List of files:

1. SPSS data-file (SPSS file)
2. SPSS syntax-file (SPSS file)
3. SPSS output file (SPSS file)
4. Data analysis memo (Word file)

To replicate the analyses:

- Conduct partial correlations on each variable, controlling for the control variables (age, gender, T1 income, T1 employment, T1 relationship).
- Obtain means and standard deviations for each variable.
- Use the PROCESS macro to run the Model 6 mediation model three times (T1 Family Identification > T2 Covid-related Financial Distress > T2 Anxiety > T2 Suicidal Thoughts/Behaviour; T1 Family Identification > T2 Covid-related Financial Distress > T2 Depression > T2 Suicidal Thoughts/Behaviour; T1 Family Identification > T2 Covid-related Financial Distress > T2 Loneliness > T2 Suicidal Thoughts/Behaviour). Each model should contain the following covariates: age, gender, T1 income, T1 employment, T1 relationship, plus the T1 versions of any T2 variables in the model.
- Use the PROCESS macro to run the Model 81 mediation model once, to test the above three models in a single model.
- PROCESS and guidance on using it can be downloaded from https://www.processmacro.org/index.html
