In this paper, we establish the correct solvability of a nonlocal multipoint in time problem for the evolutionary equation of a parabolic type with the Bessel operator of infinite order in the case where the initial function is an element of the space of generalized functions of type $(S)^\prime$.

1. Introduction

Singular parabolic equations with the Bessel operator are related to the equations with degeneracy in terms of the spatial variable operator (such equations degenerate on the boundary of domain), and they are close to evenly parabolic equations in terms of their internal properties. They are used in the study of temperature fields, in the construction of mathematical modes of diffusion processes, and in anisotropic media that describe the phenomena of heat and mass transfer, radial oscillations of waves, occur in crystallography, hydrodynamics, and problems of interaction.

The theory of classical solutions of the Cauchy problem for such equations is constructed in the works of M.I. Matiychuk, V.V. Krekhivskyi, S.D. Ivasyshen, V.P. Lavrenchuk, I.I. Verenych, and others. The Cauchy problem for singular parabolic equations in the classes of distributions and ultradistributions was studied by Ya.I. Zhytomyrskyi, V.V. Gorodetskyi, I.V. Zhytariuk, V.P. Lavrenchuk, O.V. Martyniuk, and others.

Gelfand and Shilov in monograph ([1], p. 203–211) proposed a method of constructing functional spaces of infinitely differentiable functions given on $\mathbb{R}$, which impose certain conditions for decreasing on infinity and increasing derivatives with increasing of order. These conditions are set using inequalities $|x^{\alpha}\phi^{(n)}(x)| \leq c_{kn}$, $\{k, n\} \subset \mathbb{Z}_+$, where $\{c_{kn}\}$ is some sequence of positive numbers depending on the function $\phi$. If sequence $\{c_{kn}\}$ has a special form then we get a certain subclass of spaces of Schwartz space $S = S(\mathbb{R})$ of rapidly decreasing functions on $\mathbb{R}$. In [1], the case where $c_{kn} = k^{a_n} n^{\beta}$, $a > 0, \beta > 0$ are fixed parameters is studied in detail; the corresponding spaces are called spaces of type $S$ and are denoted by the symbol $S^\beta$. Functions from these spaces and all their derivatives decrease on the real axis as $|x| \rightarrow \infty$ faster than exp $\{-a |x|^{1/\alpha}\}$, $a > 0, x \in \mathbb{R}$. Such spaces are often used in the study of the problem of the classes of uniqueness and the classes of correct solvability of the Cauchy problem for partial differential equations. In [2–8], it was established that spaces of type $S$ and spaces of the type $S^\beta$ that are topologically dual to the spaces $S$ coincide with the sets of initial data for the Cauchy problem in broad classes of partial differential equations of finite and infinite orders for which the solutions are entire functions of the space variables. For example, the fundamental solution of the Cauchy problem for the heat-conduction equation $\partial u/\partial t = \partial^2 u/\partial x^2$ is a function $G(t, x) = (2\sqrt{\pi t})^{-1} \exp \{-x^2/(4t)\}$, for every $t > 0$, this function is an element of the space $S^{1/2}$ as a function of $x$ ([7], p. 46) and the space $S^{1/2}$ is of a space of the type $S$.

If $c_{kn} = a_n b_n$, where $\{a_k, k \in \mathbb{Z}_+\}$, $\{b_n, n \in \mathbb{Z}_+\}$ are some sequences of positive numbers, then we have generalized
spaces of type $S$, denoted by the symbol $S_{ak}^b$. The spaces $S_{ak}^b$ (their topological structure, properties of functions, and basic operations in such spaces) were studied in [9]. Known spaces of type $W$, introduced by Gurevich [10] (see also ([11], p.7–17)), in which arbitrary convex functions are used to characterize the behavior of functions at infinity instead of power functions, are also embedded in spaces $S_{ak}^b$, in the particular choice of sequences $\{a_k\}$ and $\{b_n\}$ (see [12]). From the results given in [9, 13], it follows that generalized spaces of type $S$ are a natural medium for the study of nonlocal multipoint in time problems for evolutionary pseudodifferential equations (in particular, for equations with operators of differentiation of infinite order), for evolutionary equations with generalized Gelfond–Leontiev differentiation operators of finite and infinite orders.

Spaces consisting of even functions of spaces of type $S$ (in particular, spaces $S_{ak}^b$) with the corresponding topology are called spaces of type $\tilde{S}$ and are used in the study of evolutionary singular equations of parabolic type with Bessel operators (see [6], [14]). The purpose of this work is to investigate a nonlocal multipoint time problem for evolutionary singular equations of infinite order in generalized spaces of type $S$.

2. The Spaces of Test Functions

Here, we dwell on the spaces $S_{ak}^b$, constructed by the sequences of the form $\{b_n = n!\rho_n, n \in \mathbb{Z}_+\}$, $\{a_k = k!d_k, k \in \mathbb{Z}_+\}$, where $\{\rho_n\}$, $\rho_0 = 1$ is the sequence of positive numbers, which has the following properties:

(a) the sequence is monotonically decreasing 
(b) $\exists c > 0 \forall \gamma \in (0, 1) \forall n \in \mathbb{N} : \rho_n / \rho_n - 1 \leq c \cdot n^\gamma$ 
(c) $\lim_{n \to \infty} \sqrt[n]{\rho_n} = 0$ 
(d) $\forall \gamma > 0 \exists c > 0 \forall n \in \mathbb{Z}_+ : \rho_n \geq c \cdot n^\gamma$

The sequence $\{d_k, k \in \mathbb{Z}_+, d_0 = 1\}$ also has properties (a)–(d), with condition (b) having the form: $\exists c > 0 \exists \gamma \in (0, 1) \forall n \in \mathbb{N} : d_0 / d_{k-1} \leq c \cdot n^{\gamma}$. An example of a sequence $\{\rho_n\}$ with properties (a–d) can be a sequence $\rho_n = (n\beta)^{-n\beta} e^{n\beta}$, where $\beta \in (0, 1)$ is a fixed parameter. For example, let us check for the sequence $\rho_n$ of property (d). We have that

$$
\rho_n = \frac{e^{n\beta}}{(n\beta)^{n\beta}} = \frac{e^{n\beta}}{(n\beta)^{n\beta}}, \quad \frac{[n(1 - \beta)]^{n(1 - \beta)}}{[n(1 - \beta)]^{n(1 - \beta)}} = \frac{e^{n(1 - \beta)}}{e^{n(1 - \beta)}}
$$

$$
= e^{n\beta} \frac{1}{n^\beta \left(1 - \beta\right)^{1 - \beta}} \cdot \frac{\left[\left(1 - \beta\right)^{1 - \beta}\right]^n}{\left[\left(1 - \beta\right)^{1 - \beta}\right]^n} = e^\beta \frac{1}{n^\beta \omega} \sup_{\lambda = 0} \exp \left\{\lambda^{1 - \beta}\right\},
$$

where $\omega = (1 - \beta)^{-1 - \beta} < 1$. If we take arbitrary $\varepsilon > 0$ and put $\lambda = \varepsilon$, then we get the inequality $\rho_n \geq c \varepsilon^{\beta n} / n^\beta$, where $c_\varepsilon = \exp \left\{-\varepsilon^{1/(1 - \beta)}\right\}$. Note that condition (b) for this sequence is satisfied with the parameter $\gamma_1 = \beta$.

We also consider that the parameters $\gamma_1, \gamma_2$ in condition (b) for the sequences $\{\rho_n\}$ and $\{d_k\}$ are related by condition (c): $\gamma_1 + \gamma_2 = \theta \leq 1$.

By $S_{nk}^{\alpha, \beta}$ we denote a collection of functions $\varphi \in C^\infty(\mathbb{R})$, satisfying the condition

$$
\exists c, A, B > 0 \forall \{k, n\} \subset \mathbb{Z}_+ \forall x \in \mathbb{R} : \left| x^k \varphi^{(n)}(x) \right| \leq cA^kB^n a_k b_n,
$$

the system of norms in $S_{nk}^{\alpha, \beta}$ is determined by formulas

$$
\|\varphi\|_{\delta, \rho} = \sup_{x, k, n} \frac{\left| x^k \varphi^{(n)}(x) \right|}{(A + \delta)^k (B + \rho)^n a_k b_n}, \{\delta, \rho\} \subset \left\{1, \frac{1}{2}, \frac{1}{3}, \ldots\right\}.
$$

(4)

It was established in [9] that the function $\varphi \in C^\infty(\mathbb{R})$ belongs to the space $S_{ak}^b$, where $a_k = k!d_k$, $b_n = n!\rho_n$ if and only if it extends analytically into the complex plane to the whole function $\varphi(z)$, $z \in \mathbb{C}$, which satisfies the condition:

$$
\exists a, b, c > 0 \forall z = x + iy \in \mathbb{C} : |\varphi(z)| \leq c \exp(ay)c(b/y),
$$

(5)

where

$$
\varphi(x) = \begin{cases} 
1, & |x| < 1, \\
\inf_{k} \left(\frac{a_k}{|x|^k}\right), & |x| \geq 1, \\
1, & |y| < 1, \\
\sup_{n} \left(\frac{|y|^n}{b_n}\right), & |y| \geq 1.
\end{cases}
$$

(6)

We note that $\rho$ is a continuously differentiable, even function in $\mathbb{R}$ that increases monotonically over the interval $[1, +\infty)$. It follows from property (d) (see [9]) that

$$
\exists c_\varepsilon, c > 0 \forall y \in \mathbb{R} : \rho(y) \geq c_\varepsilon \exp(c|y|).
$$

(7)

For example, if $b_n = n^{\beta}$, $0 < \beta < 1$, then $\rho(y) \sim \exp\{|y|^{1/\beta}\}$. In addition, as it is proved in [9], $\ln \rho$ is a convex function on $(0, +\infty)$ in the sense that

$$
\forall \{y_1, y_2\} \subset (0, +\infty) : \ln \rho(y_1) + \ln \rho(y_2) \leq \ln \rho(y_1 + y_2).
$$

(8)
The inequality \( \ln \rho(y_1) - \ln \rho(y_2) \leq -\ln \rho(y_2) \) follows from (8).

The function \( \rho \) in (6) is related to the sequence \( \{ \rho_n \} \), which constructs the sequence \( \{ b_n = n! \rho_n \} \) as follows [9]:

\[
\rho_n = \inf \{ \rho(a)/|a|^n \} = \nu_n \rho(\nu_n),
\]

(9)

where \( \nu_n \) is the solution of the equation \( a \mu(a) = n, n \in \mathbb{N} \). The function \( \mu(a) = \rho'(a)/\rho(a) \) is a nonnegative and continuous function on the interval \((0, +\infty)\); hereafter \( \ln \rho(\omega) = \int_0^\infty \nu(x) dx, \ln \rho(\omega) = \mu(\omega) \cdot \omega, 0 < \omega < \omega_n, \) i.e., \( \mu(\omega) = \ln \rho(\omega)/\omega \). From properties of the function \( \rho \), it follows that \( \ln \rho(\omega) \) increases faster than any linear function on the interval \((1, +\infty)\), as \( \omega \to +\infty \); i.e., \( \lim_{\omega \to +\infty} \mu(a) = +\infty \).

Provided that \( \rho'(2)/\rho(2) = \mu(2) > 1 \), we obtain that \( \rho(\omega)/\omega \) possesses a unique solution \( \nu_n < n + 1, n \in \mathbb{N} \). The sequence of solutions \( \{ \nu_n \} \) is increasing and it is unbounded. Indeed, suppose it is not, for example, \( \sup_{a_n} = c < +\infty \), then we select a convergent subsequence \( \nu_{n_k} \), \( k \in \mathbb{N} \) such that \( \lim_{k \to \infty} \nu_{n_k} = a, a < +\infty \); so we obtain a contradiction, since \( \nu_{n_k} \mu(\nu_{n_k}) = n_k \) and passing to the limit as \( k \to +\infty \) we get \( a \mu(a) = +\infty \).

Since \( y(x) = 1/\tilde{y}(x) \), where \( \tilde{y}(x) = 1, |x| < 1 \), and \( y(x) = \sup_{a_n} |x|^{1/a_n} \), if \( |x| \geq 1 \) then \( y \) is a continuously differentiable, even function on \( \mathbb{R} \) that monotonically decreases on \([1, +\infty)\), \( 0 < y(x) \leq 1, x \in \mathbb{R} \). For example, if \( a_k = k^{1/a}, a \in (0, 1) \), then the following inequalities are true \([11], p. 204\):

\[
\exp \left\{ -\frac{a}{c} |x|^{1/a} \right\} \leq y(x) \leq c \exp \left\{ -\frac{ae}{2} \right\}, c = \exp \left\{ \frac{ae}{2} \right\}.
\]

(10)

Function \( \ln y \) satisfies on \((0, +\infty)\) the inequality [9].

\[
\ln y(x_1) + \ln y(x_2) \geq \ln y(x_1 + x_2), x_1, x_2 < 0, +\infty.
\]

(11)

It follows from the results given in [9], that the sequence \( \{ \varphi_n, n \geq 1 \} \subset S^{b_n}_{a_n} \) converges to zero in this space if the functions \( \varphi_n \) and their derivatives of any order converge to zero uniformly on every segment \([a, b] \subset \mathbb{R} \) and satisfy the inequality

\[
|x^k \varphi^{(n)}(x)| \leq cA^k B^n a_k b_n, \{ k, n \} \subset \mathbb{Z}_+, x \in \mathbb{R},
\]

(12)

where the constants \( c, A, B > 0 \) are independent of \( v \).

A function \( g \) is called a multiplicator in the space \( S^{b_n}_{a_n} \), if \( g \varphi \in S^{b_n}_{a_n} \) for any function \( \varphi \in S^{b_n}_{a_n} \) and the mapping \( \varphi \mapsto g \varphi \) is a linear and continuous operator from \( S^{b_n}_{a_n} \) into \( S^{b_n}_{a_n} \). A function \( g \in C^\infty(\mathbb{R}) \) that admits an analytic extension onto the entire complex plane and satisfies the condition [9]:

\[
\forall \varepsilon > 0 \exists C > 0 : |g(z)| \leq C \gamma(\varepsilon) \rho(\varepsilon), z = x + iy \in \mathbb{C},
\]

(13)

is a multiplicator in the space \( S^{b_n}_{a_n} \), \( a_k = k!d_k, b_n = n! \rho_n \). The operators of multiplication by \( x \), all polynomials, operators of differentiation, shift, and extension are defined and continuous in the spaces \( S^{b_n}_{a_n} \), \( a_k = k!d_k, b_n = n! \rho_n \) [9].

By \( S^{b_n}_{a_n} \), we denote the collection of all even functions from the space \( S^{b_n}_{a_n} \). Since \( S^{b_n}_{a_n} \) forms a subspace of \( S^{b_n}_{a_n} \), then the topology is naturally introduced in \( S^{b_n}_{a_n} \). This space with the corresponding topology is called a main space or a generalized space of type \( S \), and its elements are called test functions.

By \( S^{b_n}_{a_n} \), we denote the collection of functions that are extensions of functions \( \varphi \) from space \( S^{b_n}_{a_n} \) into \( \mathbb{C} \). According to the results obtained in [9], the space \( S^{b_n}_{a_n} \) can be represented as a union of the countably-normed spaces \( S^{b_n}_{a_n} \), \( a \in (0, 1) \), then the following inequalities are true \([11], p. 204\):

\[
\| \varphi \|_{p, \omega} = \sup_{z \in \mathbb{C}} |z|^{p \omega} \gamma(\omega(1 - 1/p)|x| \rho((b + \omega)|y|), p \in \{2, 3, \cdots \}, \omega \in \mathbb{N},
\]

(14)

then, these norms are equivalent to the corresponding norms in space \( S^{b_n}_{a_n} \). Therefore, the sequence of functions \( \{ \varphi_n(z), n \geq 1 \} \subset S^{b_n}_{a_n}, x \in \mathbb{R}, \) converges to zero if and only if the sequence of functions \( \{ \varphi_n(z), n \geq 1 \} \subset S^{b_n}_{a_n}, \) converges to zero uniformly in every bounded domain of the complex plane \( \mathbb{C} \), the inequalities

\[
\varphi_n(z) \leq C \gamma(x) \rho(by), z = x + iy \in \mathbb{C},
\]

(15)

are true, where constant \( c, A, B > 0 \) are independent of \( v \).

Every integer even function satisfying condition (13) is the multiplicator in the space \( S^{b_n}_{a_n} \). An example of a multiplicator in \( S^{b_n}_{a_n} \) is the normalized Bessel function \( j_v \), \( v > -1/2 \), which is the solution of the equation \( B_v u + \lambda u = 0 \), where \( B_v \) is Bessel operator; \( B_v = (d^2/dx^2) + (2v + 1/x)(d/dx), \) \( v > -1/2 \) is fixed parameter, provided that \( u(0) = 1, u'(0) = 0 \). Indeed, the normalized Bessel function is related to the ordinary Bessel function \( J_v, v > -1/2, \) of the first kind, so \([15]\):

\[
j_v(x) = 2^{2}T(v + 1) J_v(x).
\]

(16)
It is known (see [15]) that the function \( J_n \) admits an analytic extension into a complex plane \( \mathbb{C} \), and the Poisson integral formula holds

\[
J_n(z) = \frac{2}{\sqrt{\pi} \Gamma(n/2)} \int_0^{\infty} \cos(z \cos t) \sin^{2n}tdt.
\]

(17)

It follows from relations (16) and (17) that the normalized Bessel function \( j_n \) of the complex argument \( z \) is an integer even function and for \( j_n \) the integral image is correct:

\[
j_n(z) = \frac{2}{\sqrt{\pi} \Gamma(n/2)} \int_0^{\infty} \cos(z \cos t) \sin^{2n}tdt.
\]

(18)

In view of \( \cos z = 1/2(e^z + e^{-z}) \), \( z = x + iy \in \mathbb{C} \), and by using (18), we obtain estimate:

\[
|j_n(z)| \leq c_v e^{\beta(|y|)} \equiv c_v(\sqrt{\pi} \Gamma(n/2))^{-1/2}.
\]

(19)

Since for any convex functions \( \ln \gamma(x) \) and \( \ln \rho(y) \) and for any \( \varepsilon > 0 \), the inequality

\[
|\gamma| \leq \ln \gamma(x) + \ln \rho(x) + \varepsilon, \quad c > 0,
\]

is true, it follows that

\[
|j_n(z)| \leq c_v e^{\ln \gamma(x) + \ln \rho(x)} = c_v e^{\gamma(x)}\rho(x).
\]

(20)

It implies that \( j_n(x) \) is a multiplicator in space \( S_{\alpha_n}^{b_n} \).

According to the results presented in [16], the direct and inverse Bessel transforms

\[
\psi(\sigma) = \int_0^{\infty} \varphi(x) j_n(\sigma x) x^{2n-1}dx, \sigma \in \mathbb{R},
\]

\[
\varphi(x) = \int_0^{\infty} \psi(\sigma) j_n(\sigma x) x^{2n-1}d\sigma, x \in \mathbb{R},
\]

are defined in the spaces \( S_{\alpha_n}^{b_n} \); moreover, if the conditions (a)--(e) are satisfied for the sequences \( \{\rho_n\} \) and \( \{d_n\} \), then the formula \( F_{B_n}[S_{\alpha_n}^{b_n}] = S_{\alpha_n}^{b_n} \) is true, moreover, operator \( F_{B_n} \) is continuous [16]. The spaces \( S_{\alpha_n}^{b_n} \) are partial kind of spaces \( S_{\alpha_n}^{b_n} \). The spaces \( S_{\alpha_n}^{b_n} \) consist of even functions of spaces \( S_{\alpha_n}^{b_n} \) with the same topology; accordingly, the formula \( F_{B_n}[S_{\alpha_n}^{b_n}] = S_{\alpha_n}^{b_n} \) is correct.

By \( T_x^s \), we denote the generalized shift operator corresponding to the Bessel operator [17]:

\[
T_x^s \varphi(x) = b_v \int_0^{\infty} \varphi \left( \sqrt{x^2 + \xi^2 - 2x\xi \cos \omega} \right) \sin^{2n} \omega dw, \varphi \in S_{\alpha_n}^{b_n},
\]

(23)

where \( b_v = \Gamma(n + 1)/(\Gamma(n/2)\Gamma(n/2 + 1)) \), \( \nu > -1/2 \). Moreover, as it was proved in [18], the operation of a generalized shift is differentiable (even infinitely differentiable) in the space \( S_{\alpha_n}^{b_n} \).

We define the convolution of two functions of space \( S_{\alpha_n}^{b_n} \) by a formula

\[
(\varphi \ast \psi)(x) = \int_0^{\infty} T_x^s \varphi(x) \psi(\xi) x^{2n+1}d\xi, \{\varphi, \psi\} \subset S_{\alpha_n}^{b_n}. \tag{24}
\]

The formula

\[
F_{B_n}[\varphi \ast \psi] = F_{B_n}[\varphi] \cdot F_{B_n}[\psi], \forall \{\varphi, \psi\} \subset S_{\alpha_n}^{b_n}, \tag{25}
\]

is true [18].

We note that the operation of multiplication of test functions is defined and continuous in the spaces \( S_{\alpha_n}^{b_n} \).

The spaces \( S_{\alpha_n}^{b_n} \) form topological algebras with respect to the convolution of test functions.

Let us consider the pseudodifferential operator \( A \varphi = F_{B_n}^{-1} [\varphi F_{B_n}] \), \( \varphi \in \mathbb{S}^{b_n}_{\alpha_n} \). Provided that \( \varphi \) is a multiplicator in space \( \mathbb{S}^{b_n}_{\alpha_n} \), the operator \( A \varphi \) is linear and continuous in space \( \mathbb{S}^{b_n}_{\alpha_n} \). It turns out that if we consider the operator \( A \varphi \) in space \( \mathbb{S}^{b_n}_{\alpha_n} \), then it can be understood as a Bessel operator of “infinite order” in this space (see [18]):

\[
A \varphi = \sum_{k=0}^{\infty} c_k (-B_v)^k, \varphi(\sigma) = \sum_{k=0}^{\infty} c_k \sigma^{2k}. \tag{26}
\]

3. The Space of Generalized Functions \( (S_{\alpha_n}^{b_n})' \)

We denote by \( (S_{\alpha_n}^{b_n})' \) the space of all linear continuous functionals over the corresponding space of test functions with weak convergence. Linear continuous functionals are called regular generalized functions or regular functionals. The action of such functionals upon the test functions \( \varphi \in S_{\alpha_n}^{b_n} \) is determined by the formula

\[
(f, \varphi) = \int_0^{\infty} f(x) \varphi(x) x^{2n+1}dx. \tag{27}
\]

Every locally integrated even function \( f \) on \( \mathbb{R} \), which satisfies condition

\[
\forall \varepsilon > 0 \exists c_\varepsilon > 0 \forall x \in \mathbb{R} : |f(x)| \leq c_\varepsilon (\gamma(\varepsilon x))^{-1}, \tag{28}
\]
generates a regular generalized function \( F_f \in (S^b_{a_i})' \): \( \langle F_f, \varphi \rangle = \int \xi_f(x) \varphi(x) dx, \forall \varphi \in S^b_{a_i} \).

The following statement is correct: if locally integrated even functions \( f, g \) and \( \xi \) satisfying the condition (28) do not coincide on the set of Lebesgue positive measure, then there exists a function \( \varphi_0 \in S^b_{a_i} \) such that \( \langle f, \varphi_0 \rangle \neq \langle g, \varphi_0 \rangle \), i.e., \( f \neq g \). On the contrary, if \( f \neq g \) then the functions \( f, g \) do not coincide on set of the Lebesgue positive measure. The proof of this statement is analogous to the proof of the corresponding theorem in [19].

The formulated statement allows us to identify locally integrated functions with the generalized functions \( F_f \) generated by them from space \( (S^b_{a_i})' \). It follows from the properties of the Lebesgue integral that the embedding implies that \( F_f \) is true [18].

\( \xi \) is continuous.

Since the operation of a generalized shift of the argument is defined in space \( S^b_{a_i} \), we define the convolution of a generalized function \( f \in (S^b_{a_i})' \) with a test function by the formula

\[
(f \ast \varphi)(x) = \langle f_t, T_x^0 \varphi(x) \rangle = \langle f_t, T_x^0 \varphi(\xi) \rangle,
\]

(30)

(index \( \xi \) in \( f_t \) means that the functional \( f \) acts upon the test function \( T_x^0 \varphi(\xi) \) as a function of the argument \( \xi \)).

Let \( f \in (S^b_{a_i})' \). If \( f \ast \varphi \in S^b_{a_i}, \forall \varphi \in S^b_{a_i} \) and the relation \( \varphi \ast f \to 0 \) as \( \nu \to +\infty \) in the topology of the space \( S^b_{a_i} \) implies that \( f \ast \varphi \to 0 \) as \( \nu \to +\infty \) in the topology of the space \( S^b_{a_i} \), then the functional \( f \) is called a convolver in the space \( S^b_{a_i} \).

The Bessel transform of a generalized function \( f \in (S^b_{a_i})' \) is determined by the relation

\[
(F_f, \varphi) = \langle f, F_B[\varphi] \rangle, \forall \varphi \in S^b_{a_i}.
\]

(31)

In view of (31), the properties of the linearity and continuity of the functional \( f \) and the properties of the Bessel transform of the test functions, the functional \( F_B[f] \) is linear and continuous in the space of the test functions \( S^b_{a_i} \). Thus, the Bessel transform of the generalized function \( f \) defined on \( S^b_{a_i} \) is a generalized function on the space \( S^b_{a_i} \).

If a generalized function \( f \in (S^b_{a_i})' \) is a convolver in the space \( S^b_{a_i} \), then for any function \( \varphi \in S^b_{a_i} \), the relation

\[
F_B[f \ast \varphi] = F_B[f]F_B[\varphi],
\]

(32)

is true [18].

The following statement implies the following properties:

1. If the generalized function \( f \) is a convolver in space \( S^b_{a_i} \) then its Bessel transform is a multiplier in the space \( S^b_{a_i} \).
2. If the generalized function \( f \) is a multiplier in the space \( S^b_{a_i} \) then its Bessel transform is a convolver in the space \( S^b_{a_i} \).

4. A Nonlocal Multipoint in Time Problem

Let us consider an evolutionary equation

\[
\frac{du}{dt} = A_f u(t, x), \quad (t, x) \in (0, T] \times \mathbb{R} \equiv \Pi_T,
\]

(33)

where \( A_f = F_{B^{-1}}[\varphi(\sigma) F_B[\varphi]] \) is a pseudodifferential operator in the \( S^b_{a_i} \), constructed according to a function \( \varphi \), which is a multiplier in the space and such that \( \varphi \in S^b_{a_i} \). Note that \( A_f \) can be understood as a Bessel operator of infinite order of appearance \( A_f = \sum_{k=0}^{\infty} \sum_{j=1}^{\infty} \frac{1}{k!} B^k \) (see Section 2). By \( \hat{P}^b_{a_i} \), we denote the class of functions (symbols) \( \varphi \) satisfying the conditions formulated above. For equation (33) we define a nonlocal multipoint in time problem as follows: to find the solution of equation (33) that satisfies the condition

\[
\mu u(t, \cdot)|_{t=0} = \mu_1 u(t, \cdot)|_{t=t_1} = \ldots = \mu_m u(t, \cdot)|_{t=t_m} = 0, \quad \mu \in \mathbb{N}, \{\mu, \mu_1, \ldots, \mu_m\} \subset (0, +\infty), \quad \{t_1, \ldots, t_m\} \subset (0, T],
\]

\[
0 < t_1 < \ldots < t_m \leq T \quad \text{are fixed numbers and, moreover,} \quad \mu > m, \sum_{k=0}^{m} \mu_k f \in S^b_{a_i}.
\]

We seek the solution of problem (33), (34) with the help of the Bessel transform defined as follows:

\[
u(t, x) = F_B^{-1}[\nu(t, \sigma)]|_{x, t} \in \Pi_T.
\]

For the function \( v: \Pi_T \to \mathbb{R} \), we get the following problem with parameter \( \sigma \):

\[
\mu v(t, \sigma)|_{t=0} = \sum_{k=1}^{m} \mu_k v(t, \sigma)|_{t=t_k} = \tilde{f}(\sigma), \quad \sigma \in \mathbb{R},
\]

(36)

where \( \tilde{f}(\sigma) = F_B[f](\sigma) \). The general solution of equation (35) has the form

\[
v(t, \sigma) = c \exp \{t \varphi(\sigma)\}, \quad (t, \sigma) \in \Pi_T,
\]

(37)

where \( c = c(\sigma) \) is determined from condition (36). Substituting (37) in (36), we obtain

\[
c = \tilde{f}(\sigma) \left(\mu - \sum_{k=1}^{m} \mu_k \exp \{t_k \varphi(\sigma)\}\right)^{-1}.
\]

(38)
Then
\[ v(t, \sigma) = f(\sigma) \exp \{ t \Phi(\sigma) \} \left( \mu - \sum_{k=1}^{n} \mu_k \exp \{ t \Psi_k(\sigma) \} \right)^{-1}, (t, x) \in \Pi_T. \]

(39)

Thus, the solution of problem (33), (34) has the form
\[ u(t, x) = c_v \int_0^T G(t, x) f(\xi) \xi^{2v+1} d\xi = G(t, x) \ast f(x), (t, x) \in \Pi_T. \]

(40)

We introduce the notation \( G(t, x) = F_{\tilde{B}}^{-1}(Q(t, \sigma)) \), where
\[ Q(t, \sigma) = \exp \{ t \Phi(\sigma) \} \left( \mu - \sum_{k=1}^{n} \mu_k \exp \{ t \Psi_k(\sigma) \} \right)^{-1}. \]

(41)

Hence, as a result of formal reasoning, we find
\[ u(t, x) = \int_0^T T^k_j(t, x) f(\xi) \xi^{2v+1} d\xi = G(t, x) \ast f(x), (t, x) \in \Pi_T. \]

(42)

Indeed,
\[ u(t, x) = c_v \int_0^T Q(t, \sigma) \left( \int_0^T f(\xi) j_v(\xi) \xi^{2v+1} d\xi \right) j_v(\sigma) \sigma^{2v+1} d\sigma. \]

(43)

Since \( j_v(\sigma) j_v(\sigma x) = T^k_j(\sigma), \) we have
\[ u(t, x) = \int_0^T c_v \int_0^T Q(t, \sigma) T^k_j(T^k_j(\sigma)) \sigma^{2v+1} d\sigma \cdot f(\xi) \xi^{2v+1} d\xi = \int_0^T T^k_j G(t, x) f(\xi) \xi^{2v+1} d\xi \]
\[ = G(t, x) \ast f(x), (t, x) \in \Pi_T. \]

The correctness of these transformations follows from the properties of the function \( G \) presented in what follows. The properties of the function \( G \) are connected with properties of the function \( Q \), because \( G = F_{\tilde{B}}^{-1}(Q) \). Thus, first of all, we study the properties of the function \( Q(t, \sigma) \) regarded as a function of the argument \( \sigma \).

Since \( \varphi \in \hat{P}_{b_1}^{k}, \) therefore \( \varphi \in \hat{S}_{b_1}^{k}. \) Then (see Section 2) there exist numbers \( c_0, a, b > 0 \) such that
\[ \| \varphi^{(z)} \| \leq c_0 e^{-\gamma \Phi(\sigma)} + \ln(\rho(\beta)) + \gamma = 1/\gamma = b, \quad \gamma = \sigma + it \in \mathbb{C}. \]

(45)

Further, we assume that the constant \( c_0 > 0 \) in (45) satisfies the condition: \( c_0 \leq m, \) where \( m \) is the parameter of the multipoint problem (33), (34). Then
\[ \| \varphi^{(z)} \| \leq \| \varphi^{(z)} \|^{(t)} \leq [c_0 \exp \{ -\ln(\gamma(\sigma)) + \ln(\rho(\beta)) \}]^{(t)} \leq c \exp \{-t \ln(\gamma(\sigma)) + t \ln(\rho(\beta)) \}, \quad c = \max \{ 1, c_0 \}. \]

(46)

**Lemma 1.** Let \( \varphi \in \hat{P}_{b_1}^{k}. \) The following estimates are true for the function
\[ Q(t, s) = \exp \{ t \Phi(\sigma) \}, t \in (0, T], s = \sigma + it \in \mathbb{C}, \]
and its derivatives (with respect to the variable \( s \)) on \( \mathbb{R}: \)
\[ |D_{\sigma}^p Q(t, \sigma)| \leq c b^n n! \rho_n \exp \{ -t \ln(\gamma(\sigma)) \}, n \in \mathbb{Z}_+, \]
where the constants \( c, b > 0 \) are independent of \( t, \rho_n = \inf \{ \rho(\mu)/|\mu|^n \}. \) The function \( Q(t, s) \) belongs to the space \( \hat{S}_{b_1}^{k}(\mathbb{C}) \) for a fixed \( t \in (0, T]. \)

**Proof.** The inequality
\[ t \ln(\gamma(\sigma)) \leq \ln(\gamma(\sigma a)), \]
\[ t \ln(\gamma(\sigma a)) \leq \ln(\gamma(\sigma b)), \]
is true for fixed \( t \in (0, 1). \) This property follows from the relation
\[ \ln(\gamma(\sigma a)) = \int_0^t \mu(\xi) d\xi = \int_0^{\sigma a} \mu(\xi) d\xi \leq \int_0^t \mu(\xi) d\xi = t \ln(\gamma(\sigma a)), \]
\[ = e^{\ln(\gamma(\sigma a)) + \ln(\rho(\beta))}, a_1 \]
\[ = at, t \in (0, 1). \]

If \( t > 1, \) then the inequality \( t \ln(\rho(\beta)) \leq \ln(\rho(\beta t)) \) is true. Then, \( t = [t] + \{ t \} \) and
\[ e^{\ln(\gamma(\sigma a)) - \ln(\gamma(\sigma a))} \leq e^{-\ln(\gamma(\sigma a)) + \ln(\rho(\beta))}, a_1 \]
\[ = e^{-\ln(\gamma(\sigma a)) + \ln(\rho(\beta))}, a_2 \]
\[ = \ln(\rho(\beta t)) \leq \ln(\rho(\beta t)) = \ln(\rho(\beta t)), b_1 = bt. \]

(53)

If \( t = n, n \in \mathbb{N} \) then \( t = n - 1. \) On this
\[ e^{\ln(\gamma(\sigma a))} = e^{\ln(\gamma(\sigma a)) - (n-1) \ln(\gamma(\sigma))} \leq e^{\ln(\gamma(\sigma))}, \]
\[ \leq e^{\ln(\gamma(\sigma))}, \]
\[ \leq e^{\ln(\gamma(\sigma))}, \]

(54)

Let \( a = \min \{ a, a \}, a = a \{ t \}, \) if \( t \) is not integer and \( a = a, \) if \( t \) is an integer, \( b = \max \{ b, bT \}. \) Then, the inequality
\[ |Q_1(t, s)| \leq c e^{-\gamma(\sigma a) + \ln(\rho(\beta))}, \]
is true for \( t \in (0, T]. \) Hence, it follows that \( Q_1(t, s) \in \hat{S}_{b_1}^{k}(\mathbb{C}) \) for every \( t \in (0, T]. \)
In the following considerations, we will use the estimate
\[ |Q_i(t, s)| \leq c e^{-t \ln \gamma(a_0) + \ln \rho(\bar{b}R^a)}, \quad s = \sigma + i \tau \in \mathbb{C}. \]  
(56)

In view of the integral Cauchy formula, we obtain
\[ D^n_e Q_i(t, \sigma) = \frac{n!}{2\pi i} \int_{\Gamma_R} \frac{Q_i(t, s)}{(s - \sigma)^{n+1}} ds, \quad n \in \mathbb{Z}_+, \]  
(57)
where \( \Gamma_R \) is a circle of radius \( R \) centered at a point \( \sigma \in \mathbb{R} \). By using (56), we obtain the inequalities
\[ |D^n_e Q_i(t, \sigma)| \leq \frac{n!}{R^n} \max_{s \in \Gamma_R} |Q_i(t, s)| \leq \frac{n!}{R^n} e^{-t \ln \gamma(a_0) + \ln \rho(\bar{b}R^a)}, \]  
(58)
where \( a_0 \) is a point of maximum of the function \( \exp \{ -t \ln \gamma(a_\xi) \} \), \( \xi \in [\sigma - R, \sigma + R] \). Since \( \ln \gamma(a_\xi) \) is an even function on \( \mathbb{R} \) that increases on the interval \([0, +\infty)\), then
\[ \sigma_0 = \begin{cases} 0, & \text{for } |\sigma| \leq R, \\ \sigma + R, & \text{for } \sigma \leq -R, \\ \sigma - R, & \text{for } \sigma \geq R. \end{cases} \]  
(59)

In view the inequality \( -\ln \gamma(\sigma_1 + \sigma_2) + \ln \gamma(\sigma_1) \leq -\ln \gamma(\sigma_2), \ \sigma_1, \sigma_2 > 0 \), we prove that there exist constants \( \bar{a}, a_2 > 0, \bar{a} \leq a \) such that
\[ \forall \sigma \geq 0, \forall R > 0 : \exp \{ -t \ln \gamma(\sigma_0) \} \leq \exp \{ -t \ln \gamma(\bar{a}_R) \} \leq \exp \{ -t \ln \gamma(\bar{a}_R) \} \leq \exp \{ -t \ln \gamma(\bar{a}_R) \} \leq \exp \{ -t \ln \gamma(\bar{a}_R) \}, \]  
(60)
where \( \bar{a}_2 = \max \{ a_2, a_2T \} \). Therefore,
\[ |D^n_e Q_i(t, \sigma)| \leq \frac{c n!}{R^n} \exp \{ -t \ln \gamma(\bar{a}_R) \} \exp \{ t \ln \gamma(\bar{a}_R) \} \exp \{ \ln \rho(\bar{b}R) \} \leq \frac{c n!}{R^n} \exp \{ -t \ln \gamma(\bar{a}_R) \} \exp \{ \ln \rho(\bar{b}R) \}, \]  
(61)

We used the fact that \( \gamma = \rho \), and the inequality of convexity for the function \( \ln \rho : \ln \rho(\bar{b}R) + \ln \rho(\bar{a}_R) \leq \ln \rho(\bar{b}R + \bar{a}_R) \).

For any \( n \in \mathbb{Z}_+ \), the function \( g_{n,R}(R) = R^{-n} \exp \{ \ln \rho(\bar{b}R) \} = R^{-n} \rho(\bar{b}R) \) is differentiable on \([0, +\infty)\) and we obtain the following relations
\[ \lim_{R \to +\infty} g_{n,R}(R) = +\infty, \quad n \in \mathbb{N}; \quad \lim_{R \to +0} g_{n,R}(R) = \begin{cases} +\infty, & n \in \mathbb{N}, \\ 1, & n = 0. \end{cases} \]  
(62)

from the properties of the function \( \rho \). Since \( g_{n,R}(R) > 0, \ R \in (0, +\infty) \), this function attains its infimum. Thus,
\[ |D^n_e Q_i(t, \sigma)| \leq c n! \inf_R g_{n,R}(R) \exp \{ -t \ln \gamma(\bar{a}_R) \} \]  
\[ = c n! b^n \inf \{ \rho(\bar{b}R) \} \exp \{ -t \ln \gamma(\bar{a}_R) \}, \]  
(63)
\[ = c \bar{b} n! \rho(\bar{a}_R) \exp \{ -t \ln \gamma(\bar{a}_R) \}, \]  
\( c = \bar{c}. \)

Lemma 1 is proved.

**Lemma 2.** The function
\[ Q_2(\sigma) = \left( \mu - \sum_{k=1}^{m} \mu_k \exp \{ t_k \varphi(\sigma) \} \right)^{-1} \]  
(64)
\[ = \left( \mu - \sum_{k=1}^{m} \mu_k Q_1(t_k, \sigma) \right)^{-1}, \quad \sigma \in \mathbb{R}, \]
is a multiplier in the space \( S_{b,2} \).

**Proof.** In view of (46), the inequalities
\[ Q_1(t_k, \sigma) \leq ce^{-t_k \ln \gamma(\sigma_0)} \leq c, \quad k \in \{ 1, \ldots, m \}, \]  
(65)
are true. Since
\[ \mu - \sum_{k=1}^{m} \mu_k Q_1(t_k, \sigma) = \mu \left( 1 - \frac{1}{\mu} \sum_{k=1}^{m} \mu_k \exp \{ t_k \varphi(\sigma) \} \right), \]  
(66)
moreover,
\[ \frac{1}{\mu} \sum_{k=1}^{m} \mu_k \exp \{ t_k \varphi(\sigma) \} \leq \frac{c}{\mu} \sum_{k=1}^{m} \mu_k < \frac{m}{\mu} \sum_{k=1}^{m} \mu_k < 1, \]  
(67)
hence, by using the polynomial formula, we get
\[ Q_2(\sigma) = \frac{1}{\mu} \left( 1 - \frac{1}{\mu} \sum_{k=1}^{m} \mu_k Q_1(t_k, \sigma) \right)^{-1} \]  
\[ = \frac{1}{\mu} \sum_{r=0}^{\infty} \mu^{-r} \left( \sum_{k=1}^{m} \mu_k e^{t_k \varphi(\sigma)} \right)^r = \sum_{r=0}^{\infty} \mu^{-r+1} \sum_{r_1 + \cdots + r_m = r} r! \left( \mu_1 e^{t_1 \varphi(\sigma)} \right)^{r_1} \cdots \left( \mu_m e^{t_m \varphi(\sigma)} \right)^{r_m} Q_1(\lambda, \sigma), \]  
(68)
where \( \lambda := t_1r_1 + \cdots + t_mr_m \), \( Q_1(\lambda, \sigma) = e^{\lambda y(\sigma)} \). By using this result and (46), we obtain the inequalities

\[
|D^n_\rho Q_2(\sigma)| \leq cb^n n! \rho_n \sum_{r=0}^{\infty} \mu^{-(r+1)} 
\cdot \left( \sum_{r_1+\cdots+r_m=r} \frac{r!}{r_1! \cdots r_m!} \mu_0^n \exp \{-\lambda \ln \check{\gamma}(a\sigma)\} \right) 
\leq cb^n n! \rho_n \sum_{r=0}^{\infty} \mu^{-(r+1)} \mu_0^n \sum_{r_1+\cdots+r_m=r} \frac{r!}{r_1! \cdots r_m!}, n \in \mathbb{N},
\]

where \( \mu_0 = \max \{\mu_1, \cdots, \mu_m\} \). Further, we use the formula

\[
\sum_{r_1+\cdots+r_m=r} \frac{r!}{r_1! \cdots r_m!} m!.
\]

Then

\[
|D^n_\rho Q_2(\sigma)| \leq cb^n n! \rho_n \sum_{r=0}^{\infty} \mu^{-(r+1)} \mu_0^n \sum_{r_1+\cdots+r_m=r} \frac{r!}{r_1! \cdots r_m!}, n \in \mathbb{N},
\]

where \( \mu = \mu^{-1} \mu_0 m < 1 \), \( c' = \mu^{-1} \sum_{r=0}^{\infty} \mu = \mu^{-1}(1 - \mu)^{-1} \). By using the last inequality and boundedness of the function \( Q_2 \) on \( \mathbb{R} \), we conclude that \( Q_2 \) is a multiplicator in space \( S_{t_0}^{b_\sigma} \). Lemma 2 is proved.

By using relations (56), (71) and the Leibniz formula of differentiation of the product of two functions, we obtain

\[
|D^n_\rho Q(t, \sigma)| = \left| \sum_{i=0}^{n} C_n^i D^n_\rho Q_1(t, \sigma) D^{n-i}_\rho Q_2(\sigma) \right|
\leq c c' \sum_{i=0}^{n} C_n^i b_1 b_2^{n-i} \rho_n \exp \{-t \ln \hat{\gamma}(a\sigma)\}
\leq c_1 b_n n! \rho_n \exp \{-t \ln \hat{\gamma}(a\sigma)\}
= c_1 b_n n! \rho_n \exp \{-t \ln \hat{\gamma}(a\sigma)\}, \sigma \in \mathbb{R},
\]

where \( c_1 = c c', b_1 = 2b_2, b_n = n! \rho_n, \) the constants \( c_1, b > 0 \) are independent of \( t \). By virtue of the last inequality, we conclude that the function \( Q(t, \sigma) \) (regarded as a function of \( \sigma \)) is an element of the space \( S_{t_0}^{b_\sigma} \) (for any \( t \in (0, T) \)).

In view of the relation \( F_{t_0}^{b_\sigma} S_{t_0}^{b_\sigma} = S_{t_0}^{b_\sigma} \), we conclude that \( G(t, \cdot) = F_{t_0}^{b_\sigma} Q(t, \cdot) \) is an element of space \( S_{t_0}^{b_\sigma} \) for every \( t \in (0, T] \).

In the estimates for the derivatives of the function \( G(t, x) \) with respect to the variable \( x \), we select the dependence on the parameter \( t \).

For this, we note (see [16]) that functions from space \( S_{t_0}^{b_\sigma} \) satisfy the condition

\[
\exists c = c(\phi) > 0 \exists L = L(\phi) > 0 \exists b = b(\phi) > 0 \forall x \in [0, \infty) \forall \{k, q\} \subset \mathbb{Z}_+ : \left| x^{2k} b_q \phi(x) \right| \leq \check{\lambda} x^{2k} b_q b_k \phi, \quad \phi \in S_{t_0}^{b_\sigma}.
\]

On the contrary, if infinitely differentiable, even function \( \phi \) on \( \mathbb{R} \) satisfies condition (73), then (see [16]) \( \phi \) is an element of the space \( S_{t_0}^{b_\sigma} \). In view of this observation, we estimate the functions \( \sigma^{2q} b_q G(t, \sigma), \sigma \in \mathbb{R} \), for fixed \( \{k, q\} \subset \mathbb{Z}_+ \). To do this, we use the relation established in [16]:

\[
\sigma^{2q} b_q G(t, \sigma) = \int_0^{c_{2q}} b_q \left( x^{2k} \phi(x) \right) j_q(\sigma x) x^{2q+1} dx, \forall \phi \in S_{t_0}^{b_\sigma},
\]

from the last relation implies that

\[
\sigma^{2q} b_q G(t, \sigma) = \int_0^{c_{2q}} b_q \left( x^{2k} Q(t, x) \right) j_q(\sigma x) x^{2q+1} dx.
\]

We note also that for the function \( \phi \in S_{t_0}^{b_\sigma} \), the following formula is true

\[
B_q(\phi(x)) = \sum_{i=0}^{q} c_i(\nu) \frac{\nu^{(2q-i)(x)}}{x^i}, \nu \in \mathbb{Z}_+,
\]

where \( c_i(\nu) \) are coefficients dependent on \( \nu \), the functions \( \nu^{(2q-i)(x)}, i \in \{0, 1, \cdots, q\} \), are also elements of space \( S_{t_0}^{b_\sigma} \). Then

\[
B_q \left( x^{2k} Q(t, x) \right) = c_0(\nu) \left( x^{2k} Q(t, x) \right)^{(2q)} + c_1(\nu) \frac{x^{2k} Q(t, x)^{(2q-1)}}{x} + c_2(\nu) \frac{x^{2k} Q(t, x)^{(2q-2)}}{x^2} + \cdots + c_q(\nu) \frac{x^{2k} Q(t, x)^{(0)}}{x^q}.
\]

We note that inequality

\[
\exp \{-t \ln \hat{\gamma}(a\sigma)\} = \exp \left\{ -\frac{t}{2} \ln \hat{\gamma}(a\sigma) \right\}
\cdot \exp \left\{ -\frac{t}{2} \ln \hat{\gamma}(a\sigma) \right\} \leq \exp \{-t \ln \hat{\gamma}(a\sigma)\}
\cdot \exp \left\{ -\frac{t}{2} \ln \hat{\gamma}(a\sigma) \right\} = \hat{\gamma}(a\sigma) \exp \left\{ -\frac{t}{2} \ln \hat{\gamma}(a\sigma) \right\}
\]

is true, where \( a = a(t/2) \), if \( t/2 \) is not integer and \( a = a \), if \( t/2 \) is integer (see the proof of Lemma 1). By using (78) and (72),
we get that in addition to inequalities (72), the following inequalities are true

\[
|x^{2k}D_x^{2q}Q(t, x)| \leq c_1 b_1^{-1} b_{2q} \inf_{k} \frac{b_{2k}}{|x|^{2k}} |x|^{2k} \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\} \leq c_1 a_1 b_1^{2k} b_{2q} b_{2k} \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\}, a_1 = \frac{1}{a}.
\]

(79)

In addition,

\[
\exists c_1, A_1, B_1 > 0 \forall x \in RV\{l, n\} \subset Z_+ \left| x^{2l-2}(xD_x^{2m-1}Q(t, x)) \right| \leq c_1 (A_1 a_1)^{(2l-1)} B_1^{2n} b_{2(l-1)} b_{2n} \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\},
\]

(80)

where \(a_1 = 1/a\) (here taken into account \(xD_x^{2m-1}Q(t, x) \in S_{b_1}\)) for every \(t > 0\). According to Leibniz formula of differentiation of the product of two functions

\[
(x^2 Q(t, x))^{(2q)} = \sum_{j=0}^{\infty} \frac{2j!}{j!} (x^2)^{(j)} Q^{(2q-j)}(t, x).
\]

(81)

Let us present the right part (81) as the sum of two terms

\[
I_1 := \sum_{j=0}^{\infty} \frac{2j!}{j!} (x^2)^{(j)} Q^{(2q-j)}(t, x),
\]

\[
I_2 := \sum_{j=0}^{\infty} \frac{2j!}{j!} (x^2)^{(j)} Q^{(2q-j)}(t, x).
\]

(82)

From condition (b) for the sequence \(\{p_k\}\) (see Section 2) there follows the inequality

\[
\frac{b_{2k}}{b_{2k}} \leq c_0 k^{-2(1-\gamma)}, c_0 > 0.
\]

(83)

Thus

\[
\frac{b_{2k} b_{2q}}{b_{2k} b_{2q}^{2}} \leq c_0 \left( \frac{k}{kq} \right)^2 \leq c_0 \left( \frac{\max\{k, q\}}{kq} \right)^2 \leq c_0 \left( \frac{(k + q)}{kq} \right)^2 \leq b_{2k} b_{2q}^{2} \leq c_0 \left( \frac{\max\{k, q\}}{kq} \right)^2 \leq c_0 \left( \frac{(k + q)}{kq} \right)^2 \leq c_0 \left( \frac{\max\{k, q\}}{kq} \right)^2.
\]

(84)

(here taken into account \(2\gamma_1 \leq 1\), see Section 2). By using (79) and the last inequality, we get

\[
|I_1| \leq c_1 a_1 b_1^{2k} b_{2k} b_{2q} \exp \left\{ 1 + \frac{1}{2} \prod_{i=0}^{1} (2k - i)(2q - i) \right\}
\]

\[
\frac{1}{(a_1 b_1)^2} \cdot \frac{b_{2k} b_{2q}}{b_{2k} b_{2q}} + \frac{1}{4} \prod_{i=0}^{1} (2k - i)(2q - i) \frac{1}{(a_1 b_1)^4} \cdot \frac{b_{2k} b_{2q}}{b_{2k} b_{2q}} - \frac{b_{2k} b_{2q}}{b_{2k} b_{2q}} \cdot \frac{b_{2k} b_{2q}}{b_{2k} b_{2q}} + \cdots \cdot \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\}
\]

\[
\leq c_1 a_1 b_1^{2k} b_{2k} b_{2q} \exp \left\{ 1 + \frac{1}{2} \prod_{i=0}^{1} (4y(k + q)) \right\}
\]

\[
+ \frac{1}{4} \prod_{i=0}^{1} (4y(k + q)) \frac{1}{(a_1 b_1)^4} \cdot \frac{b_{2k} b_{2q}}{b_{2k} b_{2q}} \cdot \frac{b_{2k} b_{2q}}{b_{2k} b_{2q}} \cdot \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\}
\]

\[
\leq c_1 a_1 b_1^{2k} b_{2k} b_{2q} \exp \left\{ 1 + \frac{1}{2} \prod_{i=0}^{1} (4y(k + q)) \right\}
\]

\[
\cdot \frac{1}{4} \prod_{i=0}^{1} (4y(k + q)) \frac{1}{(a_1 b_1)^4} \cdot \frac{b_{2k} b_{2q}}{b_{2k} b_{2q}} \cdot \frac{b_{2k} b_{2q}}{b_{2k} b_{2q}} \cdot \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\}.
\]

(85)

Similarly, by using (80), we have

\[
|I_2| \leq c_2 (a_1 A_1)^2 b_{2k} b_{2q} \exp \left\{ \frac{4y(k + q)}{d} \right\} \cdot \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\}
\]

\[
\leq c_2 (a_1 A_1)^2 b_{2k} b_{2q} \exp \left\{ \frac{4y(k + q)}{d} \right\} \cdot \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\}.
\]

(86)

This yields

\[
|I_1| + |I_2| \leq c_0 c_2 b_{2k} b_{2q} \exp \left\{ \frac{4y(k + q)}{d} \right\} \cdot \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\}.
\]

(87)

where \(c_0 = \max\{c_1, c_2, B_1, A_1\}, \tilde{A}_0 = \max\{a_1, A_1, A_1\}, A_0 = \max\{a_1, A_1, A_1\}, a_1 = \frac{1}{a_1}, A_1 = \frac{1}{a_1}, B_0 = \max\{B_1, B_2\}, B_2 = \min\{B_1, B_2\}, d = \min\{a_1, A_1, A_1\}, A_1 = \frac{1}{a_1}, B_1 = \frac{1}{a_1}.

Since \(a_1 = 1/a\) then \(1/a = \tilde{a} \leq a\) (\(\min\{B_1, B_2\} = \frac{1}{a_1}\)). Moreover, we can assume that \(A \geq 1\), i.e., \(A_0 = (1/a)A_1\). So,

\[
|x^{2k}D_x^{2q}Q(t, x)| \leq \tilde{c} \left( \frac{1}{a} \right)^{2k} M^{2q} b_{2k} b_{2q} \exp \left\{ -\frac{t}{2} \ln \bar{y}(ax) \right\}, \{k, q\} \subset Z_+.
\]

(88)
where \( L = A_1 \exp \{4\alpha t\} \), \( M = B_0 \exp \{4\alpha t\} \). The other additions in (77) are evaluated similarly. As a result, we obtain the inequality

\[
\left| B_k^t \left( x^{2k} Q(t, x) \right) \right| \leq c_2 \left( \frac{A_1}{a} \right)^{2k} B_0^{2k} b_2 b_{2q} \exp \left\{- \frac{t}{2} \ln \gamma(ax) \right\}
\]

\[
\leq c_2 \left( \frac{A_2}{a} \right)^{2k} B_2^{2k} b_2 b_{2q} \exp \left\{-a_0 t |x| \right\},
\]

where the constants \( c_2, A_2, B_2, a_0 > 0 \) are independent of \( t \). Thus,

\[
\left| \sigma^2 B_k^t G(t, \sigma) \right| = \left\| \int_0^\infty B_k^t \left( x^{2k} Q(t, x) \right) j_\nu(\sigma x) x^{2\nu+1} dx \right\|
\]

\[
\leq A_3 \int_0^\infty B_k^t \left( x^{2k} Q(t, x) \right) x^{2\nu+1} dx
\]

\[
\leq c_3 \left( \frac{A_3}{a} \right)^{2k} B_2^{2k} b_2 b_{2q} \int_0^\infty x^{2\nu+1} e^{-a_0 x} dx
\]

\[
= c_4 t^{-2(\nu+1)} \left( \frac{A_3}{a} \right)^{2k} B_2^{2k} b_2 b_{2q} ;
\]

it takes into account that \( |j_\nu(\sigma x)| \leq A_\nu, A_\nu = \sqrt{\pi} \Gamma(\nu+1) / \Gamma(\nu+1/2), \{\sigma, x\} \subset \mathbb{R} \). Hence

\[
\left| B_k^t G(t, \sigma) \right| \leq c_4 \left( \frac{A_4}{a} \right)^{2k} b_2 b_{2q} \inf_\nu \left( \frac{b_{2q}}{|a| B_2^{1-1/2}} \right)^{2k}
\]

\[
= c_4 t^{-2(\nu+1)} \left( \frac{A_4}{a} \right)^{2k} b_2 b_\nu \gamma(d_0 \sigma)
\]

\[
= c_4 t^{-2(\nu+1)} \left( \frac{A_4}{a} \right)^{2k} b_2 b_\nu \exp \left\{-\ln \gamma(d_0 \sigma) \right\},
\]

where \( d_0 = B_0^{-1} \), the constants \( c_4, A_4, d_0 > 0 \) are independent of \( t \). Thus, the following statement is true.

**Lemma 3.** The following inequalities are true for the function \( B_k^t G(t, x), G(t, \cdot) \in \mathcal{S}_{k_0}^{b_0} \) for every \( t \in (0, T] \):

\[
\left| B_k^t G(t, x) \right| \leq L_0 t^{-2(\nu+1)} \left( \frac{A_0}{a} \right)^{2k} b_2 \exp \left\{-\ln \gamma(d_0 \sigma) \right\}, k \in \mathbb{Z},
\]

where the constants \( L_0, A_0, d_0 > 0 \) are independent of \( t \).

The function \( G(t, x) \) is differentiable with respect to \( t \) on the interval \((0, T]\). Indeed, since

\[
G(t, x) = c_\nu \int_0^\infty Q(t, \sigma) j_\nu(\sigma x) \sigma^{2\nu+1} d\sigma ;
\]

then, formally differentiating (93) under the sign of the integral, we obtain the function \( \Lambda(t, \sigma) = \varphi(\sigma) Q(t, \sigma) j_\nu \)

\[
(\sigma x) \sigma^{2\nu+1}. \text{ Since } \varphi \text{ is a multiplicator in the space } \mathcal{S}_{k_0}^{b_0} \text{ then }
\]

\[
\forall \epsilon > 0 \exists c_\epsilon > 0 \forall \sigma \in \mathbb{R} : |\varphi(\sigma)| \leq c_\epsilon e^{\ln \gamma(\sigma)},
\]

In addition, by (72), we obtain the estimate

\[
|Q(t, \sigma)| \leq c \epsilon^{-\nu} \ln \gamma(\sigma) \leq c \epsilon^{-\nu} \ln \gamma(\sigma) \sigma \in [0, +\infty), t \in [t_0, T] \subset (0, T],
\]

where \( \bar{a} = a (t_0) \), if \( t_0 \) is not integer and \( \bar{a} = a \), if \( t_0 \) is integer. Hence,

\[
|\Lambda(t, \sigma)| \leq c \epsilon^{-\nu} \ln \gamma(\sigma) \sigma \in [0, +\infty), t \in [t_0, T] \subset (0, T].
\]

It follows from the inequality of the convexity of the function \( \ln \gamma \) that

\[
\ln \gamma(\sigma) - \ln \gamma(\bar{a} \sigma) 
\]

\[
\leq - \ln \gamma((\bar{a} - \epsilon) \sigma) = - \ln \gamma(\bar{a} \sigma), \bar{a} = \bar{a} - \epsilon = \bar{a}/2 > 0,
\]

for \( \epsilon = \bar{a}/2 \). Since

\[
\exists \delta > 0 \forall \sigma \in [0, +\infty) : \exp \left\{- \left( -\frac{1}{4} \ln \gamma(\bar{a} \sigma) \right)^{2\nu+1} \right\} \leq \delta ;
\]

then the integrated function \( \{-(t/2) \ln \gamma(\bar{a} \sigma) \} \) is a majorant for \( \Lambda(t, \sigma), t \in [t_0, T], \sigma \in [0, +\infty) \). Therefore, the integral of the derivative (with respect to the variable \( t \)) of the integrand in (93) converges uniformly on any interval \([t_0, T] \subset (0, T]\) and therefore the derivative with respect to \( t \) under the sign of the integral in (93) can be applied at every point \( t \in (0, T]. \)

**Lemma 4.** The function \( G(t, \cdot), t \in (0, T], \) regarded as an abstract function of the parameter \( t \) with values in the space \( \mathcal{S}_{k_0}^{b_0} \), is differentiable with respect to \( t \).

**Proof.** In view of the continuity of the direct and inverse Bessel transforms in spaces of the type \( \mathcal{S}_{k_0} \), to prove the lemma, it is sufficient to show that the function \( F_{\mathcal{B}_0}[G(t, \cdot)] = Q(t, \cdot) \), as an abstract function of the parameter \( t \) with values in the space \( \mathcal{S}_{k_0}^{b_0} \), is differentiable with respect to \( t \). In other words, it is necessary to show the limit relation

\[
\Phi(\sigma) = \frac{1}{\Delta t} [Q(t + \Delta t, \sigma) - Q(t, \sigma)] = \frac{2}{\Delta t} Q(t, \sigma), \Delta t \rightarrow 0,
\]

is true in a sense that:

\[
(1) \int_0^\infty D_\sigma \Phi(\sigma) Q(t, \sigma) \, d\sigma, \quad s \in \mathbb{Z}, \text{ uniformly on every segment } [a, b] \subset \mathbb{R}.
\]
(2) \(|D_s^t\Phi_{Dt}(\sigma)| \leq \tilde{c}b^t e^{-\ln \tilde{y}(\sigma R)} \), \(s \in \mathbb{Z}_+\), where the constants \(\tilde{c}, \tilde{a}, \tilde{b} > 0\) are independent of \(\Delta t\) if \(\Delta t\) is sufficiently small.

The function \(Q(t, \sigma), (t, \sigma) \in (0, T] \times \mathbb{R}\), is differentiable with respect to \(t\) in the ordinary sense. Hence, by the Lagrange theorem on finite spaces,

\[
\Phi_{Dt}(\sigma) = \varphi(\sigma)Q(t + \theta \Delta t, \sigma), \quad 0 < \theta < 1, \quad t + \theta \Delta t \leq T. \tag{100}
\]

Thus,

\[
D_s^t \Phi_{Dt}(\sigma) = \sum_{j=0}^s C^s_j D_s^j \varphi(\sigma)D_s^{s-j}Q(t + \theta \Delta t, \sigma), \tag{101}
\]

and

\[
D_s^t \left( \Phi_{Dt}(\sigma) - \frac{\partial}{\partial t} Q(t, \sigma) \right)
= \sum_{j=0}^s C^s_j D_s^j \varphi(\sigma) \left[ D_s^{s-j}Q(t + \theta \Delta t, \sigma) - D_s^{s-j}Q(t, \sigma) \right]. \tag{102}
\]

Since

\[
D_s^{s-j}Q(t + \theta \Delta t, \sigma) - D_s^{s-j}Q(t, \sigma)
= D_s^{s-j}Q(t + \theta \Delta t, \sigma)\theta \Delta t, \quad 0 < \theta < 1,
\]

in view of estimates (72), we obtain that

\[
D_s^{s-j}Q(t + \theta \Delta t, \sigma)\theta \Delta t \longrightarrow 0, \quad \Delta t \longrightarrow 0, \tag{103}
\]

uniformly on any segment \([a, b] \subset \mathbb{R}\). Thus, condition (1) from relation (99) is satisfied.

Since \(\varphi\) is a multiplicator in the space \(S_{b_s}\), then

\[
\forall \varepsilon > 0 \exists \varepsilon > 0 \forall z = \sigma + i r \in \mathbb{C} : |\varphi(z)| \leq c e^{-\ln \tilde{y}(\varepsilon r) + \ln \rho(\varepsilon r)}, \quad \tilde{y} \gamma = 1/\gamma = \rho. \tag{104}
\]

Because of the Cauchy integral formula, we have that

\[
\varphi^{(n)}(\sigma) = \frac{n!}{2\pi i} \int_{\gamma_R} \frac{\varphi(z)}{(z - \sigma)^{n+1}} dz, \quad n \in \mathbb{Z}_+, \tag{105}
\]

where \(\gamma_R\) is a circle of radius \(R\) centered at the point \(\sigma \in \mathbb{R}\). Then, in view (106), we obtain inequalities

\[
|\varphi^{(n)}(\sigma)| \leq \frac{n!}{R^n} \max_{z \in \gamma_R} |\varphi(z)| \leq c e^{-\ln \tilde{y}(\varepsilon R) + \ln \rho(\varepsilon R)}
\leq c e^{-\ln \rho(\varepsilon R) \frac{R^n}{\varepsilon^n} \tilde{y}(\varepsilon R)}, \quad \sigma \geq 0. \tag{107}
\]

For sufficiently large values of \(\sigma > 0\), the inequality \(\varepsilon(\sigma + R) \leq (\varepsilon + R)\sigma\) is true. Since the function \(\ln \tilde{y}\) increases monotonically for \(\sigma \geq 0\), then at the same values of \(\sigma\)

\[
\ln \tilde{y}(\varepsilon(\sigma + R)) \leq \ln \tilde{y}((\varepsilon + R)\sigma). \tag{108}
\]

For all values of \(\sigma \geq 0\), the following inequality is true:

\[
\ln \tilde{y}(\varepsilon(\sigma + R)) \leq \ln \tilde{y}((\varepsilon + R)\sigma) + c_R. \tag{109}
\]

Therefore, for \(\sigma \geq 0\)

\[
\varepsilon \ln \tilde{y}(\varepsilon(\sigma + R)) \leq \varepsilon \ln \tilde{y}((\varepsilon + R)\sigma). \tag{110}
\]

Further, for a given \(\varepsilon > 0\), we assume that \(R = \varepsilon\). Then

\[
|\varphi^{(n)}(\sigma)| \leq \varepsilon \ln \tilde{y}(\varepsilon(2\varepsilon)), \quad n \in \mathbb{Z}_+. \tag{111}
\]

By using (112) and estimates for the derivatives of the functions \(Q(t, \sigma)\), we find

\[
|D_s^t \Phi_{Dt}(\sigma)| \leq \varepsilon \sum_{j=0}^s C^s_j b_j b^t e^{-\ln \tilde{y}(2\varepsilon)} - (\varepsilon + \theta \Delta t) \ln \tilde{y}(\varepsilon r)
\leq \varepsilon^{-\ln \tilde{y}(\varepsilon (t - R))} \ln \tilde{y}(\varepsilon r), \tag{113}
\]

where \(a = a(t)\), if \(t\) is not an integer; \(\tilde{a} = a\), if \(t\) is an integer, \(\tilde{c} = \tilde{c}, \quad B = 2 \max\{|\varepsilon, b_1|\}\); and \(t + \theta \Delta t > 0\). Take \(\varepsilon = \tilde{a}/4\). In view of the inequality of convexity for the function \(\ln \tilde{y}\), we obtain

\[
\ln \tilde{y}(2\varepsilon) - \ln \tilde{y}(\tilde{a} \varepsilon) \leq - \ln \tilde{y}(\tilde{a} - 2\varepsilon), \quad \tilde{a} = 2a/2 > 0. \tag{114}
\]

Thus

\[
|D_s^t \Phi_{Dt}(\sigma)| \leq \varepsilon e^{-\ln \tilde{y}(\varepsilon R)}, \quad \sigma \geq 0, \tag{115}
\]

moreover, constants \(\tilde{c}, \tilde{B}, \tilde{a} > 0\) are independent of \(\Delta t\) (for sufficiently small \(\Delta t\)). The case \(\sigma < 0\) is proved similarly. Lemma is proved.

**Corollary 5.** The formula

\[
\frac{\partial}{\partial t} (f \ast G(t, x)) = f \ast \frac{\partial G(t, x)}{\partial t}, \quad f \in \left(S_{b_s}\right)', \quad t \in (0, T], \tag{116}
\]

is true.
Proof. By the definition of a convolution of a generalized function with the test function, we find
\[
f \ast G(t, x) = \left\langle f_{\xi} \cdot T^x G(t, \xi) \right\rangle = \left\langle f_{\xi} \cdot T^x G(t, \xi) \right\rangle.
\]
(117)

Then
\[
\frac{\partial}{\partial t} (f \ast G(t, \cdot)) = \lim_{\Delta t \to 0} \frac{1}{\Delta t} \left[(f \ast G)(t + \Delta t, x) - (f \ast G)(t, x)\right]
= \lim_{\Delta t \to 0} \left\langle f_{\xi} \cdot \frac{1}{\Delta t} \left[T^x G(t + \Delta t, x) - T^x G(t, x)\right] \right\rangle.
\]
(118)

By virtue of Lemma 4, the limit relation
\[
\frac{\partial}{\partial t} T^x G(t + \Delta t, x) - T^x G(t, x) \quad \text{is true in a sense of convergence in the topology of the space } S^b_{b_t},
\]
thus
\[
\frac{\partial}{\partial t} (f \ast G(t, x)) = \left\langle f_{\xi} \cdot \frac{1}{\Delta t} \left[T^x G(t + \Delta t, x) - T^x G(t, x)\right] \right\rangle
= \left\langle f_{\xi} \cdot \frac{\partial}{\partial t} T^x G(t, x) \right\rangle
= \left\langle f_{\xi} \ast \frac{\partial}{\partial t} G(t, x) \right\rangle.
\]
(120)

Corollary is proved.

**Lemma 6.** In the space $S^b_{b_t}$, the following limit relation is true
\[
\mu \lim_{t \to t_0} G(t, \cdot) \rightarrow \sum_{n=1}^{m} \mu_n \lim_{t \to t_n} G(t, \cdot) = \delta,
\]
(121)
where $\delta$ is the Dirac delta function.

Proof. In view of the continuity of the Fourier transform and the function $G(t, \cdot)$ regarded as an abstract function of the parameter $t$ with values in the space $S^b_{b_t}$, we replace the relation (121) by the limit relation
\[
\mu \lim_{t \to t_0} F_{b_t}[G(t, \cdot)] \rightarrow \sum_{n=1}^{m} \mu_n \lim_{t \to t_n} F_{b_t}[G(t, \cdot)] = F_{b_t}[\delta],
\]
(122)
in the space $(S^b_{b_t})'$. By using the representation of the function $G$, we rewrite relation (122) in the form
\[
\mu \lim_{t \to t_0} Q(t, \cdot) \rightarrow \sum_{n=1}^{m} \mu_n \lim_{t \to t_n} Q(t, \cdot) = 1.
\]
(123)

To prove relation (123), we take an arbitrary function $\psi \in S^b_{b_t}$, apply the theorem on the limit transition under the sign of Lebesgue integration, we find
\[
\mu \lim_{t \to t_0} Q(t, \cdot), \psi) - \sum_{n=1}^{m} \mu_n \lim_{t \to t_n} Q(t, \cdot), \psi)
= \mu \lim_{t \to t_0} \int_{\mathbb{R}} Q(t, \sigma) \psi(\sigma) d\sigma - \sum_{n=1}^{m} \mu_n \lim_{t \to t_n} \int_{\mathbb{R}} Q(t, \sigma) \psi(\sigma) d\sigma
= \int_{\mathbb{R}} \left[ \mu \int_{\mathbb{R}} \left( \mu - \sum_{k=1}^{m} \mu_k Q_1(t_k, \sigma) \right) \psi(\sigma) d\sigma \right]
= \int_{\mathbb{R}} \psi(\sigma) d\sigma = (1, \psi).
\]
(124)

This implies that relation (123) is true in the space $(S^b_{b_t})'$. Therefore, the relation (121) holds. Lemma is proved.

By $(S^b_{b_t}, \ast)'$, we denote a class of generalized functions from $(S^b_{b_t})'$ that are convolvers in the space $S^b_{b_t}$.

**Corollary 7.** Let $\omega(t, x) = f \ast G(t, x)$, $f \in (S^b_{b_t}, \ast)'$, $(t, x) \in \Pi_T$. Then, the relation
\[
\mu \lim_{t \to t_0} \omega(t, \cdot) - \sum_{n=1}^{m} \mu_n \lim_{t \to t_n} \omega(t, \cdot) = f,
\]
(125)
is true in the space $(S^b_{b_t})'$.

Proof. Since $f$ is convolvers in the space $S^b_{b_t}$, we obtain
\[
F_{b_t}[f \ast G(t, \cdot)] = F_{b_t}[f] \cdot F_{b_t}[G(t, \cdot)] = F_{b_t}[f] \cdot Q(t, \cdot).
\]
(126)

$(F_{b_t}[f])$ is multiplicator in the space $S^b_{b_t}$. By using this fact and the property of the continuity of the Bessel transform, we write (125) in the form
\[
\mu \lim_{t \to 0} F_{r_i}[\omega(t, \cdot)] = \sum_{k=1}^{m} \mu_k \lim_{t \to t_k} F_{r_i}[\omega(t, \cdot)]
+ F_{r_i}[f] \left( \mu \lim_{t \to 0} Q(t, \cdot) - \sum_{k=1}^{m} \mu_k \lim_{t \to t_k} Q(t, \cdot) \right) = F_{r_i}[f],
\]
the relation is considered in space \( (S_{r_i}^{b_i})' \). In view (123), we obtain (125). The statement is proved.

The function \( \omega(t, \cdot) \) is a solution of equation (33). Indeed \( f \) is convolner in the space \( S_{r_i}^{b_i} \), we get

\[
A_{\omega} u(t, x) = F_{r_i}^{-1} [\varphi(\omega) F_{r_i} [f \ast G(t, \cdot)]]
= F_{r_i}^{-1} [\varphi(\omega) F_{r_i} [f] Q(t, \cdot)]
= F_{r_i}^{-1} [\frac{\partial}{\partial t} Q(t, \cdot) F_{r_i} [f]]
= F_{r_i}^{-1} [F_{r_i} \left[ \frac{\partial}{\partial t} G(t, \cdot) \right] \cdot F_{r_i} [f]]
= F_{r_i}^{-1} [F_{r_i} [f \ast \frac{\partial G(t, \cdot)}{\partial t}]] = f \ast \frac{\partial G(t, \cdot)}{\partial t}.
\]

On the other hand (see Corollary 5)

\[
\frac{\partial}{\partial t} (f \ast G(t, \cdot)) = f \ast \frac{\partial G(t, \cdot)}{\partial t}.
\]

This implies that the function \( \omega(t, \cdot) \) satisfies equation (33) in the ordinary sense. By Corollary 7, the nonlocal \( m \)-point in time problem for equation (33) can be formulated as follows: to find a solution of equation (33) satisfying the condition

\[
\mu \lim_{t \to 0} u(t, \cdot) - \sum_{k=1}^{m} \mu_k \lim_{t \to t_k} u(t, \cdot) = f, f \in \left( S_{r_i}^{b_i} \right)' ,
\]

where the limit relation (130) is considered in space \( (S_{r_i}^{b_i})' \) (the restriction imposed on the parameters \( \mu, \mu_1, \ldots, t_1, \ldots \) are the same as in problem (33), (34)).

It follows from the above that the function \( u(t, x) = f \ast G(t, x), f \in \left( S_{r_i}^{b_i} \right)' \), is a solution of (33). If \( f = \delta \in \left( S_{r_i}^{b_i} \right)' \), then \( f \ast G(t, x) = G(t, x) \) i.e., \( G(t, \cdot) \) is also a solution of (33). By using this fact and relation (121), in what follows the function \( G \) is called the fundamental solution of problem (33), (130).

**Theorem 8.** The problem (33), (130) is correctly solvable. Its solution is given by the formula \( u(t, x) = f \ast G(t, x), (t, x) \in \Pi_T, u(t, \cdot) \in S_{r_i}^{b_i} \) for every \( t \in (0, T] \).

Proof. The function \( f \ast G(t, x) \) satisfies (33). The solution \( u(t, x) \) continuously depends on the function \( f \) in condition (130) in the sense that if \( \{f, f_n, n \geq 1 \} \subset (S_{r_i}^{b_i})' \) and \( f_n \to f \) as \( n \to \infty \) in the space \( (S_{r_i}^{b_i})' \), then \( u_n(t, \cdot) = f_n \ast G(t, \cdot) \to u(t, \cdot) = f \ast G(t, \cdot) \) as \( n \to \infty \) in the space \( (S_{r_i}^{b_i})' \). This property follows from the property of continuity of convolution.

It remains to show that problem (33), (130) possesses a unique solution. To this end, we consider the Cauchy problem

\[
\frac{\partial}{\partial \nu} A_{\nu}^* \nu = 0, (t, x) \in [0, t_0) \times \mathbb{R}, 0 \leq t < t_0 \leq T,
\]

\[
v(t, \cdot)_{|t=t_0} = g, g \in \left( S_{r_i}^{b_i} \right)',
\]

where \( A_{\nu}^* \) is the restriction of operator adjoint to the operator \( A \) to the space \( S_{r_i}^{b_i} \subset (S_{r_i}^{b_i})' \). We understand condition (132) in a weak sense. The Cauchy problem (131), (132) is solvable, moreover \( v(t, \cdot) \in S_{r_i}^{b_i} \) for every \( t \in [0, t_0) \).

Let \( Q_{t_0}^g : (S_{r_i}^{b_i})' \to S_{r_i}^{b_i} \) be an operator that associates a functional \( g \in (S_{r_i}^{b_i})' \) with a solution of problem (131), (132). The operator \( Q_{t_0}^g \) is linear and continuous, it is defined for any \( t \) and \( t_0 \) such that \( 0 \leq t \leq t_0 \leq T \) and has the properties

\[
\forall g \in \left( S_{r_i}^{b_i} \right)', \quad \frac{dQ_{t_0}^g}{dt} + A_{\nu}^* Q_{t_0}^g = 0, \lim_{t \to t_0} Q_{t_0}^g = g,
\]

the limit is considered in the space \( (S_{r_i}^{b_i})' \).

Let us consider a solution \( u(t, x), (t, x) \in \Pi_T \) of problem (33), (130) understood as a regular functional from the space \( (S_{r_i}^{b_i})' \). We prove that problem (33), (130) may have only one solution in space \( (S_{r_i}^{b_i})' \). To this end, it suffices to prove that only the functional \( u(t, x) \equiv 0 \) (for any \( t \in (0, T] \)) can be a unique solution of Eq. (33) with the trivial boundary condition (130). We apply the functional \( u \) to a function \( Q_{t_0}^g \in S_{r_i}^{b_i} \), where \( g \) is an arbitrarily fixed element from the space \( S_{r_i}^{b_i} \subset (S_{r_i}^{b_i})' \). Further, differentiating with respect to \( t \) and using Eq. (33), (131) we get

\[
\frac{\partial}{\partial t} \left( u(t, Q_{t_0}^g) \right) = \left\langle \frac{\partial u}{\partial t}, Q_{t_0}^g \right\rangle + \left\langle u, \frac{\partial Q_{t_0}^g}{\partial t} \right\rangle
= A_{\nu}^* u, Q_{t_0}^g \right\rangle - \left\langle u, A_{\nu}^* Q_{t_0}^g \right\rangle
= A_{\nu}^* u, Q_{t_0}^g \right\rangle - \left\langle A_{\nu} u, Q_{t_0}^g \right\rangle
= 0, t \in (0, t_0).
\]

This implies that \( \langle u(t, \cdot), Q_{t_0}^g \rangle \) is constant. By using properties of abstract functions, we obtain the relation

\[
\lim_{t \to t_0} \left\langle u(t, \cdot), Q_{t_0}^g \right\rangle = \langle u(t_0, \cdot), g \rangle = const \equiv c,
\]

(135)
at any point \( t_0 \in (0, T] \). Thus, if \( f = 0 \) in (130) then

\[
\mu \lim_{t \to t_0} (u(t, \cdot), g) - \sum_{k=1}^m \mu_k \lim_{t \to t_0 -} (u(t, \cdot), g) = \mu c_0 - \sum_{k=1}^m \mu_k c_k = 0.
\]

(136)

This implies that \( c_0 = c_1 = \cdots = c_m = 0 \). Suppose it is not. For example, \( c_0 \neq 0 \). Then we get a relation \( \mu - \sum_{k=1}^m \mu_k a_k = 0 \), where \( a_k = c_0 / c_k \), i.e., \( \mu = \sum_{k=1}^m \mu_k a_k \). Since \( a_k \) is any constant, and by \( \mu, \mu_1, \ldots, \mu_m \) are fixed parameters, and \( \mu > \sum_{k=1}^m \mu_k \), the obtained contradiction proves that \( c_0 = 0 \). Similarly, we prove that \( c_1 = c_2 = \cdots = c_m = 0 \). Hence, \( \langle u(t_0, \cdot), g \rangle = 0 \) for any \( g \in S^{b_{k_m}} \), i.e., \( u(t_0, x) \) is a zero functional from the space \( (S^{b_{k_m}})^\prime \). Since \( t_0 \in (0, T] \) and \( t_0 \) is arbitrary then \( u(t, x) = 0 \) for all \( t \in (0, T] \). Theorem is proved.

As an example, we consider equation (33) with the operator \( A_p \), constructed on the basis of the function \( \varphi(x) = -x^2 \), \( x \in \mathbb{R} \). In this case, we obtain

\[
A_p = B_{x} = d^2_{xx} + (2\nu + 1)^{-1} x^{-1} \frac{d}{dx} x^\nu > -1/2,
\]

and equation (33) is the equation with the Bessel operator

\[
\frac{\partial u}{\partial t} = d^2_{xx} + \frac{2\nu + 1}{x} \frac{d}{dx} x^{-1/2}, \quad x > 0, \quad t > 0.
\]

(138)

The function \( \varphi(x) = -x^2 \) is an element of the space \( F^{1/2}_{1/2} \equiv P^{12}_{1/2} \equiv P^{12}_{b_{1/2}} \). Indeed, \( e^{-x^2} \in S^{1/2} \), because

\[
|e^{-z^2}| = |e^{-ixy}| = e^{-x^2 + y^2}, \quad z = x + iy \in \mathbb{C}.
\]

(139)

From the characteristic of the spaces \( S^n_a \) and (139) imply that \( e^{-x^2} \in S^n_a \), where \( a = 1/2, 1/1 - \beta = 2 \), i.e., \( \beta = 1/2 \). In addition, the function \( -x^2, x \in \mathbb{R} \) is a multiplier in the space \( S^{1/2}_{1/2} \). In this case, the constant \( c_0 \) in inequality (45) is equal to one, i.e., the condition \( c_0 \leq m, m \in \mathbb{N} \) is satisfied. By the above theorem, the nonlocal \( m \)-point in time problem for equation (138) is correctly solvable if \( f \in (S^{1/2}_{1/2})^\prime \), herewith \( u(t, x) = f * G(t, x) \), where

\[
G(t, x) = 2^{-\nu} \Gamma^{\nu-1} (v + 1) \sum_{r=0}^{\infty} \frac{1}{(r + 1)!} \frac{\mu_1^{1} \cdots \mu_m^{m}}{r_1! \cdots r_m!} (2\lambda(t, r))^{-(v+1)} \times \exp \left\{ -x^2 / (4\lambda(t, r)) \right\}.
\]

(140)

where \( \lambda(t, r) = t_1 r_1 + \cdots + t_m r_m + t \). In particular, if \( f = \delta \in (S^{1/2}_{m+1})^\prime, m = 1, t_1 = T \) (the case of two-point problem), then

\[
u(t, x) = G(t, x) = 2^{-(2\nu+1)} \mu^{-1} (v + 1) \sum_{r=0}^{\infty} \frac{\mu_1}{(r + 1)!} \times \exp \left\{ -x^2 / (4\mu) \right\}.
\]

(141)

5. Conclusion

The correct solvability of a nonlocal multipoint in time problem for the evolutionary equation of a parabolic type with the Bessel operator of infinite order of appearance \( \sum_{k=0}^\infty (-B_0)^k \) in the case where the initial function is an element of the space of generalized functions of type \( (S)^\prime \) is established in this paper. The properties of the fundamental solution this problem are investigated.
