Abstract
Following Abbatiello et al. (DCCDS-A 41(1):1–28, 2020), we introduce dissipative turbulent solutions to a simple model of a mixture of two non interacting compressible fluids filling a bounded domain with general non zero inflow/outflow boundary conditions. We prove existence of such solutions for all adiabatic coefficients $\gamma > 1$, their compatibility with classical solutions, the relative energy inequality, and the weak–strong uniqueness principle in this class. The class of dissipative turbulent solutions is so far the largest class of generalized solutions which still enjoys the weak–strong uniqueness property.

1 Introduction

The most simple system suggested as a “toy” problem to get a better insight into the complex mathematics in the multi-fluid modeling of compressible fluids is the following bi-fluid model for scalar density fields $R = R(t, x) \geq 0$, $Z = Z(t, x) \geq 0$, and vector common velocity field $u = u(t, x) \in \mathbb{R}^d$ ($t \in I$, $I = (0, T)$, $x \in \Omega$) consisting of

1. Conservation of mass for the species
   \[
   \partial_t R + \text{div}_x (R u) = 0; \quad \partial_t Z + \text{div}_x (Z u) = 0 \quad \text{in } Q_T = I \times \Omega; \tag{1.1}
   \]

2. Balance of linear momentum
   \[
   \partial_t ((R + Z) u) + \text{div}_x ((R + Z) u \otimes u) + \nabla_x P(R, Z) = \text{div}_x \mathbb{S} \quad \text{in } Q_T = I \times \Omega; \tag{1.2}
   \]

3. Balance of energy
   \[
   \partial_t \left( \frac{1}{2} (R + Z) |u|^2 + H(R, Z) \right) + \text{div}_x \left[ \left( \frac{1}{2} (R + Z) |u|^2 + H(R, Z) \right) u \right] = \text{div}_x (\mathbb{S} \cdot u) - \mathbb{S} : \nabla_x u \quad \text{in } Q_T = I \times \Omega, \tag{1.3}
   \]

where $P(R, Z)$ is the so-called Helmholtz function (pressure potential) related to the pressure $P = P(R, Z)$,

\[
H(R, Z) = R \int_1^R \frac{P(s, s^2 Z)}{s^2 R} \, ds, \quad \text{if } R > 0, \quad H(0, Z) = 0. \tag{1.4}
\]

4. We suppose that the fluid is contained in a bounded Lipschitz domain $\Omega \subset \mathbb{R}^d$, $d = 2, 3$, with general inflow–outflow boundary conditions
   \[
   u|_{\partial \Omega} = u_B|_{\partial \Omega}, \quad R|_{\Gamma^\text{in}} = R_B|_{\Gamma^\text{in}}, \quad Z|_{\Gamma^\text{in}} = Z_B|_{\Gamma^\text{in}}, \quad \Gamma^\text{in} = \left\{ x \in \partial \Omega \mid u_B \cdot n < 0 \right\}, \tag{1.5}
   \]

where $n$ is the outer normal vector to $\partial \Omega$. It is to be noticed that no boundary densities are prescribed at

\[
\Gamma^\text{out} = \partial \Omega \setminus \Gamma^\text{in}
\]

in agreement with the nature of the Eq. (1.1). For the sake of simplicity, we consider Newtonian fluids, i.e.

\[
\mathbb{S} = \mathbb{S}(\nabla_x u) := \mu (\nabla_x u + \nabla_x u^T) + \lambda \text{div}_x u I, \quad \mu > 0, \quad \lambda + \frac{2}{d} \mu > 0. \tag{1.6}
\]

5. Finally, we add to the system initial conditions

---

1 We suppose without loss of generality that the boundary data are restrictions to $\partial \Omega$ of functions defined on $\Omega$. 

\( \bigcirc \) Springer
The goal of this paper is to define as weak as possible solution to system (1.1–1.6) (which we will call dissipative turbulent solution), which still enjoys the following three fundamental properties:

1. **Existence**: Dissipative turbulent solutions exist on an arbitrary large time interval for any finite energy initial data.
2. **Compatibility**: If the dissipative turbulent solution is sufficiently continuously differentiable then it is a classical solution.
3. **Weak–strong uniqueness**: Any dissipative turbulent solution coincides with the strong solution of the same problem emanating from the same initial and boundary data as long as the latter exist.

It is well known from the mono-fluid theory that an object of this type is very convenient for many applications ranging from rigorous investigation of singular limits through dimension reduction to investigation of convergence and error estimates for numerical schemes to problem (1.1–1.6).

In addition to the above mentioned favorable features of these solutions, they also have a perfect physical interpretation. In the generalized weak formulation we let appear a positive semi-definite tensor $\mathcal{R}$ (cf. Definition 2.1 later) which can be interpreted as Reynolds stress in the turbulence and acoustic modeling. Indeed, this is the same tensor which appears as the source term in the Lighthill’s acoustic analogy, cf. [19, 20].

To perform this program we shall rely on the concept of dissipative solutions with Reynolds defect introduced within the context of mono-fluid theory in [1] (incompressible fluids) and [2] (compressible fluids). In the mono-fluid theory, this concept is known as the most weak concept of solutions enjoying the three fundamental properties stated above.

We finish this introductory section with some bibliographic remarks. Existence of weak solutions to system (1.1)–(1.4) with homogenous boundary conditions has been obtained by Vasseur et al. [28] (revisited later in [29]). The same problem with general non homogenous boundary data is investigated by Kwon et al. [17]. The compactness argument discovered in [28] has been generalized in [24] by using the philosophy of [22]. This argument combined with Lions’ compactness argument [21], opened the way to treat more realistic multi-fluid compressible models, see [17, 23, 24] with algebraic or differential closure. Prior to this results, only $1-d$ equations or quasi-stationary multi fluid systems could be treated: a good sample of such studies is the paper by Evje [10] ($1-d$) and by Bresch et al. [4]. An interesting overview of these type of models from the point of view of mathematical physics is the review paper by Bresch et al. [3].

The results on weak–strong uniqueness have their sources in the relative energy method [8] adapted to viscous compressible fluids in [14] (homogenous boundary conditions) and in [18] (general in/out-flow boundary conditions). Since the paper by Gwiazda et al. [15], it is known, that the weak–strong
uniqueness principle holds in larger classes than in the class of weak solutions. Such observation has not only an academic impact: it has a practical impact e.g. on the investigation of convergence and error estimates for numerical schemes. In this respect larger class means less conditions on the structure of the numerical scheme and allows more applications. The class of solutions we considered in this paper is so far the largest one, where still the weak–strong uniqueness holds in the case of compressible Navier-Stokes equations, see [2]. This paper shows weak–strong uniqueness for the bi-fluid model (1.1)–(1.7) in this class.

The paper is organized as follows. In the next section, we define (weak) dissipative (turbulent) solutions and state the main results: Theorem 2.4 (existence), Theorem 2.5 (compatibility), Theorem 2.6 (relative energy inequality), Theorem 2.7 (weak–strong uniqueness). The following Sects. 3, 4, 5 and 6 are devoted to the proofs of these theorems. Finally in Appendix, we recall some specific tools needed in the proofs, for the reader’s convenience.

2 Main results

Throughout the paper, we use the standard notation for Lebesgue, Sobolev and Bochner spaces, see e.g. the book of Evans [9]. Further, we denote by $C_{\text{weak}}(\tilde{I};X)$ (X a Banach space) the vector subspace of $L^\infty(\tilde{I};X)$ of functions $f$ defined everywhere on $\tilde{I}$ such that for all $\eta \in X^*$, $\langle \eta, f \rangle$, $X^* \times X \subseteq C(\tilde{I})$. The symbol $\mathcal{M}(\overline{\Omega})$ denotes the set of signed Radon measures on $\Omega$. Symbol $\mathcal{M}^+(\Omega_{\text{sym}})$ denotes the set of all positively semi–definite tensor valued Radon measures $\mathcal{R}$ on $\overline{\Omega}$. This means $\mathcal{R} = (\mathcal{R}_{ij})_{i,j=1,\ldots,d}$, where: (1) $\mathcal{R}_{ij}$ is a signed Radon measure on $\overline{\Omega}$; (2) $\mathcal{R}_{ij} = \mathcal{R}_{ji}$; (3) for all $0 \neq \xi, \xi^T \mathcal{R} \xi$ is positive Radon measure on $\overline{\Omega}$. Finally the Bochner type spaces $L^\infty_{\text{weak}}(\tilde{I};X)$ are defined in Appendix, see Lemma 7.3.

2.1 Definition of dissipative turbulent solutions

Motivated by [2, Section 2], we introduce the dissipative turbulent solutions to problem (1.1)–(1.7) as follows.

**Definition 2.1** We say that a triplet $(R, Z, u)$, belonging to the class

$$R, Z \in C_{\text{weak}}(\tilde{I}; L'(\Omega)) \cap L'(0, T; L'(\partial \Omega; |u_B \cdot n|dS_x)) \text{ with some } \gamma > 1,$$

$$R \geq 0, \ Z \geq 0, \ u - u_B \in L^2(\tilde{I}; W^{1,2}_0(\Omega; \mathbb{R}^d)), \ (R + Z)u$$

$$\in C_{\text{weak}}([0, T]; L^{\frac{2\gamma}{\gamma+1}}(\Omega; \mathbb{R}^d))$$

$$P(R, Z) \in L^1(\tilde{I} \times \Omega), \ H(R, Z) \in L^1(\tilde{I}; L^1(\Omega)) \cap L^1(I; L^1(\partial \Omega; |u_B \cdot n| dS_x))$$

(2.1)

is a dissipative turbulent solution to problem (1.1)–(1.7) iff:

1. The integral formulation of the continuity equations

$\text{Springer}$
There exists a tensor measure
\[ \mathcal{R} \in L^\infty(0, T; \mathcal{M}^+(\overline{\Omega}; \mathbb{R}^{d(d)}_{\text{sym}})), \]

such that the integral identity
\[
\left[ \int_{\Omega} (R + Z) \mathbf{u} \cdot \mathbf{\varphi} \, dx \right]_{t=0}^{t=\tau} = \int_0^\tau \int_{\Omega} [(R + Z) \mathbf{u} \cdot \partial_t \mathbf{\varphi} + (R + Z) \mathbf{u} \otimes \mathbf{u} : \nabla \mathbf{\varphi} + P(R, Z) \text{div} \mathbf{\varphi} - \mathbf{S}(\nabla \mathbf{u}) : \nabla \mathbf{\varphi} ] \, dx \, dt
\]

holds for any \( 0 \leq \tau \leq T \) and any test function \( \mathbf{\varphi} \in C^1([0, T] \times \overline{\Omega}) \),

\[
(\mathbf{R} + \mathbf{Z}) \mathbf{u}(0, \cdot) = \mathbf{m}_0 := (R_0 + Z_0) \mathbf{u}_0.
\]

Here we assume that all quantities appearing in (2.4) are at least integrable in \((0, T) \times \Omega\).

3. There exists an energy defect measure
\[ \mathcal{E} \in L^\infty(0, T; \mathcal{M}^+(\overline{\Omega})) \]
such that
\[
\left[ \int_{\Omega} \left[ \frac{1}{2} (R + Z) |\mathbf{u} - \mathbf{u}_h|^2 + H(R, Z) \right] \, dx \right]_{t=0}^{t=\tau} + \int_0^\tau \int_{\Omega} \mathbf{S}(\nabla \mathbf{u}) : \nabla \mathbf{\varphi} \, dx \, dt + \int_0^\tau \int_{\Gamma^h} H(R, Z) \mathbf{u}_h \cdot \mathbf{n} \, dS \, dt + \int_0^\tau \int_{\Gamma^w} H(R, Z) \mathbf{u}_h \cdot \mathbf{n} \, dS \, dt + \int_\mathcal{R} d \mathcal{E}(\tau)
\]

\[
\leq -\int_0^\tau \int_{\Omega} [(R + Z) \mathbf{u} \otimes \mathbf{u} + P(R, Z) \mathbf{u}] : \nabla \mathbf{u}_h \, dx \, dt + \int_0^\tau \int_{\Omega} (R + Z) \mathbf{u} \cdot \nabla \mathbf{u}_h \cdot \mathbf{u}_h \, dx \, dt + \int_0^\tau \int_{\Omega} \mathbf{S}(\nabla \mathbf{u}) : \nabla \mathbf{u}_h \, dx \, dt - \int_0^\tau \int_{\mathcal{R}} \nabla \mathbf{u}_h : d \mathcal{R}(t) \, dt.
\]
for a.a. $0 \leq \tau \leq T$.

4. Finally, compatibility conditions between the energy defect $\mathcal{E}$ and the Reynolds defect $\mathcal{R}$, are verified,

$$d\mathcal{E} \leq \text{Tr}[\mathcal{R}] \leq \overline{d}\mathcal{E}, \quad \text{for certain constants } 0 < d \leq \overline{d}. \quad (2.7)$$

**Remark 2.2**

1. The compatibility condition (2.7) is absolutely crucial for the weak–strong uniqueness principle stated in Theorem 2.7 below.

2. In view of (2.7), one can always consider

$$\mathcal{E} \equiv \frac{1}{d} \text{tr}[\mathcal{R}]; \quad (2.8)$$

whence, strictly speaking, the energy defect $\mathcal{E}$ can be completely omitted in the definition.

3. As we shall see in the existence proof below, the dissipative solutions can be constructed in such a way that the constant $\overline{d}$ depends solely on the dimension $d$ and the structural constants $a, \overline{a}$ appearing in (2.16).

4. We remark that all conclusions of this paper, after necessary modification of definitions, hold for general non Newtonian fluids characterized by general rheological law in the spirit of [2]. It is also possible to prescribe the Navier boundary conditions (instead of the Dirichlet boundary conditions) on a part of the $\Gamma_{\text{out}}$ boundary.

### 2.2 Main results

#### 2.2.1 Assumptions

Let

$$\mathcal{O} = \{(R, Z) | \underline{b}R < Z < \overline{b}R\} \quad \text{with some } 0 < \underline{b} < \overline{b} < \infty. \quad (2.9)$$

We suppose that

1. **Domain:**

   $$\Omega \text{ is a bounded Lipschitz domain.} \quad (2.10)$$

2. **Boundary data:**

   $$\mathbf{u}_B \in C_c^1(\mathbb{R}^d; \mathbb{R}^d), r_B \in C_c(\mathbb{R}^d), \quad r_B \geq 0, \quad (2.11)$$

   where $r_B$ stands for $R_B, Z_B$, and

   $$(R_B, Z_B) \in \overline{\mathcal{O}} \quad (2.12)$$
3. **Initial data:** There exists \( \gamma > 1 \) such that

\[
R_0 \in L^p(\Omega), \quad R_0 \geq 0, \quad m_0 \in L^{\frac{2\gamma}{\gamma-1}}(\Omega; R^d),
\]

\[
\int_\Omega \left( \frac{1}{2} \frac{|m_0|^2}{R_0 + z_0} + H(R_0, z_0) \right) \, dx < \infty,
\]

and

\[
(R_0, z_0) \in \overline{\mathcal{O}}.
\]  

(2.13)

(2.14)

4. **Pressure–density equation of state:**

\[
P \in C^1(\overline{\mathcal{O}}) \cap C^2(\mathcal{O}), \quad P(0, 0) = 0.
\]

The Helmholtz function \( H \) defined by Eq. (1.4) and \( P \) are such that

\( H \) is strictly convex on \( \mathcal{O} \), \( H - aP, \tilde{a}P - H \) are convex on \( \mathcal{O} \).

(2.15)

(2.16)

**Remark 2.3**

1. An iconic example of an equation of state satisfying assumptions (2.15)–(2.16) is the isentropic pressure–density relation

\[
P(R, Z) = a_1 R^\gamma + a_2 Z^\beta, \quad a_1, a_2 > 0, \quad \gamma, \beta > 1
\]

(2.17)

2. One easily checks by using (1.4), that \( H \in C(\overline{\mathcal{O}}) \cap C^1(\mathcal{O}) \)

3. We may suppose without loss of generality that also \( P, H - aP, \tilde{a}P - H \) are strictly convex on \( \mathcal{O} \).

4. Due to (1.4), \( P \) and \( H \) are interrelated by the differential equation

\[
R \partial_R H(R, Z) + Z \partial_Z H(R, Z) - H(R, Z) = P(R, Z).
\]

(2.18)

5. It is easy to check that any \( P \) satisfying (2.15)–(2.16) possesses certain coercivity similar to (2.17). More specifically,

\[
P(R, Z), H(R, Z) \geq aR^\gamma \quad \text{for all} \quad R \geq \overline{R}, \quad (R, Z)
\]

\[
\in \overline{\mathcal{O}} \quad \text{for certain} \quad a > 0, \quad \gamma > 1,\quad \overline{R} > 0.
\]

(2.19)

Indeed as \( \tilde{a}P - H \) is a convex function and \( H \) is strictly convex, we get

\[
\tilde{a}\Psi_s''(R) \geq \mathcal{H}_s''(R) = \frac{\mathcal{H}_s'(R)}{R}, \quad R > 0, \quad s \in [b, \overline{b}].
\]

where

\[
\Psi_s(R) = P(R, sR), \quad \mathcal{H}_s(R) = H(R, sR).
\]

In particular \( \Psi_s'(R) > 0 \) whatever \( s \in [b, \overline{b}] \) is, and by the uniform continuity \( \inf_{s \in [b, \overline{b}]} \mathcal{H}_s'(1) = \mathcal{C} > 0 \). Moreover, since \( \Psi_s(0) = 0 \) we also have \( P \geq 0 \).
This yields
\[
\left( \log(\Psi_s'(R)) \right)' \geq \left( \log \left( R^{\frac{1}{2}} \right) \right)' \\
\Rightarrow P(R, Z) \geq cR^{1 + \frac{1}{3}} \quad \text{for all } R \geq \overline{R}, (R, Z) \in O,
\]
and consequently, since \( \mathcal{H}'(R) = \Psi_s'(R)/R, \)
\[
H(R, Z) \geq cR^{1 + \frac{1}{3}} \quad \text{for all } R \geq \overline{R}, (R, Z) \in O,
\]
whence (2.19) holds for \( \gamma = 1 + \frac{1}{3}. \)

6. There exist non-negative real numbers \( a_1, a_2, a_3 \) such that
\[
0 \leq P(R, Z) \leq H(R, Z) + a_1 R + a_2 Z + a_3
\]

We are now able to formulate the main results of this paper.

2.2.2 Existence

**Theorem 2.4** (Global existence of dissipative turbulent solutions) Let assumptions (2.10)–(2.16) be satisfied. Then the problem (1.1)–(1.7) admits at least one dissipative turbulent solution \([R, Z, \mathfrak{u}]\) in \((0, T) \times \Omega\) in the sense specified in Definition 2.1.

2.2.3 Compatibility with classical solutions

**Theorem 2.5** (Compatibility of regular turbulent solutions with classical solutions) Let assumptions (2.10) and (2.15) be satisfied. Suppose that \([R, Z, \mathfrak{u}]\) is a dissipative turbulent solution to problem (1.1)–(1.7) in the sense of Definition 2.1 belonging to the class
\[
\mathfrak{u} \in C^1(\overline{I} \times \overline{\Omega}; \mathbb{R}^d), \quad R, Z \in C^1(\overline{I} \times \overline{\Omega}), \quad \inf_{I \times \Omega} Z > 0.
\]

Then \( \mathfrak{C} = \mathfrak{R} = 0 \) and Eqs. (1.1)–(1.7) are satisfied in the classical sense.

2.2.4 Relative energy inequality

We introduce the relative energy functional
\[
\mathcal{E}(R, Z, \mathfrak{u} | \mathfrak{v}, \mathfrak{z}, \mathfrak{u}) = \frac{1}{2}(R + Z)|\mathfrak{u} - \mathfrak{u}|^2 \\
+ H(R, Z) - \partial_{\mathfrak{r}} H(\mathfrak{r}, \mathfrak{z})(R - \mathfrak{r}) - \partial_{\mathfrak{z}} H(\mathfrak{r}, \mathfrak{z})(Z - \mathfrak{z}) - H(\mathfrak{r}, \mathfrak{z}).
\]
where \( R, Z, \mathbf{u} \) is a dissipative turbulent solution of problem (1.1)–(1.7), while \( r, \zeta, \mathbf{u} \) are test functions in class:

\[
\mathbf{u} \in C^1(\overline{\Omega} \setminus \Omega; \mathbb{R}^d), \quad \text{div}_x \mathbb{S}(\nabla_x \mathbf{u}) \in C(\overline{\Omega}; \mathbb{R}^d), \quad \mathbf{u}|_{\partial \Omega} = \mathbf{u}_B|_{\partial \Omega},
\]

\[
\inf_{\mathcal{F}} \beta > 0, \quad (r, \zeta) \in C^1(\overline{\Omega} \setminus \Omega; \mathbb{R}).
\]

(2.21)

The following Theorem describes the evolution of \( \mathcal{E} \):

**Theorem 2.6** (Relative energy inequality) Suppose that \( \Omega \) is a bounded Lipschitz domain and that \( P \) satisfies hypotheses (2.15). Let \( [R, Z, \mathbf{u}] \) be a dissipative turbulent solution in the sense of Definition 2.1. Then there holds:

\[
\int_0^T \int_{\Omega} \mathcal{E}(R, Z, \mathbf{u} \mid r, \zeta, \mathbf{u}) \, dx + \int_0^T \int_{\Omega} \mathbb{S}(\nabla_x \mathbf{u}) : \nabla_x (\mathbf{u} - \mathbf{u}) \, dx \, dt
\]

\[
+ \int_0^T \int_{\partial \Omega} H(R, Z) - \partial_R H(r, \zeta)(R - r) - \partial_Z H(r, \zeta)(Z - \zeta) - H(r)
\]

\[
\mathbf{u}_B \cdot n \, dS_x \, dt
\]

\[
+ \int_0^T \int_{\partial \Omega} H(R_B, Z_B) - \partial_R H(r, \zeta)(R_B - r) - \partial_Z H(r, \zeta)(Z_B - \zeta) - H(r)
\]

\[
\mathbf{u}_B \cdot n \, dS_x \, dt
\]

\[
+ \int_0^T \int_{\Omega} P[R, Z] - \partial_R P(r, \zeta)(R - r) - \partial_Z P(r, \zeta)(Z - \zeta) - P(r, \zeta) \text{div}_x \mathbf{u} \, dx \, dt
\]

\[
- \int_0^T \int_{\Omega} (R + Z)(\mathbf{u} - \mathbf{u}) \cdot \nabla_x \mathbf{u} \cdot (\mathbf{u} - \mathbf{u}) \, dx \, dt
\]

\[
+ \int_0^T \int_{\Omega} \left( \frac{R + Z}{r + \zeta} - 1 \right) \mathbf{u} \cdot \left[ \partial_i ((r + \zeta) \mathbf{u}) + \text{div}_x ((r + \zeta) \mathbf{u} \otimes \mathbf{u}) \right] \, dx \, dt
\]

\[
+ \int_0^T \int_{\Omega} (u - u) \cdot \left[ \partial_i ((r + \zeta) \mathbf{u}) + \text{div}_x ((r + \zeta) \mathbf{u} \otimes \mathbf{u}) + \nabla_x P(r, \zeta) \right] \, dx \, dt
\]

\[
+ \int_0^T \int_{\Omega} (R - r)(u - u) \cdot \left( \nabla x \partial_R^2 H(r, \zeta) + \nabla \zeta \partial_R \partial_Z H(r, \zeta) \right) \, dx \, dt
\]

\[
+ \int_0^T \int_{\Omega} (Z - \zeta)(u - u) \cdot \left( \nabla \zeta \partial_Z^2 H(r, \zeta) + \nabla r \partial_R \partial_Z H(r, \zeta) \right) \, dx \, dt
\]

\[
+ \int_0^T \int_{\Omega} \left[ \frac{Z + R}{r + \zeta} (u - u) \cdot u + \partial_R P(r, \zeta) - R \partial_R^2 H(r, \zeta) - Z \partial_R \partial_Z H(r, \zeta) \right]
\]

\[
\left[ \partial_r + \text{div}_x (ru) \right] \, dx \, dt
\]

\[
+ \int_0^T \int_{\Omega} \left[ \frac{Z + R}{r + \zeta} (u - u) \cdot u + \partial_Z P(r, \zeta) - Z \partial_Z^2 H(r, \zeta) - R \partial_R \partial_Z H(r, \zeta) \right]
\]

\[
\left[ \partial_r \zeta + \text{div}_x (\zeta u) \right] \, dx \, dt
\]

\[
- \int_0^T \int_{\Omega} \nabla_x \mathbf{u} : d \mathcal{R}(t) \, dt
\]

(2.22)
with any \((\mathbf{r}, z, \mathbf{u})\) in class \((2.21)\).

### 2.2.5 Weak–strong uniqueness

**Theorem 2.7** (Weak–strong uniqueness) Let assumptions \((2.10)\)–\((2.16)\) be satisfied. Let \([R, Z, \mathbf{u}]\) be a dissipative solution in the sense of Definition 2.1, and let \([\mathbf{r}, z, \mathbf{u}]\) be a strong solution of the same problem belonging to the class \((2.21)\) Then

\[
R = \mathbf{r}, \quad Z = z, \quad \mathbf{u} = \mathbf{u} \quad \text{in} \quad (0, T) \times \Omega, \quad \mathbf{ε} = \Re = 0.
\]

The following remark to Theorems 2.4–2.7 is in order.

**Remark 2.8**

1. The value of \(\gamma\) in Theorem 2.4 (cf. Definition 2.1) is the minimum of \(\gamma\) from assumption \((2.13)\) and \(\gamma\) calculated in Remark 2.3, cf. formula \((2.19)\).
2. We notice that compatibility theorem (Theorem 2.5) as well as relative energy inequality (Theorem 2.6) do not require practically any structural assumptions on the pressure.
3. It is to be noticed that the isothermal pressure \(P(R, Z) = a_1R + a_2Z, \ a_i > 0\) does not satisfy the hypothesis \((2.16)\). These conditions are however necessary for the Reynolds stress \(\Re\) to be a positively semi-definite tensor. Thus, from the point of view of physics, conditions \((2.16)\) may seem too restrictive. A brief inspection of the proofs reveals that all principal results remain valid for any equation of state of the form

\[
P(R, Z) + a_1R + a_2Z, \ a_i \geq 0
\]

as long as \(P\) satisfies \((2.16)\). To see it, one has to take advantage of the linearity of the “perturbation” \(a_1R + a_2Z\) in the limiting process in the proofs.

### 2.2.6 A remark on local existence on strong solutions

Theorem 2.7 operates with strong solutions to problem \((1.1)\)–\((1.7)\). A question of existence of such solutions at least locally in time is therefore quite natural. Such results are however in a short supply even for a slightly more simple monofluid case. To the best of our knowledge, all of them require quite particular geometrical conditions on the inflow boundary. One of the most representative sample of such results is Theorem 2.5 in Valli and Zajączkowski [27]. Its reformulation to the bi-fluid system \((1.1)\)–\((1.7)\) leads to the following statement (compare with [16], where the author treat the case of zero inflow-outflow).

**Proposition 2.9** (Reformulation of Valli and Zajączkowski [27]) Let \(\Omega \in C^3\) be a bounded domain, \(0 < \underline{r} < \bar{r} < \infty, \ 0 < \underline{z} < \bar{z} < \infty\), be constants. Assume that
Existence and stability of dissipative turbulent solutions…

Suppose that

\[ P \in C^2((0, \infty)^2). \]

1. Then there exists an interval \( I_* = [0, T_*) \) and numbers \( r, \overline{r}, \bar{z}, \bar{z}, 0 < r < \overline{r} < \bar{z} < \overline{z} < \infty \) such that the problem (1.1–1.7) admits in the class

\[
(r, \xi) \in C(I_*; W^{2,2}(\Omega)), \quad \partial_t(r, \xi) \in C(I_*; W^{1,2}(\Omega)),
\]

\[
u \in L^2(I_*; W^{2,2}(\Omega; \mathbb{R}^3)), \quad \partial_t \nu \in L^2(I_*; W^{2,2}(\Omega; \mathbb{R}^3)),
\]

\[
\partial^2 \nu \in L^2(I_*; L^2(\Omega, \mathbb{R}^3)),
\]

\[
\bar{r} \leq r \leq \overline{r}, \quad \bar{z} \leq \xi \leq \overline{z},
\]

\[
u(0) = \nu_0, \quad \nu|_{(0, T) \times \partial \Omega} = \nu_B|_{\partial \Omega}, \quad r|_{\Gamma^w} = r_B|_{\Gamma^w}
\]

a unique strong solution \((r, \xi, \nu)\).

2. If moreover

\[
\nu_B|_{\Gamma^w} \leq \xi_B|_{\Gamma^w} \leq \overline{\nu_B}|_{\Gamma^w}, \quad \nu_0 \leq \xi_0 \leq \overline{\nu_0},
\]

with some \( 0 < b \leq \overline{b} < \infty \), then

\[
b \nu \leq \xi \leq b \nu.
\]

Condition \( \nu_B \cdot n|_{\Gamma^w} \geq \mu > 0 \) is very restrictive. In practical situations, it can be satisfied only provided \( \Gamma^m \) is a union of nonintersecting compact manifolds.

Local existence of strong solutions with non-zero inflow/outflow in general case is, even for the mono-fluid models (with one continuity equation), to our best knowledge, an open problem. The essence of the difficulties dwells in the conditions allowing sufficiently smooth extensions of velocity field outside \( \Omega \) and in the the “management” of flow corresponding to the extended velocity field. These difficulties are the same in the mono-fluid case (they are independent
on the number of continuity/transport equations in the system that need to be treated).

3 Existence (Proof of Theorem 2.4)

Our first goal is to show that dissipative solutions exist globally in time for any finite energy initial data.

The proof is based on a multilevel approximation scheme that shares certain features with the approximation of the compressible Navier–Stokes equations in [2, 5].

3.1 First level approximation

First, we introduce a sequence of finite–dimensional spaces $X_n \subset L^2(\Omega; \mathbb{R}^d)$,

$$X_n = \text{span}\left\{ w_i \left| w_i \in C^\infty_c(\Omega; \mathbb{R}^d), \ i = 1, \ldots, n \right. \right\}$$

Without loss of generality, we may assume that $w_i$ are orthonormal with respect to the standard scalar product in $L^2$. We denote by $\Pi_n$ the orthogonal projection of $L^2(\Omega)$ onto $X_n$.

Concerning initial data, we may suppose without loss of generality that initial and boundary data are smooth and strictly positive, i.e. in addition to (2.12, 2.14),

$$r_B \in C^1(\mathbb{R}^d), \ 0 < r \leq r_B \leq \bar{r} < \infty, \ u_B \in C^1_c(\mathbb{R}^d; \mathbb{R}^d),$$

(3.1)

$$r_0 \in C^1(\mathbb{R}^d), \ 0 < r_0 \leq r_0 \leq \bar{r} < \infty, \ u_0 \in C^1_c(\mathbb{R}^d; \mathbb{R}^d).$$

(3.2)

In (3.1)–(3.2) $r_0, r_B$ stands for $R_0, R_B$ and $Z_0, Z_B$, respectively. Following [5], we use a parabolic approximation of the equations of continuity,

$$\partial_t r + \text{div}_x(r \mathbf{u}) = \varepsilon \Delta_x r \quad \text{in} \ (0, T) \times \Omega, \ \varepsilon > 0,$$

(3.3)

supplemented with the boundary conditions

$$\varepsilon \nabla_x r \cdot \mathbf{n} + (r_B - r)[u_B \cdot \mathbf{n}]^- = 0 \quad \text{in} \ [0, T] \times \partial \Omega,$$

(3.4)

and the initial condition

$$r(0, \cdot) = r_0.$$  

(3.5)

Here $r$ stands for $R$ and $Z$ and $\mathbf{u} = \mathbf{v} + \mathbf{u}_B$, with $u \in C([0, T]; X_0)$, in particular, $\mathbf{u}|_{\partial \Omega} = \mathbf{u}_B$, and symbol $[a]^-$ := min\{a, 0\}. Note that for given $\mathbf{u}, r_B, \mathbf{u}_B$, this is a linear problem for the unknown $r$.

As $\Omega$ is merely Lipschitz, the usual parabolic estimates fail at the level of the spatial derivatives (we cannot use at this stage the maximal regularity theory as it was done in [5]) and we are forced to use the weak formulation:
Existence and stability of dissipative turbulent solutions…

for any test function

\[
\phi \in L^2(0, T; W^{1,2}(\Omega)), \quad \partial_t \phi \in L^1(0, T; L^2(\Omega))
\]
as in [2].

Following [18, 23], we use the Galerkin approximation to approximate the momentum equation: We look for approximate velocity field in the form

\[
u = v + u_B, \quad v \in C([0, T]; X_n).
\]

Accordingly, the approximate momentum balance reads

\[
\int_\Omega (R + Z)u \cdot \phi \, dx \bigg|_{t=0}^{t=\tau} = \int_0^\tau \int_\Omega \left[ (R + Z)u \cdot \partial_t \phi + (R + Z)u \otimes u : \nabla_x \phi \right] \, dx \, dt + P(R, Z) \text{div}_x \phi - \mathbb{S}(\nabla u) : \nabla_x \phi - \epsilon \nabla_x (R + Z) : \nabla_x u \cdot \phi \right] \, dx \, dt
\]

for any \( \phi \in C^1([0, T]; X_n), \) with the initial condition

\[
(R + Z)u(0, \cdot) = (R_0 + Z_0)u_0, \quad u_0 = v_0 + u_B, \quad v_0 = \Pi_n(u_0 - u_B).
\]

For fixed parameters \( n, \epsilon > 0, \) the first level approximation is a solution \([R, Z, u]^0\) of the parabolic problem (3.3)–(3.5), and the Galerkin approximation (3.7), (3.8).

### 3.2 Parabolic problem with Robin boundary conditions

In setting (3.6) on Lipschitz domains (and even in a more general setting as far as the regularity of the transporting velocity \( u \) is concerned) problem (3.3)–(3.5) has been investigated in Crippa, Donadello, Spinolo [7]. The following lemma resumes Lemmas [7, Lemma 3.2 and Lemma 3.4] and [2, Lemma 3.3, Corollary 3.4 and estimate (3.7)]:

**Lemma 3.1** Let \( \Omega \subset \mathbb{R}^3 \) be a bounded Lipschitz domain and \( u = v + u_B, \) \( v \in C(\overline{I}; X_n) \). Suppose that \( (r_B, u_B) \) belongs to the class (3.1) while \( r_0 \) belongs to the class (3.2). Then we have:

\[\text{Here in the sequel, we skip the indexes } \epsilon, n \text{ and write e.g. } R \text{ instead of } R_{\epsilon, n}, \text{ etc. and will use eventually only one of them in the situations when it will be useful to underline the corresponding limit passage.} \]
1. The initial–boundary value problem (3.3–3.5) admits a weak solution \( r \) specified in (3.6), unique in the class
\[
 r \in L^2(I; W^{1,2}_0(\Omega)) \cap C(\overline{I}; L^2(\Omega)).
\]
The norm in the aforementioned spaces is bounded only in terms of the data \( r_B, r_0, u_B, \) and \( \| v, \text{div} v \|_{L^\infty(I; L^\infty(\Omega))}. \)

2. Moreover, \( \partial_t r \in L^2(I \times \Omega) \) and \( \sqrt{\varepsilon} \nabla r \in L^\infty(I; L^2(\Omega)) \) are bounded in terms of the data \( r_B, r_0, u_B \) and \( \| v, \text{div} v \|_{L^\infty(I; L^\infty(\Omega))}, \) and \( \nabla^2 r \in L^2(I; L^2_{\text{loc}}(\Omega)) \) is bounded in the same way on any compact set \( K \) of \( \Omega \) with the constant dependent in addition on \( K. \)

3. Strong maximum principle: The solution satisfies
\[
\forall \tau \in \overline{I}, \quad \| r(\tau) \|_{L^\infty(\Omega)} \leq M \exp \left( T \| \text{div}_x u \|_{L^\infty((0,T) \times \Omega)} \right),
\]
for a.a. \( \tau \in I, \) \( r(\tau, x) \leq M \exp \left( T \| \text{div}_x u \|_{L^\infty((0,T) \times \Omega)} \right) \) for a.a. \( x \in \partial \Omega, \)
where
\[
 M = \max \left\{ \max_{\Omega} r_0, \max_{\Gamma^\text{in}} r_B, \| u_B \|_{L^\infty((0,T) \times \Omega)} \right\}.
\]

4. Strong minimum principle: The solution satisfies
\[
\forall \tau \in \overline{I}, \quad \text{ess inf}_{x \in \Omega} r(\tau, x) \geq m \exp \left( -T \| \text{div}_x u \|_{L^\infty((0,T) \times \Omega)} \right),
\]
for a.a. \( \tau \in I, \) \( r(\tau, x) \geq m \exp \left( -T \| \text{div}_x u \|_{L^\infty((0,T) \times \Omega)} \right) \) for a.a. \( x \in \partial \Omega, \)
where
\[
 m = \min \left\{ \min_{\Omega} r_0, \min_{\Gamma^\text{in}} r_B \right\}.
\]

3.3 Existence of first level approximation \((\varepsilon, n \text{ fixed})\)

The existence of the approximate solutions at the level of the parabolic problem (3.3–3.5) coupled with the Galerkin approximation (3.7–3.8) can be proved in the same way as in [5, Section 4] (mono-fluid case with non zero inflow-outflow) combined with [23, Section 3], eventually with [24, Section 4] (multi-fluid with zero boundary conditions). Specifically, for \( u = u_B + v, \) \( v \in C([0, T]; X_n), \) we identify the unique solutions \( r = r[u] \) of (3.3–3.5), where \( r \) stands for \( R, Z \) and plug them as \( R, Z \) in (3.7). The unique solution \( u = u[R, Z] \) of (3.7) defines a mapping
\[
 T : v \in C([0, T]; X_n) \mapsto T[v] = (u[R, Z] - u_B) \in C([0, T]; X_n).
\]
The first level approximate solutions \( r = r_{n,\varepsilon}, \) \( u = u_{n,\varepsilon} - u_B \) – here, \( r \) stands for \( R, Z \) – are obtained via a fixed point of the mapping \( T. \) This procedure is detailed in [5] and
in [18] for the mono-fluid case with the non zero inflow-outflow and in [23] for the multi-fluid case with the no-slip boundary conditions. Combinig [18, Section 4] with [23, Section 4], we easily deduce the following result. 3

**Proposition 3.2** (First level approximate solutions ($\epsilon$, $n$ fixed)) Let $\Omega \subset \mathbb{R}^3$ be a bounded Lipschitz domain. Let the data $(R_B, Z_B, \mathbf{u}_B)$, $(R_0, Z_0, \mathbf{u}_0)$ belong to the class (2.12), (3.1), (2.14), (3.2). Suppose that assumptions (2.15–2.16) are satisfied.

Then for each fixed $n > 0$, $\epsilon > 0$, there exists a solution $(R_\epsilon, Z_\epsilon, \mathbf{u}_\epsilon = \mathbf{v}_\epsilon + \mathbf{u}_B)$ in the class

$$R, Z \in L^2(I; W^{1,2}(\Omega)) \cap L^\infty(I \times \Omega), \quad \partial_t (R, Z) \in L^2(I \times \Omega), \quad R, Z \in L^\infty(I \times \partial \Omega),$$

$$\forall t \in \tilde{T}, \quad R(t), Z(t) > 0 \text{ a.e. in } \Omega, \quad \text{for a.e. } t \in I, \quad R(t), Z(t) > 0 \text{ a.e. in } \partial \Omega,$$

$$\mathbf{v} = C(\tilde{T}; X_n), \quad \partial_t \mathbf{v} \in L^2(I; X_n).$$

of the approximate problem (3.6) and (3.7), (3.8). Moreover, the following holds:

1. **Lower and upper bounds of “densities”**: For a.e. $t \in I$, 0 < $c(n)$ ≤ $R_\epsilon(t, x), Z_\epsilon(t, x)$ ≤ $\bar{c}(n)$, $b \mathbf{R}_\epsilon(t, x) \leq Z_\epsilon(t, x)$,

$$\leq \bar{b} \mathbf{R}_\epsilon(t, x), \text{ a.e. in } \partial \Omega,$$

$$\forall t \in \tilde{T}, \quad 0 < c(n) \leq R_\epsilon(t, x), Z_\epsilon(t, x) \leq \bar{c}(n), \quad b \mathbf{R}_\epsilon(t, x) \leq Z_\epsilon(t, x) \leq \bar{b} \mathbf{R}_\epsilon(t, x), \text{ a.e. in } \partial \Omega,$$

(3.11)

2. **The approximate energy inequality**

$$\left[ \int_\Omega \left[ \frac{1}{2} (R_\epsilon + Z_\epsilon) |\mathbf{v}_\epsilon|^2 + H(R_\epsilon, Z_\epsilon) \right] \, dx \right]_{t=0}^{t=\bar{T}} + \int_0^{\bar{T}} \int_\Omega \mathbb{S}(\nabla \mathbf{u}_\epsilon) : \nabla \mathbf{u}_\epsilon \, dx \, dt$$

$$+ \int_0^{\bar{T}} \int_{\Gamma_{\text{in}}} H(R_\epsilon, Z_\epsilon) \mathbf{u}_B \cdot \mathbf{n} \, dS_x \, dt - \int_0^{\bar{T}} \int_{\Gamma_{\text{out}}} \mathbb{E}_H(R_B, Z_B) \mathbf{R}_\epsilon, Z_\epsilon) \mathbf{u}_B \cdot \mathbf{n} \, dS_x \, dt$$

$$+ \epsilon \int_0^{\bar{T}} \int_\Omega \nabla R \cdot H(R_\epsilon, Z_\epsilon)[\nabla \mathbf{R}_\epsilon, \nabla Z_\epsilon] \, dx \, dt$$

$$\leq - \int_0^{\bar{T}} \int_\Omega \left[ (R_\epsilon + Z_\epsilon) \mathbf{u}_\epsilon \otimes \mathbf{u}_\epsilon + P(R_\epsilon, Z_\epsilon) \right] : \nabla \mathbf{u}_B \, dx \, dt$$

$$+ \int_0^{\bar{T}} \int_\Omega (R_\epsilon + Z_\epsilon) \mathbf{u}_\epsilon \cdot \nabla \mathbf{u}_B \cdot \mathbf{u}_B \, dx \, dt + \int_0^{\bar{T}} \int_\Omega \mathbb{S}(\nabla \mathbf{u}_\epsilon) : \nabla \mathbf{u}_B \, dx \, dt$$

$$- \int_0^{\bar{T}} \int_{\Gamma_{\text{in}}} H(R_B, Z_B) \mathbf{u}_B \cdot \mathbf{n} \, dS_x \, dt$$

(3.12)

3 The energy inequality (3.12) in [18, Lemma 4.2] and in [23, Section 4] is derived under assumption $\Omega \in C^2$. This assumption is needed due to the treatment of the parabolic problem (3.3–3.5) via the classical maximal regularity methods. With Lemma 3.1 at hand, the same proof can be carried out without modifications also in Lipschitz domains.
holds for any $0 \leq \tau \leq T$, where
\[
\nabla_{RZ}^2 H_\delta(R, Z) [\nabla_x R, \nabla_x Z] = \partial_{R}^2 H(R, Z) |\nabla R|^2 + 2 \partial_R \partial_Z H \nabla R \cdot \nabla Z + \partial_Z^2 H(R, Z) |\nabla Z|^2.
\]

This is level I of approximations (with two parameters $n$, $\varepsilon$). We shall pass first to the limit $\varepsilon \to 0$ in order to obtain level II of approximations (with one parameter $\varepsilon$). Then we obtain the dissipative turbulent solutions of problem (1.1–1.7) by letting $n \to \infty$.

### 3.4 The second level approximation (limit $\varepsilon \to 0$)

Our next goal is to send $\varepsilon \to 0$ in the viscous approximation (3.6), (3.7), (3.12) for $n$ fixed. In what follows $\varepsilon \to 0$ mean limit over a conveniently chosen subsequence (relabeling is not indicated).

#### 3.4.1 Limit in the approximate continuity equations

Seeing that $X_n$ is a finite dimensional normed space and that $H$ is strictly convex, we deduce from (3.11) and (3.12), in particular,
\[
\| u_\varepsilon \|_{L^\infty(0, T; W^{1,\infty}(\Omega))} \leq c,
\]
for all $t \in \bar{T}$, $0 < \underline{c} \leq r_\varepsilon(t, x) \leq \bar{c}$ and $(R_\varepsilon(t, x), Z_\varepsilon(t, x)) \in \bar{O}$ for a.a. $x \in \Omega$,
\[
(3.13)
\]
for a.a. $t \in \bar{T}$, $0 < \underline{c} \leq r_\varepsilon(t, x) \leq \bar{c}$ and $(R_\varepsilon(t, x), Z_\varepsilon(t, x)) \in \bar{O}$ for a.a. $x \in \partial \Omega$,
\[
\varepsilon \| \nabla_x r_\varepsilon \|_{L^2(\bar{T}; \mathbb{R}^d)}^2 \leq c.
\]
\[
(3.14)
\]
In the above and in what follows, $r_\varepsilon$ stands for $R_\varepsilon$ and $Z_\varepsilon$.

In view of the uniform bounds established above, we may assume
\[
r_\varepsilon \to r \text{ weakly-*(*) in } L^\infty((0, T) \times \Omega) \text{ and weakly in } C_{weak}([0, T]; L'(\Omega)) \text{ for any } 1 < r < \infty,
\]
\[
(3.15)
\]
passing to a suitable subsequence as the case may be. Note that the second convergence follows from the bound on the time derivative $\partial_t r_\varepsilon$ obtained from Eq. (3.6), via an Arzela-Ascoli type compactness argument. We also have
\[
r_\varepsilon \to r \text{ weakly-*(*) in } L^\infty((0, T) \times \partial \Omega; dS_x).
\]
\[
(3.16)
\]
In addition, the limit density admits the same upper and lower bounds as in (3.14).

Similarly,
\[
\| u_\varepsilon \|_{L^\infty(0, T; W^{1,\infty}(\Omega; \mathbb{R}^d))} \leq c,
\]
\[
(3.17)
\]
and
\[
\| u_\varepsilon \|_{L^\infty(0, T; W^{1,\infty}(\Omega; \mathbb{R}^d))} \leq c.
\]
\[
(3.18)
\]
Moreover, an abstract version of Arzela–Ascoli theorem yields

$$\mathbf{m} = (R + Z)\mathbf{u} \text{ a.a. in } (0, T) \times \Omega.$$  

This is enough to pass to the limit $\varepsilon \to 0$ in the parabolic problem (3.6) and to obtain

$$\left[ \int_0^T \int_\Omega r \varphi \, dx \right]_{t=0}^{t=T} = \int_0^T \int_\Omega \left[ r \partial_t \varphi + r \mathbf{u} \cdot \nabla \varphi \right] \, dx \, dt$$

$$- \int_0^T \int_{\Gamma_{\text{out}}} \varphi r \mathbf{u}_B \cdot \mathbf{n} \, dS_x \, dt - \int_0^T \int_{\Gamma_{\text{in}}} \varphi r \mathbf{u}_B \cdot \mathbf{n} \, dS_x \, dt,$$

for any $\varphi \in C^1([0,T] \times \overline{\Omega})$, which is a weak formulation of the equation of continuity (1.1), with the boundary conditions (1.5), and the initial condition (1.7).

### 3.4.2 Limit in the approximate momentum equation

Clearly,

$$\| \nabla_x \mathbf{u}_\varepsilon \|_{L^2(I \times \Omega)} \leq c$$

and

$$\nabla_x \mathbf{u}_\varepsilon \to \nabla_x \mathbf{u} \text{ weakly in } L^2(I \times \Omega).$$

Next, we deduce from (3.7) on one hand and from Item 2. of Lemma 3.1 on the other hand that

$$\partial_t \Pi_n[(R_\varepsilon + Z_\varepsilon)\mathbf{u}_\varepsilon] \text{ bounded in } L^2(0,T;X_n), \quad \partial_r \varepsilon \text{ bounded in } L^2(I \times \Omega),$$

where $\Pi_n : L^2 \to X_n$ is the associated orthogonal projection; consequently

$$\| \partial_r \mathbf{u}_\varepsilon \|_{L^2(I \times X_n)} \leq c$$

and, due to Arzela-Ascoli (or Lions-Aubin) compactness argument, we may assume that

$$\mathbf{u}_\varepsilon \to \mathbf{u} \quad \text{ in } C(I \times \overline{\Omega});$$

$$r_\varepsilon \mathbf{u}_\varepsilon \to r \mathbf{u}, \quad r_\varepsilon \mathbf{u}_\varepsilon \otimes \mathbf{u}_\varepsilon \to r \mathbf{u} \otimes \mathbf{u} \quad C_{\text{weak}}(I, L^q(\Omega)), \quad 1 \leq q < \infty.$$  

By virtue of (3.12) and the last item in Remark 2.3,

$$\sup_{\varepsilon \in \overline{\mathcal{E}}} \| H(R_\varepsilon, Z_\varepsilon) \|_{L^\infty(\Omega)}, \quad \sup_{\varepsilon \in \overline{\mathcal{E}}} \| P(R_\varepsilon, Z_\varepsilon) \|_{L^\infty(\Omega)},$$

is bounded uniformly with $\varepsilon, n$.

Thus, there is a subsequence (not relabeled) such that

$$P(R_\varepsilon, Z_\varepsilon) \to P(R, Z) := \overline{P(R, Z)}_n \text{ weakly-* in } L^\infty(I \times \Omega),$$  

(3.22)
where (since $P$ is continuous and convex, and since, in particular, $r_\varepsilon \to r$ weakly in $L^1(I \times \Omega)$)

$$P(R, Z) := P(R_n, Z_n) \leq \overline{P(R, Z)}_n \quad \text{a.e. in } I \times \Omega.$$ 

This is enough to pass to the limit in the momentum equation (3.7), in order to obtain:

$$\left[ \int_\Omega (R + Z)u \cdot \varphi \, dx \right]_{t=\tau}^{t=\tau} = \int_0^\tau \left[ \int_\Omega (R + Z)u \cdot \partial_t \varphi + (R + Z)u \otimes u : \nabla \varphi \\
+ P(R, Z) \text{div}_x \varphi - \mathbb{S}(\nabla_x u) : \nabla_x \varphi \right] \, dx$$

for any $\varphi \in C^1([0, T]; X_n)$.

### 3.4.3 Limit in the energy inequality

We shall treat $H$ similarly as $P$: as in (3.22)

$$H(R_\varepsilon, Z_\varepsilon) \to \text{weakly-* in } H(R, Z) := \overline{H(R, Z)}_n \quad \text{in } L^\infty(I \times \Omega).$$

Since $H$ is convex continuous, since, in particular $r_\varepsilon \to r$ weakly in $L^1(I \times \Omega)$, we have

$$0 \leq H(R_n, Z_n) \leq \overline{H(R, Z)}_n,$$

(3.24)

where

$$\|\overline{H(R, Z)}_n\|_{L^\infty(I \times \Omega)}$$

is bounded uniformly with $n$.

Seeing (3.17) and convexity of $H$ we may conclude that

$$\int_0^\tau \int_{\Gamma_{out}} H(R, Z)u_B \cdot n \, dS_x \, dt \leq \lim inf_{\varepsilon \to 0} \int_0^\tau \int_{\Gamma_{out}} H(R_\varepsilon, Z_\varepsilon)u_B \cdot n \, dS_x \, dt.$$

Finally recalling (3.21), we can pass to the limit also in the energy balance (3.12), where we obtain after omitting at the left hand side several non negative terms, the following energy inequality:

$$\left[ \int_\Omega \left\{ \frac{1}{2} (R + Z) |\nabla \varphi|^2 + H(R, Z) \right\} \, dx \right]_{t=0}^{t=\tau} + \int_0^\tau \int_\Omega \mathbb{S}(\nabla_x u) : \nabla_x u \, dx \, dt$$

$$\quad + \int_0^\tau \int_{\Gamma_{out}} H(R, Z)u_B \cdot n \, dS_x \, dt \leq - \int_0^\tau \int_\Omega \left[ (R + Z)u \otimes u + P(R, Z) \right] : \nabla_x u \, dx \, dt$$

$$\quad + \int_0^\tau \int_\Omega (R + Z)u \cdot \nabla_x u_B \, dx \, dt + \int_0^\tau \int_\Omega \mathbb{S}(\nabla_x u) : \nabla_x u_B \, dx \, dt$$

$$\quad - \int_0^\tau \int_{\Gamma_{in}} H(R_B, Z_B)u_B \cdot n \, dS_x \, dt$$

(3.25)
for a.a. $\tau \in I$

Before summarizing the results of this section we introduce the kinetic energy function which will be convenient to use in the last limit process.

For any $0 \neq \xi \in \mathbb{R}^3$, we introduce the following convex lower semicontinuous function

$$
\mathbb{E}_\xi [r, m] : \mathbb{R} \times \mathbb{R}^d \ni [r, m] \mapsto \begin{cases} 
\frac{|m \cdot \xi|^2}{r} & \text{if } r > 0, \\
0 & \text{if } r = 0, m = 0, \\
\infty & \text{otherwise,}
\end{cases}
$$

(3.26)

together with function

$$
\mathbb{E} [r, m] : \mathbb{R} \times \mathbb{R}^d \ni [r, m] \mapsto \begin{cases} 
\frac{m \otimes m}{r} & \text{if } r > 0, \\
0 & \text{if } r = 0, m = 0, \\
\infty & \text{otherwise.}
\end{cases}
$$

and verify that with $R = R_n, Z = Z_n, u = u_n$, we have

$$
\mathbb{E}_\xi [R + Z, (R + Z)u] = (R + Z)|u \cdot \xi|^2, \quad \mathbb{E}_\xi [R + Z, (R + Z)v] \\
= (R + Z)|v \cdot \xi|^2, \quad \mathbb{E}_\xi (r, m) = \xi^T \mathbb{E} [r, m] \xi.
$$

Finally, we denote

$$
\mathbb{E}_0 = \mathbb{E}_{e_1} + \cdots + \mathbb{E}_{e_d}, \quad \text{where } e_i \text{ is canonical basis of } \mathbb{R}^d.
$$

3.4.4 Conclusion for the limit $\varepsilon \to 0$

To conclude, we summarize the result obtained in the limit $\varepsilon \to 0$.

**Proposition 3.3** (Second level of approximate solutions ($n$ fixed)) *Let $\Omega \subset \mathbb{R}^3$ be a bounded Lipschitz domain. Let the data $(R_B, Z_B, u_B), (R_0, Z_0, u_0)$ belong to the class (2.12), (3.1), (2.14), (3.2). Suppose that assumptions (2.15–2.16) are satisfied.*

*Then for each fixed $n > 0$, there exists $(R_n, Z_n, u_n = v_n + u_B)$ in the class

$$
R, Z \in L^\infty(I \times \Omega), \quad \partial_t (R, Z) \in L^2(I \times \Omega), \quad R, Z \in L^\infty(I \times \partial \Omega),
$$

$$
\forall t \in \bar{I}, \quad R(t), Z(t) > 0 \ a.e. \ in \ \Omega, \quad \text{for a.e. } t \in I \ R(t), Z(t) > 0 \ a.e. \ in \ \partial \Omega,
$$

$$
v = C(t; X_n), \quad \partial_t v \in L^2(I; X_n)
$$

such that the following holds:*
1. Domination inequalities:

\[
\forall t \in I, \quad 0 \leq c(n) \leq R_n(t, x), \quad Z_n(t, x) \leq \bar{c}(n), \quad bR_n(t, x) \leq \bar{Z}_n(t, x)
\]

for a.a. \( t \in I, \quad 0 \leq c(n) \leq R_n(t, x), \quad Z_n(t, x) \leq \bar{c}(n), \quad bR_n(t, x) \leq \bar{Z}_n(t, x), \quad \text{a.e. in } \Omega, \)

\[ (3.27) \]

2. Continuity equations:

\[
\left[ \int_{\Omega} r_n \varphi \ dx \right]_{t=0}^{t=t} = \int_0^t \int_{\Omega} \left[ r_n \partial_t \varphi + r_n u_n \cdot \nabla \varphi \right] \ dx \ dt \\
- \int_0^t \int_{\partial \Omega} \varphi r_n u_B \cdot n \ dS_x \ dt \\
- \int_0^t \int_{\Gamma_{in}} \varphi r_n u_B \cdot n \ dS_x \ dt, \quad r(0, \cdot) = r_0, \quad r \text{ stands for } R, Z,
\]

for any \( \varphi \in C^1([0, T] \times \Omega) ; \)

3. Momentum equation:

\[
\left[ \int_{\Omega} (R_n + Z_n) u \cdot \varphi \ dx \right]_{t=0}^{t=t} = \int_0^t \int_{\Omega} \left[ (R_n + Z_n) u_n \cdot \partial_t \varphi \right] \ dx \ dt \\
+ \left[ \mathbb{E}[R_n + Z_n, m_n] + P(R, Z)_n \right] : \nabla \varphi \\
- \mathbb{S}(\nabla u_n) : \nabla \varphi \ dx \ dt, \quad (R + Z) u(0) = m_0, \quad m_n = (R_n + Z_n) u_n
\]

for any \( \varphi \in C^1([0, T]; X_n) \), where

\[ 0 \leq P(R_n, Z_n) \leq P(R, Z)_n, \quad \|P(R, Z)_n\|_{L^\infty(I, [0, T] ; L^1(\Omega))} \text{ uniformly bounded.} \]

\[ (3.30) \]

4. The approximate energy inequality

\[
\int_{\Omega} \left[ \frac{1}{2} \mathbb{E}_0[R_n(\tau) + Z_n(\tau), q_n(\tau)] + \overline{H(R, Z)_n} \right] \ dx \\
- \int_{\Omega} \left[ \frac{1}{2} \mathbb{E}_0[R_0 + Z_0(\tau), q_0] + H(R_0, Z_0) \right] \ dx \\
+ \int_0^t \int_{\partial \Omega} \mathbb{S}(\nabla u_n) : \nabla \varphi \ dS_x \ dt + \int_0^t \int_{\Gamma_{out}} \overline{H(R_n, Z_n) u_B \cdot n} \ dS_x \ dt \ dx \\
\leq - \int_0^t \int_{\Omega} \left[ \mathbb{E}[R_n + Z_n, m_n] + P(R, Z)_n \right] : \nabla \varphi \ dx \ dt \\
+ \int_0^t \int_{\Omega} (R_n + Z_n) u_n \cdot \nabla u_B \cdot u_B \ dx \ dt + \int_0^t \int_{\Omega} \mathbb{S}(\nabla u_n) : \nabla u_B \ dx \ dt \\
- \int_0^t \int_{\Gamma_{in}} \overline{H(R_n, Z_n) u_B \cdot n} \ dS_x \ dt, \quad q_n = (R_n + Z_n) v_n, \quad q_0 = (R_0 + Z_0) v_0
\]

holds for a.a. \( \tau \in I \), where \( u = v_n + u_B \).
3.5 Existence for the bi-fluid system ($n \to \infty$)

Our ultimate goal is to perform the limit $n \to \infty$ in the family of approximate solutions obtained in Proposition 3.3.

3.5.1 Limit in the continuity equation

An easy application of Gronwall’s lemma shows that the total energy represented by the expression on the left–hand side of the energy inequality (3.31) remains bounded uniformly for $n \to \infty$. This, together with the domination inequalities (3.27) yields estimates

$$\|r_n\|_{L^\infty(I; L^r(\Omega))} \leq c, \quad \|r_n\|_{L^\infty(I; L^r(\Gamma^\text{out}; |u_B \cdot n|dS))} \leq c,$$

$$|r_n u_n|_{L^\infty(I; L^{2r/(r+1)}(\Omega))} \leq c, \quad \|\nabla_x u_n\|_{L^2(I \times \Omega)} \leq c.$$

Consequently, extracting suitable subsequences if necessary, we may suppose

$$r_n \to r \quad \text{in} \quad C_\text{weak}([0, T]; L^r(\Omega)), \quad r_n \to r \quad \text{weakly-}^* \quad \text{in} \quad L^\infty(0, T; L^r(\Gamma^\text{out}; |u_B \cdot n|dS)),$$

$$m_n = r_n u_n \to m \quad \text{weakly-}^* \quad \text{in} \quad L^\infty(0, T; L^{2r/(r+1)}(\Omega; \mathbb{R}^d)).$$

(3.32)

and

$$u_n \to u \quad \text{weakly in} \quad L^2(0, T; W^{1,2}(\Omega; \mathbb{R}^d)).$$

(3.33)

$$m = ru \quad \text{a.a. in} \quad (0, T) \times \Omega.$$  

(3.34)

We show now that

This is a direct application of (nontrivial) Lemma 7.1 (see Appendix), where we take

$$r_n = r_n, \quad v_n = u_n', \quad i = 1, \ldots, d, \quad g_n = -r_n u_n, \quad h_n = 0$$

The hypotheses of the lemma are satisfied with exponents $\rho = \gamma, \quad r = s = \frac{2r}{r+1}$.

At this stage, we are able to perform the limit in the equations of continuity (3.28) to obtain (2.2).

Remark 3.4 Let us introduce the quantity

$$m = \begin{cases} r u_B \cdot n \quad \text{on} \quad \Gamma^\text{out} \\ \rho u_B \cdot n \quad \text{on} \quad \Gamma^\text{in} \end{cases}$$

(3.35)
where $r$ stands for $R, Z$ and $r_B$ stands for $R_B, Z_B$, then $m$ is the normal trace of the divergenceless vector field $(r, r\mathbf{u})$ on the lateral boundary $(0, T) \times \partial \Omega$ in the sense of Lions [21] or Chen, Torres and Ziemer [6]. For more details see Appendix.

### 3.5.2 Limit in the momentum equation

The next step is to perform the same limit in the momentum Eq. (3.29).

Seeing, on one hand that $\mathcal{L}^\infty(I; \mathcal{L}^1(\Omega)) \hookrightarrow \mathcal{L}^\infty(I; M(\Omega))$ and that $\left(\mathcal{L}^1(I; C(\Omega))\right)^* = \mathcal{L}^\infty(I, M(\Omega))^*$, cf. Lemma 7.3, and on the other hand that $P$ is convex, continuous and that (3.32) holds we get from (3.30), in particular

$$L^\infty_{\text{weak}^{\ast}}(I, M^+\Omega) \ni \mathcal{R}_1 : = \overline{P(R, Z) - P(R, Z)},$$

where $\overline{P(R, Z)}$ is $\ast$-weak limit of a chosen subsequence $\overline{P(R, Z)}_n$ (not relabeled) in $L^\infty_{\text{weak}^{\ast}}(I, M(\Omega))$ (whose existence is guaranteed by the Banach-Alaoglu-Bourbaki theorem). Likewise,

$$\mathbb{E}[R_n + Z_n, m_n] \to \mathbb{E}[R + Z, m] \text{ weakly-}* \text{ in } L^\infty_{\text{weak}^{\ast}}(I, M(\Omega))$$

where

$$\mathcal{R}_2 = \mathbb{E}[R + Z, m] - \mathbb{E}[R + Z, m] \in L^\infty_{\text{weak}^{\ast}}(I, M^+(\Omega; \mathbb{R}^{d \times d}_{\text{sym}})).$$

Indeed, since for all $0 \neq \xi, \mathbb{E}_{\xi}$ is lower semicontinuous and convex, we have

$$\xi^T \mathbb{E}[R + Z, m] \xi \leq \xi^T \mathbb{E}[R + Z, m] \xi, \quad \xi \in \mathbb{R}^d.$$

Thus, letting $n \to \infty$ in (3.29) we obtain the formulation (2.4) of the momentum equation with

$$\mathcal{R} = \mathcal{R}_1 + \mathcal{R}_2 = \mathbb{E}[R + Z, m] - \mathbb{E}[R + Z, m] + \left(\overline{P(R, Z) - P(R, Z)}\right).$$

**Remark 3.5** Let us remark why we introduce $\mathcal{R}_2$. We are looking for the solution in the largest class of regularity than the weak solution (under assumption for $\gamma > 1$). Moreover in many cases (e.g. in numerical scheme) the compactness in time is not easy to get it. To overcome such problem we introduce the most general solution (dissipative solution) where the weak–strong uniqueness holds. Let us mention that for less general case there is an existence of a weak solution under assumption $\gamma \geq 2$, see [17], where we got the corresponding limit in the convective term.
3.5.3 Limit in the energy inequality

By the same token, due to (3.24),

\[
L_{\text{weak}^{-\ast}}^\infty(I, \mathcal{M}^+(\Omega)) \ni \mathcal{E}_1 := \overline{H(R, Z) - H(R, Z)},
\]

where \(\overline{H(R, Z)}\) is \(*\)-weak limit of a chosen subsequence \(\overline{H(R, Z)}_n\) (not relabeled) in \(L_{\text{weak}^{-\ast}}^\infty(I, \mathcal{M}(\Omega))\). Further, it is easy to see that

\[
\mathcal{E}_2 := E_0(R + Z, \mathbf{q}) - E_0[R + Z, \mathbf{m}] = E_0(R + Z, \mathbf{m}) - E_0[R + Z, \mathbf{m}]
\in L_{\text{weak}^{-\ast}}^\infty(I, \mathcal{M}^+(\Omega)).
\]

Thus setting

\[
\mathcal{E}(\tau) = \lim_{h \to 0+} \frac{1}{2h} \int_{\tau - h}^{\tau + h} \int_{\Omega} d(\mathcal{E}_1(t) + \mathcal{E}_2(t))
\]

(due to the Theorem on Lebesgue points, this limit is equal to \(\mathcal{E}_1(\tau) + \mathcal{E}_2(\tau)\) for a.a. \(\tau \in I\). Due to (3.32) and since \(H\) is convex,

\[
\int_0^\tau \int_{\Gamma_{\text{out}}} H(R, Z) \mathbf{u}_B \cdot ndS_x dt \leq \lim_{n \to \infty} \int_0^\tau \int_{\Gamma_{\text{out}}} H(R_n, Z_n) \mathbf{u}_B \cdot ndS_x dt.
\]

We are ready to pass to the limit in energy inequality (3.31) in order to get (2.6).

3.5.4 Compatibility conditions

By structural assumptions (2.15)–(2.16) and convexity

\[
\frac{a}{\bar{a}}(P(R, Z) - P(R, Z)) \geq \overline{H(R, Z) - H(R, Z)}
\]

and

\[
\frac{a}{\bar{a}}(P(R, Z) - P(R, Z)) \leq \overline{H(R, Z) - H(R, Z)}
\]

we deduce

\[
\min \left\{ \frac{1}{\bar{a}}, \frac{1}{\bar{a}} \right\} \mathcal{E} \leq \frac{1}{d} \text{Tr} \mathbf{R} \leq \max \left\{ \frac{1}{\bar{a}}, \frac{1}{\bar{a}} \right\} \mathcal{E}.
\]

This implies compatibility conditions (2.7).

3.5.5 Finite energy initial data

At this stage we have proved existence of dissipative turbulent solutions with the regular initial and boundary data in class (3.1)–(3.2) and (2.12), (2.14). In order to
get finite energy initial data (2.13) and boundary data (2.11) (and (2.12), (2.14)) we have to perform the steps from Sections 3.5.1–3.5.4 with boundary data \((r_{0,n}, u_{0,n})\), and \((r_{B,n}, u_B)\) in class (3.1)–(3.2), where \((r_{0,n}, u_{0,n})\) and \((r_{B,n}, u_B)\) are approximations of \((r_0, u_0)\), and \(r_B\) such that

\[
\begin{align*}
    r_{0,n} &\to r_0 \text{ in } L^1(\Omega), \quad H(R_{0,n}, Z_{0,n}) \to H(R_0, Z_0) \text{ in } L^1(\Omega), \quad r_{B,n} \to r_B \text{ in } C(\overline{\Omega}), \\
    (R_{0,n} + Z_{0,n}, u_{0,n}) &\to m_0 \text{ in } L^{2\gamma}(\Omega), \quad \mathcal{E}_0[R_{0,n} + Z_{0,n}, (R_{0,n} + Z_{0,n})u_{0,n}] \to \mathcal{E}_0[R_0 + Z_0, m_0] \text{ in } L^1(\Omega).
\end{align*}
\]

In this way, we obtain (2.3), (2.4), (2.6) with the desired finite energy initial data.

### 4 Compatibility with classical solution: Proof of Theorem 2.5

In this section, we show Theorem 2.5: if a dissipative solution enjoys certain regularity, specifically if

\[
    u \in C^1([0, T] \times \overline{\Omega}, R^d), \quad R, Z \in C^1([0, T] \times \overline{\Omega}), \quad \inf_{(0,T) \times \Omega} Z > 0,
\]

then \([R, Z, u]\) is a classical solution, meaning \(\mathcal{C} = \mathcal{R} = 0\).

To see this, we realize that \((u - u_B)\) can be used as a test function in the momentum equation (2.4), which, together with the equation of continuity (2.2), yield the total energy equality:

\[
\begin{align*}
    &\left[\int_{\Omega} \left[ \frac{1}{2} (R + Z)|u - u_B|^2 + H(R, Z) \right] \mathrm{d}x \right]_{t=0}^{t=r} + \int_0^r \int_{\Omega} \mathcal{S}(\nabla_x u) : \nabla_x u \ \mathrm{d}x \ \mathrm{d}t \\
    &\quad + \int_0^r \int_{\Gamma^{n\alpha}} H(R, Z)u_B \cdot \mathbf{n} \ \mathrm{d}S_x \ \mathrm{d}t + \int_0^r \int_{\Gamma^{B\alpha}} H(R_B, Z_B)u_B \cdot \mathbf{n} \ \mathrm{d}S_x \ \mathrm{d}t \\
    &= -\int_0^r \int_{\Omega} [(R + Z) \otimes u + P(R, Z) ] : \nabla_x u_B \ \mathrm{d}x \ \mathrm{d}t \\
    &\quad + \int_0^r \int_{\Omega} (R + Z)u \cdot \nabla_x u_B \cdot u_B \ \mathrm{d}x \ \mathrm{d}t \\
    &\quad + \int_0^r \int_{\Omega} \mathcal{S} : \nabla_x u_B \ \mathrm{d}x \ \mathrm{d}t - \int_0^r \int_{\Omega} \nabla_x (u_B - u) : d\mathcal{R}(t) \ \mathrm{d}t.
\end{align*}
\]

Relation (4.1) subtracted from the energy inequality (2.6) gives rise to

\[
\int_{\Omega} 1 \mathrm{d} \mathcal{R}(t) \leq \int_0^t \int_{\Omega} \nabla_x u : d\mathcal{R}(t) \ \mathrm{d}t.
\]

Since \(u \in C^1([0, T] \times \overline{\Omega})\), we have

\[
|\int_{\Omega} \nabla_x u : d\mathcal{R}_{ij}(t)| \leq \|\nabla_x u(t)\|_{C(\overline{\Omega})} \int_{\Omega} \mathrm{d}|\mathcal{R}_{ij}|,
\]
where
\[ |\mathcal{R}_{i,j}| := \sup_{\|\varphi\|_{C^1(\Omega)} \leq 1} \int_{\Omega} \varphi d\mathcal{R}_{i,j} \]
is the total variation of the signed measure \(\mathcal{R}_{i,j}\). We have
\[
\sum_{i,j=1}^{3} \int_{\Omega} d|\mathcal{R}_{i,j}| = \sum_{i,j=1}^{3} \sup_{\|\varphi\|_{C^1(\Omega)} \leq 1} \int_{\Omega} \varphi d\mathcal{R}_{i,j}
\]
\[\lesssim \sum_{i,j=1}^{3} \sup_{\|\varphi\|_{C^1(\Omega)} \leq 1} \sup_{|\xi|=1} \int_{\Omega} \varphi d(\xi^T \mathcal{R}_{i,j} \xi) \lesssim \int_{\Omega} d\text{Tr} \mathcal{R}.
\]
This, together with the compatibility hypothesis (2.7) and Gronwall lemma, yields the desired conclusion \(\mathcal{G} = \mathcal{R} = 0\).

## 5 Relative energy: Proof of Theorem 2.6

The relative energy \(\mathcal{E}(R,Z,u \mid r, \zeta, u)\) can be rewritten as
\[
\frac{1}{2} (R + Z) |u - u|^2 + H(R,Z) - \partial_R H(r, \zeta)(R - r) - \partial_Z H(r, \zeta)(Z - \zeta) - P(r, \zeta)
\]
\[= \frac{1}{2} (R + Z) |u - u_B - (u - u_B)|^2 + H(R,Z) - \partial_R H(r, \zeta)(R - r)
\]
\[- \partial_Z H(r, \zeta)(Z - \zeta) - P(r, \zeta)
\]
\[= \left[ \frac{1}{2} (R + Z) |u - u_B|^2 + H(R,Z) \right] - (R + Z) u \cdot (u - u_B)
\]
\[+ \left[ \frac{1}{2} (|u|^2 - |u_B|^2) - \partial_R H(r, \zeta) \right] R + \left[ \frac{1}{2} (|u|^2 - |u_B|^2) - \partial_Z H(r, \zeta) \right] Z + P(r, \zeta).
\]

Our goal is to evaluate the time evolution of
\[
\int_{\Omega} \mathcal{E}(R,Z,u \mid r, r, u) \, dx
\]
where \([R,Z,u]\) is a dissipative solutions and \([r, \zeta, u]\) are test functions in the class (2.7).

*Step 1:* In accordance with the energy inequality (2.6), we get
\[
\left[ \int_{\Omega} \left[ \frac{1}{2} (R + Z) |\mathbf{u} - \mathbf{u}_B|^2 + H(R, Z) \right] \, dx \right]_{t=0}^{t=\tau} + \int_{t=0}^{\tau} \int_{\Omega} \mathbb{S}(\nabla_x \mathbf{u}) : \nabla_x \mathbf{u} \, dx \, dt \\
+ \int_{t=0}^{\tau} \int_{\Gamma = \partial \Omega} H(R, Z) \mathbf{u}_B \cdot \mathbf{n} \, dS_x \, dt + \int_{t=0}^{\tau} \int_{\Gamma = \partial \Omega} H(R_B, Z_B) \mathbf{u}_B \cdot \mathbf{n} \, dS_x \, dt + \int_{\Omega} 1 \, d \mathcal{E}(\tau) \\
\leq -\int_{t=0}^{\tau} \int_{\Omega} P(R, Z) \text{div}_x \mathbf{u}_B \, dx \, dt \\
+ \int_{t=0}^{\tau} \int_{\Omega} (R + Z) \left( \mathbf{u} \cdot \nabla_x \mathbf{u}_B - \mathbf{u} \cdot \nabla_x \mathbf{u} - \mathbf{u}_B \cdot \mathbf{u} \right) \, dx \, dt \\
+ \int_{t=0}^{\tau} \int_{\Omega} \mathbb{S}(\nabla_x \mathbf{u}) : \nabla_x \mathbf{u}_B \, dx \, dt - \int_{t=0}^{\tau} \int_{\Omega} \nabla_x \mathbf{u}_B : \, d \mathcal{R}(t) \, dt.
\] (5.1)

**Step 2:** Plugging \( \varphi = \mathbf{u} - \mathbf{u}_B \) in the momentum equation (2.4), we get
\[
\left[ \int_{\Omega} (R + Z) \mathbf{u} \cdot (\mathbf{u} - \mathbf{u}_B) \, dx \right]_{t=0}^{t=\tau} = \int_{0}^{\tau} \int_{\Omega} \left( (R + Z) \left( \mathbf{u} \cdot \partial_t \mathbf{u} + \mathbf{u} \cdot \nabla_x \mathbf{u} + \mathbf{u}_B \cdot \mathbf{u} - \mathbf{u} \cdot \nabla_x \mathbf{u}_B \cdot \mathbf{u} \right) \\
+ P(R, Z) \text{div}_x (\mathbf{u} - \mathbf{u}_B) - \mathbb{S}(\nabla_x \mathbf{u}) : \nabla_x (\mathbf{u} - \mathbf{u}_B) \right] \, dx \, dt \\
+ \int_{0}^{\tau} \int_{\Omega} \nabla_x (\mathbf{u} - \mathbf{u}_B) : \, d \mathcal{R}(t) \, dt.
\] (5.2)

**Step 3:** Finally, we consider \( \varphi = \left[ \frac{1}{2} \left( |\mathbf{u}|^2 - |\mathbf{u}_B|^2 \right) - \partial_R H(\mathbf{r}, \zeta) \right] \) in the equation of continuity (2.2) with \( r = R \) and \( \varphi = \left[ \frac{1}{2} \left( |\mathbf{u}|^2 - |\mathbf{u}_B|^2 \right) - \partial_Z H(\mathbf{r}, \zeta) \right] \) in the equation of continuity (2.2) with \( r = Z \) obtaining:
\[
\left[ \int_{\Omega} r \left[ \frac{1}{2} \left( |\mathbf{u}|^2 - |\mathbf{u}_B|^2 \right) - \partial_Z H(\mathbf{r}, \zeta) \right] \, dx \right]_{t=0}^{t=\tau} = \int_{0}^{\tau} \int_{\Omega} \partial_Z H(\mathbf{r}, \zeta) r \mathbf{u}_B \cdot \mathbf{n} \, dS_x \\
- \int_{0}^{\tau} \int_{\Gamma_{\text{out}}} \partial_R H(\mathbf{r}, \zeta) r \mathbf{u}_B \cdot \mathbf{n} \, dS_x \\
= \int_{0}^{\tau} \int_{\Omega} r \partial_\zeta \left( \frac{1}{2} |\mathbf{u}|^2 - \partial_Z H(\mathbf{r}, \zeta) \right) \\
+ r \mathbf{u} \cdot \nabla_x \left( \frac{1}{2} \left( |\mathbf{u}|^2 - |\mathbf{u}_B|^2 \right) - \partial_R H(\mathbf{r}, \zeta) \right) \, dx \, dr,
\] (5.3)

where \( r \) stands once for \( R \) and once for \( Z \).

**Step 4:** Summing up (5.1),(5.2), subtracting (5.3)\(_{r=R}\) and (5.3)\(_{r=Z}\), and using identity
\[
\left[ \int_{\Omega} \left( R \partial_R H(\mathbf{r}, \zeta) + Z \partial_Z H(\mathbf{r}, \zeta) - H(\mathbf{r}, \zeta) \right) \, dx \right]_{0}^{\tau} = \int_{0}^{\tau} \int_{\Omega} \partial_i P(\mathbf{r}, \zeta) \, dx,
\]
we get

\[ \text{Springer} \]
\[
\left[ \int_\Omega \mathcal{E}\left( R, Z, \mathbf{u} \mid \mathbf{r}, \mathbf{z}, \mathbf{u} \right) \; dx \right]_{t=0}^{r} \\
+ \int_0^r \int_\Omega \mathcal{S}(\nabla_{\mathbf{x}} \mathbf{u}) : \nabla_{\mathbf{x}} \mathbf{u} \; dx \; dt - \int_0^r \int_\Omega \mathcal{S}(\nabla_{\mathbf{x}} \mathbf{u}) : \nabla_{\mathbf{x}} \mathbf{u} \; dx \; dt \\
+ \int_0^r \int_{\Gamma^{\text{out}}} \left[ H(R, Z) - R \partial_R H(\mathbf{r}, \mathbf{z}) - Z \partial_Z H(\mathbf{r}, \mathbf{z}) \right] \mathbf{u}_B \cdot \mathbf{n} \; dS, \; dt \\
+ \int_0^r \int_{\Gamma^{\text{in}}} \left[ H(R_B, Z_B) - R_B \partial_R H(\mathbf{r}, \mathbf{z}) - Z_B \partial_Z H(\mathbf{r}, \mathbf{z}) \right] \mathbf{u}_B \cdot \mathbf{n} \; dS \; dt \\
+ \int_{\Omega} 1 \; d \mathcal{E}(t)
\leq - \int_0^r \int_\Omega \left[ (R + Z)(\mathbf{u} \cdot \partial_r \mathbf{u} + \mathbf{u} \cdot \nabla_{\mathbf{x}} \mathbf{u} \cdot \mathbf{u}) + P(R, Z) \text{div}_x \mathbf{u} \right] \; dx \; dt \\
- \int_0^r \int_\Omega \nabla_{\mathbf{x}} \mathbf{u} : d \mathcal{R}(t) \; dt + \int_0^r \int_\Omega \partial_t P(\mathbf{r}, \mathbf{z}) \; dx \; dt \\
+ \int_0^r \int_\Omega \left[ R \partial_t \left( \frac{1}{2} |\mathbf{u}|^2 - \partial_R H(\mathbf{r}, \mathbf{z}) \right) + R \mathbf{u} \cdot \nabla_{\mathbf{x}} \left( \frac{1}{2} |\mathbf{u}|^2 - \partial_R H(\mathbf{r}, \mathbf{z}) \right) \right] \; dx \; dt \\
+ \int_0^r \int_\Omega \left[ Z \partial_t \left( \frac{1}{2} |\mathbf{u}|^2 - \partial_Z H(\mathbf{r}, \mathbf{z}) \right) + Z \mathbf{u} \cdot \nabla_{\mathbf{x}} \left( \frac{1}{2} |\mathbf{u}|^2 - \partial_Z H(\mathbf{r}, \mathbf{z}) \right) \right] \; dx \; dt.
\]

(5.4)

**Step 5:** Now we regroup conveniently the terms in (5.4). To this end we proceed as follows:

1. Since

\[
\partial_t P(\mathbf{r}, \mathbf{z}) = \partial_R P(\mathbf{r}, \mathbf{z}) \partial_t \mathbf{r} + \partial_Z P(\mathbf{r}, \mathbf{z}) \partial_t \mathbf{z} + \text{div}_x(P(\mathbf{r}, \mathbf{z}) \mathbf{u}) \\
+ (\mathbf{r} \partial_R P(\mathbf{r}, \mathbf{z}) + \mathbf{z} \partial_Z P(\mathbf{r}, \mathbf{z})) \text{div}_x \mathbf{u}
\]

we have

\[
\int_\Omega \partial_t P(\mathbf{r}, \mathbf{z}) \; dx = \int_\Omega \partial_R P(\mathbf{r}, \mathbf{z})(\partial_t \mathbf{r} + \text{div}_x(\mathbf{ru})) \; dx \\
+ \int_\Omega \partial_Z P(\mathbf{r}, \mathbf{z})(\partial_t \mathbf{z} + \text{div}_x(\mathbf{zu})) \; dx \\
- \int_{\partial\Omega} P(\mathbf{r}, \mathbf{z}) \mathbf{u} \cdot \mathbf{n} dS = \int_{\Omega}(\mathbf{r} \partial_R P(\mathbf{r}, \mathbf{z}) + \mathbf{z} \partial_Z P(\mathbf{r}, \mathbf{z})) \text{div}_x \mathbf{u} \; dx \\
+ \int_{\Omega} P(\mathbf{r}, \mathbf{z}) \text{div}_x \mathbf{u} \; dx,
\]

where
\[- \int_{\partial \Omega} P(\mathbf{r}, \mathbf{z}) \mathbf{u} \cdot \mathbf{n} dS_x = \int_{\partial \Omega} \left( H(\mathbf{r}, \mathbf{z}) - \mathbf{r} \partial_R H((\mathbf{r}, \mathbf{z}) - \mathbf{z} \partial_Z H(\mathbf{r}, \mathbf{z})) \right) \mathbf{u}_B \cdot \mathbf{n} dS_x. \]

2. We calculate
\[
R \left( \partial_z \partial_r H(\mathbf{r}, \mathbf{z}) + \mathbf{u} \cdot \nabla_x \partial_r H(\mathbf{r}, \mathbf{z}) \right)
= R \partial_r^2 H(\mathbf{r}, \mathbf{z}) \left( \partial_z \mathbf{r} + \text{div}_x(\mathbf{r} \mathbf{u}) \right) - R \partial_r^2 H(\mathbf{r}, \mathbf{z}) \text{div}_x \mathbf{u}
+ R \partial_r^2 H(\mathbf{r}, \mathbf{z}) (\mathbf{u} - \mathbf{u}) \cdot \nabla \mathbf{r} + R \partial_r \partial_z H(\mathbf{r}, \mathbf{z}) \left( \partial_z \mathbf{r} + \text{div}_x(\mathbf{r} \mathbf{u}) \right)
- R \partial_r \partial_z H(\mathbf{r}, \mathbf{z}) \partial_z \mathbf{u} + R \partial_r \partial_z H(\mathbf{r}, \mathbf{z}) (\mathbf{u} - \mathbf{u}) \cdot \nabla \mathbf{z}.
\]

Similar calculation holds for
\[
Z \left( \partial_z \partial_r H(\mathbf{r}, \mathbf{z}) + \mathbf{u} \cdot \nabla_x \partial_Z H(\mathbf{r}, \mathbf{z}) \right).
\]

Consequently,
\[
R \left( \partial_z \partial_r H(\mathbf{r}, \mathbf{z}) + \mathbf{u} \cdot \nabla_x \partial_r H(\mathbf{r}, \mathbf{z}) \right) + Z \left( \partial_z \partial_r H(\mathbf{r}, \mathbf{z}) + \mathbf{u} \cdot \nabla_x \partial_Z H(\mathbf{r}, \mathbf{z}) \right)
= \left( R \partial_r^2 H(\mathbf{r}, \mathbf{z}) + Z \partial_r \partial_z H(\mathbf{r}, \mathbf{z}) \right) \left( \partial_z \mathbf{r} + \text{div}_x(\mathbf{r} \mathbf{u}) \right) + \left( Z \partial_z^2 H(\mathbf{r}, \mathbf{z}) + \text{div}_x(\mathbf{z} \mathbf{u}) \right)
- R \partial_r P(\mathbf{r}, \mathbf{z}) \text{div}_x \mathbf{u} - Z \partial_z P(\mathbf{r}, \mathbf{z}) \text{div}_x \mathbf{u}
+ (R - \mathbf{r}) \partial_r^2 H(\mathbf{r}, \mathbf{z}) (\mathbf{u} - \mathbf{u}) \cdot \nabla \mathbf{r} + (R - \mathbf{r}) \partial_r \partial_z H(\mathbf{r}, \mathbf{z}) (\mathbf{u} - \mathbf{u}) \cdot \nabla \mathbf{z}
+ (Z - \mathbf{r}) \partial_z^2 H(\mathbf{r}, \mathbf{z}) (\mathbf{u} - \mathbf{u}) \cdot \nabla \mathbf{z} + (Z - \mathbf{r}) \partial_r \partial_z H(\mathbf{r}, \mathbf{z}) (\mathbf{u} - \mathbf{u}) \cdot \nabla \mathbf{r}
+ \partial_r P(\mathbf{r}, \mathbf{z}) \nabla \mathbf{r} \cdot (\mathbf{u} - \mathbf{u}) + \partial_z P(\mathbf{r}, \mathbf{z}) \nabla \mathbf{z} \cdot (\mathbf{u} - \mathbf{u}),
\]

where we have used the property (2.18) in several lines.

3. We also have
\[
(R + Z) (\mathbf{u} - \mathbf{u}) \cdot \mathbf{d}_x \mathbf{u} = \frac{R + Z}{\mathbf{r} + \mathbf{z}} \mathbf{d}_x (\mathbf{r} + \mathbf{z}) \mathbf{u} \cdot (\mathbf{u} - \mathbf{u})
- \frac{R + Z}{\mathbf{r} + \mathbf{z}} (\mathbf{u} - \mathbf{u}) \cdot \mathbf{u} \left( \mathbf{d}_x (\mathbf{r} + \mathbf{z}) + \text{div}_x((\mathbf{r} + \mathbf{z}) \mathbf{u}) \right)
+ \frac{R + Z}{\mathbf{r} + \mathbf{z}} (\mathbf{u} - \mathbf{u}) \cdot \mathbf{u} \text{div}_x((\mathbf{r} + \mathbf{z}) \mathbf{u})
\]

and
\[
(R + Z) \mathbf{u} \cdot \nabla_x \mathbf{u} \cdot (\mathbf{u} - \mathbf{u}) = \frac{R + Z}{\mathbf{r} + \mathbf{z}} (\mathbf{r} + \mathbf{z}) \mathbf{u} \cdot \nabla_x \mathbf{u} \cdot (\mathbf{u} - \mathbf{u})
- (R + Z) (\mathbf{u} - \mathbf{u}) \cdot \nabla_x \mathbf{u} \cdot (\mathbf{u} - \mathbf{u});
\]

whence
\[ (R + Z)(u - u) \partial_t u + (R + Z)u \cdot \nabla_x u \cdot (u - u) \]
\[ = \frac{R + Z}{r + \delta} \left( \partial_t ((r + \delta)u) + \text{div}_x((r + \delta)u \otimes u) \right) \cdot (u - u) \]
\[ - (R + Z)(u - u) \cdot \nabla_x u \cdot (u - u) - \frac{R + Z}{r + \delta} (u - u) \cdot u \left( \partial_t (r + \delta) + \text{div}_x((r + \delta)u) \right). \]

This calculations guide us in regrouping the terms in (5.4) in order to obtain (2.22). Theorem 2.6 is thus proved.

### 6 Weak–strong uniqueness: Proof of Theorem 2.7

Our goal is to show that any dissipative solution coincides with the strong solution emanating from the same initial data and boundary conditions. Assuming the strong solution \([r, \delta, u]\)–which solves (1.1)–(1.7) in the classical sense– belongs to the class (2.21), the obvious idea is to use the relative energy inequality (2.22). We may rewrite (2.22) as

\[
\left[ \int_\Omega \mathcal{E}(R, Z, u \mid r, \delta, u) \, dx \right]_{t=0}^{t=\tau} + \int_0^\tau \int_\Omega S(\nabla_x(u - u)) : \nabla_x(u - u) \, dx \, dt \\
+ \int_0^\tau \int_{\Gamma_{out}} [H(R, Z) - \partial_R H(r, \delta)(R - r) - \partial_Z H(r, \delta)(Z - r)] \cdot u_B \cdot n \, dS_x \, dt \\
+ \int_\Omega 1 \, d \mathcal{E}(r) \leq -\int_0^\tau \int_\Omega (R + Z)(u - u) \cdot \nabla_x u \cdot (u - u) \, dx \, dt \\
- \int_0^\tau \int_\Omega \left[ P(r, \delta) - \partial_R P(r, \delta)(R - r) - \partial_Z P(r, \delta)(Z - r) - P(r, \delta) \right] \text{div}_x u \, dx \, dt \\
+ \int_0^\tau \int_\Omega \left( \frac{R + Z}{r + \delta} - 1 \right) (u - u) \cdot \left[ \partial_t ((r + \delta)u) + \text{div}_x((r + \delta)u \otimes u) \right] \, dx \, dt \\
+ \int_0^\tau \int_\Omega (R - r)(u - u) \cdot \left( \nabla r \partial_r^2 H(r, \delta) + \nabla \delta \partial_r \partial_Z H(r, \delta) \right) \, dx \, dt \\
+ \int_0^\tau \int_\Omega (Z - \delta)(u - u) \cdot \left( \nabla \delta \partial_Z^2 H(r, \delta) + \nabla r \partial_r \partial_Z H(r, \delta) \right) \, dx \, dt \\
- \int_0^\tau \int_\Omega \nabla_x u : d \mathcal{R}(t) \, dt, \tag{6.1}
\]

where we have used equation (1.2) for \(r, \delta, u\) in the seventh line of formula (2.22) and the identity
Let
\[ 0 < r < \bar{r} := \inf_I r < \bar{r} := \sup_I r < \infty, \]
\[ 0 < z < \bar{z} := \inf_I z < \bar{z} := \sup_I z < \infty, \]
and denote
\[ K = [r, \bar{r}] \times [z, \bar{z}] \cap \overline{\Omega}, \quad L = (r, \bar{r}) \times (z, \bar{z}) \cap \overline{\Omega}. \]

It follows from the structural hypothesis (2.16) that \( E(R, Z|\mathbf{r}, \mathbf{z}) \) majorates \( R + Z + 1 \) and \( P(R, Z) \) outside \( L \), and \( (R - r)^2 + (Z - z)^2 \) in \( L \) for any \((\mathbf{r}, \mathbf{z}) \in K\) - with a multiplicative constant dependent solely of \( L \) and \( K \). Adding to these ingredients the compatibility condition (2.7) we verify that the absolute value of the r.h.s. of (6.1) is bounded by
\[
c \left( \| r, \mathbf{z}, \mathbf{u} \|_{C^1(I \times \overline{\Omega})}, \delta \right) \left[ \int_0^T \int_{\Omega} E(R, Z, \mathbf{u} \mid \mathbf{r}, \mathbf{z}, \mathbf{u}) \, dx \, dt \right]
+ \int_0^T \left( \int_{\Omega} d \mathfrak{G}(t) \right) dt + \delta \| \mathbf{u} - \mathbf{u} \|_{L^2(I \times \overline{\Omega})}^2
\]
with any \( \delta > 0 \).

The term \( \delta \| \mathbf{u} - \mathbf{u} \|_{L^2(I \times \overline{\Omega})}^2 \) can “absorbed” at the left hand side by the term
\[
\int_0^T \int_{\Omega} \mathfrak{S}(\nabla \chi(\mathbf{u} - \mathbf{u})) : \nabla \chi(\mathbf{u} - \mathbf{u}) \, dx \, dt - \int_0^T \int_{\Omega} (R + Z)(\mathbf{u} - \mathbf{u})^2 \, dx \, dt,
\]
where the latter is true by virtue of the Korn and Sobolev inequalities (cf.\cite[Theorem 10.17]{11}).

Inequality (6.1) therefore becomes
\[
\int_{\Omega} E(R, Z, \mathbf{u} \mid \mathbf{r}, \mathbf{z}, \mathbf{u})(\mathbf{r}, \cdot) \, dx + \int_{\Omega} d \mathfrak{G}(t) \leq c \int_0^T \int_{\Omega} E(R, Z, \mathbf{u} \mid \mathbf{r}, \mathbf{z}, \mathbf{u}) \, dx \, dt
+ \int_0^T \int_{\Omega} d \mathfrak{G}(t) dt.
\]

Thus applying the standard Gronwall argument to (6.2) we obtain the desired conclusion:
\[
r = \mathbf{r}, \quad \mathbf{u} = \mathbf{u}, \quad \mathcal{R} = \mathfrak{G} = 0.
\]
Appendix

We recall here some key lemmas which we have used in the proofs and give more details concerning the meaning of the non-homogeneous boundary data.

The first lemma is proved in [2, Lemma 8.1].

**Lemma 7.1** Let \( Q = (0, T) \times \Omega \), where \( \Omega \subset \mathbb{R}^d \) is a bounded domain. Suppose that

\[
  r_n \to r \text{ weakly in } L^p(Q), \quad v_n \to v \text{ weakly in } L^q(Q), \quad p > 1, q > 1,
\]

and

\[
  r_n v_n \to w \text{ weakly in } L^r(Q), \quad r > 1.
\]

In addition, let

\[
  \partial_t r_n = \text{div}_x g_n + h_n \text{ in } \mathcal{D}'(Q), \quad \|g_n\|_{L^s(Q; \mathbb{R}^d)} \lesssim 1,
\]

\[
  s > 1, \quad h_n \text{ precompact in } W^{-1,z}, \quad z > 1,
\]

and

\[
  \|\nabla_x v_n\|_{L^r(Q; \mathbb{R}^d)} \lesssim 1 \text{ uniformly for } n \to \infty.
\]

Then

\[
  w = rv \text{ a.a. in } Q.
\]

The second lemma in Lemma 2.11 and Corollary 2.2 in Feireisl [12].

**Lemma 7.2** Let \( O \subset \mathbb{R}^d, \quad d \geq 2 \), be a measurable set and \( \{v_n\}_{n=1}^{\infty} \) a sequence of functions in \( L^1(O; \mathbb{R}^M) \) such that

\[
  v_n \to v \text{ in } L^1(O; \mathbb{R}^M).
\]

Let \( \Phi : \mathbb{R}^M \to (-\infty, \infty] \) be a lower semi-continuous convex function such that \( \Phi(v_n) \) is bounded in \( L^1(O) \).

Then \( \Phi(v) : O \mapsto \mathbb{R} \) is integrable and

\[
  \int_O \Phi(v)dx \leq \liminf_{n \to \infty} \int_O \Phi(v_n)dx.
\]

The last lemma we wish to recall deals with the duals of Bochner spaces. Let \( X \) be a Banach space. For \( 1 \leq p < \infty \), we introduce Bochner-type spaces
\[ L^p(I, X) = \{ f : I \to X \text{ measurable}, \|f\|_{L^p(I, X)}^p := \int_I \|f(t)\|^p_X dt < \infty \}, \]
\[ L^p_{\text{weak-*}}(I, X^*) = \{ f : I \to X^* \text{ weakly-* measurable}, \|f\|_{L^p(I, X^*)}^p := \int_I \|f(t)\|^p_{X^*} dt < \infty \}. \]

They are Banach spaces with corresponding norms \( \|f\|_{L^p(I, X)}^p \) resp. \( \|f\|_{L^p(I, X^*)}^p \). It is not true in general that \((L^p(I, X))^* \) can be identified with \( L^{p'}(I, X^*) \), \( 1/p + 1/p' = 1 \). However, the following lemma holds, cf. Pedregal [25]:

**Lemma 7.3** Let \( X \) be a separable Banach space. Then

\[(L^p(I, X))^* = L^{p'}_{\text{weak-*}}(I, X^*)\]
under the duality mapping

\[ < f, g > = \int_I < f(t), g(t) >_{X^*, X} dt. \]

The particular case we are interested in this paper deal with

\[ X = C(\overline{\Omega}), \text{ whence } X^* = \mathcal{M}(\overline{\Omega}), \]

cf. Rudin [26, Theorem 2.14].

**Non-homogeneous boundary data**

Let us explain in details how to understand non-homogeneous Dirichlet boundary conditions. We will follow Lions [21], page 209. We will explain the meaning \( u = u_B \) on \( \partial \Omega \times (0, T) \) and \( r = r_B \) on \( \{(x, t) \in \partial \Omega, u_B \cdot n < 0\} \). We assume that the boundary data \((r_B, u_B)\) satisfy

\[ u_B \in L^2(0, T; W^{1,2}(\Omega)) \cap L^\infty(0, T; L^{\frac{2}{\gamma-2}}(\Omega)) \]
\[ \text{div } u_B \in L^1(0, T; L^\infty(\Omega)), \text{Du}_B \in L^1(0, T; L^\infty(\Omega)) \]

\((\text{Du}_B\) we denote the symmetrical part of the stress tensor)

\[ r_B \in L^l(\partial \Omega \times (0, T); (u_B \cdot n)^-)dS \otimes dt \]
which means \( \int_0^T dt \int_{\partial \Omega} r_B^y(u_B \cdot n)^-dS \otimes dt < \infty \). Since \( u_B \) is trace of \( u \) then \( u - u_B \in L^2(0, T; W^{1,2}_0(\Omega)) \).

With the density the situation is more complicated since there is no trace of \( r \).

*How to understand such case?*

Taking the test function \( \phi \) in the weak formulation of the continuity equation, \( \phi \) smooth in \( (0, T) \times \Omega \), then together with regularity properties:
Existence and stability of dissipative turbulent solutions...

\[ r \in L^\infty(0, T; L'), \sqrt{r}u \in L^\infty(0, T; L^2(\Omega)) \]

and

\[ u \in L^2(0, T; W^{1,2}(\Omega)), \]

\( r(u_B \cdot n) \) makes sense on \( \partial\Omega \times (0, T) \) as an element of the dual space of the space consisting of traces on \( \partial\Omega \times (0, T) \) of the following functional space \( \mathcal{W} \),

\[
\mathcal{W} = \{ \phi; \phi \in C([0, T]; L^{\frac{1}{\gamma-1}}(\Omega)), \frac{\partial \phi}{\partial t} \in L^1(0, T; L^{\frac{1}{\gamma-1}}(\Omega)), \]

\[ \phi \in L^1(0, T; W^{1, \frac{2}{\gamma-1}}(\Omega)) + L^2(0, T; W^{1,r}(\Omega)) \}
\]

where \( 1/r = 5/6 - 1/\gamma; \gamma > 6/5 \). This implies that the boundary condition on \( r \) means

\[ r(u_B \cdot n)^- = r_B(u_B \cdot n)^-. \]
