1}{6} \sqrt{\frac{3}{\alpha_2}} x,$$

where $x$ obeys equation

$$x^5 + 3\gamma x^4 - 5x^3 - 5\gamma x^2 + 3x + \gamma = 0,$$

with
\[ \gamma = \tan \left( \frac{\sqrt{3}(t + t_0)}{2\sqrt{\alpha_2}} \right). \]

2. \( H = -\frac{3 - \sqrt{5}}{2}h \). Plugging into the second equation we have
\[ \dot{h} = \frac{3h^2(-40\alpha_2h^2 + 16\alpha_2h^2\sqrt{5} - \sqrt{5} + 5)}{2(-\sqrt{5} + 18\alpha_2h^2\sqrt{5} - 30\alpha_2h^2)}. \]

Then \( h \) obeys equation
\[ 8 \arctanh \left( -\sqrt{\alpha_2}h + \sqrt{5\alpha_2}h \right) \sqrt{\alpha_2}h + 1 - 6(t + t_0)h + \sqrt{5} = 0. \]

3. \( H = -\frac{3 + \sqrt{5}}{2}h \). Plugging into the second equation we have
\[ \dot{h} = \frac{3h^2(40\alpha_2h^2 - 5 - \sqrt{5} + 16\alpha_2h^2\sqrt{5})}{2(30\alpha_2h^2 + 18\alpha_2h^2\sqrt{5} - \sqrt{5})}. \]

Then \( h \) obeys equation
\[ 8 \arctanh \left( \sqrt{\alpha_2}h + \sqrt{5\alpha_2}h \right) \sqrt{\alpha_2}h - 1 + 6(t + t_0)h + \sqrt{5} = 0. \]

In all cases above there is only parametric dependence \( H(t) \) and \( h(t) \). Some explicit solutions in Einstein-Gauss-Bonnet gravity for 7 or other dimensions will be obtained in the second section.

### 1.3 Exponential solution in the third order

Now consider equations of the third order Lovelock gravity with constant Hubble parameters:
\[ \dot{H} = 0, \quad \dot{h} = 0. \]

Then the system (11) takes a form
\[
\begin{cases}
H^2 + 3Hh + h^2 + 12\alpha_2 H^2h + 36\alpha_2 H^2h^2 + 12\alpha_2 Hh^3 - 240\alpha_3 H^3h^3 = 0, \\
3H^2 + 6Hh + 6h^2 + 72\alpha_2 H^2h^2 + 72\alpha_2 H^2h^3 + 24\alpha_2 H^2h^3h + 12\alpha_2 h^4 - 432\alpha_3 H^2h^4 - 288\alpha_3 H^3h^3 = 0, \\
3h^2 + 6Hh + 6H^2 + 72\alpha_2 H^2h^2 + 72\alpha_2 H^2h^3 + 24\alpha_2 H^2h^3h + 12\alpha_2 H^4 - 432\alpha_3 H^4h^2 - 288\alpha_3 H^3h^3 = 0.
\end{cases}
\]

Subtracting the second equation from the third one we have
\[ (H^2 - h^2) \left[ 1 + 16\alpha_2 Hh + 4\alpha_2 (H^2 + h^2) - 144\alpha_3 H^2h^2 \right] = 0. \]
Then \( h = -H \) is a solution of this equation.

Plugging this equality into the second equation of (15) one can obtain 4 various solutions:

\[
H = \pm \sqrt{\frac{-\alpha_2 \pm \sqrt{\alpha_2^2 + 12\alpha_3}}{24\alpha_3}},
\]

(16)

Because of the expansion of visible dimensions let us take only \( H > 0 \). Then we have

\[
H = \sqrt{\frac{-\alpha_2 + \sqrt{\alpha_2^2 + 12\alpha_3}}{24\alpha_3}}, \quad h = -\sqrt{\frac{-\alpha_2 - \sqrt{\alpha_2^2 + 12\alpha_3}}{24\alpha_3}}.
\]

(17)

Plugging \( h = -H \) into the first equation of (15) we obtain

\[
H = \pm \sqrt{\frac{-\alpha_2 \pm \sqrt{\alpha_2^2 + (20/3)\alpha_3}}{40\alpha_3}}.
\]

(18)

Comparing that with (16) we have

\[
\alpha_3 = -\frac{1}{12} \alpha_2^2.
\]

Then

\[
H = \frac{1}{\sqrt{2\alpha_2}}, \quad h = -\frac{1}{\sqrt{2\alpha_2}}.
\]

Therefore (because of (12)),

\[
a(t) = C_1 \exp\left(\frac{t}{\sqrt{2\alpha_2}}\right), \quad b(t) = C_2 \exp\left(-\frac{t}{\sqrt{2\alpha_2}}\right),
\]

(19)

where \( C_1, C_2 \) are arbitrary positive constants.

It is clear that \( \dot{a}(t) > 0, \ddot{a}(t) > 0 \), i.e. the abovementioned solution describes accelerated expansion of visible dimensions. At that extra dimensions shrink. Then it is possible that visible and extra dimensions were equivalent and the Universe look as 4-dimensional one only after expansion of one subspace and contraction of another one. Solution (19) seems to be useful for the description of inflation.

Finally, if \( T_{\mu\nu} = 0, \alpha_2 > 0 \) and \( \alpha_3 = -\frac{1}{12} \alpha_2^2 \) then system (5) has solution (9) where functions \( a(t) \) and \( b(t) \) are expressed by (19) with arbitrary positive constants \( C_1 \) and \( C_2 \).

2 Einstein-Gauss-Bonnet gravity with dilaton

Such a theory is the following: fields \( g_{\mu\nu}, \varphi, \Phi^I \); Lagrangian

\[
\mathcal{L}_{EGBd} = R + g^{\mu\nu} \partial_\mu \varphi \partial_\nu \varphi - V(\varphi) + \varepsilon(\varphi) \mathcal{L}_2 + \mathcal{L}_M(\Phi^I, g_{\mu\nu}).
\]

(20)

Here \( \varepsilon(\varphi), V(\varphi) \) are functions of dilaton \( \varphi \), \( \mathcal{L}_2 \) is a Gauss-Bonnet Lagrangian (3). Theory under consideration is different from generalized Brans-Dicke theory (see, e.g. [20]) even
in 4-dimensional space, that is why we investigate both (3+1)-dimensional space and spaces with extra dimensions (where Einstein-Gauss-Bonnet gravity without dilaton is sensible).

Variating the action with Lagrangian \([20]\) we get field equations:

\[
\begin{align*}
R_{\mu\nu} - \frac{1}{2} R g_{\mu\nu} - \frac{1}{2} g_{\mu\nu} g^{\alpha\beta} \partial_{\alpha} \varphi \partial_{\beta} \varphi & + \frac{1}{2} g_{\mu\nu} V(\varphi) + \varepsilon(\varphi) G^{(2)}_{\mu\nu} + \partial_{\mu} \varphi \partial_{\nu} \varphi - \\
- 4 \left( R_{\mu\nu} - \frac{1}{2} R g_{\mu\nu} \right) \Box \varepsilon(\varphi) - 4 \left( R_{\mu}^{\alpha\beta} \nu + R^{\alpha\beta} g_{\mu\nu} \right) \nabla_{\alpha} \nabla_{\beta} \varepsilon(\varphi) + \\
+ 8 R^{\alpha} \mu \nabla_{\alpha} \nabla_{\nu} \varepsilon(\varphi) - 2 R \nabla_{\mu} \nabla_{\nu} \varepsilon(\varphi) & = \frac{8 \pi G}{c^4} T_{\mu\nu}; \\
2 \Box \varphi + V'(\varphi) - \varepsilon'(\varphi) \mathcal{L}_2 & = 0.
\end{align*}
\]

Here \(G^{(2)}_{\mu\nu}\) is the second Lovelock tensor \([7]\).

### 2.1 Cosmological equations

Consider space of \(D = p + q + 1\) dimensions with two maximally symmetric subspaces: \(p\)-dimensional and \(q\)-dimensional. Square interval in such a space is

\[
ds^2 = -e^{2u_0(t)} dt^2 + e^{2u_1(t)} ds_p^2 + e^{2u_2(t)} ds_q^2,
\]

where \(ds_p^2\) and \(ds_q^2\) are square intervals in \(p\)- and \(q\)-dimensional subspaces respectively, \(u_0(t), u_1(t), u_2(t)\) are arbitrary functions of time \(t\).

If metric is \([22]\) then Christoffel symbols are (as above, Latin indexes from the middle of alphabet \(i,j,k,...\) run over visible \(p\)-subspace, and Latin indexes from the beginning of alphabet \(a,b,c,...\) run over extra \(q\)-subspace; index 0 notice the time coordinate; Greek indexes run over all the space)

\[
\begin{align*}
\Gamma_{00}^i &= \dot{u}_0, & \Gamma_{ij}^0 &= \dot{u}_1 e^{-2u_0} g_{ij}, & \Gamma_{ab}^0 &= \dot{u}_2 e^{-2u_0} g_{ab}, \\
\Gamma_{jk}^i &= \tilde{\Gamma}_{jk}^i, & \Gamma_{0i}^i &= \dot{\Gamma}_{0i}^i = \dot{u}_1, & \Gamma_{bc}^a &= \tilde{\Gamma}_{bc}^a, & \Gamma_{0a}^a &= \Gamma_{a0}^a = \dot{u}_2.
\end{align*}
\]

Riemann tensor, Ricci tensor and scalar curvature are

\[
\begin{align*}
R_{i00j} &= e^{-2u_0} X_{g_{ij}}, & R_{a0b} &= e^{-2u_0} Y_{g_{ab}}, \\
R_{ijkl} &= e^{-2u_0} A_p (\delta_i \delta_j g_{kl} - \delta_i g_{jk}), & R_{ijb} &= e^{-2u_0} \dot{u}_1 \dot{u}_2 \delta_i g_{aj}, \\
R_{abcd} &= e^{-2u_0} A_q (\delta_c g_{bd} - \delta_d g_{bc}), & R_{00} &= -pX - qY, \\
R_{ij} &= e^{-2u_0} (X + (p - 1) A_p + q \dot{u}_1 \dot{u}_2) g_{ij}, & R_{ab} &= e^{-2u_0} (Y + (q - 1) A_q + p \dot{u}_1 \dot{u}_2) g_{ab}, \\
R &= e^{-2u_0} [2pX + 2qY + p_1 A_p + q_1 A_q + 2pq \dot{u}_1 \dot{u}_2].
\end{align*}
\]
Gauss-Bonnet Lagrangian (3):

\[ \mathcal{L}_2 = e^{-4u_0} \left\{ p_3 A_p^2 + 2p_1 q_1 A_p A_q + q_3 A_q^2 + 4\dot{u}_1 \dot{u}_2 (p_2 q A_p + p q_2 A_q) + 4p_1 q_1 \dot{u}_1^2 \dot{u}_2^2 + \\
+ 4pX [(p-1)_2 A_p + q_1 A_q + 2(p-1)q\dot{u}_1 \dot{u}_2] + 4qY [p_1 A_p + (q-1)_2 A_q + 2p(q-1)\dot{u}_1 \dot{u}_2] \right\}. \]

Here we introduce the following notations:

\[ A_p \equiv \dot{u}_1^2 + \sigma_p e^{2(u_0 - u_1)}, \quad A_q \equiv \dot{u}_2^2 + \sigma_q e^{2(u_0 - u_2)}, \]
\[ X \equiv \ddot{u}_1 - \dot{u}_0 \dot{u}_1 + \dot{u}_1^2, \quad Y \equiv \ddot{u}_2 - \dot{u}_0 \dot{u}_2 + \dot{u}_2^2, \]
\[ (p-m)_n \equiv (p-m)(p-m-1)(p-m-2) \ldots (p-n), \]
\[ (q-m)_n \equiv (q-m)(q-m-1)(q-m-2) \ldots (q-n), \]

\[ \sigma_p \equiv \frac{\tilde{R}_p}{p(p-1)}, \quad \sigma_q \equiv \frac{\tilde{R}_q}{q(q-1)}, \]

where \( \tilde{R}_p, \tilde{R}_q \) are internal curvatures of \( p \)- and \( q \)-dimensional subspaces respectively, \( \tilde{\Gamma}_j^i \) and \( \tilde{\Gamma}_b^a \) are internal Christoffel symbols.

Now field equations are

\[ \frac{1}{2} p_1 A_p + \frac{1}{2} q_1 A_q + pq \dot{u}_1 \dot{u}_2 + \frac{1}{2} \dot{\varphi}^2 - \frac{1}{2} e^{-2u_0} V(\varphi) + \frac{1}{2} e^{-2u_0} \varepsilon(\varphi) \{ p_3 A_p^2 + 2p_1 q_1 A_p A_q + \\
+ q_3 A_q^2 + 4\dot{u}_1 \dot{u}_2 (p_2 q A_p + p q_2 A_q) + 4p_1 q_1 \dot{u}_1^2 \dot{u}_2^2 \} + 2e^{-2u_0} \varepsilon'(\varphi) \dot{\varphi} \{ A_p (p_2 q \dot{u}_1 + \\
+ q p_1 \dot{u}_2) + A_q (pq_1 \dot{u}_1 + q_2 \dot{u}_2) + 2\dot{u}_1 \dot{u}_2 (p q_1 \dot{u}_1 + pq_1 \dot{u}_2) \} = \frac{8\pi G}{c^4} T_{00}, \]
\[ e^{-2uo}\{(1 - p)X - qY - \frac{1}{2}(p - 1)A_p - \frac{1}{2}q_1A_q - (p - 1)q\dot{u}_1\dot{u}_2\}g_{ij} + \frac{1}{2}e^{-2uo}\phi^2g_{ij} + \]

\[ + \frac{1}{2}V(\varphi)g_{ij} - \frac{1}{2}\varepsilon(\varphi)e^{-4uo}g_{ij}\{(p - 1)4A_p^2 + 4(p - 1)2q_1\dot{u}_1^2\dot{u}_2^2 + 4(p - 1)3A_pX + \]

\[ + 4(p - 1)3q\dot{u}_1\dot{u}_2A_p + 8(p - 1)q_1\dot{u}_1\dot{u}_2Y + 4(p - 1)q_2\dot{u}_1\dot{u}_2A_q + 4(p - 1)q_1A_qX + \]

\[ + 8(p - 1)2q\dot{u}_1\dot{u}_2X + 4(p - 1)2qA_pY + 2(p - 1)2q_1A_pA_q + q_3A_q^2 + 4q_2A_qY\} + \]

\[ + 2e^{-4uo}g_{ij}\{(\varepsilon''\dot{\varphi}^2 + \varepsilon'\dot{\varphi} - \varepsilon'\dot{u}_0\dot{\varphi})[(p - 1)2A_p + q_1A_q + 2(p - 1)q\dot{u}_1\dot{u}_2] + \]

\[ + \varepsilon'\dot{u}_1\dot{\varphi}[-2(p - 1)2X - 2(p - 1)qY - (p - 1)3A_p - (p - 1)q_1A_q - \]

\[ - 2(p - 1)2q\dot{u}_1\dot{u}_2] + \varepsilon'\dot{u}_2\dot{\varphi}[-2(p - 1)qX - 2q_1Y - (p - 1)2qA_p - \]

\[ - q_2A_q - 2(p - 1)q_1\dot{u}_1\dot{u}_2)]\} = \frac{8\pi G}{c^4}T_{ij}, \]

\[ e^{-2uo}\{(1 - q)Y - pX - \frac{1}{2}(q - 1)A_q - \frac{1}{2}p_1A_p - (q - 1)p\dot{u}_1\dot{u}_2\}g_{ab} + \frac{1}{2}e^{-2uo}\phi^2g_{ab} + \]

\[ + \frac{1}{2}V(\varphi)g_{ab} - \frac{1}{2}\varepsilon(\varphi)e^{-4uo}g_{ab}\{(q - 1)4A_q^2 + 4(q - 1)2p_1\dot{u}_1^2\dot{u}_2^2 + 4(q - 1)3A_qY + \]

\[ + 4(q - 1)3p\dot{u}_1\dot{u}_2A_q + 8(q - 1)p_1\dot{u}_1\dot{u}_2X + 4(q - 1)p_2\dot{u}_1\dot{u}_2A_p + 4(q - 1)p_1A_pY + \]

\[ + 8(q - 1)2p\dot{u}_1\dot{u}_2Y + 4(q - 1)2pA_qX + 2(q - 1)2p_1A_pA_q + q_3A_q^2 + 4q_2A_qX\} + \]

\[ + 2e^{-4uo}g_{ab}\{-\varepsilon''\dot{\varphi}^2 + \varepsilon'\dot{\varphi} - \varepsilon'\dot{u}_0\dot{\varphi})[(q - 1)2A_q + p_1A_p + 2(q - 1)p\dot{u}_1\dot{u}_2] + \]

\[ + \varepsilon'\dot{u}_2\dot{\varphi}[-2(q - 1)2Y - 2(q - 1)pX - (q - 1)3A_q - (q - 1)p_1A_p - \]

\[ - 2(q - 1)2p\dot{u}_1\dot{u}_2] + \varepsilon'\dot{u}_1\dot{\varphi}[-2(q - 1)pY - 2p_1X - (q - 1)2pA_q - \]

\[ - p_2A_p - 2(q - 1)p_1\dot{u}_1\dot{u}_2)]\} = \frac{8\pi G}{c^4}T_{ab}, \]
\[2[\ddot{\varphi} + (-\dot{u}_0 + p\dot{u}_1 + q\dot{u}_2)\dot{\varphi}] - V'(\varphi) + \varepsilon'(\varphi)e^{-2u_0}\left\{p_3A_p^2 + 2p_1q_1A_pA_q + q_3A_q^2 +
\right.
\]
\[+ 4\dot{u}_1\dot{u}_2(p_2q_2A_p + pq_2A_q) + 4p_1q_1\ddot{u}_1\ddot{u}_2 + 4pX[(p - 1)_2A_p + q_1A_q +
\right.
\]
\[+ 2(p - 1)q\dot{u}_1\dot{u}_2] + 4qY[p_1A_p + (q - 1)_2A_q + 2p(q - 1)\dot{u}_1\dot{u}_2]\} = 0. \tag{30} \]

These equations are equivalent to those in [14] if we substitute \(g^{\mu\nu}\partial_\mu\varphi\partial_\nu\varphi\) by \(-\frac{1}{2}g^{\mu\nu}\partial_\mu\varphi\partial_\nu\varphi\) in Lagrangian and put \(\varepsilon(\varphi) = \alpha_2e^{-u_0\varphi}, V(\varphi) = 0, T_{\mu\nu} = 0. \)

Henceforth, we may put \(u_0 = 0\) (for simplification), \(p = 3\) (to identify \(p\)-subspace with visible space).

### 2.2 Stationary solutions

Let us now turn to find solutions of (27)–(30) under \(p = 3, u_0 = 0\). The simplest solutions are stationary ones. Hence put

\[u_1 = \text{const}, \quad u_2 = \text{const}, \quad \varphi = \text{const}. \]

Then (24) are

\[A_p = \sigma_pe^{-2u_1}, \quad A_q = \sigma_qe^{-2u_2}, \quad X = Y = 0. \]

Consider space with homogeneous dust, i.e. \(T_{00} \neq 0\) (other \(T_{\mu\nu} = 0\)).

After that, system (27)–(30) get the form of algebraic equations

\[3A_p + \frac{1}{2}q_1A_q - \frac{1}{2}V(\varphi) + \frac{1}{2}\varepsilon(\varphi)\{12q_1A_pA_q + q_3A_q^2\} = \frac{8\pi G}{c^4}T_{00}; \tag{31} \]

\[- A_p - \frac{1}{2}q_1A_q + \frac{1}{2}V(\varphi) - \frac{1}{2}\varepsilon(\varphi)\{4q_1A_qA_p + q_3A_p^2\} = 0; \tag{32} \]

\[- \frac{1}{2}(q - 1)_2A_q - 3A_p + \frac{1}{2}V(\varphi) - \frac{1}{2}\varepsilon(\varphi)\{(q - 1)_4A_p^2 + 12(q - 1)A_pA_q\} = 0; \tag{33} \]

\[V'(\varphi) - \varepsilon'(\varphi)\{12q_1A_pA_q + q_3A_q^2\} = 0. \tag{34} \]

From (34) and (31) we have

\[3A_p + \frac{1}{2}q_1A_q = \frac{1}{2}V(\varphi) - \frac{1}{2}\varepsilon(\varphi)\frac{V'(\varphi)}{\varepsilon'(\varphi)} + \frac{8\pi G}{c^4}T_{00}. \tag{35} \]
Try to find linear combination of (31)–(33) in order to cancel terms with \( \varepsilon(\varphi) \). Let \( \alpha, \beta, \gamma \) are coefficients for (32), (33) and (31) in such a combination. Then we need

\[
\begin{align*}
\alpha q_3 + \beta(q - 1)_4 &= \gamma q_3, \\
4\alpha q_1 + 12\beta(q - 1)_2 &= 12\gamma q_1.
\end{align*}
\]

Therefore

\[
\gamma = \left(1 - \frac{1}{q}\right)\beta, \quad \alpha = \frac{3}{q}\beta.
\]

Now put \( \beta = q \). Then \( \alpha = 3, \quad \gamma = q - 1 \).

Now multiplying (32) by \( 3/(q + 1) \), (33) by \( q/(q + 1) \) and putting them together we have (taking (34) into account)

\[
3A_p + \frac{1}{2}q_1A_q = \frac{q + 3}{2(q + 1)}V(\varphi) - \frac{q - 1}{2(q + 1)}\varepsilon(\varphi)\frac{V'(\varphi)}{\varepsilon'(\varphi)}.
\]

From this and (35) one can get

\[
\frac{1}{q + 1}V(\varphi) + \frac{1}{q + 1}\varepsilon(\varphi)\frac{V'(\varphi)}{\varepsilon'(\varphi)} - \frac{8\pi G}{c^4} T_{00} = 0.
\]

Put now

\[
V(\varphi) = ae^{-\alpha \varphi}, \quad \varepsilon(\varphi) = be^{-\beta \varphi}.
\]

Then (37) get the form

\[
\frac{1}{q + 1}\left(1 + \frac{\alpha}{\beta}\right)ae^{-\alpha \varphi} - \frac{8\pi G}{c^4} T_{00} = 0.
\]

It is easy to see:

\[
\varphi = -\frac{1}{\alpha} \ln \left\{ \frac{\beta(q + 1)}{a(\alpha + \beta)} \cdot \frac{8\pi G}{c^4} T_{00} \right\}.
\]

Plugging this \( \varphi \) into (35) we have:

\[
3A_p + \frac{1}{2}q_1A_q = \frac{4\pi G}{c^4} T_{00} \frac{(1 - q)\alpha + (q + 3)\beta}{\alpha + \beta}.
\]

Plugging \( A_p \) derived from that into (34) we can get

\[
A_q = \frac{\frac{1 - q}{\alpha + \beta} - \frac{3}{q} \beta A_q}{\beta A_q} = \frac{\alpha a}{\beta b} \left\{ \beta(q + 1) \cdot \frac{8\pi G}{c^4} T_{00} \right\} \frac{\alpha - \beta}{\alpha}.
\]

where

\[
\kappa \equiv \frac{8\pi G}{c^4} T_{00}.
\]

That is quadratic equation on \( A_q \), which solutions are

\[
A_q = \frac{-2q_1\kappa (1 - q)\alpha + (q + 3)\beta}{\alpha + \beta} \pm \sqrt{D} \quad 2(q_3 - 2q_1^2),
\]

(40)
where
\[ D = \left( 2q_1 \frac{(1 - q)\alpha + (q + 3)\beta}{\alpha + \beta} \right)^2 + 4q_1 \{(q - 2)(q - 3) - 2q(q - 1)\} \frac{\alpha a}{\beta b} \left\{ \frac{\beta (q + 1)}{a(\alpha + \beta)} \right\} \frac{\alpha - \beta}{\alpha}. \] (41)

Then, taking (39) into account, we obtain
\[ A_p = \frac{1}{6} \frac{(1 - q)\alpha + (q + 3)\beta}{\alpha + \beta} - \frac{q_1}{6} A_q. \] (42)

Finally,
\[ u_1 = -\frac{1}{2} \ln \frac{A_p}{\sigma_p}, \quad u_2 = -\frac{1}{2} \ln \frac{A_q}{\sigma_q} \] (43)
and \( \varphi \) is (38).

It should be noted that the following constraints were applied:
\[ T_{00} \neq 0, \quad a \neq 0, \quad b \neq 0, \quad \alpha \neq 0, \quad \beta \neq 0, \quad \alpha \neq -\beta, \quad q \neq 0, \quad q \neq 2, \quad q \neq 4, \quad \sigma_p \neq 0, \quad \sigma_q \neq 0. \]

It is easy to derive solution for (3+1)-dimensional space with perfect fluid of arbitrary equation of state parameter. At that we should not specify \( V(\varphi) \) and \( \varepsilon(\varphi) \) because of \( \varepsilon(\varphi) \) do not participate in equations and \( V(\varphi) \) is specified from those. Dilaton also do not contribute in equations, therefore we should solve just Einstein equations with cosmological constant. Solution is
\[ V = (1 + 3w) \frac{8\pi G}{c^4} T_{00}, \quad u_1 = -\frac{1}{2} \ln \left( \frac{1 + w}{2\sigma_p} \frac{8\pi G}{c^4} T_{00} \right). \]
Here \( \omega \) is equation of state parameter (\( p = w \epsilon \), \( p \) is pressure, \( \epsilon \equiv T_{00} \) is energy density). A particular case (when \( w = 0 \)) was derived by A. Einstein in 1917 [23].

2.3 Exponential solutions
For the dynamical solutions we need to do further simplification of (27)–(30). Therefore, in addition to \( p = 3 \) and \( u_0 = 0 \), put \( \sigma_p = \sigma_q = 0 \) i. e. subspaces are flat. In addition to simplicity, such a condition is caused by Cosmic Microwave Background observations [24, 25] indicate the flatness of visible subspace. For extra subspace \( \sigma_q = 0 \) is only a simplification.

After that, equations (27)–(30) are
\[ 3\dot{u}_1^2 + \frac{1}{2} q_1 \dot{u}_2^2 + 3q_1 \dot{u}_1 \dot{u}_2 + \frac{1}{2} \dot{\varphi}^2 - \frac{1}{2} V(\varphi) + \frac{1}{2} \varepsilon(\varphi) \left\{ 36q_1 \dot{u}_1^2 \dot{u}_2^2 + q_3 \dot{u}_4^2 + 12 \dot{u}_1 \dot{u}_2 (2q_1 \dot{u}_1^2 + q_2 \dot{u}_2^2) \right\} + \\
+ 2 \varepsilon' \dot{\varphi} \left\{ 6q_1 \dot{u}_1^2 + 18q_1 \dot{u}_1 \dot{u}_2 + 9q_1 \dot{u}_1 \dot{u}_2 + q_2 \dot{u}_2^2 \right\} = \frac{8\pi G}{c^4} T_{00}. \] (44)
\{-2\ddot{u}_1 - q\dddot{u}_2 - 3\dot{u}_1^2 - \frac{1}{2}q(q + 1)\ddot{u}_1^2 - 2q\dddot{u}_1 \ddot{u}_2\} g_{ij} + \frac{1}{2}\dot{\varphi}^2 g_{ij} + \frac{1}{2}V(\varphi)g_{ij} - \\
- \frac{1}{2}\varepsilon(\varphi)g_{ij}\{8\dddot{u}_1 \ddot{u}_2(q_1 \dddot{u}_2 + 2q\dddot{u}_1) + 4\dddot{u}_2(4q_1 \dddot{u}_1 \ddot{u}_2 + 2q\dddot{u}_1^2 + q_2 \dddot{u}_2^2) + (q + 1)q_2 \dddot{u}_2^2 + \\
+ 4q(5q - 3)\dddot{u}_1^2 \ddot{u}_2^2 + 8qq_1 \dddot{u}_1 \ddot{u}_2^3 + 16q\dddot{u}_1^3 \ddot{u}_2\} + 2g_{ij}\{-(-\varepsilon'' \dot{\varphi}^2 + \varepsilon' \dot{\varphi} \dddot{\varphi})[2\dddot{u}_1 + q_1 \dddot{u}_2 + \\
+ 4q\dddot{u}_1 \ddot{u}_2] + \varepsilon' \dddot{u}_1 \dddot{\varphi}[-4\dddot{u}_1 - 4q\dddot{u}_2 - 4\dot{u}_1^2 - 2(q + 1)q\dddot{u}_2^2 - 4q\dddot{u}_1 \ddot{u}_2] + \\
+ \varepsilon' \dddot{u}_2 \dddot{\varphi}[-4q\dddot{u}_1 - 2q_1 \dddot{u}_2 - 6q\dddot{u}_1^2 - qq_1 \dddot{u}_2^2 - 4q_1 \dddot{u}_1 \ddot{u}_2]\} = \frac{8\pi G}{c^4} T_{ij}. 

\{-3\dddot{u}_1 - (q - 1)\dddot{u}_2 - 6\dot{u}_1^2 - \frac{1}{2}q_1 \dddot{u}_1^2 - 3(q - 1)\dddot{u}_1 \ddot{u}_2\} g_{ab} + \frac{1}{2}\dot{\varphi}^2 g_{ab} + \frac{1}{2}V(\varphi)g_{ab} - \\
- \frac{1}{2}\varepsilon(\varphi)g_{ab}\{12\dddot{u}_1(2\dddot{u}_1^2 + (q - 1)\dddot{u}_1 \ddot{u}_2^2 + 4(q - 1)\dddot{u}_1 \ddot{u}_2) + 4\dddot{u}_2(6(q - 1)\dddot{u}_1 \ddot{u}_2 + \\
+ (q - 1)3\dddot{u}_2^2 + 6(q - 1)\dddot{u}_1^2) + 24\dddot{u}_1^4 + q_3 \dddot{u}_2^3 + 24(q - 1)(2q - 3)\dddot{u}_1^2 \ddot{u}_2 + \\
+ 72(q - 1)\dddot{u}_1^3 \ddot{u}_2 + 12(q - 1)(q - 1)\dddot{u}_1 \ddot{u}_2^3\} + 2g_{ab}\{-(-\varepsilon'' \dot{\varphi}^2 + \varepsilon' \dot{\varphi} \dddot{\varphi})[6\dddot{u}_1^2 + \\
+ (q - 1)2\dddot{u}_2^2 + 6(q - 1)\dddot{u}_1 \ddot{u}_2] + \varepsilon' \dddot{u}_2 \dddot{\varphi}[-6(q - 1)\dddot{u}_1 - 2(q - 1)2\dddot{u}_2 - \\
- 12(q - 1)\dddot{u}_1^2 - (q - 1)(q - 1)2\dddot{u}_1^2 \ddot{u}_2 - 6(q - 1)\dddot{u}_1 \ddot{u}_2]\} + \varepsilon' \dddot{u}_1 \dddot{\varphi}[-12\dddot{u}_1 - \\
- 6(q - 1)\dddot{u}_2 - 18\dddot{u}_1^2 - 3q_1 \dddot{u}_2^2 - 12(q - 1)\dddot{u}_1 \ddot{u}_2]\} = \frac{8\pi G}{c^4} T_{ab}. 

-2\dddot{\varphi} - 2(3\dddot{u}_1 + q\dddot{u}_2) \dddot{\varphi} + V'(\varphi) - \varepsilon'(\varphi)\{12\dddot{u}_1[2\dddot{u}_1^2 + q_1 \dddot{u}_2^2 + 4q\dddot{u}_1 \ddot{u}_2] + 4q\dddot{u}_2[6\dddot{u}_1^2 + (q - 1)2\dddot{u}_2^2 + \\
+ 6(q - 1)\dddot{u}_1 \ddot{u}_2] + 24\dddot{u}_1^4 + (q + 1)q_2 \dddot{u}_2^4 + 24q(2q - 1)\dddot{u}_1^2 \ddot{u}_2^2 + 72q\dddot{u}_1^3 \ddot{u}_2 + 12qq_1 \dddot{u}_1 \ddot{u}_2^3\} = 0. 

Find at first solutions without dilaton, without matter and with constant Hubble parameters:

\varphi = 0, \quad V(\varphi) = 0, \quad T_{\mu\nu} = 0, \quad \dddot{u}_1 = \text{const}, \quad \dddot{u}_2 = \text{const}. 

(48)
Then system (44)–(46) will be a system of algebraic equations for which we have found two analytical solutions for arbitrary $q$ and negative $\varepsilon$:

$$
\dot{u}_1 = \dot{u}_2 = \pm \frac{1}{\sqrt{-q(q+1)\varepsilon}}.
$$

(49)

Also particular cases from $q = 1$ to $q = 22$ ($22+4=26$ is required for the bosonic strings, and in the case of $q = 0$ Lovelock gravity is just Einstein gravity) have been studied, but solutions different from (49) have been obtained only for $q = 3$ (i.e. for 7-dimensional space just as in section 1):

$$
\dot{u}_1 = -\zeta_1 \sqrt{\frac{3 + \zeta_2 \sqrt{5}}{2\varepsilon}} \cdot \frac{575 + 257\zeta_2 \sqrt{5}}{3010 + 1346\zeta_2 \sqrt{5}},
\dot{u}_2 = \zeta_1 \sqrt{\frac{3 + \zeta_2 \sqrt{5}}{8\varepsilon}},
$$

(50)

and

$$
\dot{u}_1 = \zeta_1 \sqrt{\frac{3 + \zeta_2 \sqrt{5}}{8\varepsilon}},
\dot{u}_2 = -\zeta_1 \sqrt{\frac{3 + \zeta_2 \sqrt{5}}{2\varepsilon}} \cdot \frac{575 + 257\zeta_2 \sqrt{5}}{3010 + 1346\zeta_2 \sqrt{5}},
$$

(51)

where constants $\zeta_1$ and $\zeta_2$ take values of $+1$ and $-1$ independently from each other, and $\varepsilon > 0$.

Therefore scale factors are

$$
a(t) \equiv e^{u_1} = a_0 e^{\dot{u}_1 t}, \quad b(t) \equiv e^{u_2} = b_0 e^{\dot{u}_2 t}.
$$

It is clear that solutions (49) are not useful for us by the following cause: when visible subspace expands, extra subspace expands too, then extra subspace must be visible in this case. But solutions (50) for $\zeta_1 = -1$ and (51) for $\zeta_1 = +1$ satisfy our purpose.

Now let us try to obtain exponential solutions in the presence of perfect fluid. For that substitute conditions (48) by

$$
\varphi = 0, \quad V(\varphi) = 0, \quad T_{00} = \epsilon, \quad T_{ij} = \epsilon g_{ij}, \quad T_{ab} = \epsilon g_{ab}, \quad \dot{u}_1 = \text{const}, \quad \dot{u}_2 = \text{const}.
$$

(52)

After plugging those into (44)–(46) and subtracting factors $g_{ij}$ and $g_{ab}$ we see that left-hand sides of equations are independent of time. Hence the right-hand sides also must be constant.

From 00-component of local conservation law for energy-momentum tensor ($\nabla^\mu T_{\mu 0} = 0$) one can obtain (taking (52) into account)

$$
\epsilon = \epsilon_0 \exp[-(1 + w)(3\dot{u}_1 + q\dot{u}_2)t].
$$

Therefore $\epsilon = \text{const}$ under at least one of a two conditions (here $H \equiv \dot{u}_1$, $h \equiv \dot{u}_2$):

1. $w = -1$;
2. $h = -\frac{3}{q}H$.

In the first case matter can be described by cosmological constant, in the second one comoving bulk is constant. In the latter case equations (44)–(46), as equations on $H, \epsilon, w$, have two solutions:
1. \[ H = 0, \quad \epsilon = 0, \quad w \text{ is arbitrary}, \]
   i. e. flat space with Lorenz metric.

2. \[ H \text{ is arbitrary}, \quad \epsilon = \frac{3c^4H^2(-q^3 - 3q^2 + 3\epsilon H^2q^3 + 54\epsilon H^2q^2 + 81\epsilon H^2q - 162\epsilon H^2)}{16\pi Gq^3}, \]
   \[ w = \frac{\epsilon H^2q^2 - q^2 + 15\epsilon H^2q - 18\epsilon H^2}{-q^2 + 3\epsilon H^2q^2 + 45\epsilon H^2q - 54\epsilon H^2}; \]
   (53)
   i. e. one can obtain any value for \( H \) by matching energy density \( \epsilon \) and EoS parameter \( w \). It is clear that \( h < 0 \) if \( H > 0 \), that’s why this solution satisfies all requirements. Finally, such a solution describes anisotropic expansion of the Universe with matter which not tends to isotropization. In Einstein gravity it is possible only for maximally stiff fluid: \( w = 1 \).

Now turn to the cosmological constant case: \( w = -1 \). Then it is possible to consider \([44]–[46]\) as equations on \( H, h \) and \( \epsilon \). These have the following solutions:

1. \[ H = h \text{ and is arbitrary}, \quad \epsilon = \frac{c^4h^2(6 + q^2 + 5q + \epsilon q^4h^2 + 6\epsilon q^3h^2 + 11h^2\epsilon q^2 + 6h^2\epsilon q)}{16\pi G}; \]
   (54)

2. \[ h \text{ is arbitrary,} \quad H = -(q - 1)h \pm \frac{\sqrt{2\epsilon^2h^2q(q - 1) - \epsilon}}{2\epsilon} \]
   \[ \epsilon = \frac{c^4}{32\pi G} (-96H\epsilon^2q^2h^3 + 48H\epsilon^2q^3h^3 - 24H\epsilon qh + 48H\epsilon^2q^3h^3 + 24H\epsilon h + 2h^2\epsilon q^2 + 10h^2\epsilon q + 14\epsilon^2q^4h^4 - 60\epsilon^2q^3h^4 + 82\epsilon^2q^2h^4 - 36\epsilon^2q^4h^4 - 3 - 12h^2\epsilon ). \]
   (55)

It is evident that the first solution is unsatisfactory. The second one is adequate under \( h < 0, H > 0 \). Such conditions are fulfilled in three cases:

1. \( \epsilon > 0, \quad h < -\frac{1}{\sqrt{2\epsilon q(q - 1)}} \), sign in expression for \( H \) is arbitrary.

2. \( \epsilon < 0, \) sign is ”−”.

3. \( \epsilon < 0, \quad h < -\frac{1}{\sqrt{-2\epsilon(q - 2)(q - 1)}} \), sign is ”+”.

Here we also should emphasize an existence of solutions with matter which do not tend to isotropization.
2.4 Exponent-of-exponent form solutions

Try to obtain solutions with a dynamical dilaton. For that purpose consider equations \((44)\)–\((47)\) and notice that functions \(u_1(t)\) and \(u_2(t)\) make contribution only through derivatives \(\dot{u}_1, \dot{u}_2, \ddot{u}_1, \ddot{u}_2, \) but \(\varphi(t)\) participate explicitly. To find solutions with constant derivatives let’s eliminate \(\varphi(t)\) by introducing new time variable. At first we put

\[
\varepsilon(\varphi) = \beta e^{-\gamma \varphi}, \quad V(\varphi) = \alpha e^{\gamma \varphi}, \quad T_{\mu\nu} = 0. \tag{56}
\]

Now turn from time \(t\) to new variable \(\tau\):

\[
\partial_{\tau} = e^{-\gamma \varphi/2} \partial_{t}.
\]

Derivatives with respect to \(\tau\) will be denoted by the prime \(\prime\). After such a substitution and putting \(u''_1 = u''_2 = \varphi'' = 0\) one can obtain

\[
3u'^2_1 + \frac{1}{2} q_1 u'^2_2 + 3qu'_1 u'_2 + \frac{1}{2}\varphi'^2 - \frac{1}{2}\alpha + \frac{1}{2}\beta\{36q_1 u'^2_1 u'_2 + q_3 u'^4_2 +
\]

\[
+ 12u'_1 u'_2 (2q u'^2_1 + 2q u'^2_2)\} - 2\beta \gamma \varphi' \{18qu'^2_1 u'_2 + 9q_1 u'_1 u'_2 + 6qu'^3_1 + qu'^3_2\} = 0;
\]

\[
-3u'^2 - \frac{1}{2}(q + 1)qu'^2_2 - \gamma \varphi' \left(u'_1 + \frac{q}{2} u'_2\right) - 2qu'_1 u'_2 + \frac{1}{2}\varphi'^2 + \frac{\alpha}{2} - \frac{1}{2}\beta\{-4q(3q + 1)\gamma \varphi' u'^2_1 u'^2_2 -
\]

\[
- 28q \gamma \varphi' u'^2_1 u'_2 - 2(q + 2)q_1 \gamma \varphi' u'^3_2 - 4\gamma^2 \varphi'^3 u'^2_1 - 2q_1 \gamma^2 \varphi'^2 u'^2_2 + 4q(5q - 3)u'^2_1 u'^2_2 +
\]

\[
+ 8qq_1 u'^3_1 u'_2 + 16qu'^3_1 u'_2 + (q + 1)qu'^4_2 - 16q \gamma^2 \varphi'^2 u'_1 u'_2\} = 0;
\]

\[
-\frac{1}{2} q_1 u'^2_2 - 6u'^2_u - \frac{q - 1}{2} \gamma \varphi' u'_2 - \frac{3}{2} \gamma \varphi' u'_1 - 3(q - 1)u'_1 u'_2 + \frac{1}{2}\varphi'^2 + \frac{\alpha}{2} -
\]

\[
- \frac{1}{2}\beta\{-2(q + 1)(q - 1)\gamma \varphi' u'^2_2 - 6(q - 1)(3q - 2)\gamma \varphi' u'^2_1 u'_2 - 60(q - 1)\gamma \varphi' u'^2_2 u'_2 -
\]

\[
- 60\gamma \varphi' u'^3_1 - 2(q - 1)2\gamma^2 \varphi'^2 u'^2_2 - 12\gamma^2 \varphi'^2 u'^2_1 + q_3 u'^4_2 + 24(q - 1)(2q - 3)u'^2_1 u'^2_2 +
\]

\[
+ 12(q - 1)(q - 1)u'_1 u'_2 + 72(q - 1)u'^3_1 u'_2 + 24u'^4_1 - 12(q - 1)\gamma^2 \varphi'^2 u'_1 u'_2\} = 0;
\]

\[
-\gamma \varphi'^2 - 2(3u'_1 + qu'_2)\varphi' + \beta \gamma \{12q(4q - 2)u'^2_1 u'^2_2 + (q + 1)qu'^4_2 + 72qu'^3_1 u'_2 + 12qq_1 u'_1 u'^3_2 +
\]

\[
+ 18q_1 \gamma \varphi' u'^2_1 u'_2 + 36qq \gamma \varphi' u'^2_1 u'_2 + 12q \gamma \varphi' u'^3_2 + 24u'^4_1 + 2q_2 \gamma \varphi' u'^3_2\} + \alpha \gamma = 0.
\]

\[
\alpha, \beta, \gamma = 0.
\]

\[
\tag{59}
\]
Now assume that we have obtained some quantities \( u_1', u_2', \varphi' \) which satisfy these equations. What should they be to describe accelerating expansion of visible subspace and contraction of extra one? It is easy to see that the scale factor of visible subspace would be

\[
a(t) \equiv e^{u_1} = a_0 \exp \left\{ \frac{2u_1' c_0}{\varphi'} e^{\varphi' t/2} \right\},
\]

where \( a_0, c_0 \) are arbitrary positive constants. Then its first and second derivatives with respect to time \( t \) would be

\[
\dot{a}(t) = a_0 u_1' c_0 e^{\varphi' t/2} \exp \left\{ \frac{2u_1' c_0}{\varphi'} e^{\varphi' t/2} \right\},
\]

\[
\ddot{a}(t) = \frac{1}{2} a_0 u_1' c_0 \varphi' e^{\varphi' t/2} + a_0 u_1'^2 c_0^2 \varphi' e^{\varphi' t} \exp \left\{ \frac{2u_1' c_0}{\varphi'} e^{\varphi' t/2} \right\}.
\]

It is clear that both derivatives would be positive (as need for accelerating expansion) if \( u_1' > 0, \varphi' > 0 \) (the latter is not necessary but is sufficient).

By the same manner we obtain the scale factor for extra dimensions:

\[
b(t) \equiv e^{u_2} = b_0 \exp \left\{ \frac{2u_2' c_0}{\varphi'} e^{\varphi' t/2} \right\},
\]

\( (b_0 \) is positive constant) and its first derivative:

\[
\dot{b}(t) = b_0 u_2' c_0 e^{\varphi' t/2} \exp \left\{ \frac{2u_2' c_0}{\varphi'} e^{\varphi' t/2} \right\},
\]

which would be negative (as need for contraction) under \( u_2' < 0 \).

Therefore it is necessary to find solutions of (57)–(60) satisfied conditions

\[
u_1' > 0, \quad u_2' < 0, \quad \varphi' > 0.
\]

Numerical calculations give us solutions for different dimensions from \( q = 1 \) to \( q = 20 \). For example,

\[
q = 1, \quad \alpha = 1, \beta = 1, \gamma = 1, \quad \varphi' = 0.383, \quad u_1' = 0.378, \quad u_2' = -1.32.
\]

\[
q = 2, \quad \alpha = 0.01, \beta = 100, \gamma = 0.01, \quad \varphi' = 5.09 \cdot 10^{-5}, \quad u_1' = 0.0175, \quad u_2' = -0.0803.
\]

\[
q = 3, \quad \alpha = 0.001, \beta = 100, \gamma = 0.001, \quad \varphi' = 2.33 \cdot 10^{-4}, \quad u_1' = 0.0306, \quad u_2' = -0.0788.
\]

Finally, field equations in the case of flat subspaces without matter and with \( V(\varphi) \) and \( \varepsilon(\varphi) \) in the form of (56) have exponent-of-exponent form solutions (61), (62) with above-mentioned parameters.

### 2.5 Power-law solutions

Now consider space with dust-like matter:

\[
T_{00} \neq 0, \quad \text{other } T_{\mu\nu} = 0.
\]
And try to obtain solutions of system (44)-(47) with scale factors of power-law form:

\[ a(t) \equiv e^{u_1} = \left( \frac{t}{t_1} \right)^n, \quad b(t) \equiv e^{u_2} = \left( \frac{t}{t_2} \right)^m. \] (63)

Then all Einstein terms in left-hand sides of equations (44)-(46) are proportional to \(1/t^2\) and Gauss-Bonnet terms are proportional to \(1/t^4\). Hence solutions with scale factors (63) are possible if

\[ T_{00} \propto \frac{1}{t^2}, \] (64)
\[ \dot{\phi}^2 \propto \frac{1}{t^2}, \] (65)
\[ \varepsilon(\phi) \propto t^2, \] (66)
\[ V(\phi) \propto \frac{1}{t^2}, \] (67)

Consider these conditions one by one.

It is possible to derive time dependence of energy density from conservation law of energy-momentum tensor:

\[ T^{00} = \text{const} \cdot t^{-3n-qm}. \]

From comparison this expression with (64) we have

\[ m = \frac{2 - 3n}{q}. \]

Note that under this condition extra subspace contracts \((m < 0)\) if visible subspace expands accelerative \((n > 1)\) (but we haven’t obtain such a solution, see below). For \((3+1)\)-dimensional space condition (64) leads to \(n = 2/3\) i.e. to Friedmann solution.

From condition (65) it is easy to obtain \(\dot{\phi}(t) = \psi \ln(t/t_3)\), where \(\psi, t_3\) are arbitrary constants \((t_3 > 0)\). In order to avoid unnecessary complication put \(\psi = 1\). Therefore

\[ \dot{\phi}(t) = \ln \left( \frac{t}{t_3} \right). \]

From comparison that with (66), (67) we see:

\[ V(\phi) = \tilde{\alpha} e^{-2\phi}, \quad \varepsilon(\phi) = \tilde{\beta} e^{2\phi}, \]

where \(\tilde{\alpha}, \tilde{\beta}\) are constants.

Plugging all those into equations (44)-(47) and putting

\[ \tilde{\alpha} \rightarrow \alpha = \tilde{\alpha} t_3^2, \quad \tilde{\beta} \rightarrow \beta = \tilde{\beta}/t_3^2, \]

one can obtain a system of algebraic equations on \(n\) with parameters \(\alpha, \beta, q\) and \(\tilde{\varepsilon} \equiv \frac{8\pi G}{c^4} T_{00}(t_0)/t_0^2\), where \(T_{00}(t_0)\) is energy density at some time moment \(t_0\). Such a system of equations has solutions not at all values of parameters. Considering dimensions from \(q = 1\)

19
to $q = 22$ we have obtained a set of solutions with arbitrary $\kappa$. Here $\alpha$ and $\beta$ are functions of $\kappa$ and $0 < n = m < 1$ i.e. visible and extra subspaces expands with deceleration (and with the same velocity). In another set of solutions $\kappa$ possesses fixed values. Here in two cases $n = m$ and in another cases $n \neq m$. These are solutions for $q = 1, 2, 6, 9, 12$:

$q = 1$, \quad $\kappa$ is arbitrary, \quad $\alpha = \frac{3}{7} \kappa - \frac{29}{14}, \quad \beta = \frac{2}{21} \kappa - \frac{5}{21}, \quad n = m = \frac{1}{2}$

$q = 2$, \quad $\kappa = \frac{53}{40}$, \quad $\alpha = -\frac{973}{640}, \quad \beta = -\frac{25}{272}, \quad n = \frac{3}{10}, \quad m = \frac{11}{20}$

$q = 6$, \quad $\kappa$ is arbitrary, \quad $\alpha = \frac{112}{253} \kappa - \frac{5077}{227}, \quad \beta = \frac{729}{16192} \kappa - \frac{2025}{16192}, \quad n = m = \frac{2}{9}$

$q = 6$, \quad $\kappa = \frac{51397}{39528}$, \quad $\alpha = -\frac{21035}{13176}, \quad \beta = -\frac{243}{3904}, \quad n = \frac{8}{27}, \quad m = \frac{5}{27}$

$q = 9$, \quad $\kappa = \frac{17}{6}$, \quad $\alpha = -1, \quad \beta = 0, \quad n = m = \frac{1}{6}$

$q = 12$, \quad $\kappa = \frac{43}{15}$, \quad $\alpha = -1, \quad \beta = 0, \quad n = m = \frac{2}{15}$

Note that in the last two cases $\beta = 0$, therefore these solutions are solutions in Brans-Dicke theory (i.e. theory with Lagrangian (20) without Gauss-Bonnet term).

In all obtained power-law solutions $0 < n < 1$, $0 < m < 1$, that’s why such solutions don’t describe accelerated expansion of visible space or contraction of extra dimensions. However solutions with $n \neq m$ are interesting for another cause. In Einstein theory there is no anisotropic power-law solution in the presence of dust. However, in Einstein-Gauss-Bonnet theory with dilaton that is possible.

**Conclusion**

Different variants of Lovelock gravity with dilaton were considered in $D$-dimensional space with two maximally symmetric subspaces: 3-dimensional and $(D−4)$-dimensional. Absence of matter and existence of perfect fluid were investigated. We have several types of obtained solutions:

1. Stationary.
2. Power-law.
3. Exponential.
4. Exponent-of-exponent form solutions.

Among the last two forms solutions which describe accelerating expansion of 3-dimensional subspace and contraction of $(D - 4)$-dimensional one were elected. Unobservability of the latter subspace was justified on the basis of Kaluza-Klein approach. Also a set of anisotropic solutions which do not tend to isotropization in the presence of matter, in contrast to Einstein gravity, have been obtained. Such a possibility is of importance because it allows us to assume that extra dimensions become small during the Universe evolution. This issue we are going to investigate in more detail in another work. Moreover, it would be interesting to extend the results of this work for account of third-order Lovelock terms. This will be done elsewhere.

Studying of future singularities in such models would also be important. For 4-dimensional modified gravities this problem was considered in [26, 27].

Unfortunately most of solutions describe only flat maximally symmetric subspaces. For curved subspaces there are only stationary solutions. Those are of interest as exact solutions of very complicated equations and as possible basis for numerical dynamical solutions in the case of curved subspaces.
