**ABSTRACT**  *Fusarium langsethiae* is a suspected plant-pathogenic fungus causing cereal contamination with trichothecene mycotoxins. Here, we report the genome sequences of two *F. langsethiae* strains, MFG217701 (a prototroph) and MFG217702 (a biotin auxotroph), isolated from a grain of oat harvested in Russia.

*Fusarium langsethiae* (1) is a fungus that asymptptomatically infects a range of grain cereals, such as oat, wheat, and barley (2). There has been increasing interest in *F. langsethiae* because this species produces mycotoxins (T-2 and HT-2) which are type A trichothecenes (2–5). Previously, we detected a biotin auxotrophy in *F. langsethiae* strains collected from geographically different areas of Europe (6). Some *F. langsethiae* strains showed a disruption of normal growth, forming a poor, extremely sparsely branched colony in a synthetic medium unless biotin was added (6), indicating that biotin is available for *F. langsethiae* in colonized plant tissue. Auxotrophic strains are common in nature; thus, genetic changes in the basic metabolism of pathogens may give rise to changes in plant-fungi interactions, highlighting the importance of further investigations into the genomic changes and pathogenicity of auxotrophic strains.

Here, we report the draft genome sequences of two *F. langsethiae* strains, MFG217701 (prototrophic) and MFG217702 (biotin auxotrophic), isolated from a sample of a single grain of oat harvested in northwestern Russia (Leningrad Oblast) in 2014. The *Fusarium* strains were single-spored and stored in the All-Russian Plant Protection Institute collection (St. Petersburg, Russia). Strain MFG217702 grows poorly on synthetic Czapek (CZ) medium; however, it exhibits colony phenotypes comparable with the prototrophic strain MFG217701 on CZ medium supplemented with biotin (Fig. 1).

Strains MFG217701 and MFG217702 were grown in potato sucrose broth, and genomic DNA was extracted using a DNeasy plant minikit (Qiagen, Germany). Whole-genome sequencing libraries were prepared using the MGIEasy FS DNA library prep set and sequenced on a DNSEQ-G400RS instrument (MGI, China) using a whole-genome shotgun strategy. After quality filtering and trimming using fastp v0.20.0 with the options for removing adaptors and low-quality reads (7), paired-end data sets were assembled de novo using SPAdes v3.15.3 with the --careful option (8). The assembly quality was assessed using QUAST v4.4 (9) (Table 1). Default parameters were used except where otherwise noted.

A summary of the genome assemblies and annotations is shown in Table 1. Prediction of the protein-encoding genes was performed using BRAKER2 (10) with the annotated protein sequences of *F. langsethiae* strain Fl201059 as the input for model hints. The quality and completeness of the assembled genome were estimated using Benchmarking Universal Single-Copy Orthologs (BUSCO) with the data set hypocreales_odb10 (11). The gene cluster for biotin biosynthesis in *F. langsethiae* strain Fl201059 (12) containing BioF, BioD/A, a hypothetical protein, and C2H2 transcription factor genes were found in both genomes, although the gene cluster in the biotin-auxotrophic genome was interrupted by repetitive sequences.
that cause disruption of the genes encoding BioD/A and the hypothetical protein (Fig. 1). The gene cluster for trichothecene biosynthesis containing the Tri3 to Tri14 genes was found in both *F. langsethiae* genomes (MFG217701_contig0169 and MFG217702_contig0164).

**Data availability.** The *F. langsethiae* genome sequences were deposited at DDBJ/EMBL/GenBank under accession no. BQKT0100001 to BQKT01003556 (MFG217701) and BQKU0100001 to BQKU01003809 (MFG217702). The raw sequencing reads have been submitted to the DDBJ Sequence Read Archive (DRA) under accession no. DRR333357 (MFG217701) and DRR333358 (MFG217702).
TABLE 1 Summary of *Fusarium langsethiae* genome assemblies and annotations

| Strain         | Phenotype         | No. of filtered paired reads | $N_{50}$ (bp) | GC content (%) | Total no. of bases | No. of contigs | Sequencing coverage (%) | No. of genes | BUSCO analysis results | Complete BUSCOs (%) | No. of BUSCOs | No. of missing BUSCOs | No. of fragmented BUSCOs |
|----------------|-------------------|------------------------------|---------------|----------------|--------------------|---------------|------------------------|--------------|-----------------------|----------------------|---------------|------------------------|------------------------|
| MFG 217701     | Prototroph        | 45,369,500                   | 76,622        | 48.2           | 38,427,502         | 3,556         | 351                    | 12,467       | 99.0                  | 4,447                | 32            | 15                     |                        |
| MFG 217702     | Biotin auxotroph  | 40,119,319                   | 78,906        | 48.3           | 38,261,259         | 3,809         | 313                    | 12,370       | 98.9                  | 4,443                | 36            | 15                     |                        |

*Analysis conducted using the data set hypocreales_odb10.*
