Weak convergence rates for an explicit full-discretization of stochastic Allen-Cahn equation with additive noise

November 22, 2019

Abstract

We discretize the stochastic Allen-Cahn equation with additive noise by means of a spectral Galerkin method in space and a tamed version of the exponential Euler method in time. The resulting error bounds are analyzed for the spatio-temporal full discretization in both strong and weak senses. Different from existing works, we develop a new and direct approach for the weak error analysis, which does not rely on the associated Kolmogorov equation. It turns out that the obtained weak convergence rates are, in both spatial and temporal direction, essentially twice as high as the strong convergence rates. Also, it is revealed how the weak convergence rates depend on the regularity of the noise. Numerical experiments are finally reported to confirm the theoretical conclusion.

Key Words: stochastic Allen-Cahn equation, one-sided Lipschitz condition, Malliavin calculus, strong and weak convergence rates, spectral Galerkin method, tamed exponential Euler method

1 Introduction

Over the past decades, the numerical analysis of stochastic partial differential equations (SPDEs) has attracted increasing attention (see e.g. [28, 32] and references therein). In these two recent monographs, the analysis always relies on the globally Lipschitz condition imposed on the nonlinearities. Nevertheless, most models encountered in practice fail to satisfy such a restrictive condition, which motivates the development of numerical SPDEs in the non-globally Lipschitz regime. A typical example is the stochastic Allen-Cahn equation. Although there has been a few works on

numerical stochastic Allen-Cahn equations, e.g., \cite{4 5 8 9 10 11 14 19 23 27 30 31 34 36}, it is still far from being well-understood. The present article aims to make further contributions to the weak error analysis for a spatio-temporal full discretization of stochastic Allen–Cahn equation driven by additive noise.

Given \( T \in (0, \infty) \), let \( A \) be Dirichlet Laplacian and \( F \) be a Nemytskii operator associated with a cubic polynomial that violates the globally Lipschitz condition. Moreover, we let \( \{W(t)\}_{t \in [0,T]} \) be a standard (possibly cylindrical) \( Q \)-Wiener process in a separable Hilbert space \( H \) on the stochastic basis \( (\Omega, \mathcal{F}, \mathbb{P}, \{\mathcal{F}_t\}_{t \in [0,T]}) \). Throughout this article we consider the stochastic Allen–Cahn equation, given by

\[
\begin{align*}
\frac{dX(t)}{dt} + AX(t) dt &= F(X(t)) dt + dW(t), \quad t \in (0, T], \\
X(0) &= X_0.
\end{align*}
\]

Under certain assumptions, it is well-known that (1.1) has a unique solution defined by

\[
X(t) = E(t)X_0 + \int_0^t E(t-s)F(X(s))ds + \int_0^t E(t-s)dW(s), \quad t \in [0, T],
\]

where \( E(t) = e^{-tA}, \ t \geq 0 \) is an analytic semigroup on \( H \) generated by \(-A\).

As indicated in \cite{3}, the fully discrete exponential Euler and the fully discrete linear-implicit Euler approximations diverge strongly and numerically weakly when used to solve the stochastic Allen–Cahn equations. In the existing literature, the backward Euler \cite{19 26 27 30 31 34} and modified Euler-type time-stepping schemes \cite{4 8 9 11 19 20 36} are introduced to produce convergent approximations for such SPDEs. In this article, a tamed exponential Euler time discretization is proposed based on the spectral Galerkin spatial semi-discretization. For \( N, M \in \mathbb{N}, N = \{1, 2, \cdots \} \), by \( X^{M,N}_t \) we denote the full-discrete approximations of \( X(t) \), produced by the proposed fully discrete scheme,

\[
X^{M,N}_{t_{m+1}} = E_N(\tau)X^{M,N}_{t_m} + \frac{\tau E_N(\tau)P_N F(X^{M,N}_{t_m})}{1 + \tau \|P_N F(X^{M,N}_{t_m})\|} + E_N(\tau)P_N \Delta W_m,
\]

where \( \frac{1}{N} \) and \( \tau := \frac{T}{M} \) represent, respectively, the uniform space and time step sizes. The goal of this work is then to analyze the weak error estimates. More specifically, the main result, Theorem \cite{4 8} shows that for \( \Phi \in C_0^\infty(H, \mathbb{R}) \) and arbitrarily small \( \epsilon > 0 \),

\[
|\mathbb{E}[\Phi(X(T))] - \mathbb{E}[\Phi(X^{M,N}_T)]| \leq C \left( \lambda_N^{-\gamma+\epsilon} + \gamma^{\gamma-\epsilon} \right), \quad \gamma \in (0, 1],
\]

where \( \gamma \) from Assumption \cite{2 3} is a parameter used to measure the spatial regularity of the noise process and \( \lambda_N \) is the \( N \)-th eigenvalue of the linear operator \( A \). As a by product of the weak error analysis, we also obtain strong convergence rates as

\[
\sup_{t \in [0,T]} \|X(t) - X^{M,N}_t\|_{L^2(\Omega; H)} \leq C\left( \lambda_N^{-\frac{\gamma}{2}} + \tau^{\frac{\gamma}{2}} \right), \quad \gamma \in (0, 1].
\]

The weak error, sometimes more relevant in various fields such as financial engineering, concerns with the approximation of the law of the solution. In recent years, much progress has been made
in weak approximation of SPDEs in a globally Lipschitz setting, see [1, 2, 7, 13, 17, 18, 21, 22, 24, 25, 37, 35]. By contrast, the study of weak approximations of SPDEs with non-globally Lipschitz coefficients is still at an early stage. Existing publications include [10, 14] and [15], where the authors analyzed the weak error of temporal semi-discretization splitting schemes, spatial finite element semi-discretization and implicit full-discretization of the stochastic Allen–Cahn equations, respectively. All of these three works employed a splitting strategy to construct a nice auxiliary continuous-time process with appropriate spatio-temporal regularity properties and deduce the weak convergence rate from the regularity of the regularized Kolmogorov equation. In this paper, however, we develop a different and more direct approach for the weak error analysis, which does not rely on the use of the regularized Kolmogorov equation. Furthermore, we highlight that the proposed fully discrete scheme with explicit time-stepping is more computationally efficient than the nonlinearity-implicit time-stepping in [13], which is the first paper to analyze weak error of a fully discrete scheme for the stochastic Allen–Cahn equations.

We now briefly explain the new approach for the weak convergence analysis. After introducing the spectral Galerkin spatial semi-discretization $X^N(t)$, we separate the error into two parts,

$$E[\Phi(X(T))] - E[\Phi(X^N(T))] = (E[\Phi(X(T))] - E[\Phi(X^N(T))]) + (E[\Phi(X^N(T))] - E[\Phi(X^M,N)])$$

(1.6)

where the first term corresponds to the spatial error and the second one corresponds to the temporal error. We define two auxiliary processes as $\bar{X}(t) := X(0) - O_t$ and $\bar{X}^N(t) := X^N(0) - O^N_t$, where $O_t = \int_0^t E(t - r)dW(r)$ and $O^N_t := P_N O_t$, and separate the spatial error into two parts:

$$E[\Phi(X(T))] - E[\Phi(X^N(T))] = (E[\Phi(\bar{X}(T) + O_T)] - E[\Phi(\bar{X}^N(T) + O_T)])$$

$$+ (E[\Phi(\bar{X}^N(T) + O^N_T)] - E[\Phi(\bar{X}^N(T) + O^N_T)])$$

(1.7)

To estimate the first item, it suffices to measure the discrepancy between $\bar{X}^N(T)$ and $\bar{X}(T)$ in the strong sense,

$$|E[\Phi(\bar{X}(T) + O_T)] - E[\Phi(\bar{X}^N(T) + O_T)]|$$

$$\leq C |E \int_0^1 \Phi'(X(T) + s(\bar{X}^N(T) - \bar{X}(T))) (\bar{X}^N(T) - \bar{X}(T)) ds|$$

(1.8)

$$\leq C \|\bar{X}^N(T) - P_N \bar{X}(T)\|_{L^2(\Omega, H)} + C \|P_N \bar{X}(T) - \bar{X}(T)\|_{L^2(\Omega, H)}.$$  

Since the process $\bar{X}(T)$, getting rid of the stochastic convolution, admits higher spatial regularity, one can follow standard arguments to arrive at the desired rates. Concerning the remaining term in (1.7), we use the Taylor expansion to get

$$|E[\Phi(\bar{X}^N(T) + O_T)] - E[\Phi(\bar{X}^N(T) + O^N_T)]| \leq |E[\Phi'(X^N(T))(O_T - O^N_T)]|$$

$$+ |E \left[ \int_0^1 \Phi''(X^N(T) + \lambda(O_T - O^N_T))(O_T - O^N_T)(O_T - O^N_T)(1 - \lambda)d\lambda \right] |.$$  

(1.9)

The first term needs to be treated carefully and the key ingredient is the Malliavin integration by parts formula. As $\Phi \in C_b^2(H, \mathbb{R})$, the second term clearly contributes to rates twice as high as
the strong convergence rates. As a by product of the weak error analysis, one can easily obtain the rate of the strong error, $\|X(t) - X^N(t)\|_{L^2(\Omega, H)} \leq \|\bar{X}(t) - \bar{X}^N(t)\|_{L^2(\Omega, H)} + \|\mathcal{O}_t - \mathcal{O}_t^N\|_{L^2(\Omega, H)}$, which is half of the weak error, due to the presence of the second error. In a similar manner, we introduce an auxiliary process $X_{T}^{M,N} := X_{T}^{M,N} - \mathcal{O}_{T}^{M,N}$, where $\mathcal{O}_{T}^{M,N} := \int_{0}^{T} E_{N}(T - [s]_{\tau}) P_{N} dW(s)$ with $[t]_{\tau} := t_i$ for $t \in [t_i, t_{i+1})$. Therefore, the temporal error is splitted into two terms:

$$
\mathbb{E}[\Phi(X^N(T))] - \mathbb{E}[\Phi(X_{T}^{M,N})] = (\mathbb{E}[\Phi(\bar{X}^N(T) + \mathcal{O}_{T}^N)] - \mathbb{E}[\Phi(\bar{X}^N(T) + \mathcal{O}_{T}^{M,N})])
$$

$$
+ (\mathbb{E}[\Phi(\bar{X}^N(T) + \mathcal{O}_{T}^{M,N})] - \mathbb{E}[\Phi(\bar{X}_{T}^{M,N} + \mathcal{O}_{T}^{M,N})]).
$$

(1.10)

In order to handle these two terms, we essentially follow the basic lines of the weak error analysis in the spatial case. However, the analysis here is much more complicated with the emergence of new challenges and difficulties (see Section 4). For example, $\frac{1}{2}$ is put as an ultimate limit on the order of the Hölder regularity in time of $X_{i}^{M,N}$ for any $\gamma \in (0, 1]$ and this causes essential difficulties in the weak error analysis for the case $\gamma \in (1/2, 1]$. To overcome it, we repeatedly use the Taylor expansion and properties of stochastic integrals (cf. (4.41)–(4.49)) to finally obtain the expected weak rates (see estimates of $K_2$ in (4.30)).

The article is organized as follows. In the next section we present some preliminaries and give a brief introduction to the Malliavin calculus. In section 3, we prove strong and weak convergence rates for the spectral Galerkin spatial approximation. A priori moment bounds of full discretization and convergence analysis in both strong and weak sense are given in section 4. Finally, section 5 provides numerical experiments to confirm the theoretical findings.

## 2 Preliminaries

Let $(H, \langle \cdot, \cdot \rangle, \| \cdot \|)$ and $(U, \langle \cdot, \cdot \rangle_U, \| \cdot \|_U)$ be the real separable Hilbert spaces. Let $\mathcal{L}(U, H)$ be the space of all bounded linear operators from $U$ to $H$ endowed with the usual operator norm $\| \cdot \|_{\mathcal{L}(U, H)}$ and by $\mathcal{L}_2(U, H) \subset \mathcal{L}(U, H)$ we denote the space consisting of all Hilbert-Schmidt operators from $U$ to $H$. For short, we write $\mathcal{L}(H)$ and $\mathcal{L}_2(H)$ instead of $\mathcal{L}(H, H)$ and $\mathcal{L}_2(H, H)$, respectively. It is well-known that $\mathcal{L}_2(U, H)$ is a Hilbert space equipped with the scalar product and norm,

$$
\langle \Gamma_1, \Gamma_2 \rangle_{\mathcal{L}_2(U, H)} = \sum_{i \in \mathbb{N}} \langle \Gamma_1 \phi_i, \Gamma_2 \phi_i \rangle, \quad \| \Gamma \|_{\mathcal{L}_2(U, H)} = \left( \sum_{i \in \mathbb{N}} \| \Gamma \phi_i \|^2 \right)^{\frac{1}{2}},
$$

(2.1)

which are both independent of the choice of orthonormal basis $\{ \phi_i \}$ of $U$. If $\Gamma \in \mathcal{L}_2(U, H)$ and $L \in \mathcal{L}(H, U)$, then $\Gamma L \in \mathcal{L}_2(H)$ and $L \Gamma \in \mathcal{L}_2(U)$. Furthermore,

$$
\| \Gamma L \|_{\mathcal{L}_2(H)} \leq \| \Gamma \|_{\mathcal{L}_2(U, H)} \| L \|_{\mathcal{L}(H, U)}, \quad \| L \Gamma \|_{\mathcal{L}_2(U)} \leq \| \Gamma \|_{\mathcal{L}_2(U, H)} \| L \|_{\mathcal{L}(H, U)}.
$$

(2.2)

Also if $\Gamma_1, \Gamma_2 \in \mathcal{L}_2(U, H)$, then

$$
\| \langle \Gamma_1, \Gamma_2 \rangle_{\mathcal{L}_2(U, H)} \| \leq \| \Gamma_1 \|_{\mathcal{L}_2(U, H)} \| \Gamma_2 \|_{\mathcal{L}_2(U, H)}.
$$

(2.3)

Let $\mathcal{I} := (0, 1)$ and let $L^r(\mathcal{I}, \mathbb{R}), r \geq 1$ be the Banach space consisting of $r$-times integrable functions. Particularly, taking $r = 2$, $H := L^2(\mathcal{I}, \mathbb{R})$ denotes the real separable Hilbert space
endowed with usual inner product $\langle \cdot, \cdot \rangle$ and norm $\| \cdot \| = \langle \cdot, \cdot \rangle^{1/2}$. For convenience, the notation $L^r(I)$ (or $L^r$) is frequently used. By $C_b^2(H, \mathbb{R})$ we denote the space of not necessarily bounded mappings from $H$ to $\mathbb{R}$ that have continuous and bounded Fréchet derivatives up to order 2. Finally, $V := C(I, \mathbb{R})$ represents the Banach space of all continuous functions from $I$ to $\mathbb{R}$ endowed with supremum norm.

### 2.1 Main assumptions and the well-posedness of the model

In this article, we restrict ourselves to an abstract stochastic evolution equation in the Hilbert space $H$, driven by additive noise, described by

$$
\begin{align*}
\begin{cases}
\text{d}X(t) + AX(t) \text{d}t &= F(X(t)) \text{d}t + \text{d}W(t), &t \in (0, T], \\
X(0) &= X_0.
\end{cases}
\end{align*}
$$

To get started, main assumptions are formulated in this subsection. Throughout this paper, by $C$ we denote a generic positive constant that is independent of the discretization parameters and that possibly differs at different occurrences.

**Assumption 2.1.** Let $-A : \text{Dom}(A) \subset H \to H$ be the Laplacian with homogeneous Dirichlet boundary conditions, defined by $-Au = \Delta u, u \in \text{Dom}(A) := H^2 \cap H^1_0$.

Under Assumption 2.1 there exists a family of eigenpairs $\{\lambda_k, e_k\}_{k \in \mathbb{N}}$ such that

$$
Ae_k = \lambda_k e_k, \quad e_k(x) = \sqrt{2} \sin(k\pi x) \quad \text{and} \quad \lambda_k = k^2. \tag{2.5}
$$

Moreover, $-A$ generates an analytic semigroup $E(t)$ on $H$. We define the fractional powers of $A$, namely, $A^\alpha$ for $\alpha \in \mathbb{R}$, by means of the spectral decomposition of $A$ \cite[Appendix B.2]{23}. Furthermore, the interpolation spaces denoted by $\dot{H}^\alpha := \text{Dom}(A^{\frac{\alpha}{2}})$ are separable Hilbert space equipped with inner product $\langle \cdot, \cdot \rangle_{\alpha} := \langle A^{\frac{\alpha}{2}} \cdot, A^{\frac{\alpha}{2}} \cdot \rangle$ and norm $\| \cdot \|_{\alpha} = \| A^{\frac{\alpha}{2}} \cdot \| = \langle \cdot, \cdot \rangle_{\alpha}^{1/2}$. Regularity properties of the semigroup are stated as follows:

$$
\| A^\alpha E(t) \|_{\mathcal{L}(H)} \leq C t^{-\alpha}, \quad \| A^{-\beta}(I - E(t)) \|_{\mathcal{L}(H)} \leq C t^\beta, \quad t > 0, \alpha \geq 0, \beta \in [0, 1]. \tag{2.6}
$$

**Assumption 2.2.** Let $F : L^6(I, \mathbb{R}) \to H$ be a Nemytskii operator defined by

$$
F(v)(x) = f(v(x)) = v(x) - v^3(x), \quad x \in I, \quad v \in L^6(I, \mathbb{R}). \tag{2.7}
$$

Furthermore, we denote, for $v, \zeta, \zeta_1, \zeta_2 \in L^6(I, \mathbb{R})$,

$$
\begin{align*}
(F'(v)(\zeta))(x) &= f'(v(x))\zeta(x) = (1 - 3v^2(x))\zeta(x), \quad x \in I, \\
(F''(v)(\zeta_1, \zeta_2))(x) &= f''(v(x))\zeta_1(x)\zeta_2(x) = -6v(x)\zeta_1(x)\zeta_2(x), \quad x \in I.
\end{align*}
$$

It is easy to check that

$$
\begin{align*}
&\langle u, F'(v)u \rangle \leq \| u \|^2, \quad u, v \in L^6(I, \mathbb{R}), \tag{2.9} \\
&\| F'(v)u \| \leq C (1 + \| v \|^2) \| u \|, \quad v \in V, u \in L^6(I, \mathbb{R}), \tag{2.10} \\
&\| F(u) - F(v) \| \leq C (1 + \| u \|^2 + \| v \|^2) \| u - v \|, \quad u, v \in V, \tag{2.11} \\
&\| F''(\zeta)(u, v) \|_{-1} \leq C \| \zeta \| v \| u \| \| v \|, \quad \zeta \in V, u, v \in L^6(I, \mathbb{R}). \tag{2.12}
\end{align*}
$$
Assumption 2.3. Let \( \{W(t)\}_{t \in [0,T]} \) be a standard \( H \)-valued (possibly cylindrical) \( Q \)-Wiener process on the stochastic basis \( (\Omega, \mathcal{F}, \mathbb{P}, \{\mathcal{F}_t\}_{t \in [0,T]}) \), with the covariance operator \( Q \) satisfying
\[
\| A^{\frac{\gamma-1}{2}} \|_{\mathcal{L}_2^0}^2 = \| A^{\frac{\gamma-1}{2}} Q^{\frac{1}{2}} \|_{\mathcal{L}_2(H)} < \infty \quad \text{for some } \gamma \in (0,1].
\] (2.13)

In the case \( \gamma \leq \frac{1}{2} \), we in addition assume that \( Q \) commutes with \( A \).

Here by \( \mathcal{L}_2^0 := \mathcal{L}_2(U_0, H) \) we denote the space of Hilbert-Schmidt operators from the Hilbert space \( U_0 = Q^{\frac{1}{2}}(H) \) to \( H \). To simplify the notation, we write
\[
\mathcal{O}_t := \int_0^t E(t-s) dW(s).
\] (2.14)

A slight modification of the proof in [16, Theorem 5.25] derives that for any \( p \geq 2 \),
\[
\mathbb{E} \left[ \sup_{t \in [0,T]} \| \mathcal{O}_t \|_p^p \right] + \sup_{t \in [0,T]} \mathbb{E} \left[ \| \mathcal{O}_t \|_\gamma^p \right] < \infty.
\] (2.15)

Furthermore, for any \( \alpha \in [0,\gamma] \) and \( 0 \leq s < t \leq T \),
\[
\| \mathcal{O}_t - \mathcal{O}_s \|_{L^p(\Omega, H^\alpha)} \leq C(t-s)^{\frac{\gamma-\alpha}{2}}.
\] (2.16)

Assumption 2.4 (Initial value). The initial value \( X_0 \) is considered to be deterministic and for \( \gamma \in (0,1] \) from (2.13) it holds
\[
\|X_0\|_\gamma + \|X_0\|_V < \infty.
\] (2.17)

The above assumptions are sufficient to establish well-posedness and spatio-temporal regularity properties of (2.4) [12, 8, 34]. Here we just state the main results as follows.

Theorem 2.5. Under Assumptions 2.1-2.4 there is a unique mild solution of (2.4) given by
\[
X(t) = E(t)X_0 + \int_0^t E(t-s) F(X(s)) \, ds + \int_0^t E(t-s) \, dW(s), \quad t \in [0,T].
\] (2.18)

Moreover, for any \( p \geq 2 \),
\[
\sup_{t \in [0,T]} \|X(t)\|_{L^p(\Omega, V)} < \infty, \quad \text{and} \quad \sup_{t \in [0,T]} \|X(t)\|_{L^p(\Omega, H^\gamma)} < \infty.
\] (2.19)

Additionally, for any \( \alpha \in [0,\gamma] \) and \( 0 \leq s < t \leq T \),
\[
\sup_{0 \leq s < t \leq T} \frac{\|X(t) - X(s)\|_{L^p(\Omega, H^\alpha)}}{(t-s)^{(\gamma-\alpha)/2}} < \infty.
\] (2.20)
2.2 Introduction to Malliavin calculus

In this part, we give a brief introduction to Malliavin calculus, which is a key tool for the weak analysis. For a comprehensive knowledge one can refer to the classical monograph [33]. We firstly define an isonormal process \( \mathcal{W} : L^2([0, T], \mathcal{L}_2(U_0, \mathbb{R})) \rightarrow L^2(\Omega, \mathbb{R}) \) such that for any deterministic mapping \( \kappa \in L^2([0, T], \mathcal{L}_2(U_0, \mathbb{R})) \),

\[
\mathcal{W}(\kappa) := \int_0^T \kappa(t)dW(t),
\]

where the integral is the usual Itô-integral. Next, for \( N, M \in \mathbb{N} \), \( h_i \in H, i = 1, 2, \ldots, N \) and \( \kappa_j \in L^2([0, T], \mathcal{L}_2(U_0, \mathbb{R})) \), for \( j = 1, 2, \ldots, M \), let \( \vartheta(H) \) be a family of all smooth \( H \)-valued cylindrical random variables

\[
\vartheta(H) = \left\{ G = \sum_{i=1}^N f_i(\mathcal{W}(\kappa_1), \ldots, \mathcal{W}(\kappa_M))h_i : f_i \in C^\infty_p(\mathbb{R}^M, \mathbb{R}) \right\}.
\]

Here \( C^\infty_p(\mathbb{R}^M, \mathbb{R}) \) represents the space of all continuous mappings \( g : \mathbb{R}^M \rightarrow \mathbb{R} \) with the infinite-times continuous Fréchet differentiable derivatives such that \( g \) and all its derivatives are at most polynomially growing. Then we are ready to introduce the action of the Malliavin derivative on \( G \in \vartheta(H) \):

\[
\mathcal{D}_tG := \sum_{i=1}^N \sum_{j=1}^M \partial_j f_i(\mathcal{W}(\kappa_1), \ldots, \mathcal{W}(\kappa_M))h_i \otimes \kappa_j(t),
\]

where \( h_i \otimes \kappa_j(t) \) denotes the tensor product, that is, for \( 1 \leq j \leq M \) and \( 1 \leq i \leq N \),

\[
(h_i \otimes \kappa_j(t))(u) = (\kappa_j(t)(u))h_i \in H, \quad \forall u \in U_0, \ h_i \in H, \ t \in [0, T].
\]

The operator \( \mathcal{D}_t \) is well-defined since \( h_i \otimes \kappa_j(t) \in \mathcal{L}_2^0 \). For brevity, we write \( \langle \mathcal{D}_tG, u \rangle = \mathcal{D}^u_tG \) to represent the derivative in the direction \( u \in U_0 \). Recall that if \( G \) is \( \mathcal{F}_t \)-measurable, then \( \mathcal{D}_sG = 0 \) for \( s > t \). Thanks to the fact that \( \mathcal{D}_t \) defines a closable operator, we then denote by \( \mathbb{D}^{1,2}(H) \) the closure of the set of smooth random variables \( \vartheta(H) \) in \( L^2(\Omega, H) \) with respect to the norm

\[
\|G\|_{\mathbb{D}^{1,2}(H)} = \left( \mathbb{E}\left[\|G\|^2\right] + \mathbb{E}\int_0^T \|\mathcal{D}_tG\|_{\mathcal{L}_2^0}^2dt \right)^{\frac{1}{2}}.
\]

The chain rule of the Malliavin derivative holds. Namely, given a separable Hilbert space \( \mathcal{H} \), if \( \varrho \in C^1_t(H, \mathcal{H}) \) and \( G \in \mathbb{D}^{1,2}(H) \), then \( \varrho(G) \in \mathbb{D}^{1,2}(\mathcal{H}) \) and \( \mathcal{D}^t\varrho(G) = \varrho'(G) \cdot \mathcal{D}^tG \).

Based on these preparations, at the very heart of Malliavin calculus is the following integration by parts formula. For any \( G \in \mathbb{D}^{1,2}(H) \) and adapted process \( \Upsilon \in L^2([0, T], \mathcal{L}_0^0) \), the duality reads

\[
\mathbb{E}\left[\left\langle \int_0^T \Upsilon(t)dW(t), G \right\rangle \right] = \mathbb{E}\int_0^T \langle \Upsilon(t), \mathcal{D}_tG \rangle_{\mathcal{L}_2^0}dt. \tag{2.25}
\]

Finally, the Malliavin derivative acts on the Itô integral \( \int_0^t \Upsilon(r)dW(r) \) satisfying for all \( t \in [0, T] \),

\[
\mathcal{D}^s_t\int_0^t \Upsilon(r)dW(r) = \int_0^t \mathcal{D}^u_t\Upsilon(r)dW(r) + \Upsilon(s)u, \quad 0 \leq s \leq t \leq T. \tag{2.26}
\]
3 Weak error estimates for the spectral Galerkin method

This section is devoted to the weak error analysis for the spectral Galerkin spatial semi-discretization. For $N \in \mathbb{N}$, we define a finite dimensional subspace $H_N \subset H$ which is spanned by the $N$ first eigenvectors of the linear operator $A$. Also, we define the projection operator $P_N$ from $\tilde{H}$ onto $H_N$ as $P_Nx = \sum_{i=1}^{N} \langle x, e_i \rangle e_i$, $\forall x \in \tilde{H}$, $\iota \in \mathbb{R}$. Meanwhile, by $I \in \mathcal{L}(H)$ we denote the identity mapping on $H$. Based on these facts, we can easily obtain that

$$\| (P_N - I) A^{-\alpha} \|_{\mathcal{L}(H)} \leq C \lambda_N^{-\alpha}, \quad \alpha \geq 0. \quad (3.1)$$

In the sequel, we define $A_N = A P_N$ from $H$ to $H_N$ and $-A_N$ generates the analytic semigroup $E_N(t) = e^{-tA_N}$ in $H_N$ for any $t \in [0, \infty)$. As a result, the spatial semi-discretization of (2.4) results in the finite dimension SDEs

$$dX^N(t) + A_N X^N(t) dt = P_N F\left(X^N(t)\right) dt + P_N dW(t), \quad X^N(0) = P_N X_0, \quad (3.2)$$

whose unique mild solution is given by

$$X^N(t) = E_N(t) P_N X_0 + \int_0^t E_N(t-r) P_N F(X^N(r)) dr + \mathcal{O}_t^N, \quad \mathcal{O}_t^N := \int_0^t E_N(t-r) P_N dW(r). \quad (3.3)$$

3.1 A priori estimate and regularity of the semi-discretization

Before starting the proof of weak convergence rate, we offer several results which are essential in the convergence analysis.

**Lemma 3.1.** Let Assumption 2.3 hold. Then for any $p \geq 2$, we have

$$\sup_{t \in [0,T], N \in \mathbb{N}} \| \mathcal{O}_t^N \|_{L^p(\Omega,V)} < \infty. \quad (3.4)$$

**Proof.** This lemma is an immediate consequence for $\gamma \in (0, \frac{1}{2}]$ from [6, Lemma 5.4] under the condition that $A$ commute with $Q$. In the case of $\gamma \in (\frac{1}{2}, 1]$, the assertion can be deduced easily with the aid of the Sobolev embedding inequality. \qed

In the sequel, we denote $\| u \|_{L^p(\mathcal{I} \times [0,t])} = \int_0^t \| u(s) \|_{L^p(\mathcal{I}, E)}^p ds$ and $\mathbb{L}^p := L^p(\mathcal{I} \times [0,t])$ for convenience. The particular case $p = 2$, when equipped with the inner product $\langle u, w \rangle_{L^2(\mathcal{I} \times [0,t])} = \int_0^t \langle u(s), w(s) \rangle ds$, turns to be the Hilbert space. With the previous preparations, we will give the forthcoming estimate in [36, Lemma 4.2] which plays a key role in proving moment bounds.

**Proposition 3.2.** Let $u^N, w^N : [0,T] \rightarrow H_N$ satisfy the problem,

$$\begin{aligned}
\left\{ \begin{array}{l}
\frac{\partial u^N(t)}{\partial t} + A_N u^N(t) = P_N F(u^N(t) + w^N(t)), \quad t \in (0,T], \\
u^N(0) = 0.
\end{array} \right.
\end{aligned} \quad (3.5)$$

Then for any $t \in [0,T]$ it holds

$$\| u^N(t) \|_V \leq C \left( 1 + \| w^N \|_{L^p(\mathcal{I} \times [0,t])}^9 \right). \quad (3.6)$$
In order to get the a priori moment bounds for the numerical approximation, we need additional assumption on the initial data.

**Assumption 3.3.** For $N \in \mathbb{N}$, the initial value satisfies
\[
\sup_{N \in \mathbb{N}} \|P_N X_0\|_V < \infty. \tag{3.7}
\]

As a consequence, we obtain the next lemma, similar to the proof of Lemma 3.3.

**Lemma 3.4.** Let Assumptions 2.1-2.4, 3.3 hold and let $X(t)$ be the mild solution of (2.4). Then for any $p \geq 2$ and $t \in (0, T]$ it holds that
\[
\sup_{N \in \mathbb{N}, t \in [0, T]} \|P_N X(t)\|_{L^p(\Omega, V)} < \infty. \tag{3.8}
\]

Now we consider the moment of $\|X^N(t)\|_V$ in the following theorem.

**Theorem 3.5 (A priori moment bounds for spatial semi-discretization).** Under the Assumptions 2.1-2.4 and 3.3, for any $p \geq 2$, the unique mild solution $X^N(t)$ of (3.2) satisfies
\[
\sup_{N \in \mathbb{N}, t \in [0, T]} \mathbb{E}[\|X^N(t)\|^p_V] < \infty. \tag{3.9}
\]

**Proof.** We firstly introduce a process
\[
Z^N(t) := E_N(t)P_N X_0 + O^N_t. \tag{3.10}
\]

Then we can recast (3.3) as
\[
X^N(t) = \int_0^t E_N(t - r)P_N F(X^N(r))dr + Z^N(t). \tag{3.11}
\]

Furthermore, we denote
\[
\hat{X}^N(t) := X^N(t) - Z^N(t) = \int_0^t E_N(t - r)P_N F(\hat{X}^N(r) + Z^N(r))dr. \tag{3.12}
\]

Now one can apply Proposition 3.2 to deduce that
\[
\|\hat{X}^N(t)\|_V \leq C \left(1 + \|Z^N(t)\|_{L^p(I \times [0, t])}\right), \quad \text{for } t \in [0, T]. \tag{3.13}
\]

As a result, we have
\[
\mathbb{E}[\|\hat{X}^N(t)\|^p_V] \leq C \left(1 + \mathbb{E}[\|Z^N\|_{L^p(I \times [0, t])}^{9p}]\right) \leq C \left(1 + \mathbb{E}\left[\int_0^t \|Z^N(s)\|_V^{9p}ds\right]\right). \tag{3.14}
\]

Bearing (3.7) and (3.4) in mind, one can verify the desired assertion. \qed

With Theorem 3.5 at hand, it is easy to validate the next corollary.
Corollary 3.6. Under conditions in Theorem 3.5, for any \( p \geq 2 \) it holds
\[
\sup_{N \in \mathbb{N}, t \in [0, T]} E\left[ \| X^N(t) \|_p^p \right] < \infty. \tag{3.15}
\]
Furthermore, for \( 0 \leq s \leq t \leq T \),
\[
\| X^N(t) - X^N(s) \|_{L^p(\Omega, H)} \leq C(t - s)^{\frac{\gamma}{2}}. \tag{3.16}
\]

Next we are prepared to give the regularity of the Malliavin derivative of \( X^N(t) \).

Proposition 3.7 (Regularity of the Malliavin derivative). Let Assumptions 2.1-2.4 hold. Then the Malliavin derivative of \( X^N(t) \) satisfies
\[
E\left[ \| D_s X^N(t) \|_{L^2(\Omega)}^2 \right] \leq C(t - s)^{\gamma - 1}, \quad 0 \leq s < t \leq T. \tag{3.17}
\]

Proof. Differentiating the equation (3.3) in the direction \( y \in U_0 \) and by (2.26), the chain rule we derive that for \( 0 \leq s \leq t \leq T \),
\[
D_s^y X^N(t) = E_N(t - s) P_N y + \int_s^t E_N(t - r) P_N F'(X^N(r)) D_s^y X^N(r) dr. \tag{3.18}
\]

Therefore, we get
\[
\int_s^t E_N(t - r) P_N F'(X^N(r)) D_s^y X^N(r) dr = D_s^y X^N(t) - E_N(t - s) P_N y := \Gamma_s^N(t, y). \tag{3.19}
\]

It is easy to check that \( \Gamma_s^N(t, y) \) is time differentiable and satisfies the following equation
\[
\begin{cases}
\frac{d}{dt} \Gamma_s^N(t, y) = \left( -A_N + P_N F'(X^N(t)) \right) \Gamma_s^N(t, y) + P_N F'(X^N(t)) E_N(t - s) P_N y, \\
\Gamma_s^N(s, y) = 0.
\end{cases} \tag{3.20}
\]

Consequently,
\[
\Gamma_s^N(t, y) = \int_s^t \Psi(t, r) P_N F'(X^N(r)) E_N(r - s) P_N y dr, \tag{3.21}
\]

where \( \Psi(t, r) \) is the evolution operator associated with the linear equation
\[
\frac{d}{dt} \Psi(t, r) z = -A_N \Psi(t, r) z + P_N F'(X^N(t)) \Psi(t, r) z, \quad \Psi(r, r) z = z. \tag{3.22}
\]

Multiplying both sides by \( \Psi(t, r) z \) and integrating over \([r, t]\) tell us that
\[
\begin{align*}
\| \Psi(t, r) z \|^2 & \leq \| z \|^2 + 2 \int_r^t \langle \Psi(u, r) z, -A_N \Psi(u, r) z \rangle du + 2 \int_r^t \langle \Psi(u, r) z, (F'(X^N(u))) \Psi(u, r) z \rangle du \\
& \leq \| z \|^2 + 2 \int_r^t \| \Psi(u, r) z \|^2 du.
\end{align*} \tag{3.23}
\]
By use of Gronwall’s inequality we deduce
\[ \| \Psi(t,r)z \| \leq C \| z \|. \]  
(3.24)
This yields for \( \alpha < \frac{1}{2} \) and \( s < t \),
\[ \| \Gamma^N_s(t,y) \| \leq C \int_s^t \| P_NF'(X^N(r)) E_N(r-s)y \| dr \] 
(3.25)
\[ \leq C \left( \int_s^t \left[ 1 + \| X^N(r) \|_{V}^2 \right]^{\frac{1}{2}} \left( \int_s^t (r-s)^{-2\alpha} dr \right)^{\frac{1}{2}} \| A^{-\alpha} y \|. \]
Due to the fact that \( \| E_N(t-s)y \| \leq C(t-s)^{-\alpha} \| A^{-\alpha} y \| \), we deduce from (3.19) and (3.25) that
\[ \| D_s X^N(t) \| \leq C \left( \int_s^t \left[ 1 + \| X^N(r) \|_{V}^2 \right]^{\frac{1}{2}} \left( \int_s^t (r-s)^{-\alpha} dr \right)^{\frac{1}{2}} \| A^{-\alpha} y \|. \]  
(3.26)
Finally, taking \( y = Q^{1/2} \varphi_i, \ i \in \mathbb{N} \) (Here \{\varphi_i\}_{i \in \mathbb{N}} forms an orthonormal basis of \( H \)) and \( \alpha = \frac{1}{2} \) together with a priori moment estimate of \( X^N(r) \) yields that
\[ \mathbb{E} \left[ \| D_s X^N(t) \|_{L_2^\gamma}^2 \right] \leq C \sum_{i \in \mathbb{N}} \mathbb{E} \left( \int_s^t \left[ 1 + \| X^N(r) \|_{V}^2 \right]^{\frac{1}{2}} \left( \int_s^t (r-s)^{-\alpha} dr \right)^{\frac{1}{2}} \| A^{-\alpha} Q^{1/2} \varphi_i \| (t-s)^{\gamma-1} \right) \leq C(t-s)^{\gamma-1}, \] 
as required. \[ \square \]

3.2 Weak convergence rate of the spatial semi-discretization

In addition to the above preparations, we still rely on the following regularity results of the nonlinearity, which are important in identifying the expected weak error rates.

**Lemma 3.8.** Let \( F : L^6(I, \mathbb{R}) \to H \) be the Nemytskii operator defined in Assumption 2.2. Then
\[ \| F(\phi) \|_1 \leq C \left( 1 + \| \phi \|_{V}^2 \right) \| \phi \|_1, \ \forall \phi \in \dot{H}^1. \]  
(3.28)
**Proof.** Noting that \( f(\phi) = -\phi^3 + \phi \), one can derive
\[ \| F(\phi) \|_1^2 = \| \nabla F(\phi) \|_1^2 = \int_I \left| \frac{d}{d\xi} f(\phi(\xi)) \right|^2 d\xi = \int_I \left| f'(\phi(\xi)) \phi'(\xi) \right|^2 d\xi \] 
(3.29)
\[ = \int_I \left| (1 - 3\phi^2(\xi)) \phi'(\xi) \right|^2 d\xi \leq C(1 + \| \phi \|_V^2) \| \phi \|_1^2. \]  
\[ \square \]
Lemma 3.9. Let $F : L^6(I, \mathbb{R}) \to H$ be the Nemytskii operator defined in Assumption 2.2. Then for any $\theta \in (0, 1)$ and $\eta \geq 1$ it holds
\begin{equation}
\|F'(\varsigma)\psi\|_\eta \leq C(1 + \max\{\|\varsigma\|_V, \|\varsigma\|_\theta\}^2)\|\psi\|_{\theta}, \quad \forall \varsigma \in V \cap \dot{H}^\theta, \psi \in V. \tag{3.30}
\end{equation}

Proof. Standard arguments with the Sobolev-Slobodeckij norm yields that
\begin{equation}
\|F'(\varsigma)v\|_\theta^2 \leq C\|F'(\varsigma)v\|^2 + C\int_0^1 \int_0^1 \frac{|f'(\varsigma(x))v(x) - f'(\varsigma(y))v(y)|^2}{|x - y|^{2\theta+1}} \, dy \, dx
\end{equation}
\begin{equation}
\leq C\|F'(\varsigma)v\|^2 + C\int_0^1 \int_0^1 \frac{|f'(\varsigma(x))v(x) - f'(\varsigma(y))v(y)|^2}{|x - y|^{2\theta+1}} \, dy \, dx
\end{equation}
\begin{equation}
+ C\int_0^1 \int_0^1 \frac{|f''(\varsigma(x))(v(x) - v(y))|^2}{|x - y|^{2\theta+1}} \, dy \, dx
\end{equation}
\begin{equation}
\leq C\|F'(\varsigma)v\|^2 + C\|f'(\varsigma(\cdot))\|^2_{W^\theta,2} \cdot \|v\|^2_{W^\theta,2} + C\|f''(\varsigma(\cdot))\|^2_{W^\theta,2} \cdot \|v\|^2_{W^\theta,2}
\end{equation}
\begin{equation}
\leq C\left(1 + \max\{\|\varsigma\|_V, \|\varsigma\|_\theta\}^2\right)(\|v\|^2_{\theta} + \|v\|_{\theta}^2).
\end{equation}

Accordingly, one can show that for $\varsigma \in V \cap \dot{H}^\theta$, $\psi \in V$,
\begin{equation}
\|F'(\varsigma)\psi\|_\eta = \sup_{\varphi \in \dot{H}} \frac{\langle A^{\frac{\theta}{2}}F'(\varsigma)\psi, \varphi \rangle}{\|\varphi\|} = \sup_{\varphi \in \dot{H}} \frac{\langle A^{\frac{\theta}{2}}\psi, A^{\frac{\theta}{2}}F'(\varsigma)A^{-\frac{\theta}{2}}\varphi \rangle}{\|\varphi\|}
\end{equation}
\begin{equation}
\leq \sup_{\varphi \in \dot{H}} \frac{\|\psi\|_{\theta}\|F'(\varsigma)A^{\frac{\theta}{2}}\varphi\|_{\theta}}{\|\varphi\|} \leq C\left(1 + \max\{\|\varsigma\|_V, \|\varsigma\|_\theta\}^2\right)\|\psi\|_{\theta}. \tag{3.32}
\end{equation}

This finishes the proof. ∎

Armed with the above preparatory results, we are now ready to obtain weak convergence rate for the spectral Galerkin method.

Theorem 3.10 (Spatial weak convergence rate). Suppose Assumptions 2.1, 2.4 and 3.3 are fulfilled. Let $X(t)$ and $X^N(t)$ be the mild solution of (2.1) and (3.2), respectively. Then for sufficiently small $\epsilon > 0$ and arbitrary test function $\Phi \in C^2_b(H, \mathbb{R})$ we have
\begin{equation}
\left|\mathbb{E}[\Phi(X(T))] - \mathbb{E}[\Phi(X^N(T))]\right| \leq C\lambda_N^{-\gamma+\epsilon}. \tag{3.33}
\end{equation}

Proof. Firstly, we denote $\bar{X}(t) := X(t) - O_t$ and $\bar{X}^N(t) := X^N(t) - O^N_t$. Then we can separate the weak error term $\mathbb{E}[\Phi(X(T))] - \mathbb{E}[\Phi(X^N(T))]$ as
\begin{equation}
\mathbb{E}[\Phi(X(T))] - \mathbb{E}[\Phi(X^N(T))] = \left(\mathbb{E}[\Phi(\bar{X}(T) + O_T)] - \mathbb{E}[\Phi(\bar{X}^N(T) + O_T)]\right)
\end{equation}
\begin{equation}
+ \left(\mathbb{E}[\Phi(\bar{X}^N(T) + O^N_T)] - \mathbb{E}[\Phi(\bar{X}^N(T) + O^N_T)]\right)
\end{equation}
\begin{equation}
=: I_1 + I_2. \tag{3.34}
\end{equation}
Next, we bound $|I_2|$ by the second-order Taylor expansion,

\[
|I_2| = \left| E\left[ \dot{\Phi}'(X^N(T))(O_T - O_T^N) \right] + \int_0^1 \dot{\Phi}''(X^N(T) + \lambda(O_T - O_T^N))(O_T - O_T^N, O_T - O_T^N)(1 - \lambda)d\lambda \right| 
\]

(3.35)

\[
\leq \left| E\left[ \dot{\Phi}'(X^N(T))(I - P_N)O_T \right] + C E\left[ \|O_T - O_T^N\|^2 \right] \right|
\]

By utilizing (2.15) and (3.1), we follow standard arguments to derive

\[
E\left[ \|O_T - O_T^N\|^2 \right] = E\left[ \|I - P_N\|O_T\|^2 \right] \leq C\lambda_N^{-\gamma}.
\]

(3.36)

Employing Proposition 3.7, the Malliavin integration by parts formula (2.25) and the chain rule of the Malliavin derivative enables us to obtain

\[
\left| E\left[ \dot{\Phi}'(X^N(T))(I - P_N)O_T \right] \right| = E\left\{ \langle (I - P_N)E(T - s), D_h \dot{\Phi}'(X^N(T)) \rangle \right\}_{L^2} ds
\]

\[
\leq E\int_0^T \|(I - P_N)A^{-\gamma+\epsilon}A\frac{1+\gamma}{2} - \epsilon E(T - s)A\frac{1}{2}\|_{L^2} \|\dot{\Phi}''(X^N(T))\|_{\mathcal{L}(H)}\|D_h X^N(T)\|_{L^2} ds
\]

\[
\leq C\int_0^T \|(I - P_N)A^{-\gamma+\epsilon}\|_{\mathcal{L}(H)}\|A\frac{1+\gamma}{2} - \epsilon E(T - s)\|_{\mathcal{L}(H)}\|A\frac{1}{2}Q\|_{\mathcal{L}(H)}(T - s)^{\frac{\gamma-1}{2}} ds
\]

\[
\leq C\lambda_N^{-\gamma+\epsilon} \int_0^T (T - s)^{-1+\epsilon} ds \leq C\lambda_N^{-\gamma+\epsilon}.
\]

(3.37)

At the moment, it remains to bound $|I_1|$. Since $\Phi \in C^2_b(H, \mathbb{R})$,

\[
|I_1| = \left| E\left[ \dot{\Phi}(\bar{X}(T) + O_T) \right] - E\left[ \dot{\Phi}(\bar{X}^N(T) + O_T) \right] \right|
\]

(3.38)

\[
\leq C E\left[ \|\bar{X}(T) - \bar{X}^N(T)\| \right] \leq C \|e_1(T)\|_{L^2(\Omega, H)} + C \|e_2(T)\|_{L^2(\Omega, H)},
\]

where

\[
e_1(T) := \bar{X}^N(t) - P_N\bar{X}(t) \quad \text{and} \quad e_2(t) := P_N\bar{X}(t) - \bar{X}(t).
\]

(3.39)

Owing to (2.19), it is easy to see,

\[
\left\| A^{\gamma-\epsilon} \bar{X}(T) \right\|_{L^2(\Omega, H)} \leq \left\| A^{\gamma-\epsilon} E(T)X_0 + \int_0^T A^{\gamma-\epsilon} E(T - s)F(X(s))ds \right\|_{L^2(\Omega, H)}
\]

(3.40)

\[
\leq C\left( \|X_0\| + \int_0^T (T - s)^{-\gamma+\epsilon} ds \sup_{s \in [0, T]} \|F(X(s))\|_{L^2(\Omega, H)} \right) < \infty.
\]

Then, the error term $\|e_2(T)\|_{L^2(\Omega, H)}$ can be easily controlled due to the regularity of $\bar{X}(T)$,

\[
\left\| e_2(T) \right\|_{L^2(\Omega, H)} = \left\| (P_N - I)A^{-\gamma+\epsilon} A^{\gamma-\epsilon} \bar{X}(T) \right\|_{L^2(\Omega, H)} \leq C\lambda_N^{-\gamma+\epsilon}.
\]

(3.41)
Finally, we turn to the error term $\|e_1(T)\|_{L^2(\Omega, H)}$, where $e_1(t)$ is differentiable with respect to $t$,
\[
\frac{d}{dt} e_1(t) = -A_N e_1(t) + P_N [F(\bar{X}^N(t) + \mathcal{O}_t^N) - F(\bar{X}(t) + \mathcal{O}_t)].
\] (3.42)

Therefore,
\[
\frac{d}{dt} \|e_1(t)\|^2 + 2 \langle e_1(t), A_N e_1(t) \rangle \\
= 2\langle F(\bar{X}^N(t) + \mathcal{O}_t^N) - F(P_N \bar{X}(t) + \mathcal{O}_t^N), e_1(t) \rangle + 2 \langle F(P_N X(t)) - F(X(t)), e_1(t) \rangle \\
\leq 2 \|e_1(t)\|^2 + \|A_N \frac{1}{2} (F(P_N X(t)) - F(X(t)))\|^2 + \|A_N^2 e_1(t)\|^2.
\] (3.43)

Then integrating over $[0, T]$ we get
\[
\|e_1(T)\|_{L^2(\Omega, H)}^2 \leq C \int_0^T \|e_1(t)\|_{L^2(\Omega, H)}^2 dt + C \int_0^T \|F(P_N X(t)) - F(X(t))\|_{L^2(\Omega, H^{-1})}^2 dt.
\] (3.44)

Based on the Taylor expansion, Lemmas 3.4, 3.9 and Hölder’s inequality we get
\[

\|F(P_N X(t)) - F(X(t))\|_{L^2(\Omega, H^{-1})} \\
\leq \int_0^1 \left\| F'(X(t) + \lambda (P_N X(t) - X(t))) (P_N X(t) - X(t)) \right\|_{L^2(\Omega, H^{-1})} d\lambda \\
\leq \left\{ 1 + \max \left\{ \|X(t)\|_{L^8(\Omega, V)}, \|P_N X(t)\|_{L^8(\Omega, V)}, \|X(t)\|_{L^8(\Omega, H^\gamma)} \right\} \right\} \|P_N X(t) - X(t)\|_{L^4(\Omega, H^{-\gamma + 2\epsilon})} \\
\leq C \|(P_N - I) A^{-\gamma + \epsilon} A_{\frac{1}{2}} X(t)\|_{L^4(\Omega, H)} \\
\leq C\lambda^{-\gamma + \epsilon} \|X(t)\|_{L^4(\Omega, H^\gamma)} \leq C\lambda^{-\gamma + \epsilon}.
\] (3.45)

Using Gronwall’s inequality one can arrive at
\[
\|e_1(T)\|_{L^2(\Omega, H)} \leq C\lambda^{-\gamma + \epsilon}.
\] (3.46)

This in combination with (3.34)-(3.41) completes the proof. \qed

**Corollary 3.11.** Under Assumptions 2.1, 2.4, 3.3 there exists a generic constant such that for any $N \in \mathbb{N}$ and $\gamma \in (0, 1]$,
\[
\sup_{t \in [0, T]} \|X(t) - X^N(t)\|_{L^2(\Omega, H)} \leq C\lambda^{-\frac{\gamma}{2}}.
\] (3.47)

**Proof.** By (3.36), (3.46), (3.41) and the triangle inequality, we deduce
\[
\|X(t) - X^N(t)\|_{L^2(\Omega, H)} \leq \|\bar{X}(t) - \bar{X}^N(t)\|_{L^2(\Omega, H)} + \|\mathcal{O}_t - \mathcal{O}_t^N\|_{L^2(\Omega, H)} \leq C\lambda^{-\frac{\gamma}{2}},
\] (3.48)
as required. \qed
4 Error estimates for the full discretization

In this section, we turn our attention to the strong and weak convergence analysis for a spatio-temporal full discretization. A uniform mesh is constructed on $[0,T]$ with the time stepsize $\tau = \frac{T}{M}$ and we denote the nodes $t_m = m\tau$ for $m \in \{1, \ldots, M\}, M \in \mathbb{N}$. Before introducing the full discretization, we need the following notation:

$$[t]_\tau := t_i \quad \text{for} \quad t \in [t_i, t_{i+1}), \quad \Delta W_i = W(t_{i+1}) - W(t_i), \quad i \in \{0, 1, \ldots, M-1\}. \quad (4.1)$$

Based on the spatial semi-discretization (3.2), we propose a tamed exponential Euler scheme,

$$X_{t_{m+1}}^{M,N} = E_N(\tau)X_{t_m}^{M,N} + \frac{\tau E_N(\tau)P_N F(X_{t_m}^{M,N})}{1+\|P_N F(X_{t_m}^{M,N})\|} + E_N(\tau)P_N \Delta W_m. \quad (4.2)$$

Particularly, we pay more attention to its continuous version,

$$X_t^{M,N} = E_N(t)X_0^{M,N} + \int_0^t \frac{E_N(t-[s]_\tau)P_N F(X_s^{M,N})}{1+\|P_N F(X_s^{M,N})\|} \, ds + \int_0^t E_N(t-[s]_\tau)P_N dW(s), \quad (4.3)$$

where $X_t^{M,N}$ is $\mathcal{F}_t$-adapted random variable. Likewise, we denote $O_t^{M,N} := \int_0^t E_N(t-[s]_\tau)P_N dW(s)$ for convenience. The following lemma is concerned with the spatial regularity of $O_t^{M,N}$. 

**Lemma 4.1.** Suppose Assumptions 2.1 and 2.3 are satisfied, then for any $p \geq 2$ the discreted stochastic convolution $\{O_t^{M,N}\}_{t \in [0,T]}$ satisfies

$$\sup_{t \in [0,T], M,N \in \mathbb{N}} \|O_t^{M,N}\|_{L^p(\Omega, V)} < \infty. \quad (4.4)$$

**Proof.** In the case $\gamma \in (\frac{1}{2}, 1]$, the assertion follows easily thanks to the Sobolev embedding inequality. For $\gamma \in (0, \frac{1}{2}]$, let $\beta_i : [0, T] \times \Omega \to \mathbb{R}$ be a family of independent standard Brownian motions and $\{q_i, e_i\}_{i \in \mathbb{N}}$ be the eigenpairs of covariance operator $Q$. Here $\{e_i\}_{i \in \mathbb{N}}$ is also the eigenfunction of $A$ as $A$ and $Q$ commute by assumption. Then we have $W(t) = \sum_{i \in \mathbb{N}} \sqrt{q_i} \beta_i(t) e_i$. Using (2.13) and the Burkholder-Davis-Gundy inequality yields

$$\mathbb{E}[|O_{t}^{M,N}(x) - O_{t}^{M,N}(y)|^2] \leq \sum_{i \in \mathbb{N}} q_i \mathbb{E} \left[ \left| \int_0^t e^{-\lambda_i(t-[s]_\tau)}d\beta_i(s) \right|^2 \right] |e_i(x) - e_i(y)|^2 \leq C \sum_{i \in \mathbb{N}} q_i \lambda_i^{-1} t^{2\gamma} (|x-y|^{2\gamma} + |e_i(y)|)^{2(1-\gamma)} \leq C\|A^{\frac{\gamma-1}{2}} Q^{\frac{1}{2}}\|_{L_2}^2 (x-y)^{2\gamma} \leq C|x-y|^{2\gamma}, \quad \forall x, y \in \mathcal{I}. \quad (4.5)$$

Taking $y = 0$ in (4.5) yields

$$\mathbb{E}[|O_{t}^{M,N}(x)|^2] < \infty. \quad (4.6)$$
Letting $p > \frac{2}{\gamma}$ for $\gamma \in (0, \frac{1}{2}]$ and employing the Sobolev embedding inequality $V \subset W_2^{2p}$ give

$$
E \left[ \left\| O_t^{M,N} \right\|_V^p \right] \leq C \int_0^1 \int_0^1 \frac{E \left[ \left\| O_t^{M,N}(x) - O_t^{M,N}(y) \right\|_V^p \right]}{|x-y|^{2p+1}} \, dx \, dy
$$

\[ \leq C \int_0^1 \int_0^1 \frac{E \left[ \left\| O_t^{M,N}(x) - O_t^{M,N}(y) \right\|_V^p \right]}{|x-y|^{2p+1}} \, dx \, dy \]

\[ \leq C \left( 1 + \int_0^1 \int_0^1 |x-y|^{-2p} \, dx \, dy \right) < \infty. \]  

(4.7)

This completes the proof. \qed

### 4.1 Moment bounds for the full discretization

In the sequel, a certain bootstrap argument will be applied to obtain a priori moment estimate for the full discretization. In order to show it, we construct a sequence of decreasing subevents,

$$
\Omega_{B,t_i} := \{ \omega \in \Omega : \sup_{j \in \{0,1,...,i\}} \| X_{t_j}^{M,N}(\omega) \|_V \leq B \}, \text{ for } B \in (0, \infty), i \in \{0,1,...,M\}. \quad (4.8)
$$

For brevity, we denote $\Omega^c$ and $\chi^c$ the complement and indicator function of a set $\Omega$, respectively. It is easy to confirm that $\chi_{\Omega_{B,t_i}}$ is $\mathcal{F}_{t_i}$ adapted and $\chi_{\Omega_{B,t_i}} \leq \chi_{\Omega_{B,t_j}}$ for $t_i \geq t_j$.

**Lemma 4.2.** Let Assumptions 2.1-2.4, 3.3 hold and let $p \in [2, \infty)$, $B_\tau := \tau^{-\frac{\gamma}{15}}$ for $\gamma \in (0,1]$ coming from (2.13). Then the numerical approximations $X_{t_i}^{M,N}, i \in \{0,1,...,M\}$ satisfy

$$
\sup_{M,N \in \mathbb{N}} \sup_{i \in \{0,1,...,M\}} \mathbb{E} \left[ \chi_{\Omega_{B_{\tau},t_i-1}} \| X_{t_i}^{M,N} \|_V^p \right] < \infty, \quad (4.9)
$$

where we set $\chi_{\Omega_{B_{\tau},t-1}} = 1$.

**Proof.** Firstly we introduce a process $Z_{t}^{M,N}$, defined by

$$
Z_{t}^{M,N} := E_N(t)X_{0}^{M,N} + \int_0^t \frac{E_N(t-|s|_{\tau}) P_N F(X_{|s|_{\tau}}^{M,N})}{1+\tau P_N F(X_{|s|_{\sigma}}^{M,N})} - E_N(t-s) P_N F(X_{s}^{M,N}) ds + \int_0^t E_N(t-|s|_{\tau}) P_N dW(s).
$$

With this and the continuous version of the full discretization (4.3) we have

$$
X_{t}^{M,N} = Z_{t}^{M,N} + \int_0^t E_N(t-s) P_N F(X_{s}^{M,N}) ds =: Z_{t}^{M,N} + \hat{X}_{t}^{M,N} \quad \text{with} \quad \hat{X}_{0}^{M,N} = 0, \quad (4.10)
$$

where $\hat{X}_{t}^{M,N} = \int_0^t E_N(t-s) P_N F(\hat{X}_{s}^{M,N} + Z_{s}^{M,N}) ds$ obeys

$$
d_{d} \hat{X}_{t}^{M,N} = -A_N \hat{X}_{t}^{M,N} + P_N F(\hat{X}_{t}^{M,N} + Z_{t}^{M,N}), \quad \hat{X}_{0}^{M,N} = 0.
$$

16
We apply Proposition 3.2 to derive that for any \( i \in \{1, 2, \ldots, M\}, \)
\[
\mathbb{E}\left[ \chi_{\Omega_{B_r,t_i-1}} \| \hat{X}_{t_i}^{M,N} \|^p \right] \leq C \left( 1 + \mathbb{E}\left[ \chi_{\Omega_{B_r,t_i-1}} \| Z_p^{M,N} \|^p_{L^p(I \times [0,t_i])} \right] \right)
\leq C \left( 1 + \mathbb{E}\left[ \chi_{\Omega_{B_r,t_i-1}} \int_0^{t_i} \| Z_s^{M,N} \|^p \right] \right). \tag{4.11}
\]

For \( s \in [0, t_i], i \in 0, 1, \ldots, M \), one can separate the integrand into several parts:
\[
\chi_{\Omega_{B_r,t_i-1}} \| Z_s^{M,N} \| \leq \| E_{N}(s) X_0^{M,N} \| + \int_0^{s} E_{N}(s - |r| \tau) P_N dW(r) \Bigg|_V
\]
\[
+ \chi_{\Omega_{B_r,t_i-1}} \int_0^{s} \frac{E_{N}(s - \lfloor r \rfloor \tau) P_N F(X_{\lfloor r \rfloor \tau}^{M,N})}{1 + \tau \| P_N F(X_{\lfloor r \rfloor \tau}^{M,N}) \|} - E_{N}(s - r) P_N F(X_{r}^{M,N}) dr \Bigg|_V
\]
\[
\leq \| E_{N}(s) X_0^{M,N} \| + \int_0^{s} E_{N}(s - |r| \tau) P_N dW(r) \Bigg|_V
\]
\[
+ \chi_{\Omega_{B_r,t_i-1}} \int_0^{s} \frac{E_{N}(s - \lfloor r \rfloor \tau) P_N F(X_{\lfloor r \rfloor \tau}^{M,N})}{1 + \tau \| P_N F(X_{\lfloor r \rfloor \tau}^{M,N}) \|} - E_{N}(s - \lfloor r \rfloor \tau) P_N F(X_{\lfloor r \rfloor \tau}^{M,N}) dr \Bigg|_V
\]
\[
+ \chi_{\Omega_{B_r,t_i-1}} \int_0^{s} E_{N}(s - |r| \tau) P_N F(X_{r}^{M,N}) - E_{N}(s - \lfloor r \rfloor \tau) P_N F(X_{\lfloor r \rfloor \tau}^{M,N}) dr \Bigg|_V
\]
\[
= \| E_{N}(s) X_0^{M,N} \| + \int_0^{s} E_{N}(s - |r| \tau) P_N dW(r) \Bigg|_V + J_1 + J_2 + J_3. \tag{4.12}
\]

The first term \( J_1 \) can be easily estimated according to the Sobolev embedding theorem,
\[
J_1 \leq \chi_{\Omega_{B_r,t_i-1}} \int_0^{s} \tau \cdot \| E_{N}(s - |r| \tau) P_N F(X_{\lfloor r \rfloor \tau}^{M,N}) \| \cdot \| P_N F(X_{\lfloor r \rfloor \tau}^{M,N}) \| dr
\]
\[
\leq \chi_{\Omega_{B_r,t_i-1}} \tau \int_0^{s} (s - |r| \tau)^{\frac{1}{2}} \cdot \| P_N F(X_{\lfloor r \rfloor \tau}^{M,N}) \|^2 dr \tag{4.13}
\]
\[
\leq C\tau \left( (B_r)^6 + 1 \right) \leq C \left( \tau^{1 - \frac{2\gamma}{3}} + \tau \right) \leq C.
\]

Before proceeding further, by the same argument used in [36], we can show that for \( r \in [0, t_i] \), \( \| X_r^{M,N} \|_V \) can be bounded on the subevent \( \Omega_{B_r,t_i-1}, \)
\[
\chi_{\Omega_{B_r,t_i-1}} \| X_r^{M,N} \| \leq C \left( 1 + B_r + \tau^{\frac{3}{2}} (B_r)^3 \right), \quad \forall r \in [0, t_i]. \tag{4.14}
\]
In order to deal with the third term $J_3$, we again use the Sobolev embedding inequality to infer,

\[
\begin{align*}
J_3 &\leq \chi_{B_r,t_{i-1}} \int_0^s \left\| E_N(s-r)[E_N(r-[r]_\tau) - I]P_N F(X_r^{M,N}) \right\|_V dr \\
&\leq C \cdot \chi_{B_r,t_{i-1}} \int_0^s \left\| A^{\frac{3}{4}} E(s-r) A^{-\frac{1}{4}} [E(r-[r]_\tau) - I]P_N F(X_r^{M,N}) \right\|_V dr \\
&\leq C \cdot \chi_{B_r,t_{i-1}} \int_0^s (s-r)^{-\frac{2}{3}} \cdot \tau^{\frac{1}{4}} \cdot \|F(X_r^{M,N})\|_V dr \\
&\leq C \cdot \tau^{\frac{1}{4}} \cdot (1 + (B_r)^3 + \tau^\frac{9}{4}(B_r)^9) \leq C.
\end{align*}
\tag{4.15}
\]

Putting these estimates together we can deduce from (4.12) that for any $s \in [0, t_i]$,

\[
\mathbb{E}\left[ \left\| Z_{M,N}^{M,N} \right\|_V^{9p} \right] < \infty.
\tag{4.17}
\]

The desired assertion is thus verified by taking (4.10) and (4.11) into account.

By use of the Markov inequality, we follow the same way in [36, Theorem 4.5] to obtain the moment bound for the full discretization.

**Theorem 4.3** (A priori moment bound). Under Assumptions 2.1-2.4, 3.3, for any $p \geq 2$ it holds,

\[
\sup_{M,N \in \mathbb{N}} \sup_{t \in [0,T]} \mathbb{E}\left[ \left\| X_{t_{M,N}} \right\|_V^p \right] < \infty.
\tag{4.18}
\]

Following the same arguments as used in [29, Lemma 3.4] with $1 + r = \gamma$ and $G = I$ and by the aid of Parseval’s identity, we can easily obtain the following useful result.

**Lemma 4.4.** Let $\alpha \in [0, \gamma]$ and $p \geq 2$. Then for all $s, t \in [0, T]$ with $s < t$ it holds

\[
\left\| \int_s^t E(t-[r]_\tau) dW(r) \right\|_{L^p(\Omega, H^\alpha)} \leq C (t-s)^{\gamma-\alpha/2}. \tag{4.19}
\]

Based on the above facts, it is easy to validate the forthcoming regularity estimates.

**Corollary 4.5.** Under Assumptions 2.1-2.4, 3.3 for any $p \geq 2$ it holds

\[
\sup_{M,N \in \mathbb{N}, t \in [0,T]} \mathbb{E}\left[ \left\| X_t^{M,N} \right\|_V^p \right] + \sup_{M,N \in \mathbb{N}, t \in [0,T]} \mathbb{E}\left[ \left\| X_t^{M,N} \right\|_H^p \right] < \infty.
\tag{4.20}
\]

Furthermore, for $0 \leq s < t \leq T$,

\[
\left\| X_t^{M,N} - X_s^{M,N} \right\|_{L^p(\Omega, H)} \leq C(t-s)^{\gamma/2}. \tag{4.21}
\]
Corollary 4.6. Under Assumptions [2.4, 3.3] for any $p \geq 2$ and sufficient small $\epsilon > 0$ we obtain
\[
\sup_{M,N \in \mathbb{N}, m \in \{1, \ldots, M\}} \|X_{t_m}^{M,N}\|_{L^p(\Omega, \mathcal{H}^1)} \leq C + C\tau^{-1+\gamma-\epsilon/2}.
\] (4.22)

Proof. Firstly, we recall the continuous version of the fully discrete scheme
\[
X_t^{M,N} = E_N(t)X_0^{M,N} + \int_0^t E_N(t - [s]_\tau)P_NF(X_{[s]_\tau}^{M,N})\frac{dW(s)}{1+\|P_NF(X_{[s]_\tau}^{M,N})\|_{L^p(\Omega, \mathcal{H})}} + \int_0^t E_N(t - [s]_\tau)P_NdW(s),
\] (4.23)
which combined with (2.6), properties of nonlinearities and Theorem 4.3 yields
\[
\|X_{t_m}^{M,N}\|_{L^p(\Omega, \mathcal{H}^1)} \leq \|E_N(t_m)X_0^{M,N}\|_1 + \int_0^{t_m} \|E_N(t_m - [s]_\tau)P_NF(X_{[s]_\tau}^{M,N})\|_{L^p(\Omega, \mathcal{H}^1)}\,ds
\]
\[+ \left(\int_0^{t_m} \|A^{1/2}E_N(t_m - [s]_\tau)\|_{L^p(\Omega, \mathcal{E}^p)}^2\,ds\right)^{1/2}
\leq C\tau^{-1/2} + C\int_0^{t_m} (t_m - [s]_\tau)^{-1/2}ds \sup_{s \in [0,T]} \|P_NF(X_{[s]_\tau}^{M,N})\|_{L^p(\Omega, \mathcal{H})}
\]
\[+ \left(\int_0^{t_m} \|A^{1/2}E_N(t_m - [s]_\tau)\|_{L^p(H)}^2\|A^{-1/2}Q^{1/2}\|_{L^2(H)}^2&s\right)^{1/2}
\leq C\tau^{-1/2} + C + C\tau^{-1+\gamma-\epsilon/2}\left(\int_0^{t_m} (t_m - [s]_\tau)^{-1+\epsilon}ds\right)^{1/2}
\leq C + C\tau^{-1+\gamma-\epsilon/2},
\]
where we used the fact $t_m - [s]_\tau \geq \tau$ for $0 \leq s < t_m$. \qed

4.2 Weak convergence rate for the full discretization

In order to carry out the error analysis, we similarly introduce the continuous process
\[
\bar{X}_t^{M,N} := X_t^{M,N} - O_t^{M,N} = E_N(t)X_0^{M,N} + \int_0^t E_N(t - [s]_\tau)P_NF(X_{[s]_\tau}^{M,N} + O_{[s]_\tau}^{M,N})\frac{dW(s)}{1+\|P_NF(X_{[s]_\tau}^{M,N} + O_{[s]_\tau}^{M,N})\|_{L^p(\Omega, \mathcal{H})}}\,ds.
\] (4.25)

The next lemma is essentially used in the weak error analysis.

Lemma 4.7. Let Assumptions [2.4, 2.5] hold. For any $0 \leq \beta \leq 1$ and $p \geq 2$ it holds that,
\[
\|O_s - O_s^{M,N}\|_{L^p(\Omega, \mathcal{H}^{1-\beta})} \leq C\tau^{\gamma+\beta-\epsilon/2} + C\lambda_N^{-\gamma-\beta/2}.
\] (4.26)

Proof. Using the triangle inequality gives
\[
\mathbb{E}[\|O_s - O_s^{M,N}\|_{-\beta}^p] \leq C\mathbb{E}[\|(I - P_N)O_s\|_{-\beta}^p] + C\mathbb{E}[\|P_NO_s - O_s^{M,N}\|_{-\beta}^p].
\] (4.27)
Thanks to (2.15) and (3.1), it suffices to show in detail the estimate of the second term. By (2.6), (2.13) and the Burkholder-Davis-Gundy inequality, we can show

\[
\mathbb{E}[\|P_N\mathcal{O}_s - \mathcal{O}^{M,N}_s\|_{\mathbb{L}_2}^p]
\]

\[
\leq C\left(\int_0^s \|A^{-\frac{\beta}{2}}E_N(s-r)(I-E_N(r-[r]_\tau))\|_{\mathbb{L}_2}^2 dr\right)^{\frac{p}{2}}
\]

\[
\leq C\left(\int_0^s \|A^{\frac{1+\epsilon}{2}}E_N(s-r)\|_{\mathbb{L}(H)}^2 \|A^{-\frac{\beta-\gamma+\epsilon}{2}}(I-E_N(r-[r]_\tau))\|_{\mathbb{L}(H)}^2 \|A^{\frac{1-\epsilon}{2}}Q_2\|_{\mathbb{L}_2(H)}^2 dr\right)^{\frac{p}{2}}
\]

\[
\leq C\left(\tau^{\gamma+\beta-\epsilon} \int_0^s (s-r)^{-\beta+\epsilon} dr\right)^{\frac{p}{2}} \leq C \tau^{(\gamma+\beta-\epsilon)p/2}.
\]

(4.28)

\]

Equipped with the previous preparation, we are now ready to prove the expected weak error.

**Theorem 4.8** (Weak convergence rate for the full discretization). **Under Assumptions** 2.1-2.4 **and 3.3** it holds that, for any \( M, N \in \mathbb{N} \) and \( \Phi \in C^2_b(H,\mathbb{R}) \),

\[
\mathbb{E}[\Phi(X(T))] - \mathbb{E}[\Phi(X^{M,N}_T)] \leq C (\lambda_N^{-\gamma+\epsilon} + \tau^{\gamma-\epsilon}).
\]

(4.29)

**Proof.** Due to Theorem 3.10 it suffices to handle the term \( \mathbb{E}[\Phi(X^N(T))] - \mathbb{E}[\Phi(X^{M,N}_T)] \), which can be separated as follows,

\[
\mathbb{E}[\Phi(X^N(T))] - \mathbb{E}[\Phi(X^{M,N}_T)] = \left(\mathbb{E}[\Phi(X^N(T) + \mathcal{O}_T^N)] - \mathbb{E}[\Phi(X^N(T) + \mathcal{O}^{M,N}_T)]\right) + \left(\mathbb{E}[\Phi(X^N(T) + \mathcal{O}^{M,N}_T)] - \mathbb{E}[\Phi(X^{M,N}_T + \mathcal{O}^{M,N}_T)]\right).
\]

(4.30)

\[
=: K_1 + K_2.
\]

We bound \( K_1 \) by the second-order Taylor expansion and Malliavin integration by parts formula,

\[
|K_1| = \left|\mathbb{E}\left[\Phi'(X^N(T))(\mathcal{O}^{M,N}_T - \mathcal{O}_T^N)\right.\right.
\]

\[
+ \left.\int_0^1 \Phi''(X^N(T) + \lambda(\mathcal{O}^{M,N}_T - \mathcal{O}_T^N))(\mathcal{O}^{M,N}_T - \mathcal{O}^N_T, \mathcal{O}^{M,N}_T - \mathcal{O}_T^N)(1-\lambda)d\lambda\right]\right|
\]

\[
\leq C \left|\mathbb{E}\left\langle E_N(T-s) - E_N(T-[s]_\tau), \mathcal{D}_s \Phi(X^N(T))\right\rangle_{\mathbb{L}_2^2}\right| + C \mathbb{E}\left[\|\mathcal{O}^{M,N}_T - \mathcal{O}_T^N\|^2\right].
\]

(4.31)

For the second term, we derive from (4.28) that

\[
\mathbb{E}\left[\|\mathcal{O}^{M,N}_T - \mathcal{O}_T^N\|^2\right] \leq C \tau^{\gamma-\epsilon}.
\]

(4.32)
Employing (2.6), (2.13), Lemma 3.7 and the chain rule enables us to obtain
\[
\mathbb{E} \int_0^T \left\langle E_N(T - s) - E_N(T - [s]_{\tau}), \mathcal{D}_t \Phi'(X^N(T)) \right\rangle d\tau \leq \mathbb{E} \int_0^T \|E_N(T - s) - E_N(T - [s]_{\tau})\|_{L_2^0} \|\Phi''(X^N(T)) \mathcal{D}_t X^N(T)\|_{L_2^0} ds
\]
\[
\leq C \int_0^T \|E_N(T - s)(I - E_N(s - [s]_{\tau}))\|_{L_2^0} \cdot (T - s)^{-1/2} ds
\]
\[
\leq C \tau^{\gamma - \epsilon} \int_0^T (T - s)^{-1+\epsilon} ds \leq C \tau^{\gamma - \epsilon}.
\]

Now it remains to bound $K_2$, which can be done by estimating $\|\bar{X}^{M,N}_T - \bar{X}^N(T)\|_{L^2(\Omega, H)}$. To this end, we define $\Lambda^{M,N}(t) := \bar{X}^{M,N}_t - \bar{X}^N(t)$, which is differentiable with respect to $t$ and
\[
\frac{d}{dt} \Lambda^{M,N}(t) = -A_N \Lambda^{M,N}(t) + P_N \left[ \frac{E(t-[t]_{\tau}) F(X^N_{[t]_{\tau}})}{1+\tau \|P_N F(X^N_{[t]_{\tau}})\|} - F(\bar{X}^N(t) + \mathcal{O}^N_t) \right].
\]

Using the Newton-Leibniz formula and then integrating over $[0,T]$ promise
\[
\frac{1}{2} \|\Lambda^{M,N}(T)\|^2 = \int_0^T \langle \Lambda^{M,N}(t), -A_N \Lambda^{M,N}(t) \rangle dt
\]
\[
+ \int_0^T \left\langle \Lambda^{M,N}(t), \frac{E(t-[t]_{\tau}) F(X^N_{[t]_{\tau}})}{1+\tau \|P_N F(X^N_{[t]_{\tau}})\|} - E(t-[t]_{\tau}) F(X^N_{[t]_{\tau}}) \right\rangle dt
\]
\[
+ \int_0^T \left\langle \Lambda^{M,N}(t), (E(t-[t]_{\tau}) - I) F(X^N_{[t]_{\tau}}) \right\rangle dt
\]
\[
+ \int_0^T \left\langle \Lambda^{M,N}(t), F(X^N_{[t]_{\tau}}) - F(X^N(t)) \right\rangle dt
\]
\[
+ \int_0^T \left\langle \Lambda^{M,N}(t), F(\bar{X}^N(t) + \mathcal{O}^N_t) - F(\bar{X}^N(t) + \mathcal{O}^N_t) \right\rangle dt
\]
\[
=: K_{21} + K_{22} + K_{23} + K_{24} + K_{25} + K_{26}.
\]

Based on the fact that $A$ is self-adjoint, we have
\[
\mathbb{E}[K_{21}] = \mathbb{E} \int_0^T \langle \Lambda^{M,N}(t), -A \Lambda^{M,N}(t) \rangle dt = -\mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|^2 dt.
\]
Applying Theorem 4.3 and Young’s inequality yields that

\[
\mathbb{E}[K_{22}] = \mathbb{E} \int_0^T \langle \Lambda^{M,N}(t), -\tau \|P_N F(X^{M,N}_{[t],[t]\tau})\| E(t - [t],[t]\tau)\rangle dt \\
\leq C \mathbb{E} \int_0^T \left( \|\Lambda^{M,N}(t)\|^2 + \tau^2 \|E(t - [t],[t]\tau)\|^2_{\mathbb{E}} \|F(X^{M,N}_{[t],[t]\tau})\|^4 \right) dt \\
\leq C \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|^2 dt + C \tau^2.
\]

(4.37)

To bound \(K_{23}\), we employ Lemma 3.8 Corollary 4.6 the regularity of \(X^{M,N}_t\),

\[
\mathbb{E}[K_{23}] \leq \frac{1}{4} \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|^2 dt + C \tau^2 + C \mathbb{E} \int_{\tau}^T \left( \|A^{-1}(E(t - [t],[t]\tau) - I)A^{22} F(X^{M,N}_{[t],[t]\tau})\|^2 \right) dt \\
\leq \frac{1}{4} \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|^2 dt + C \tau^2 + C \mathbb{E} \int_{\tau}^T \left( 1 + \|X^{M,N}_{[t],[t]\tau}\|_t^4 \right) \|X^{M,N}_{[t],[t]\tau}\|^2 dt \\
\leq \frac{1}{4} \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|^2 dt + C \tau^2 (1 + \tau^{-1+\gamma-\epsilon}) \\
\leq \frac{1}{4} \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|^2 dt + C \tau^{1+\gamma-\epsilon}.
\]

(4.38)

We skip the estimate of \(E[K_{24}]\) and leave it later. By the monotonicity condition (2.9) we obtain the estimate of \(E[K_{25}]\) as follows,

\[
\mathbb{E}[K_{25}] = \mathbb{E} \int_0^T \langle \Lambda^{M,N}(t), F(\bar{X}^{M,N}_t + O^{M,N}_t) - F(\bar{X}^{N}_t + O^{M,N}_t) \rangle dt \leq \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|^2 dt.
\]

(4.39)

Thanks to moment bounds and regularity of \(O^{M,N}_t\) and \(X^{N}_t\), we use Lemmas 3.9 4.7 to show

\[
\mathbb{E}[K_{26}] \leq \frac{1}{4} \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|_1^2 dt + C \mathbb{E} \int_0^T \left( \|F(\bar{X}^{N}_t + O^{M,N}_t) - F(\bar{X}^{N}_t + O^{N}_t)\|_{-1}\right)^2 dt \\
\leq \frac{1}{4} \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|_1^2 dt + C \sup_{t \in [0,T]} \left( \mathbb{E} \left[ \|O^{M,N}_t - O^{N}_t\|^{4}_{\gamma+\epsilon} \right] \right)^{\frac{1}{2}} \\
\leq \frac{1}{4} \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|_1^2 dt + C \tau^{2\gamma-2\epsilon}.
\]

(4.40)

Finally, we turn to the estimate of \(K_{24}\), which is the most difficult term in the weak convergence analysis. With the aid of the Taylor expansion, we have

\[
F(X^{M,N}_t) - F(X^{M,N}_{[t],[t]\tau}) = F'(X^{M,N}_{[t],[t]\tau}) \left( E(t - [t],[t]\tau) - I \right) X^{M,N}_{[t],[t]\tau} + F'(X^{M,N}_{[t],[t]\tau}) \int_{[t],[t]\tau}^t E(t - [s],[s]\tau) d W(s) + R_F,
\]

(4.41)
Using this we separate $K_{24}$ into four parts:

$$
\mathbb{E}[K_{24}] = \mathbb{E} \int_0^T \left< \Lambda^{M,N}(t), F'(X^{M,N}_{[t]_t}) \right> \left< E(t - [t]_\tau) - I \right> X^{M,N}_{[t]_t} dt
+ \mathbb{E} \int_0^T \left< \Lambda^{M,N}(t), F'(X^{M,N}_{[t]_t}) \right> \int_{[t]_t}^t \frac{E(t-[s]_\tau)F(X^{M,N}_{[s]_t})}{1+\|F(X^{M,N}_{[s]_t})\|} ds dt
+ \mathbb{E} \int_0^T \left< \Lambda^{M,N}(t), F'(X^{M,N}_{[t]_t}) \right> \int_{[t]_t}^t E_N(t-[s]_\tau) dW(s) dt
+ \mathbb{E} \int_0^T \left< \Lambda^{M,N}(t), R_F \right> dt
=: K_{241} + K_{242} + K_{243} + K_{244}.
$$

(4.42)

For the first term $K_{241}$, using (2.6), Lemma 3.9, Corollary 4.5 and Hölder’s inequality, we infer

$$
K_{241} = \mathbb{E} \int_0^T \left< \Lambda^{M,N}(t), F'(X^{M,N}_{[t]_t}) \right> \left< E(t - [t]_\tau) - I \right> X^{M,N}_{[t]_t} dt
= \mathbb{E} \int_0^T \left< A^{1/2} \Lambda^{M,N}(t), A^{-1/2} F'(X^{M,N}_{[t]_t}) \right> \left< E(t - [t]_\tau) - I \right> A^{-\gamma/2} A^{\gamma/2} X^{M,N}_{[t]_t} dt
\leq \frac{1}{4} \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|^2 dt + C \tau^{2\gamma-\epsilon}.
$$

(4.43)

Utilizing the Cauchy-Schwarz inequality and moment bounds of the numerical solutions yields

$$
K_{242} \leq C \mathbb{E} \int_0^T \|\Lambda^{M,N}(t)\|^2 dt + C \tau^2.
$$

(4.44)

We are now in the position to estimate $K_{243}$. Note first that

$$
K_{243} = \mathbb{E} \int_0^T \left< \Lambda^{M,N}(t), F'(X^{M,N}_{[t]_t}) \right> \int_{[t]_t}^t E_N(t-[s]_\tau) dW(s) dt
= \mathbb{E} \int_0^T \left< \Lambda^{M,N}(t) - \Lambda^{M,N}([t]_\tau), F'(X^{M,N}_{[t]_t}) \right> \int_{[t]_t}^t E_N(t-[s]_\tau) dW(s) dt,
$$

(4.45)

where

$$\Lambda^{M,N}(t) - \Lambda^{M,N}([t]_\tau) = \left< E_N(t-[t]_\tau) - I \right> \Lambda^{M,N}([t]_\tau)
+ \int_{[t]_t}^t \left< E(t-[s]_\tau) \frac{P_N F(X^{M,N}_{[s]_t})}{1+\|P_N F(X^{M,N}_{[s]_t})\|} - E_N(t-s) F(X^N(s)) \right> ds.
$$

(4.46)

23
Inserting (4.46) into (4.45) and using (2.6), (2.13), (2.10), Corollaries 3.6, 4.5, Lemma 4.4 as well as the properties of stochastic integrals, we arrive at

\[
K_{243} = \mathbb{E} \int_0^T \left\langle \int_{[t, \tau]} -E_N(t - s)F(X_N^N(s))ds, F'(X_{[t, \tau]}^M) \int_{[t, \tau]} E_N(t - [s, \tau])dW(s) \right\rangle dt
\]

\[
= \mathbb{E} \int_0^T \left\langle \int_{[t, \tau]} E_N(t - s)\left[ F(X_N^N([t, \tau])) - F(X_N^N(s)) \right] ds, F'(X_{[t, \tau]}^M) \int_{[t, \tau]} E_N(t - [s, \tau])dW(s) \right\rangle dt
\]

\[
\leq \int_0^T \left( \int_{[t, \tau]} \| F(X_N^N([t, \tau])) - F(X_N^N(s)) \|_{L^2(\Omega, H)}^2 ds \right)
\times \left\| F'(X_{[t, \tau]}^M) \int_{[t, \tau]} E_N(t - [s, \tau])dW(s) \right\|_{L^2(\Omega, H)} dt
\]

\[
\leq C \tau^{1+\gamma}.
\]

(4.47)

Finally, by the Sobolev embedding theorem, (2.12), (4.21) and Corollary 4.5 we can easily get

\[
K_{244} \leq \frac{1}{4} \mathbb{E} \int_0^T \| \Lambda_{M,N}(t) \|_1^2 dt + C \tau^{2\gamma}.
\]

(4.48)

Therefore,

\[
\mathbb{E}[K_{24}] \leq C \mathbb{E} \int_0^T \| \Lambda_{M,N}(t) \|_1^2 dt + \frac{1}{2} \mathbb{E} \int_0^T \| \Lambda_{M,N}(t) \|_1^2 dt + C \tau^{2\gamma-\epsilon}.
\]

(4.49)

Putting together estimates of $K_{21}, K_{22}, K_{23}, K_{24}, K_{25}$ and $K_{26}$, and using Gronwall’s inequality, one can obtain that

\[
\mathbb{E}[\| \Lambda_{M,N}(T) \|_1^2] \leq C \tau^{2\gamma-\epsilon}.
\]

(4.50)

This completes the proof.  

Also, we get the strong convergence rate of full discretization as follows.

**Corollary 4.9.** Under Assumptions 2.1, 2.4 and 3.3, there exists a generic constant $C$ such that for any $M,N \in \mathbb{N}$,

\[
\sup_{t \in [0,T]} \| X(t) - X_{t}^M \|_{L^2(\Omega, H)} \leq C \left( \frac{\gamma}{N} + \frac{\gamma}{2} \right).
\]

(4.51)

5 **Numerical experiments**

We perform some numerical experiments in this section to visually confirm our theoretical conclusion. To this end, we focus on a stochastic Allen-Cahn equation driven by additive Q-wiener process in one space dimension,

\[
\begin{aligned}
\frac{\partial v}{\partial t}(t, x) &= \frac{\partial^2 v}{\partial x^2}(t, x) - v^3(t, x) + v(t, x) + \dot{W}(t, x), \quad (t, x) \in (0, 1) \times (0, 1), \\
v(0, x) &= \sin(\pi x), \quad x \in (0, 1), \\
v(t, 0) &= v(t, 1) = 0, \quad t \in (0, 1).
\end{aligned}
\]

(5.1)
Here \( \{W(t)\}_{t \in [0,T]} \) is a cylindrical Q-wiener process. In order to satisfy the condition (2.13), we take \( Q = A^{-0.5005} \) for the trace-class noise case (i.e. \( \text{Tr}(Q) < \infty \)). As a result, we can easily verify that the assumptions in section 2 are fulfilled. We choose \( \Phi(X) = \sin(\|X\|) \) to measure the weak error at the endpoint \( T = 1 \) and the expectations are approximated by computing averages over 100 samples. Since no expression for the exact solution is available, we identify the ‘exact’ solution by using sufficiently small step-size. Particularly, we take \( M_{\text{exact}} = 2^{20}; N_{\text{exact}} = 2^{10} \) to compute the ‘exact’ solution for the spatial discretization and take \( N_{\text{exact}} = 1000; M_{\text{exact}} = 2^{15} \) for the temporal discretization, respectively.

![Figure 1: Weak convergence rates for full discretization.](image)

In the left picture of Figure 1, we depict the weak errors due to the spatial discretization, against space step-sizes \( \frac{1}{N}, N = 2^i, i = 1, 2, \ldots, 7 \), on a log-log scale, together with two reference lines. Also, the resulting weak errors for the temporal discretization against time step-sizes \( \tau = \frac{1}{M}, M = 2^i, i = 5, 6, \ldots, 12 \) are plotted on a log-log scale in the right picture of Figure 1. One can observe that, the slopes of the error lines and the reference lines match well, which indicates that the weak convergence rates are almost 1 in space and almost \( \frac{1}{2} \) in time for the space-time white noise case. Analogously, one can find that the weak convergence order is almost 2 in space and almost 1 in time for the trace-class noise.
