Approximation of Discrete Functions Using Special Series by Modified Meixner Polynomials

R.M. Gadzhimirzaev

Abstract. This article is devoted to the study of approximative properties of the special series by modified Meixner polynomials $M^n_{\alpha,N}(x)$ ($n = 0, 1, \ldots$). For $\alpha > -1$ these polynomials form an orthogonal system on the grid $\Omega = \{0, \delta, 2\delta, \ldots\}$ with respect to the weight function $w(x) = e^{-x} \Gamma(Nx+\alpha+1) \Gamma(Nx+1)$, where $\delta = \frac{2}{N}$, $N > 0$. We obtained upper estimate on $\varepsilon^{\frac{1}{2} - \alpha}$ for the Lebesgue function of partial sums of a special series, where $\theta_n = 4n + 2\alpha + 2$.

Keywords: Meixner polynomials, Fourier series, special series, Lebesgue function.

1. Introduction

Suppose $\Omega = \{0, \delta, 2\delta, \ldots\}$, where $\delta = \frac{2}{N}$, $N > 0$. We denote by $M^n_{\alpha,N}(x) = M^n_{\alpha}(Nx, e^{-\delta})$ ($n = 0, 1, \ldots$) the modified Meixner polynomials that form for $\alpha > -1$ an orthogonal system on the grid $\Omega$ with respect to the weight function $w(x) = e^{-x} \Gamma(Nx+\alpha+1) \Gamma(Nx+1)$, i.e.

$$\sum_{x \in \Omega} M^n_{\alpha,N}(x) M^k_{\alpha,N}(x) w(x) = (1 - e^{-\delta})^{-\alpha-1} h^n_{\alpha,N} \delta_{nk}, \quad \alpha > -1,$$

where $\delta_{nk}$ is the Kronecker symbol and $h^n_{\alpha,N} = \binom{n+\alpha}{n} e^{n\delta} \Gamma(\alpha+1)$. The corresponding orthonormal polynomials with the weight function $\rho(x) = (1 - e^{-\delta})^{\alpha+1} w(x)$ we denote by $m^n_{\alpha,N}(x) = (h^n_{\alpha,N})^{-1/2} M^n_{\alpha,N}(x)$ ($n = 0, 1, \ldots$). In this paper, we continue the study of the approximative properties of partial sums of special series by the modified Meixner polynomials $m^n_{\alpha,N}(x)$. The special series by the system...
of polynomials $m_{n,N}^\alpha(x)$ is a natural (and alternative to Fourier–Meixner series) apparatus for simultaneous approximation of functions and their finite differences. Moreover, partial sums of special series interpolate the original function at the points $0, \delta, \ldots, (r - 1)\delta$. Note that partial sums of Fourier–Meixner series do not have this property. However, the approximative properties of partial sums of the special series are not sufficiently studied. In particular, the problem of estimating on the interval $[\frac{\delta}{2}, \infty)$ the Lebesgue function $l_{n,N}^\alpha(x)$ of partial sums of a special series was not studied. For the estimate of the function $l_{n,N}^{\alpha,r}(x)$, the Christoffel–Darboux formula (1) and weighted estimates (3), (5) play an important role. These estimates hold for any $x \in [0, \infty)$ and depend on the location of the variable $x$ on the semi-axis. Therefore, to estimate the Lebesgue function $l_{n,N}^{\alpha,r}(x)$ on $[r\delta, \infty)$, it is necessary to split the semi-axis into sets $G_1 = [r\delta, \frac{3\delta}{n}]$, $G_2 = [\frac{3\delta}{n}, \frac{\delta}{2}]$, $G_3 = [\frac{\delta}{2}, \frac{3\delta}{n}]$ and $G_4 = [\frac{3\delta}{n}, \infty)$, where $\theta_n = 4n + 2\alpha + 2$. For $x \in G_1 \cup G_2$ the function $l_{n,N}^{\alpha,r}(x)$ was estimated in [1]. The main result of this paper is Theorem 1. In this theorem, we obtained upper estimates for the function $l_{n,N}^{\alpha,r}(x)$ on the sets $G_3$ and $G_4$.

2. Some properties of the modified Meixner polynomials

To study the approximative properties of partial sums of a special series, we need some properties of the polynomials $M_{n,N}^\alpha(x)$. Let $N > 0$, $\delta = \frac{1}{N}$, $\Omega_3 = \{0, n, 2\delta, \ldots\}$, and let $\alpha$ be an arbitrary real number. Then for the polynomials $M_{n,N}^\alpha(x)$ we have [2]:

- the Rodrigues formula
  \[ M_{n,N}^\alpha(x) = \frac{\Gamma(Nx + 1)e^{\delta t + x}}{n!\Gamma(Nx + n + 1)} \Delta_1^N \left\{ \frac{\Gamma(Nx + \alpha + 1)}{\Gamma(Nx + n + 1)} e^{-x} \right\}, \]
  where $\Delta_1^N f(x) = f(x)$, $\Delta_2^N f(x) = f(x + \delta) - f(x)$, $\Delta_3^N f(x) = \Delta_2^N (\Delta_1^N f(x))$;
- the orthogonality relation
  \[ \sum_{x \in \Omega_3} M_{n,N}^\alpha(x)M_{k,N}^\alpha(x)\delta_{nk} = h_{n,N}^\alpha \delta_{nk}, \alpha > -1; \]
- the Christoffel–Darboux formula

$$\begin{align*}
(1) \quad K_{n,N}^\alpha(t, x) &= \sum_{k=0}^{n} m_{k,N}^\alpha(t) m_{n,N}^\alpha(x) = \\
&= \frac{\delta\sqrt{(n + 1)(n + \alpha + 1)}}{e^{\alpha t} - e^{-\alpha t}} \left( m_{n+1,N}^\alpha(t) m_{n,N}^\alpha(x) - m_{n,N}^\alpha(t) m_{n+1,N}^\alpha(x) \right),
\end{align*}$$

which can be written [3, 4] as follows:

$$\begin{align*}
(2) \quad K_{n,N}^\alpha(t, x) &= \frac{\alpha_n}{(\alpha_n + \alpha_{n-1})} m_{n,N}^\alpha(t) m_{n,N}^\alpha(x) + \frac{\alpha_n \alpha_{n-1}}{(\alpha_n + \alpha_{n-1})} \frac{\delta}{(e^{\alpha t} - e^{-\alpha t})} \left( x - t \right) \\
&= \frac{\alpha_n}{(\alpha_n + \alpha_{n-1})} m_{n,N}^\alpha(t) m_{n,N}^\alpha(x),
\end{align*}$$

where $m_{n,N}^\alpha(x)$ the function

$$\begin{align*}
(3) \quad m_{n,N}^\alpha(x) &= m_{n+1,N}^\alpha(t) m_{n,N}^\alpha(x) - m_{n,N}^\alpha(t) m_{n+1,N}^\alpha(x).
\end{align*}$$

For $0 < \delta \leq 1$, $N = \frac{1}{\lambda}$, $\lambda > 0$, $1 \leq n \leq AN$, $\alpha > -1$, $0 \leq x < \infty$, $s \geq 0$, $\theta_n = 4n + 2\alpha + 2$ the following weighted estimates hold [2, 5]:

$$\begin{align*}
(3) \quad e^{-\frac{\alpha}{2}} \left| m_{n,N}^\alpha(x \pm s\delta) \right| &\leq c(\alpha, \lambda, s)\theta_n^{-\frac{3}{2}} A_{n,N}^\alpha(x),
\end{align*}$$
we can define a discrete analog of the Taylor polynomial of the following form
\begin{equation}
A_n^\alpha(x) = \begin{cases}
\theta_n^\alpha, & 0 \leq x \leq \frac{1}{\theta_n}, \\
\frac{\theta_n^\alpha}{2} x - \frac{\theta_n^\alpha}{4}, & \frac{1}{\theta_n} < x \leq \frac{\theta_n}{2}, \\
\left[\theta_n (\theta_n^\alpha + |x - \theta_n|)\right]^{-\frac{1}{2}}, & \frac{\theta_n}{2} < x \leq \frac{3\theta_n}{4}, \\
e^{-\frac{\theta_n}{4}}, & \frac{3\theta_n}{4} < x < \infty,
\end{cases}
\end{equation}
\begin{equation}
e^{-\frac{2}{\theta_n}} \left| m_{n+1,N}^\alpha(x \pm s\delta) - m_{n-1,N}^\alpha(x \pm s\delta) \right| \leq
\begin{cases}
\theta_n^\alpha - 1, & 0 \leq x \leq \frac{1}{\theta_n}, \\
\frac{\theta_n^\alpha}{2} x^2 - \frac{\theta_n^\alpha}{4}, & \frac{1}{\theta_n} < x \leq \frac{\theta_n}{2}, \\
\left[\theta_n (\theta_n^\alpha + |x - \theta_n|)\right]^{\frac{1}{2}}, & \frac{\theta_n}{2} < x \leq \frac{3\theta_n}{4}, \\
e^{-\frac{2}{\theta_n}}, & \frac{3\theta_n}{4} < x < \infty,
\end{cases}
\end{equation}

Hereinafter, \(c, c(\alpha), c(\alpha, \lambda, s)\) are positive numbers which can be different in different places of the text.

3. Lebesgue’s inequality for the partial sums of special series by modified Meixner polynomials

We denote by \(l_{r,s}^2(\Omega_\delta)\) the space of functions \(f\) defined on the grid \(\Omega_\delta\) and such that \(\sum_{x \in \Omega_\delta} f^2(x) \rho_N(x) < \infty\). For \(f \in l_{r,s}^2(\Omega_\delta)\) and \(x \in \Omega_{r,s} = \{r\delta, (r+1)\delta, \ldots\}\), we can define a discrete analog of the Taylor polynomial of the following form
\[P_{r-1,N}(x) = \sum_{\nu=0}^{r-1} \frac{\Delta^\nu f(0)}{\nu!} (N x)^\nu.\]
It is easy to show that the function \(f_r(x) = \frac{f(x) - P_{r-1,N}(x)}{N^{-r}(N x)^r}\) belongs to the space \(l_{r,s}^2(\Omega_{r,s})\), where \(\rho_{N,r}(x) = \rho_N(x - r\delta)\). Since the modified Meixner polynomials \(m_{k,N,r}^\alpha(x) = m_{k,N}^\alpha(x - r\delta)\) \((k = 0, 1, \ldots)\) for \(\alpha > -1\) form an orthonormal basis in \(l_{r,s}^2(\Omega_{r,s})\), then we can define the Fourier–Meixner coefficients of \(f_r\)
\[\hat{f}_{r,k} = \sum_{x \in \Omega_{r,s}} f_r(t) \rho_{N,r}(t) m_{k,N,r}^\alpha(t) = \sum_{x \in \Omega_{r,s}} f(t) - P_{r-1,N}(t) \frac{N^{-r}(N t)^r}{N^{-r}(N x)^r} \rho_{N,r}(t) m_{k,N,r}^\alpha(t),\]
and the Fourier–Meixner series of \(f_r\)
\begin{equation}
f_r(x) = \sum_{k=0}^{\infty} \hat{f}_{r,k} m_{k,N,r}^\alpha(x).
\end{equation}
Series (6) converges to \(f_r\) uniformly with respect to \(x \in \Omega_{r,s}\). This follows from the basis property of the system of polynomials \(m_{k,N,r}^\alpha(x)\) \((k = 0, 1, \ldots)\) in the space \(l_{r,s}^2(\Omega_{r,s})\). Then
\begin{equation}
f(x) = P_{r-1,N}(x) + N^{-r}(N x)^r \sum_{k=0}^{\infty} \hat{f}_{r,k} m_{k,N,r}^\alpha(x), \quad x \in \Omega_\delta.
\end{equation}
Following [1, 6], we will call (7) the special series by the modified Meixner polynomials. Denote by \(S_n^{\alpha,N}(f, x)\) the partial sum of the special series (7) of the form
\[S_n^{\alpha,N}(f, x) = P_{r-1,N}(x) + N^{-r}(N x)^r \sum_{k=0}^{n} \hat{f}_{r,k} m_{k,N,r}^\alpha(x).
\]
We note that if \(f(x) = p_{n+r}(x)\) is an algebraic polynomial of degree \(n+r\), then \(\hat{f}_{r,k} = 0\) for \(k \geq n+1\). Therefore from (7) follows that \(S_n^{\alpha,N}(p_{n+r}, x) = p_{n+r}(x)\).
Further, denote by \( q_{n+r}(x) \) an algebraic polynomial of degree \( n + r \) such that
\[
\Delta^i f(0) = \Delta^i q_{n+r}(0) \quad (i = 0, r - 1).
\]

Then for \( x \in \Omega_{r, \delta} \) we have
\[
e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} |f(x) - S_{n+r,N}^0(f, x)| \leq e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} |f(x) - q_{n+r}(x)| +
\]

(8)
\[
e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} |S_{n+r,N}^0(q_{n+r} - f, x)|.
\]

Since \( P_{r-1,N}(q_{n+r} - f, x) = 0 \),
\[
e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} |S_{n+r,N}^0(q_{n+r} - f, x)| =
\]
\[
e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} N^{-r}(Nx)^{|r|} \left[ \sum_{k=0}^{n} (q_{n+r} - f)^{\alpha} m_{k,N}^0(x - r\delta) \right] \leq
\]
\[
e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} (Nx)^{|r|} \sum_{t \in \Omega_{r, \delta}} \frac{|q_{n+r}(t) - f(t)|}{(NT)^{|r|}} \rho_{N,t}(t) \left[ \sum_{k=0}^{n} m_{k,N}^0(t - r\delta) m_{k,N}^0(x - r\delta) \right] =
\]

(9)
\[
e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} (Nx)^{|r|} \sum_{t \in \Omega_{r, \delta}} |q_{n+r}(t) - f(t)| \rho_{N,t}(t) \left[ K_{N,N}^0(t - r\delta, x - r\delta) \right].
\]

Put
\[
E_k^r(f, \delta) = \inf_{q_k} \sup_{x \in \Omega_{r, \delta}} e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} |f(x) - q_k(x)|,
\]

where the infimum is taken over all algebraic polynomials \( q_k(x) \) of degree \( k \) for which \( \Delta^i f(0) = \Delta^i q_k(0) \quad (i = 0, r - 1) \). Then from (8) – (10) we have
\[
e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} |f(x) - S_{n+r,N}^0(f, x)| \leq E_k^r(f, \delta)(1 + l_{n,N}^{\alpha, r}(x)),
\]

where
\[
l_{n,N}^{\alpha, r}(x) = e^{-\frac{x}{2}} x^{-\frac{r}{2} + \frac{1}{4}} (Nx)^{|r|} (1 - e^{-\delta})^{\alpha + 1} \times
\]
\[
\sum_{t \in \Omega_{r, \delta}} e^{-\frac{x}{2} + r\delta - \frac{1}{2} + \frac{\alpha}{2} + \frac{\alpha}{2}} \frac{(NT)^{|r|} \Gamma(Nt - r + 1)}{\Gamma(Nt - r + 1)} |K_{n,N}^0(t - r\delta, x - r\delta)|.
\]

Inequality (11) leads to the problem of estimating on \( |r\delta, \infty) \) the Lebesgue function \( l_{n,N}^{\alpha, r}(x) \) defined in (12). For \( x \in G_1 \cup G_2 \) this problem was solved in [1]. In this paper, we will estimate the function \( l_{n,N}^{\alpha, r}(x) \) on the sets \( G_3 \) and \( G_4 \).

**Theorem 1.** Suppose that \( r \in \mathbb{N}, r - \frac{1}{2} < \alpha < r + \frac{1}{2}, \theta_n = 4n + 2\alpha + 2, \lambda > 0, 0 < \delta \leq 1, 1 \leq n \leq \lambda N \). Then the following estimates hold:

1) if \( x \in G_3 \), then
\[
l_{n,N}^{\alpha, r}(x) \leq c(\alpha, \lambda, r) \left[ \ln(n + 1) + \left( \frac{\theta_n}{\theta_n + |x - \theta_n|} \right)^{\frac{1}{2}} \right];
\]

2) if \( x \in G_4 \), then
\[
l_{n,N}^{\alpha, r}(x) \leq c(\alpha, \lambda, r)n^{-\frac{r}{2} + \frac{\alpha}{2}} x^{-\frac{r}{2} + \frac{1}{4}} e^{-\frac{x}{2}}.
\]
Proof. Assume that $x \in G_3$. We introduce the notations: $D_1 = [r\delta, x - \sqrt{r}/\theta_n] \cap \Omega_{r,\delta}$, $D_2 = [x - \sqrt{r}/\theta_n, x + \sqrt{r}/\theta_n] \cap \Omega_{r,\delta}$, $D_3 = [x + \sqrt{r}/\theta_n, \infty) \cap \Omega_{r,\delta}$. Using these notations, we can write

$$t_{\alpha, N}(x) = H_1 + H_2 + H_3,$$

where

$$H_i = e^{-\frac{x}{2}x^{-\frac{\alpha}{2}}(N|x|)^{\frac{\alpha}{2}}(1 - e^{-\delta})^{\alpha+1}} \times$$

$$\sum_{i \in D_i} e^{\frac{x}{2}r^\frac{\alpha}{2}t^{-\frac{\alpha}{2}}(\Gamma(Nt - r + 1)) |K_{n,N}^t(t - r\delta, x - r\delta)|, \quad i = 1, 2, 3.}

First, we estimate $H_2$. Note that the Cauchy–Schwartz inequality yields

$$|K_{n,N}^t(t - r\delta, x - r\delta)| \leq |K_{n,N}^t(t - r\delta, t - r\delta)|^{1/2} |K_{n,N}^t(x - r\delta, x - r\delta)|^{1/2}.$$

If $x \in G_3$, then for $t \in D_2$ we have $c_1 x \leq t \leq c_2 x$. Therefore, from (16) and (17) we obtain the inequality

$$H_2 \leq \alpha, r| x^{\frac{\alpha}{2}r^\frac{\alpha}{2}t^{-\frac{\alpha}{2}}(\Gamma(Nt - r + 1)) |K_{n,N}^t(t - r\delta, x - r\delta)|^{1/2} \delta \times$$

$$\sum_{i \in D_2} t^{\alpha - \frac{\alpha}{2}}t^{-\frac{\alpha}{2}}|e^{-t}K_{n,N}^t(t - r\delta, t - r\delta)|^{1/2}. \delta \times$$

For the value $|e^{-t}K_{n,N}^t(t - r\delta, t - r\delta)|$ in [1] the following estimate was obtained:

$$|e^{-t}K_{n,N}^t(t - r\delta, t - r\delta)| \leq c(\alpha, \lambda, r)t^{-\frac{\alpha}{2}n^{\frac{1}{2}}},$$

where $\alpha > -1, \theta_n = 4n + 2\alpha + 2, t \geq 3/\theta_n, \lambda > 0, 1 \leq n \leq \lambda N$. From this estimate it follows that

$$H_2 \leq \alpha, r| x^{\frac{\alpha}{2}r^\frac{\alpha}{2}t^{-\frac{\alpha}{2}}(\Gamma(Nt - r + 1)) |K_{n,N}^t(t - r\delta, x - r\delta)|^{1/2} \delta \times$$

$$\sum_{i \in D_2} t^{\alpha - \frac{\alpha}{2}}t^{-\frac{\alpha}{2}}|e^{-t}K_{n,N}^t(t - r\delta, t - r\delta)|^{1/2}. \delta \leq c(\alpha, \lambda, r).$$

We proceed to estimating $H_3$. To this end, we use equality (2) and write

$$H_3 \leq c(\alpha, r)(H_{31} + H_{32} + H_{33}),$$

where

$$H_{31} = e^{-\frac{x}{2}x^{\frac{\alpha}{2}r^\frac{\alpha}{2}t^{-\frac{\alpha}{2}}(\Gamma(Nt - r + 1)) |m_{n,N}^{\alpha}(x - r\delta) - m_{n-1,N}^{\alpha}(x - r\delta)| \delta \times$$

$$\sum_{i \in D_3} e^{\frac{x}{2}t^{\alpha - \frac{\alpha}{2}}t^{-\frac{\alpha}{2}}|m_{n,N}^{\alpha}(t - r\delta)|,}$$

$$H_{32} = ne^{-\frac{x}{2}x^{\frac{\alpha}{2}r^\frac{\alpha}{2}t^{-\frac{\alpha}{2}}(\Gamma(Nt - r + 1)) |m_{n+1,N}^{\alpha}(x - r\delta) - m_{n-1,N}^{\alpha}(x - r\delta)| \delta \times$$

$$\sum_{i \in D_3} e^{\frac{x}{2}t^{\alpha - \frac{\alpha}{2}}t^{-\frac{\alpha}{2}}|m_{n,N}^{\alpha}(t - r\delta)|,}$$

$$H_{33} = ne^{-\frac{x}{2}x^{\frac{\alpha}{2}r^\frac{\alpha}{2}t^{-\frac{\alpha}{2}}(\Gamma(Nt - r + 1)) |m_{n,N}^{\alpha}(x - r\delta)| \delta \times$$

$$\sum_{i \in D_3} e^{\frac{x}{2}t^{\alpha - \frac{\alpha}{2}}t^{-\frac{\alpha}{2}}|m_{n,N}^{\alpha}(t - r\delta)|,}.$$
To estimate $H_{31}$, we represent it as

$$H_{31} = H_{31}^1 + H_{31}^2,$$

where

$$H_{31}^1 = e^{-\frac{2}{5}x^2 + \frac{4}{5}t^2} |m_{i,n}^\alpha(x - r\delta)| \delta \sum_{t \in D_3^1} e^{-\frac{2}{5}t^2 x^2 + \frac{4}{5}t^2} |m_{i,n}^\alpha(t - r\delta)|, \quad i = 1, 2,$$

$$D_3^1 = [x + \sqrt{x/\theta_n}, 3\theta_n/2 + \sqrt{x/\theta_n}] \cap \Omega_{r,\delta}, \quad D_3^2 = [3\theta_n/2 + \sqrt{x/\theta_n}, \infty) \cap \Omega_{r,\delta}.$$ From inequalities (3) and (4) we obtain

$$H_{31}^1 \leq c(\alpha, \lambda, r) \frac{\theta_n^{-\frac{1}{2}}}{(\theta_n^\frac{1}{2} + |x - \theta_n|)^{\frac{5}{4}}} \delta \sum_{t \in D_3^1} \frac{t^{\alpha - \frac{2}{5}} e^{-\frac{2}{5}t x^2 + \frac{4}{5}t^2}}{(\theta_n^\frac{1}{2} + |t - \theta_n|)^{\frac{5}{4}}} \leq c(\alpha, \lambda, r) \frac{\theta_n^{-\frac{1}{2}}}{(\theta_n^\frac{1}{2} + |x - \theta_n|)^{\frac{5}{4}}},$$

$$H_{31}^2 \leq c(\alpha, \lambda, r) \frac{\theta_n^{-\frac{1}{2}}}{(\theta_n^\frac{1}{2} + |x - \theta_n|)^{\frac{5}{4}}} \delta \sum_{t \in D_3^2} t^{\alpha - \frac{2}{5}} e^{-\frac{2}{5}t x^2 + \frac{4}{5}t^2} \leq c(\alpha, \lambda, r) \int_{\frac{3\theta_n}{2}}^{\frac{3\theta_n}{2}} \frac{\theta_n^{\frac{1}{2}} - |x - \theta_n|}{(\theta_n^\frac{1}{2} + t - \theta_n)^{\frac{5}{4}}} \leq c(\alpha, \lambda, r) \int_{\frac{3\theta_n}{2}}^{\frac{3\theta_n}{2}} \frac{t^{\alpha - \frac{2}{5}} e^{-\frac{2}{5}t x^2 + \frac{4}{5}t^2}}{(\theta_n^\frac{1}{2} + t - \theta_n)^{\frac{5}{4}}} dt = c(\alpha, \lambda, r) \int_{\frac{3\theta_n}{2}}^{\frac{3\theta_n}{2}} \frac{t^{\alpha - \frac{2}{5}} e^{-\frac{2}{5}t x^2 + \frac{4}{5}t^2}}{(\theta_n^\frac{1}{2} + t - \theta_n)^{\frac{5}{4}}} dt.$$

From (21)–(23) we derive the following estimate

$$H_{31} \leq c(\alpha, \lambda, r) \left( \frac{\theta_n}{\theta_n^\frac{1}{2} + |x - \theta_n|} \right)^{\frac{5}{4}}.$$ Now we estimate $H_{32}$. To this end, we write it in the form

$$H_{32} = H_{32}^1 + H_{32}^2,$$
where

\[ H_{32}^{i} = ne^{-\frac{x}{2}}x^{\frac{1}{2}} \left| m_{n+1,N}^{i}(x - r\delta) - m_{n-1,N}^{i}(x - r\delta) \right| \delta \times \sum_{t \in D_{3}^{i}} e^{-\frac{\lambda}{t - x}} \left| m_{n,N}^{i}(t - r\delta) \right|, \quad i = 1, 2. \]

Using the inequalities (3)–(5) we can write

\[ H_{32}^{1} \leq c(\alpha, \lambda, r)n x^{\frac{1}{2}} x^{-\frac{i}{2}} \theta_{n}^{-\frac{i}{2}} \left[ \theta_{n}^{\frac{1}{2}} + |x - \theta_{n}| \right]^{-\frac{1}{2}} \delta \times \sum_{t \in D_{3}^{1}} \frac{t^{\frac{i}{2}} - \frac{\lambda}{t - x}}{t - x} \leq c(\alpha, \lambda, r) \delta \sum_{t \in D_{3}^{1}} \frac{(\theta_{n}^{\frac{1}{2}} + |x - \theta_{n}|)^{\frac{1}{2}}}{(\theta_{n}^{\frac{1}{2}} + |t - \theta_{n}|) t^{\frac{1}{2}}(t - x)}. \]

Further, we consider two cases: 1) \( \theta_{n}/2 \leq x \leq \theta_{n} - 2\theta_{n}^{\frac{1}{2}} \); 2) \( \theta_{n} - 2\theta_{n}^{\frac{1}{2}} \leq x \leq 3\theta_{n}/2 \). In the second case we have

\[ \frac{\theta_{n}^{\frac{1}{2}} + |x - \theta_{n}|}{\theta_{n}^{\frac{1}{2}} + |t - \theta_{n}|} \leq 3, \]

then

\[ (26) \quad H_{32}^{1} \leq c(\alpha, \lambda, r) \delta \sum_{t \in D_{3}^{1}} \frac{1}{t - x} \leq c(\alpha, \lambda, r) \delta \frac{3\theta_{n}/2 + \sqrt{x/\theta_{n} - x}}{\sqrt{x/\theta_{n}}} \leq c(\alpha, \lambda, r) \ln(n + 1). \]

If \( \theta_{n}/2 \leq x \leq \theta_{n} - 2\theta_{n}^{\frac{1}{2}} \), we can write

\[ (27) \quad H_{32}^{1} \leq c(\alpha, \lambda, r)(I_{1} + I_{2} + I_{3}), \]

where

\[ I_{k} = \delta \sum_{t \in D_{3k}^{1}} \frac{(\theta_{n}^{\frac{1}{2}} + |x - \theta_{n}|)^{\frac{1}{2}}}{(\theta_{n}^{\frac{1}{2}} + |t - \theta_{n}|)^{\frac{1}{2}}(t - x)}, \quad k = 1, 2, 3, \]

\[ D_{31}^{1} = [x + \sqrt{x/\theta_{n}}, \theta_{n} - \theta_{n}^{\frac{1}{2}} + \sqrt{x/\theta_{n}}] \cap D_{3}^{1}, \quad D_{32}^{1} = [\theta_{n} - \theta_{n}^{\frac{1}{2}} + \sqrt{x/\theta_{n}}, \theta_{n} + \theta_{n}^{\frac{1}{2}} + \sqrt{x/\theta_{n}}] \cap D_{3}^{1}, \]

\[ D_{33}^{1} = [\theta_{n} + \theta_{n}^{\frac{1}{2}} + \sqrt{x/\theta_{n}}, 3\theta_{n}/2 + \sqrt{x/\theta_{n}}] \cap D_{3}^{1}. \]
Since $2\theta_n^{1/4} \leq \theta_n - x$, we have

$$I_1 \leq \delta \sum_{t \in D_{13}} \frac{\left[\frac{3}{2}(\theta_n - x)\right]^{1/4}}{(\theta_n + |t - \theta_n|)^{1/2}(t - x)} \leq \delta \sum_{t \in D_{13}} \frac{\left[\frac{3}{2}(\theta_n - x)\right]^{1/4}}{\theta_n - t + |t - \theta_n|^{1/2}(t - x)} \leq$$

$$\leq \frac{\theta_n^{1/4}}{(\theta_n - x - \sqrt{x/\theta_n})^{1/2}\sqrt{x/\theta_n}} + \int_{x + \sqrt{x/\theta_n}}^{\theta_n - x - \sqrt{x/\theta_n}} \frac{1}{\theta_n - x} dt \leq \int_{\frac{x^2}{\theta_n - x}}^{\frac{1}{\theta_n - x}} \frac{dy}{(1 - y)^{1/4}} \leq c(\alpha) \ln(n + 1),$$

$$I_2 \leq \delta \sum_{t \in D_{13}} \frac{\left[\frac{3}{2}(\theta_n - x)\right]^{1/4}}{(\theta_n + |t - \theta_n|)^{1/2}(t - x)} \leq \left[\frac{3}{2}(\theta_n - x)\right]^{1/4} \sum_{t \in D_{13}} \frac{1}{\theta_n - t} \leq$$

$$c(\alpha) \left[\frac{3}{2}(\theta_n - x)\right]^{1/4} \theta_n^{1/4} \frac{\ln \theta_n + \frac{2\theta_n^{1/4}}{|\theta_n|^{1/4}}} {\theta_n - \theta_n^{1/4} + \sqrt{x/\theta_n} - x} \leq$$

$$c(\alpha) \left[\frac{3}{2}(\theta_n - x)\right]^{1/4} \theta_n^{1/4} \frac{2\theta_n^{1/4}} {\theta_n - \theta_n^{1/4} + \sqrt{x/\theta_n} - x} \leq$$

$$c(\alpha)(\theta_n - x)^{1/4} \frac{2\theta_n^{1/4}} {\theta_n - x - \theta_n^{1/4}} \leq c(\alpha)(\theta_n - x)^{1/4} \frac{2\theta_n^{1/4}} {\theta_n - x - \theta_n^{1/4}} \leq$$

$$c(\alpha) \left(\frac{4\theta_n}{(\theta_n - x)^3}\right)^{1/4} \leq c(\alpha) \left(\frac{4\theta_n}{(2\theta_n^{1/4})^4}\right)^{1/4} \leq c(\alpha),$$

$$I_3 \leq \delta \sum_{t \in D_{13}} \frac{\left[\frac{3}{2}(\theta_n - x)\right]^{1/4}}{(\theta_n + |t - \theta_n|)^{1/2}(t - x)} \leq \sum_{t \in D_{13}} \frac{\delta(t - x)^{1/4}}{(t - \theta_n)^{1/4}(t - x)} \leq$$

$$c \sum_{t \in D_{13}} \frac{\delta(t - x)^{1/4}}{(t - \theta_n)^{1/4}(t - x)} \leq c \sum_{t \in D_{13}} \frac{\delta} {t - \theta_n} \leq c(\alpha) \ln(n + 1).$$

From inequalities (26), (27) and the estimates for $I_k$, $k = 1, 2, 3$ it follows that

$$H_{13}^1 \leq c(\alpha, \lambda, r) \ln(n + 1).$$

(28)
To estimate $H_{32}^2$, we use inequalities (3) and (5):

$$H_{32}^2 \leq c(\alpha, \lambda, r)n x^\frac{\alpha}{2} + t^\frac{\alpha}{2} \theta_n^{-\frac{\alpha}{4}} (\theta_n^\frac{1}{4} + |x - \theta_n|)^{\frac{\alpha}{4}} \delta \times$$

$$\sum_{t \in D_3} \frac{\theta_n^{-\frac{\alpha}{4}} e^{-\frac{t}{2}}}{t - x} \leq c(\alpha, \lambda, r) \theta_n^{-\alpha} (\theta_n^\frac{1}{4} + |x - \theta_n|)^{\frac{\alpha}{2}} \delta \sum_{t \in D_3} \frac{t^\alpha e^{-\frac{t}{2}}}{t - x} \leq$$

$$c(\alpha, \lambda, r) \theta_n^{-\alpha} (\theta_n^\frac{1}{4} + |x - \theta_n|)^{\frac{\alpha}{2}} \int_{\frac{2r}{\alpha} + \sqrt{\frac{t}{2}}}^\infty t^\alpha e^{-\frac{t}{2}} dt \leq c(\alpha, \lambda, r).$$

From (25), (28) and (29) we obtain

$$H_{32} \leq c(\alpha, \lambda, r) \ln(n + 1).$$

Similarly, we get the estimate for $H_{33}$:

$$H_{33} = H_{33}^1 + H_{33}^2,$$

where

$$H_{33}^1 = n e^{-\frac{\alpha}{4} x^\frac{\alpha}{4} + t^\frac{\alpha}{4} \theta_n^{-\frac{\alpha}{2}} (\theta_n^\frac{1}{4} + |x - \theta_n|)^{\frac{\alpha}{2}} \delta \times$$

$$\sum_{t \in D_3} \frac{e^{-\frac{t}{2}}}{t - x} \left| m_{n,N}^\alpha(x - r\delta) - m_{n+1,N}^\alpha(t - r\delta) - m_{n-1,N}^\alpha(t - r\delta) \right|, \quad i = 1, 2.$$

From (3)–(5) we have

$$H_{33}^1 \leq c(\alpha, \lambda, r)n x^\frac{\alpha}{2} + t^\frac{\alpha}{2} \theta_n^{-\frac{\alpha}{4}} (\theta_n^\frac{1}{4} + |x - \theta_n|)^{\frac{\alpha}{4}} \delta \times$$

$$\sum_{t \in D_3} \frac{e^{-\frac{t}{2}}}{t - x} t^\frac{\alpha}{4} \theta_n^{-\frac{\alpha}{4}} (\theta_n^\frac{1}{4} + |t - \theta_n|)^{\frac{\alpha}{2}} \leq$$

$$c(\alpha, \lambda, r) \delta \sum_{t \in D_3} \frac{(\theta_n^\frac{1}{4} + |t - \theta_n|)^{\frac{\alpha}{2}}}{(t - x)(\theta_n^\frac{1}{4} + |x - \theta_n|)^{\frac{\alpha}{2}}} \leq c(\alpha, \lambda, r) \ln(n + 1),$$

$$H_{33}^2 \leq c(\alpha, \lambda, r)n x^\frac{\alpha}{2} + t^\frac{\alpha}{2} \theta_n^{-\frac{\alpha}{4}} (\theta_n^\frac{1}{4} + |x - \theta_n|)^{\frac{\alpha}{4}} \delta \sum_{t \in D_3} \frac{t^\alpha e^{-\frac{t}{2}}}{t - x} \leq$$

$$c(\alpha, \lambda, r) \theta_n^{-\alpha} (\theta_n^\frac{1}{4} + |x - \theta_n|)^{\frac{\alpha}{2}} \int_{\frac{2r}{\alpha} + \sqrt{\frac{t}{2}}}^\infty t^\alpha e^{-\frac{t}{2}} dt \leq c(\alpha, \lambda, r) \left( \frac{\theta_n}{\theta_n^\frac{1}{4} + |x - \theta_n|} \right)^\frac{\alpha}{4}.$$

From (31)–(33) it follows that

$$H_{33} \leq c(\alpha, \lambda, r) \ln(n + 1) + \left( \frac{\theta_n}{\theta_n^\frac{1}{4} + |x - \theta_n|} \right)^\frac{\alpha}{4}.$$
Comparing (24), (30) and (34) with (20) we have

\[
H_3 \leq c(\alpha, \lambda, r) \left[ \ln(n+1) + \left( \frac{\theta_n}{\sqrt{\theta_n^2 + |x - \theta_n|}} \right)^{\frac{1}{\gamma}} \right].
\]

Using the same scheme as for \( H_3 \), we can obtain the following estimate

\[
H_1 \leq c(\alpha, \lambda, r) \left[ \ln(n+1) + \left( \frac{\theta_n}{\sqrt{\theta_n^2 + |x - \theta_n|}} \right)^{\frac{1}{\gamma}} \right].
\]

From estimates (19), (35) and (36) we deduce that

\[
l_n^{\alpha, r}(x) \leq c(\alpha, \lambda, r) \left[ \ln(n+1) + \left( \frac{\theta_n}{\sqrt{\theta_n^2 + |x - \theta_n|}} \right)^{\frac{1}{\gamma}} \right].
\]

Thus, (13) is proved.

Now let us prove (14). Assume that \( x \in G_4 \). From (12) and (17) it follows that

\[
l_n^{\alpha, r}(x) \leq c(\alpha, r) x^{\frac{\alpha}{2} - \frac{1}{4}} (e^{-x} K_{n,N}^\alpha(x - r \delta, x - r \delta))^{1/2} \delta \times
\sum_{t \in \Omega_{r, \delta}} t^{\alpha - \frac{1}{2}} (e^{-t} K_{n,N}^\alpha(t - r \delta, t - r \delta))^{1/2} =
\]
\[
c(\alpha, r) x^{\frac{\alpha}{2} - \frac{1}{4}} (e^{-x} K_{n,N}^\alpha(x - r \delta, x - r \delta))^{1/2} (J_1 + J_2 + J_3),
\]

where

\[
J_k = \delta \sum_{t \in E_k} t^{\alpha - \frac{1}{2}} (e^{-t} K_{n,N}^\alpha(t - r \delta, t - r \delta))^{1/2}, \quad k = 1, 2, 3,
\]
\[
E_1 = \left( \frac{r \delta, 1/2}{\theta_n} \right) \cap \Omega_{r, \delta}, \quad E_2 = \left[ \frac{1}{\theta_n}, \frac{3 \theta_n}{2} \right] \cap \Omega_{r, \delta}, \quad E_3 = \left[ \frac{3 \theta_n}{2}, \infty \right) \cap \Omega_{r, \delta}.
\]

First, estimate the value \( (e^{-x} K_{n,N}^\alpha(x - r \delta, x - r \delta))^{1/2} \). From (1), (3), and (4) we have

\[
(e^{-x} K_{n,N}^\alpha(x - r \delta, x - r \delta))^{1/2} \leq \left( \sum_{k=0}^{n} m_n^\alpha(x - r \delta) e^{-\frac{x}{2}} \right)^{1/2} \leq c(\alpha, \lambda, r) n^{\frac{1 - \alpha}{2}} e^{-\frac{x}{2}}.
\]

Let us estimate \( J_1 \) (we assume that \( J_1 = 0 \), if \( r \delta > \frac{1}{\theta_n} \)):

\[
J_1 \leq c(\alpha, \lambda, r) \delta \sum_{t \in E_1} t^{\alpha - \frac{1}{2}} \left( \frac{\sum_{k=0}^{n} m_n^\alpha(x - r \delta)}{\theta_n} \right)^{\frac{1}{2}} \leq c(\alpha, \lambda, r) \theta_n^{\alpha - \frac{1}{2}} \delta \sum_{t \in E_1} t^{\alpha - \frac{1}{2}} \leq c(\alpha, \lambda, r) \theta_n^{\alpha - \frac{1}{2}} \left( \frac{1}{\theta_n} \right)^{\alpha - \frac{1}{2}} \leq c(\alpha, \lambda, r) n^{-\frac{\alpha}{2} - \frac{1}{4}}.
\]
Further, estimate (18) yields

\[ J_2 \leq c(\alpha, \lambda, r) \delta \sum_{t \in E_2} t^{\alpha - \frac{1}{2} - \frac{1}{4} + \frac{1}{4} r} n^{\frac{1}{2}} \leq c(\alpha, \lambda, r)n^{\frac{1}{2}} \delta \left( \delta \left( \frac{1}{\beta n} \right) \frac{1}{2} t^{-\frac{1}{2}} \int_{\frac{1}{\beta n}}^{\frac{3\beta n}{\beta n}} t^{\frac{1}{2}} \frac{1}{2} dt \right) \leq c(\alpha, \lambda, r)n^{\frac{1}{2}} \delta. \]

Finally, from (38) we have

\[ J_3 = \delta \sum_{t \in E_3} t^{\alpha - \frac{1}{2} - \frac{1}{4} \left( e^{-t} K_{n,N}(t - r\delta, t - r\delta) \right)}^{1/2} \leq c(\alpha, \lambda, r)n^{\frac{1}{2}} \delta \sum_{t \in E_3} t^{\alpha - \frac{1}{2} - \frac{1}{4} e^{-\frac{1}{4}}} \leq c(\alpha, \lambda, r). \]

From inequalities (37)–(41) we deduce the following estimate

\[ l_{n,r}(x) \leq c(\alpha, \lambda, r)n^{-\frac{1}{4}} x^{-\frac{1}{2}} e^{-\frac{1}{4}}. \]

This completes the proof of the theorem.
