Faruk Özger*

Characterizations of compact operators on \( \ell_p \)–type fractional sets of sequences

https://doi.org/10.1515/dema-2019-0015
Received August 6, 2018; accepted January 30, 2019

Abstract: Among the sets of sequences studied, difference sets of sequences are probably the most common type of sets. This paper considers some \( \ell_p \)–type fractional difference sets via the gamma function. Although, we characterize compactness conditions on those sets using the main key of Hausdorff measure of noncompactness, we can only obtain sufficient conditions when the final space is \( \ell_\infty \). However, we use some recent results to exactly characterize the classes of compact matrix operators when the final space is the set of bounded sequences.

Keywords: gamma function, fractional operator, operator norm, compact operator, Hausdorff measure of noncompactness

MSC: 46B45, 47B37

1 Introduction

The gamma function of a real number \( x \) (except zero and the negative integers) is defined by an improper integral:

\[
\Gamma(x) = \int_0^\infty e^{-t} t^{x-1} dt.
\]

It is known that for any natural number \( n \), \( \Gamma(n+1) = n! \), and \( \Gamma(n+1) = n\Gamma(n) \) hold for any real number \( n \notin \{0, -1, -2, \ldots\} \). The fractional difference operator for a fraction \( \tilde{\alpha} \) was defined in [1] as

\[
\Delta^{(\tilde{\alpha})}(x)_k = \sum_{i=0}^\infty (-1)^i \frac{\Gamma(\tilde{\alpha} + 1)}{i!\Gamma(\tilde{\alpha} - i + 1)} x_{k-i}.
\]

(1.1)

It is assumed that the series defined in Eq. (1.1) is convergent for \( x \in \omega \). The infinite sum in Eq. (1.1) becomes a finite sum if \( \tilde{\alpha} \) is a nonnegative integer. We use the usual convention that any term with a negative subscript is equal to naught, throughout the paper.

Let \( m \) be a positive integer, then recall the difference operators \( \Delta^{(1)} \) and \( \Delta^{(m)} \) are defined by:

\[
(\Delta^{(1)} x)_k = \Delta^{(1)} x_k = x_k - x_{k-1}
\]

and

\[
(\Delta^{(m)} x)_k = \sum_{i=0}^m (-1)^i \binom{m}{i} x_{k-i}.
\]
We write $\Delta$ and $\Delta^{(m)}$ for the matrices with $\Delta_{nk} = (\Delta^{(1)} e^{(k)})_n$ and $\Delta^{(m)}_{nk} = (\Delta^{(m)} e^{(k)})_n$ for all $n$ and $k$. The topological properties of some spaces that are constructed by the matrix operator $\Delta^{(m)}$ were studied in the paper [2]. Some identities and estimates for the Hausdorff measure of noncompactness of matrix operators from $\Delta^{(m)}$-type spaces into the sets of bounded $\ell_\infty$, convergent $c$, null sequences $c_0$ and also absolutely convergent series were established in [3].

We can write the fractional difference operator defined in Eq. (1.1) as an infinite matrix:

$$\Delta^{(\bar{\alpha})}_{nk} = \begin{cases} (-1)^{n-k} \frac{\Gamma(\bar{\alpha}+1)}{(n-k)!(\bar{\alpha}-n+k+1)} & (0 \leq k \leq n), \\ 0 & (k > n). \end{cases}$$

Remark 1.1. [1] The inverse of fractional difference matrix is given by

$$\Delta^{(-\bar{\alpha})}_{nk} = \begin{cases} (-1)^{n-k} \frac{\Gamma(-\bar{\alpha}+1)}{(n-k)!(\bar{\alpha}-n+k+1)} & (0 \leq k \leq n), \\ 0 & (k > n). \end{cases}$$

For some values of $\bar{\alpha}$, we have

$$\Delta^{1/2} x_k = x_k - \frac{1}{2} x_{k-1} - \frac{1}{8} x_{k-2} - \frac{1}{16} x_{k-3} - \frac{5}{128} x_{k-4} - \cdots,$$

$$\Delta^{-1/2} x_k = x_k + \frac{1}{2} x_{k-1} + \frac{3}{8} x_{k-2} + \frac{5}{16} x_{k-3} + \frac{35}{128} x_{k-4} + \cdots,$$

$$\Delta^{2/3} x_k = x_k - \frac{2}{3} x_{k-1} - \frac{1}{9} x_{k-2} - \frac{4}{81} x_{k-3} - \frac{7}{243} x_{k-4} - \cdots.$$

The idea of constructing new sets of sequences via infinite matrices started with [4] and then it has been developed by numerous researchers using different triangles [5–10]. In the papers [11–19] different difference sets of sequences have been studied based on some newly defined infinite matrices. Some new results on the visualization and animations of the topologies of certain sets were illustrated in [20–22]. The authors applied their software package for this purpose. Those results have an interesting and important applications in crystallography. The fractional Banach sets of difference sequences $\ell(\Delta^{(\bar{\alpha})}, p)$ were geometrically characterized and the modular structure of those sets were investigated in [23].

Many authors have made efforts to apply Hausdorff measure of noncompactness to find compactness conditions of certain sets of sequences during the past decade [24–27]. Note that, necessary and sufficient compactness conditions for a matrix operator from fractional sets of sequences $c_0(\Delta^{(\bar{\alpha})})$, $c(\Delta^{(\bar{\alpha})})$ and $\ell_\infty(\Delta^{(\bar{\alpha})})$ to the classical sets of sequences have been very recently determined in [28].

Fractional difference sequence spaces have been studied in the literature recently [1, 29, 30]. The authors of those papers especially studied the properties of fractional operators in their research in addition to focusing on certain fractional sequence spaces.

In this work, we consider the fractional sets of sequences $\ell_p(\Delta^{(\bar{\alpha})})$ for $1 \leq p \leq \infty$ and determine operator norms of our spaces. We establish some identities and estimates for the Hausdorff measures of noncompactness of certain operators on the sets $\ell_p(\Delta^{(\bar{\alpha})})$ of fractional orders. We characterize some classes of compact operators on these sets. Note that, we can only obtain sufficient conditions when the final space is $\ell_\infty$. However, we use the results of [31, 32] to obtain necessary and sufficient conditions for the classes of compact matrix operators from $\ell_p(\Delta^{(\bar{\alpha})})$ spaces into the sets of bounded sequences and for the classes $c(\Delta^{(\bar{\alpha})})$, $\ell_\infty$ and $\ell_\infty(\Delta^{(\bar{\alpha})})$, $\ell_1$ and $\ell_p$.
Given any infinite matrix \( A = (a_{nk})_{n,k=0}^\infty \) of complex numbers and any sequence \( x \), we write \( A_n = (a_{nk})_{k=0}^\infty \) for the sequence in the \( n^{th} \) row of \( A \), \( A_n x = \sum_{k=0}^\infty a_{nk} x_k \) \( (n = 0, 1, \ldots) \) and \( Ax = (A_n x)_{n=0}^\infty \), provided \( A_n \in X^\beta \) for all \( n \).

If \( X \) and \( Y \) are subsets of \( \omega \), then
\[
X_A = \{ x \in \omega : Ax \in X \}
\]
denotes the matrix domain of \( A \) in \( X \) and \((X, Y)\) is the class of all infinite matrices that map \( X \) into \( Y \); so \( A \in (X, Y) \) if and only if \( X \subset Y_A \).

An infinite matrix \( T = (t_{nk}) \) is called a triangle if \( t_{nn} \neq 0 \) and \( t_{nk} = 0 \) for all \( k > n \). We denote its inverse by \( S \). A \( BK \) space is a Banach space with continuous coordinates. A \( BK \) space \( X \) is said to have \( AK \) if every sequence \( x \in X \) has the unique representation \( x = \sum_k x_k e^{(k)} \).

Consider the following fractional difference sets of sequences for \( 1 \leq p < \infty \):
\[
\ell_p(\Delta^{(\alpha)}) := \left\{ x = (x_k) \in \omega : \sum_{n=0}^\infty \left| \sum_{i=0}^\infty (-1)^i \frac{\Gamma(\alpha + 1)}{\Gamma(\alpha - i + 1)} x_{n-i} \right|^p \right\}.
\]
Let us define the sequence \( y = (y_k) \) which will be used, by the \( \Delta^{(\alpha)} \)-transform of a sequence \( x = (x_k) \), that is,
\[
y_k = x_k - \alpha x_{k-1} + \frac{\alpha(\alpha - 1)}{2!} x_{k-2} - \frac{\alpha(\alpha - 1)(\alpha - 2)}{3!} x_{k-3} + \cdots
\]
\[
= \sum_{i=0}^\infty (-1)^i \frac{\Gamma(\alpha + 1)}{\Gamma(\alpha - i + 1)} x_{k-i}.
\]
It seems those spaces can be considered as the matrix domains of the triangle \( \Delta^{(\alpha)} \) in the classical sequence spaces \( \ell_p \), where \( 1 \leq p < \infty \). We also have the following relation between the sequences \( x = (x_k) \) and \( y = (y_k) \):
\[
x_k = \sum_{i=0}^\infty (-1)^i \frac{\Gamma(-\alpha + 1)}{\Gamma(-\alpha - i + 1)} y_{k-i}.
\]
(2.1)

**Lemma 2.1.** [33, Theorem 4.3.12, p. 63] Let \((X, \|\cdot\|)\) be a \( BK \) space. Then \( X_T \) is a \( BK \) space with \( \|\cdot\|_T = \|T(\cdot)\| \).

By Lemma 2.1, the defined fractional difference sequence spaces are complete, linear, \( BK \) spaces with the following norm:
\[
\|x\| = \left( \sum_{n=0}^\infty \left| \sum_{i=0}^\infty (-1)^i \frac{\Gamma(\alpha + 1)}{\Gamma(\alpha - i + 1)} x_{n-i} \right|^p \right)^{\frac{1}{p}}.
\]

Let \( X \) be a normed space. Then \( S_X = \{ x \in X : \|x\| = 1 \} \) and \( B_X = \{ x \in X : \|x\| \leq 1 \} \) denote the unit sphere and closed unit ball in \( X \), where \( X \) is a normed space.

By \( \mathcal{F}_r \) \( (r = 0, 1, \ldots) \), we denote the subcollection of \( \mathcal{F} \) consisting of all nonempty and finite subsets of \( \mathbb{N} \) with terms that are greater than \( r \), that is
\[
\mathcal{F}_r = \{ N \in \mathcal{F} : n > r \text{ for all } n \in N \}, \quad (r = 0, 1, \ldots).
\]

Given \( a \in \omega \), we write
\[
\|a\|_X^\alpha = \sup_{x \in S_X} \left| \sum_{k=1}^\infty a_k x_k \right|
\]
powered the expression on the right hand side is defined and finite which is the case whenever \( X \) is a \( BK \) space and \( a \in X^\beta \).

**Lemma 2.2.** Let \( X \) and \( Y \) be \( BK \) spaces.

(i) Then, we have \((X, Y) \subset \mathcal{B}(X, Y)\), that is, every \( A \in (X, Y) \) defines an operator \( L_A \in \mathcal{B}(X, Y) \), where \( L_A(x) = Ax \) for all \( x \in X \) (see [34, Theorem 1.23]).
We have \(|x|_X^\prime = \|x\|_{X^\prime}\) for all \(x \in X^\prime\), where \(|\cdot|_{X^\prime}\) is the natural norm on the dual set \(X^\prime\) (see [35, Theorem 3.2]).

**Lemma 2.3.** Let \(Y\) be an arbitrary subset of \(\omega\) and \(X\) be a BK space with \(AK\) or \(X = \ell_\infty\), and \(R = S^\prime\). Then \(A \in (X_T, Y)\) if and only if \(\hat{A} \in (X, Y)\) and \(W^{(n)} \in (X, c_0)\) for all \(n = 0, 1, \ldots\). Here \(\hat{A}\) is the matrix with rows \(\hat{A}_n = R A_n\) for \(n = 0, 1, \ldots\), and the triangles \(W^{(n)}\) are defined by \(w^{(n)}_{m,k} = \sum_{j=m}^\infty a_{nj}s_{jk}\). Moreover, if \(A \in (X, Y)\) then we have \(A z = \hat{A}(Tz)\) for all \(z \in Z = X_T\) (see [35, Theorem 3.4, Remark 3.5(a)]).

We have the following results for operator norms of bounded operators following [36, Theorem 2.8].

**Lemma 2.4.** Let \(X\) be a BK space.

(i) If \(A \in (X, \ell_1)\), then

\[
\|A\|_{(X, \ell_1)} \leq \|L_A\| \leq 4 \cdot \|A\|_{(X, \ell_1)},
\]

where

\[
\|A\|_{(X, \ell_1)} = \sup_{N \in \mathcal{N}} \left\| \sum_{n \in \mathcal{N}} A_n \right\|_X < \infty.
\]

(ii) If \(A \in (X, Y)\), then

\[
\|L_A\| = \|A\|_{(X, \ell_\infty)} = \sup_n \|A_n\|_X < \infty,
\]

where \(Y\) is any of the spaces \(c_0, c, \ell_\infty\).

We obtain the following result as an immediate consequence of Lemma 2.2(ii).

**Lemma 2.5.** Let \(1 \leq p < \infty\), then we have \(\|x\|_{\ell_p} = \|x\|_{\ell_q}\) for all \(x = (x_k) \in \ell_q\).

**Remark 2.6.** Let \(1 \leq p < \infty, A\) be an infinite matrix and \(X\) be a BK space. If \(A \in (\ell_p(A^{(\#)}), Y)\), then \(\hat{A} \in (\ell_p, Y)\) such that \(Ax = \hat{A}y\) for all \(x \in \ell_p(A^{(\#)})\) and \(y \in \ell_p\). Here \(x\) and \(y\) are connected by Eq. (2.1) and \(\hat{A} = (\hat{a}_{nk})\) is defined by

\[
\hat{a}_{nk} = \sum_{j=k}^\infty (-1)^{j-k} \frac{\Gamma(-\hat{a} + 1)}{(j-k)!\Gamma(-\hat{a} + j + k + 1)} a_{nj} \text{ for all } n, k \in \mathbb{N}_0;
\]

and for \(k = 0, 1, \ldots\) we also define \(\hat{a} = (\hat{a}_k)_{k=0}^{\infty}\) by

\[
\hat{a}_k = \lim_{n \to \infty} \hat{a}_{nk}.
\]

**Proof.** Let \(1 \leq p < \infty, A \in (\ell_p(A^{(\#)}), Y)\) and \(x \in \ell_p(A^{(\#)})\). So, \(A_n \in (\ell_p(A^{(\#)})^\#\) for all \(n = 0, 1, \ldots\). Then, we have \(\hat{A}_n \in \ell_p^\# = \ell_q\) for all \(n = 0, 1, \ldots\) and \(Ax = \hat{A}y\) is satisfied. Therefore, \(\hat{A}y \in Y\) and this means \(\hat{A} \in (\ell_p, Y)\).

**Lemma 2.7.** If \(a = (a_k) \in (\ell_p(A^{(\#)}))^\#\), then \(\overline{a} = (\overline{a}_k) \in \ell_q\) and the equality

\[
\sum_{k=0}^\infty a_k x_k = \sum_{k=0}^\infty \overline{a}_k y_k
\]

is satisfied for every \(x = (x_k) \in \ell_p(A^{(\#)})\), where \(1 \leq p \leq \infty\) and

\[
\overline{a}_k = \sum_{i=k}^\infty (-1)^{i-k} \frac{\Gamma(-\overline{a} + 1)}{(i-k)!\Gamma(-\overline{a} - i + k + 1)} a_i,
\]

Let us now denote \(S = S_{\ell_p}\) and \(\hat{S} = S_{\ell_p(A^{(\#)})}\) for the sake of brevity.

**Lemma 2.8.** Let \(1 \leq p < \infty\) and \(\overline{a} = (\overline{a}_k)\) be defined as in Eq. (2.5), then we have
where a convergent subsequence. We denote the class of such operators by becompactifthedomainof
This is an immediate consequence of Lemma 2.2 and Lemma 2.4.

Proof. Assume that \( \overline{\alpha} \in (\ell_p(\Gamma^0))^\beta \). So, we have by Lemma 2.7 that \( \overline{\alpha} \in \ell_q \) and the Eq. (2.4) is satisfied for all sequences \( x = (x_k) \in \ell_p((\Gamma^0)) \) and \( y = (y_k) \in \ell_p \) which are connected by Eq. (2.1). Additionally, we have by Lemma 2.5 that \( x \in \tilde{S} \) if and only if \( y \in S \). Hence, we have by Eq. (2.4) that

\[
\|a\|_{\ell_p(\Gamma^0)} = \sup_{x \in \tilde{S}} \left\| \sum_{k=0}^{\infty} a_k x_k \right\| = \sup_{y \in S} \left\| \sum_{k=0}^{\infty} \overline{\alpha}_k y_k \right\| = \|\overline{\alpha}\|_{\ell_p} < \infty.
\]  

Moreover, we obtain by Eq. (2.6) and Lemma 2.5 that

\[
\|a\|_{\ell_p(\Gamma^0)} = \|\overline{\alpha}\|_{\ell_p} = \|\overline{\alpha}\|_{\ell_q}
\]

because \( \overline{\alpha} \in \ell_q \). This completes the proof. \( \square \)

We obtain estimates and identities for the norms of the matrix operators for the classes \( (\ell_p(\Gamma^0), c_0) \), \( (\ell_p(\Gamma^0), c) \), \( (\ell_p(\Gamma^0), c_\infty) \) and \( (\ell_p(\Gamma^0), \ell_1) \).

**Theorem 2.9.** Let \( A \) be in any of the classes \( (\ell_p(\Gamma^0), c_0) \), \( (\ell_p(\Gamma^0), c) \) or \( (\ell_p(\Gamma^0), c_\infty) \), then

\[
\|L_A\| = \|A\|_{(\ell_p(\Gamma^0), \ell_\infty)},
\]

where \( 1 \leq p < \infty \) and

\[
\|A\|_{(\ell_p(\Gamma^0), \ell_\infty)} = \sup_n \left( \sum_{k=0}^{\infty} |\hat{\alpha}_n|^q \right)^{\frac{1}{q}} < \infty.
\]

**Proof.** This is an immediate consequence of Lemma 2.2 and Lemma 2.4. \( \square \)

**Theorem 2.10.** Let \( 1 \leq p < \infty \) and \( A \in (\ell_p(\Gamma^0), \ell_1) \), then

\[
\|A\|_{(\ell_p(\Gamma^0), \ell_1)} \leq \|L_A\| \leq 4 \cdot \|A\|_{(\ell_p(\Gamma^0), \ell_1)},
\]

where

\[
\|A\|_{(\ell_p(\Gamma^0), \ell_1)} = \sup_{N \in \mathbb{N}} \left( \sum_{n=0}^{\infty} \sum_{k=0}^{N} |\hat{\alpha}_{nk}| \right) < \infty.
\]

**Proof.** This is an immediate consequence of Lemma 2.2 and Lemma 2.4. \( \square \)

### 3 Main results related to compact operators

The following notations are needed to establish estimates and identities for the Hausdorff measure of non-compactness of matrix operators and characterize the classes of compact operators. We also use the results in Katarina’s paper [31] to prove our results.

We recall the definitions of Hausdorff measure of noncompactness of bounded subsets of a metric space, and Hausdorff measure of noncompactness of operators between Banach spaces.

If \( X \) and \( Y \) are infinite–dimensional complex Banach spaces then a linear operator \( L : X \to Y \) is said to be compact if the domain of \( L \) is all of \( X \), and, for every bounded sequence \( (x_n) \) in \( X \), the sequence \( (L(x_n)) \) has a convergent subsequence. We denote the class of such operators by \( C(X, Y) \).

\[
\|a\|_{\ell_p(\Gamma^0)} = \|\overline{\alpha}\|_{\ell_p(\Gamma^0)} = \left( \sum_{k=0}^{\infty} \frac{1}{k!} |a_k|^q \right)^{\frac{1}{q}} \quad (1 < p < \infty),
\]

\[
\sup_k |\overline{\alpha}_k| \quad (p = 1),
\]

for all \( a = (a_k) \in (\ell_p(\Gamma^0))^\beta \).
Definition 3.1. Let \((X, d)\) be a metric space, \(B(x_0, \delta) = \{x \in X : d(x, x_0) < \delta\}\) denote the open ball of radius \(\delta > 0\) and center in \(x_0 \in X\), and \(\mathcal{M}_X\) be the collection of bounded sets in \(X\). The Hausdorff measure of noncompactness of \(Q \in \mathcal{M}_X\) is
\[
\chi(Q) = \inf \left\{ \varepsilon > 0 : Q \subset \bigcup_{k=1}^{n} B(x_k, \delta_k), x_k \in X, \delta_k < \varepsilon, 1 \leq k \leq n, n \in \mathbb{N} \right\}.
\]

Let \(X\) and \(Y\) be Banach spaces and \(\chi_1\) and \(\chi_2\) be measures of noncompactness on \(X\) and \(Y\). Then the operator \(L : X \rightarrow Y\) is called \((\chi_1, \chi_2)\)-bounded if \(L(Q) \in \mathcal{M}_Y\) for every \(Q \in \mathcal{M}_X\) and there exists a positive constant \(C\) such that
\[
\chi_2(L(Q)) \leq C \chi_1(Q)
\]
for every \(Q \in \mathcal{M}_X\). If an operator \(L\) is \((\chi_1, \chi_2)\)-bounded then the number
\[
\|L\|_{\chi_1, \chi_2} = \inf \left\{ C \geq 0 : \text{ Eq. (3.1) holds for all } Q \in \mathcal{M}_X \right\}
\]
is called the \((\chi_1, \chi_2)\)-measure of noncompactness of \(L\). In particular, if \(\chi_1 = \chi_2 = \chi\), then we write \(\|L\|_{\chi}\) instead of \(\|L\|_{\chi_1, \chi_2}\).

Lemma 3.2. [34, Corollary 2.26] Let \(X\) and \(Y\) be Banach spaces and \(L \in \mathcal{B}(X, Y)\). Then, we have
\[
\|L\|_\chi = \chi(L(B_X)) = \chi(L(S_X)),
\]
and
\[
L \in \mathcal{C}(X, Y) \text{ if and only if } \|L\|_\chi = 0.
\]

Lemma 3.3. [34, Theorem 2.23] Let \(X\) be a Banach space with Schauder basis \((b_n)_{n=0}^\infty\), \(Q \in \mathcal{M}_X\), \(P_n : X \rightarrow X\) be the projector onto the linear span of \(\{b_0, b_1, \ldots, b_n\}\) and let \(I\) be the identity map on \(X\) and \(R_n = I - P_n\) \((n = 0, 1, \ldots)\). Then, we have
\[
\frac{1}{a} \limsup_{n \to \infty} \left( \sup_{x \in Q} \|R_n(x)\| \right) \leq \chi(Q) \leq \limsup_{n \to \infty} \left( \sup_{x \in Q} \|R_n(x)\| \right),
\]
where \(a = \limsup_{n \to \infty} \|R_n\|\).

Lemma 3.4. [34, Theorem 2.8] Let \(Q\) be a bounded subset of the normed space \(X\), where \(X\) is \(\ell_p\) for \(1 \leq p < \infty\) or \(c_0\). If \(P_n : X \rightarrow X\) is the operator defined by \(P_n(x) = x^{[n]}\) for \(x = (x_k)_{k=0}^\infty \in X\), then we have
\[
\chi(Q) = \lim_{n} \left( \sup_{x \in Q} \|R_n(x)\| \right).
\]

When the first space is \(\ell_1\), a problem takes place since \(\beta\) dual of \(\ell_1\) is \(\ell_\infty\), which has no \(AK\). In this case, the following study of Sargent [32] is used in order to characterize compact operators.

Lemma 3.5. [32, Theorem 5] If \(L \in \mathcal{B}(\ell_1, \ell_\infty)\), then \(L\) is compact if and only if
\[
\lim_{m \to \infty} \sup_{1 \leq i \leq m} \sup_{1 \leq k_1, k_2} |a_{n,k_1} - a_{n,k_2}| = \sup_n |a_{n,k_1} - a_{n,k_2}|
\]
uniformly in \(k_1\) and \(k_2\), \((1 \leq k_1, k_2 < \infty)\).

The following results (by [36, Corollary 3.6] and [27, Theorems 3.7 and 3.11]) are needed to determine estimates for the norms of continuous linear operators \(L_A\) on our spaces and establish the necessary and sufficient conditions for a matrix operator to be a compact operator.

Lemma 3.6. Let \(X\) be a BK space.
(i) If \( A \in (X, c_0) \), then we have
\[
\|L_A\|_X = \limsup_{n \to \infty} \|A_n\|_X^*.
\]

(ii) If \( A \in (X, c) \), then we have
\[
\frac{1}{2} \cdot \limsup_{n \to \infty} \|A_n - \alpha\|_X^* \leq \|L_A\|_X \leq \limsup_{n \to \infty} \|A_n - \alpha\|_X^*.
\]

(iii) If \( A \in (X, \ell_1) \), then we have
\[
\lim_{n \to \infty} \left( \sup_{N \in \mathbb{N}} \left\| \sum_{n \in N} A_n \right\|_X^* \right) \leq \|L_A\|_X \leq 4 \cdot \lim_{n \to \infty} \left( \sup_{N \in \mathbb{N}} \left\| \sum_{n \in N} A_n \right\|_X^* \right).
\]

We are now ready to state the main results related to compact operators. We start with establishing some estimates for the norms of bounded linear operators \( L_A \) on the given fractional sequence spaces \( \ell_p(\Delta^{(\alpha)}) \).

**Theorem 3.7.** Let \( 1 < p < \infty \) and \( q = \frac{p}{p-1} \).

(i) If \( A \in (\ell_p(\Delta^{(\alpha)}), c_0) \), then we have
\[
\|L_A\|_X = \limsup_{n \to \infty} \|\hat{A}_n\|_{\ell_q} \left( \sum_{k} |\hat{a}_{nk}|^q \right)^{\frac{1}{q}}.
\] (3.2)

(ii) If \( A \in (\ell_p(\Delta^{(\alpha)}), c) \), then we have
\[
\frac{1}{2} \cdot \limsup_{n \to \infty} \left( \sum_{k} |\hat{a}_{nk} - \hat{a}_k|^q \right)^{\frac{1}{q}} \leq \|L_A\|_X \leq \limsup_{n \to \infty} \left( \sum_{k} |\hat{a}_{nk} - \hat{a}_k|^q \right)^{\frac{1}{q}}.
\]

(iii) If \( A \in (\ell_p(\Delta^{(\alpha)}), \ell_1) \), then we have
\[
\lim_{n \to \infty} \left( \sup_{N \in \mathbb{N}} \left( \sum_{k} \left( \sum_{n} |\hat{a}_{nk}|^{q_2} \right)^{\frac{1}{q_2}} \right) \right) \leq \|L_A\|_X \leq 4 \cdot \lim_{n \to \infty} \left( \sup_{N \in \mathbb{N}} \left( \sum_{k} \left( \sum_{n} |\hat{a}_{nk}|^{q_2} \right)^{\frac{1}{q_2}} \right) \right).
\] (3.3)

**Proof.** Let \( A \in (\ell_p(\Delta^{(\alpha)}), c_0) \). By Lemma 2.8, we have
\[
\|A\|_{\ell_p(\Delta^{(\alpha)})} = \|\hat{A}_n\|_{\ell_q} = \left( \sum_{k=0}^{\infty} |\hat{a}_{nk}|^q \right)^{\frac{1}{q}}
\]
for all \( n = 0, 1, \ldots \), because \( A_n \in (\ell_p(\Delta^{(\alpha)}))^\beta \) for all \( n = 0, 1, \ldots \). Taking into account this result and Lemma 3.6(i) we obtain Eq. (3.2).

In order to prove the second part, we start with \( A \in (\ell_p(\Delta^{(\alpha)}), c) \). By Remark 2.2 \( \hat{A} \in (\ell_p, c) \). So, we have by Lemma 3.6(ii) that
\[
\frac{1}{2} \cdot \limsup_{n \to \infty} \|\hat{A}_n - \alpha\|_{\ell_q} \leq \|L_A\|_X \leq \limsup_{n \to \infty} \|\hat{A}_n - \alpha\|_{\ell_q},
\]
where \( \alpha \) defined in Eq. (2.3). Hence, by Lemma 3.2, we get
\[
\|L_A\|_X = \chi \left( L_A(\hat{S}) \right) = \chi \left( \hat{A} \hat{S} \right)
\] (3.4)
and
\[
\|L_A\|_X = \chi \left( L_A(S) \right) = \chi \left( \hat{A} S \right).
\] (3.5)
Moreover, \( x \in \hat{S} \) if and only if \( y \in S \). We have \( \hat{A} \hat{S} = \hat{A} S \) because \( Ax = \hat{A} y \) by Remark 2.2. Taking into account the Eqs. (3.4) and (3.5), we conclude that \( \|L_A\|_X = \|L_A\|_X^* \), which completes the second part of the proof.
Finally, let $A \in (\ell_p(\Delta^{(a)}), \ell_1)$. We derive from Lemma 2.6 that

$$\left\| \sum_{n \in N} A_n \right\|_{\ell_p(\Delta^{(a)})} = \left\| \sum_{n \in N} \hat{A}_n \right\|_{\ell_\infty},$$

(3.6)

because $A_n \in (\ell_p(\Delta^{(a)}))^\beta$. Hence, we obtain the condition in Eq. (3.3) by the help of Eq. (3.6) and Lemma 3.6(iii).

**Theorem 3.8.** Let $X = \ell_1(\Delta^{(a)})$.

(i) If $A \in (X, c_0)$, then we have

$$\|L_A\|_X = \lim_{r \to \infty} \sup_{n \geq r} \left( \sup_k \|\hat{a}_{nk}\| \right).$$

(ii) If $A \in (X, c)$, then we have

$$\frac{1}{2} \cdot \lim_{r \to \infty} \sup_{n \geq r} \left( \sup_k \|\hat{a}_{nk} - \hat{a}_k\| \right) \leq \|L_A\|_X \leq \lim_{r \to \infty} \sup_{n \geq r} \left( \sup_k \|\hat{a}_{nk} - \hat{a}_k\| \right).$$

(iii) If $A \in (X, \ell_1)$, then we have

$$\|L_A\|_X = \lim_{r \to \infty} \sup_{n \geq r} \sum_{k} \|\hat{a}_{nk}\|.$$

**Proof.** This is an immediate consequence of Theorem 2.9, Lemma 3.6 and Theorem 3.7.

We now use the results of [31] and [32] to obtain the necessary and sufficient conditions for the classes of compact matrix operators in $(\ell_p(\Delta^{(a)}), \ell_\infty), (\ell_1(\Delta^{(a)}), \ell_\infty)$ and $(\ell_\infty(\Delta^{(a)}), \ell_\infty)$.

**Theorem 3.9.** Let $1 < p < \infty$ and $q = \frac{p}{p-1}$.

(i) If $A \in (\ell_p(\Delta^{(a)}), \ell_\infty)$, then $L_A$ is compact if and only if

$$\lim_{r \to \infty} \sup_{n} \left( \sum_{k=r+1}^{\infty} \|\hat{a}_{nk}\|^q \right)^{\frac{1}{q}} = 0.$$

(ii) If $A \in (\ell_1(\Delta^{(a)}), \ell_\infty)$, then $L_A$ is compact if and only if

$$\lim_{m \to \infty} \sup_{1 \leq n \leq m} \|\hat{a}_{n,k_1} - \hat{a}_{n,k_2}\| = \sup_{n} \|\hat{a}_{n,k_1} - \hat{a}_{n,k_2}\|$$

uniformly in $k_1$ and $k_2 (1 \leq k_1, k_2 < \infty)$.

**Proof.** Assume $A \in (\ell_p(\Delta^{(a)}), \ell_\infty)$. By Lemma 2.3, we obtain $L_A \in \mathcal{B}(\ell_p(\Delta^{(a)}), \ell_\infty)$ and $\hat{A} \in (\ell_p, \ell_\infty)$ such that $Ax = \hat{A}(\Delta^{(a)}x)$ for all $x \in \ell_p(\Delta^{(a)})$, where $\Delta^{(a)}$ is the inverse of the triangle $\Delta^{(a)}$ and $\hat{a}_{nk}$ defined in Eq. (2.2).

We have $L_A \in \mathcal{B}(\ell_p, \ell_\infty)$ and $\hat{A}x = L_A(x)$ for all $x \in \ell_p$ because $\ell_p$ is a BK space. If we write $(\hat{A}_n)_r$ for the rth row of the matrix $\hat{A}$ with $\hat{a}_{nk}$ replaced by 0 for $k > r$,

$$(\hat{A}_n)_r = \sum_{k=0}^{r} \hat{a}_{nk} e^{(k)}$$

and applying [32, (b), p. 85], we obtain $L_A$ is compact if and only if

$$\sup_{n} \|\hat{A}_n\|_q = \sup_{n} \left( \sum_{k} \|\hat{a}_{nk}\|^q \right)^{\frac{1}{q}} < \infty$$

and

$$\lim_{r \to \infty} \sup_{n} \|\hat{A}_n - (\hat{A}_n)_r\|_q = \lim_{r \to \infty} \sup_{n} \left( \sum_{k=r+1}^{\infty} \|\hat{a}_{nk}\|^q \right)^{\frac{1}{q}} = 0.$$
The first condition is satisfied from the characterizations of matrix transformations, [33, Example 8.4.5D and Example 8.4.6D]. Hence, $L_A$ is compact if and only if the condition

$$\lim_{r \to \infty} \sup_{n} \left( \sum_{k=r+1}^{\infty} |\hat{a}_{nk}|^q \right)^{\frac{1}{q}} = 0$$

is satisfied. Taking into account the equalities (3.4) and (3.5), we have $L_A$ is compact if and only if $L_A$ is compact. This completes the first part of the proof.

We know that $L_A$ is compact if and only if $L_A$ is compact with the equalities (3.4) and (3.5). Also $A \in (\ell_1(\tilde{A}), \ell_1)$ implies $\tilde{A} \in (\ell_1, \ell_\infty)$. As an immediate consequence of Lemma 3.5 we prove the second part of the theorem.

**Theorem 3.10.** Let $A \in (\ell_\infty(\Delta^{(\tilde{A}^*)}), \ell_\infty)$. Then $L_A$ is compact if and only if

$$\lim_{r \to \infty} \sup_{n} \sum_{k=r+1}^{\infty} |\hat{a}_{nk}| = 0. \quad (3.7)$$

**Proof.** By the help of Lemma 2.3, we have $\tilde{A} \in (\ell_\infty, \ell_\infty)$ because $\ell_\infty$ is a BK space and also by Lemma 2.2 the associated operator $L_A$ is bounded and linear. Since $(\ell_\infty, \ell_1)$ is a BK space, by the condition (b) in [32, p. 85] we have: the spaces $\ell_\infty$ and $c_0$ have the same dual space $\ell_1$, and therefore the conditions [32, (b) and (f), p. 85] are the same. It follows that $L_A$ is compact if and only if

$$\sup_{n} ||\tilde{A}_n|| = \sup_{n} \sum_{k=0}^{\infty} |\tilde{a}_{nk}| < \infty$$

and

$$\lim_{r \to \infty} \sup_{n} ||\tilde{A}_n - (\tilde{A}_n)_n|| = \lim_{r \to \infty} \sup_{n} \sum_{k=r+1}^{\infty} |\hat{a}_{nk}| = 0.$$

So, the first condition is satisfied [33, Example 8.4.5A], and it follows that $L_A$ is compact if and only if the condition in Eq. (3.7) is satisfied. This completes the proof because $L_A$ is compact if and only if $L_A$ is compact by Lemma 2.2 and by the equalities of (3.4) and (3.5).

---

### 4 Conclusion

The main objective of this paper is to consider fractional sequence spaces $\ell_p(\Delta^{(\tilde{A})})$ for $1 \leq p \leq \infty$ via the gamma function. We derive some estimates and identities for the norms of bounded linear operators on fractional sequence spaces $\ell_p(\Delta^{(\tilde{A})})$. In general, Hausdorff measure of noncompactness is used to find necessary and sufficient conditions for a matrix operator on a given sequence space to be a compact operator. However, we can only obtain sufficient conditions when the final space is $\ell_\infty$, that is for a matrix class $(X, \ell_\infty)$. This is why we use the results of [31] and [32] to obtain necessary and sufficient conditions for the classes of compact matrix operators in $(\ell_p(\Delta^{(\tilde{A})}), \ell_\infty)$ for $1 \leq p \leq \infty$. In addition to these characterizations, we apply Hausdorff measure of noncompactness to establish necessary and sufficient conditions for a matrix operator to be a compact operator from fractional sequence spaces $(X, Y)$, where $X = \ell_p(\Delta^{(\tilde{A})})$ or $X = \ell_1(\Delta^{(\tilde{A})})$ ($1 < p < \infty$) and $Y$ is any of the spaces $c_0$, $c$ and $\ell_1$.

All these results are given with the following table:

1. $$\lim_{r \to \infty} \sup_{n} \left( \sum_{k=0}^{\infty} \sum_{j=k}^{\infty} (-1)^{j-k} \frac{\Gamma(-\hat{a}_{k+1} + 1)}{\Gamma(-\hat{a}_{k+1} j + 1)} a_{nj} \right) \left( \frac{q}{\hat{a}_{nk}} \right)^{\frac{1}{q}} = 0.$$

2. $$\lim_{r \to \infty} \sup_{n} \left( \sum_{k=0}^{\infty} \sum_{j=k}^{\infty} (-1)^{j-k} \frac{\Gamma(-\hat{a}_{k+1} + 1)}{\Gamma(-\hat{a}_{k+1} j + 1)} a_{nj} - \lim_{n \to \infty} \hat{a}_{nk} \right) \left( \frac{q}{\hat{a}_{nk}} \right)^{\frac{1}{q}} = 0.$$
Table 1: Necessary and sufficient conditions for an operator to be compact for $1 < p < \infty$.

| $\ell_p(\Delta^{(\tilde{a})})$ | $\ell_1(\Delta^{(\tilde{a})})$ |
|-----------------------------|-----------------------------|
| $c_0$                       | 1.                          |
| $c$                         | 2.                          |
| $\ell_\infty$               | 3.                          |
| $\ell_1$                    | 4.                          |

3. \[ \limsup_{n \to \infty} \frac{1}{n} \left( \sum_{k=1}^{\infty} \left| \sum_{j=k}^{\infty} (-1)^{j-k} \frac{\Gamma(\tilde{a}+1)}{\Gamma(\tilde{a}+j-k+1)} d_{nj} \right|^q \right)^{1/q} = 0. \]

4. \[ \limsup_{n \to \infty} \frac{1}{n} \left( \sum_{k=0}^{\infty} \left| \sum_{j=k}^{\infty} (-1)^{j-k} \frac{\Gamma(\tilde{a}+1)}{\Gamma(\tilde{a}+j-k+1)} d_{nj} \right|^q \right)^{1/q} = 0. \]

5. \[ \limsup_{n \to \infty} \frac{1}{n} \left( \sum_{k=1}^{\infty} \left| \sum_{j=k}^{\infty} (-1)^{j-k} \frac{\Gamma(\tilde{a}+1)}{\Gamma(\tilde{a}+j-k+1)} a_{nj} \right| \right) = 0. \]

6. \[ \limsup_{n \to \infty} \left( \frac{1}{n} \sum_{k=1}^{\infty} \left| \sum_{j=k}^{\infty} (-1)^{j-k} \frac{\Gamma(\tilde{a}+1)}{\Gamma(\tilde{a}+j-k+1)} a_{nj} - \lim_{n \to \infty} \tilde{a}_{nk} \right| \right) = 0. \]

7. \[ \lim_{m \to \infty} \sup_{n \in \mathbb{N}} |\tilde{a}_{n,k_1} - \tilde{a}_{n,k_2}| = \sup_{n} |\tilde{a}_{n,k_1} - \tilde{a}_{n,k_2}|, \text{ uniformly in } k_1 \text{ and } k_2, (1 \leq k_1, k_2 < \infty). \]

8. \[ \limsup_{m \to \infty} \frac{1}{m} \left( \sum_{k=1}^{\infty} \left| \sum_{j=k}^{\infty} (-1)^{j-k} \frac{\Gamma(\tilde{a}+1)}{\Gamma(\tilde{a}+j-k+1)} a_{nj} \right| \right) = 0. \]
