Knowledge and attitude regarding legal and ethical aspects in nursing among nurses in a tertiary care teaching hospital, Nepal

Himala Rimal*
Staff Nurse, Nepal Police Hospital, Kathmandu, Nepal

*During study period, author was Masters of Nursing student at Lalitpur Nursing Campus, School of Nursing and Midwifery, Patan Academy of Health Sciences, Lalitpur Kathmandu, Nepal

Abstract

Introduction: Health care laws and ethics serve as a hallmark in maintaining the equilibrium in the delivery of health care services. The study aimed to find out the knowledge and attitude regarding the legal and ethical aspects of nursing.

Method: A cross-sectional study was conducted in Patan Hospital, Patan Academy of Health Sciences, Nepal, from July to August 2017. A self-administered structured questionnaire was used to find out knowledge and attitude regarding legal and ethical aspects in nursing and relation to the demographics- age, an academic qualification in nursing, year of experiences, designation, and place of work in different departments of the hospital. Ethical approval was obtained. Data were analyzed using SPSS, Chi-square test, and the Pearson correlation coefficient was used to determine the association.

Result: Findings revealed that among 200 nurses, 26.0% had good knowledge (score >75%), 62.0% average knowledge (score 50%-75%) and 12.0% poor knowledge (score <50%) regarding legal and ethical aspects in nursing. Similarly, 64.5% of nurses had a favourable attitude (score >50%) while 35.5% had an unfavourable attitude on legal and ethical aspects. Knowledge and attitude had no statistically significant association with demographic variables.

Conclusion: Most of the nurses had an average level of knowledge and more than half of them had a favourable attitude regarding legal and ethical aspects of nursing.

Keywords: attitude, ethical aspects, knowledge, legal aspects
Introduction

Legal aspects in nursing has standards which guide a nurse to conduct herself properly and to carry out actions that are appropriate and safe for the patient. The Code of Ethics for Nurses is a guide for carrying out nursing responsibilities in a manner consistent with the quality of nursing care and ethical obligations of the profession. Ethics deal with standards of conduct and moral judgment requires to make ethical decisions during patient care. The best way to practice nursing effectively is to be knowledgeable about the science and art of nursing coupled with sound knowledge of laws that establish, control, and promote the nursing practice. Majority of participants (69.7%) had an average level of knowledge, 19% had adequate knowledge and only 11.3% had poor knowledge on legal and ethical aspects in nursing among selected nurses working in the Shahid Gangalal National Heart Center, Nepal, which emphasizes the need to be updated with present knowledge on ethical and legal aspects of patient care.

The objective of this study was to find out the level of knowledge and attitude regarding legal and ethical aspects in nursing among nurses of Patan Hospital, Nepal.

Method

A cross-sectional study was conducted at Patan Hospital, Patan Academy of Health Sciences (PAHS), Lagankhel, Lalitpur, Nepal, from 21 July to 18 August 2017. Non-probability convenience sampling technique was used. The sample size was 200 including a 10% non-response rate.

A structured self-administered questionnaire was developed by the researcher after the literature review and finalized following consultation with the advisor. The questionnaire consists of 25 questions divided into three parts. Part I consists of a questionnaire related to socio-demographic characteristics of the nurses which include age, academic qualification in nursing, year of experiences, designation, and place of work. Part II consists of a questionnaire related to knowledge regarding the legal and ethical aspects of nursing. The score of knowledge on legal and ethical aspects was categorized as good (75-100%), average (50-74%), and Poor (<50%). Part III consists of lists of ten statements regarding the attitude that will be measured by scoring in a tool which has a 5-point Likert scale. This was used to represent, 1 (Strongly Disagree), 2 (Disagree), 3 (Uncertain), 4 (Agree), and 5 (Strongly Agree). The total score was 50. The score for attitudes on legal and ethical aspects was categorized as unfavourable (0-50%) and favourable (51-100%). Content validity of the instrument was established by literature review, consultation with the research advisor, statistician, and three subject experts (>80% rating score for content validity). Reliability of the instrument was tested using Cronbach’s alpha for attitude related statements which gave a satisfactory value of 0.657.

The ethical clearance was obtained from the Institutional Review Board of Tribhuvan University, Institute of Medicine and Institutional Review Committee, Patan Academy of Health Science. The written informed consent was obtained from each nurse before data collection. The information given by respondents was kept confidential by using the findings for study purposes only. Anonymity was maintained by giving code number instead of the nurse’s name.

Data were analyzed using SPSS software version 23. Analysis and interpretation of the findings were done by descriptive statistics (frequency, percentage, mean and standard deviation). Inferential statistics (Chi-square test, and Pearson correlation coefficient) were used to determine the association between the knowledge and attitude of nurses regarding the legal and ethical aspects of nursing.
**Result**

In this study, among 200 nurses majority of nurses, (62.0%) had average knowledge on legal and ethical aspects in nursing while 26.0% had good knowledge and only 12.0% had poor knowledge and among which more than half (64.5%) had a favourable attitude on legal and ethical aspects in nursing. Regarding demographic information, 139(69.5%) belonged to the age group 20-30 years, 106(53.0%) had completed Bachelor level in nursing education. Furthermore, 169(84.5%) are in the designation of staff nurse. Concerning years of work experience, nearly half of the nurses 103(51.5%) have experienced between 6-10 years. Regarding the present area of work, 70(35.0%) respondents were working in the general wards of Patan Hospital.

The total mean score on the Knowledge regarding Nepal Nursing Council (NNC) act was 61.4±19.3 and on Consumer’s protection act was 72.3±43.9. Likewise, the mean score for knowledge on Nursing documentation, Ethical Principles, and the International Council of Nurses (ICN) Code of Ethics/ NNC code of conduct were 72.3±6.6, 48.9±6.0, 58.9±18.6 respectively, Table 1. The mean score of overall knowledge was 12.6±2.6 with a range of 15, Figure 1. There was a statistically significant association between the present area of work and the level of knowledge (CI: 95%, P=0.03). However, there was no statistically significant association between other selected variables (age, an academic qualification in nursing, designation, and year of work experiences), Table 2. Overall, the favourable and unfavourable attitude among nurses was 129 (64.5%) and 71 (35.5%) respectively, Figure 2. Shows the Overall attitude with mean score±SD= 70.8±8.7 with range of 36, Table 3. There was statistically significant correlation with knowledge and attitude regarding legal and ethical aspects in nursing at 95% confidence interval with (p= 0.003, r=-0.210).

**Table 1. Mean knowledge score of legal and ethical aspects of nursing among nurses at Patan Hospital, Nepal, N=200**

| Characteristics                        | Mean  | SD   |
|----------------------------------------|-------|------|
| Nepal Nursing Council act              | 61.4  | 19.3 |
| Consumer’s protection act              | 72.3  | 43.9 |
| Nursing documentation                  | 72.3  | 6.6  |
| Ethical principles                     | 48.9  | 6.0  |
| International Council of nurses code of ethics/ International Council of nurses code of conduct | 58.9  | 18.6 |

### Discussion

In this study, the majority of nurses (62.0%) had average knowledge on legal and ethical aspects in nursing while 26.0% had good knowledge and only 12.0% had poor knowledge. The reason for an average and good level of knowledge among nurses might be due to their academic qualification in nursing as well as their length of nursing practice whereby the majority of them have work experience between 6-10 years. This is supported by the study conducted in Nepal, where 45% had adequate knowledge while the rest of them had inadequate knowledge regarding nursing ethics; over half of the respondents (53.0%) had adequate knowledge of nursing law while 46% had inadequate knowledge of it. Similarly, the finding of another study conducted among nurses at a tertiary care hospital in rural India showed that the majority (78%) of the participants had inadequate knowledge regarding law and ethics in Nursing.

In this study, the majority of nurses (87% PCL nursing and 89.0% Bsc Nursing/ PBBN/ BNS) gained knowledge for legal and ethical aspects was from their nursing courses and through the act and code of ethics established by the regulatory bodies for nursing in Nepal, which is similar to the study conducted in Nepal where 90 % of the nurses preferred journals and books on ethics as the instruments for learning.

In the present study, the findings on attitude regarding legal and ethical aspects show that among 200 nurses, 71(35.5%) had unfavourable attitudes while 129(64.5%) had a favourable attitude. This is similar to a study that showed (50.8%) of respondents had favorable and 60 (49.2%) had an unfavorable level of attitude regarding patients right.

There was no statistically significant association between the level of knowledge and selected variables (age, an academic qualification in nursing, designation, and year of work experiences) which was similar to the study conducted at Sree Gokulam Medical College and Hospital, Venjaramoodu Trivandrum, Kerala, India. In contrast with this, another study conducted in India, showed a significant association between knowledge level and variables (age, gender, professional qualification, and experience).

In this study, Nurses working in general wards have a good level of knowledge than those working in specialized wards which is similar to the study Conducted in the Tertiary Care Hospital of Eastern Nepal.

Legal documents used by nurses is the evidence in a court of law or a professional conduct proceeding in nursing and any violation in the law is liable for punishment.

### Conclusion

The majority of nurses had an average level of knowledge (62.0%) regarding legal and ethical aspects of nursing and most of them had a favorable (64.5%) attitude regarding the belief that ‘legal and ethical aspects are important for nurses.'
Acknowledgement
This was a thesis work during the master’s of nursing program. I thank my supervisor and faculties for their guidance. I wish to present my special thanks to the nurses of Patan Hospital for their co-operation.
