ON TRIVIALITIES OF CHERN CLASSES

ANIRUDDHA C. NAOLEKAR AND AJAY SINGH THAKUR

Abstract. A finite CW-complex $X$ is C-trivial if for every complex vector bundle $\xi$ over $X$, the total Chern class $c(\xi) = 1$. In this note we completely determine when each of the following spaces are C-trivial: suspensions of stunted real projective spaces, suspensions of stunted complex projective spaces and suspensions of stunted quaternionic projective spaces.

1. Introduction

A $CW$-complex $X$ is said to be $C$-trivial if for any complex vector bundle $\xi$ over $X$, the total Chern class $c(\xi) = 1$.

A related notion is that of $W$-triviality. A $CW$-complex $X$ is said to be $W$-trivial if for any real vector bundle $\eta$ over $X$, the total Stiefel-Whitney class $w(\eta) = 1$. A central result in this direction is a theorem of Atiyah-Hirzebruch ([1], Theorem 2) which states that for any finite $CW$-complex $X$, the 9-fold suspension $\Sigma^9X$ of $X$ is always $W$-trivial. In particular, the spheres $S^k$ are all $W$-trivial for $k \geq 9$. In fact, a sphere $S^k$ is $W$-trivial if and only if $k \neq 1, 2, 4, 8$ (see [1], Theorem 1).

Understanding which spaces are $W$-trivial has been of some interest in recent times (see [4], [6], [7] and the references therein). In [6], the author has completely determined which suspensions $\Sigma^k\mathbb{F}\mathbb{P}^n$ are $W$-trivial. Here $\mathbb{F}$ denotes either the field $\mathbb{R}$ of real number, the field $\mathbb{C}$ of complex numbers or the skew-field $\mathbb{H}$ of quaternions and $\mathbb{F}\mathbb{P}^n$ denotes the appropriate projective space. In [7], the second named author has determined, in most cases, which suspensions of the Dold manifolds are $W$-trivial. In [4], the authors have completely determined which suspensions of the stunted real projective spaces are $W$-trivial.

In this note we study the notion of $C$-triviality and determine whether some of the familiar spaces and their suspensions are $C$-trivial. To begin with it is well known that there is no analogue of the Atiyah-Hirzebruch theorem for Chern classes. Indeed,
by the Bott integrality theorem (see Theorem 3.1 below for the precise statement) the even dimensional spheres are not C-trivial. Thus if $d > 4$, then $S^{2d}$ is $W$-trivial but not $C$-trivial. The circle $S^1$ is $C$-trivial but not $W$-trivial. We give other examples in the sequel. However, there are sufficient conditions under which one implies the other. We point out conditions under which this happens.

In this note we completely determine when the suspension of a stunted real projective space is $C$-trivial (see Theorem 1.1 and Theorem 1.2 below). We also completely determine which suspensions of the stunted complex and quaternionic projective spaces are $C$-trivial (see Corollary 3.4 below).

We now state the main results of this paper. The following theorem completely describes which suspensions $\Sigma^k \mathbb{R}P^n$ of the real projective spaces are $C$-trivial. Since $S^1 = \mathbb{R}P^1$ is $C$-trivial and $\mathbb{R}P^n$ is not $C$-trivial for $n > 1$, we shall assume $k > 0$.

**Theorem 1.1.** Let $X^k_n = \Sigma^k \mathbb{R}P^n$ with $k, n > 0$. Then $X^k_n$ is not $C$-trivial if and only if one of the following conditions is satisfied.

1. $k, n$ are both odd.
2. $k = 2, 4$ and $n \geq k$.

Next we look at the suspensions of the stunted real projective spaces. To state the results we introduce the following notations. Let $X_{m,n}$ denote the stunted real projective space $X_{m,n} = \mathbb{R}P^m/\mathbb{R}P^n$ and $X^k_{m,n}$ the $k$-fold suspension $X^k_{m,n} = \Sigma^k (\mathbb{R}P^m/\mathbb{R}P^n)$.

**Theorem 1.2.** Let $X^k_{m,n}$ be as above with $k \geq 0$ and $0 < n < m$.

1. If $k$ is odd and $m$ is even, then $X^k_{m,n}$ is $C$-trivial.
2. If $k, m$ are odd, then $X^k_{m,n}$ is not $C$-trivial.
3. If $n = 2t$, then $X_{m,n}$ is $C$-trivial if and only if $m < 2t+1$.
4. If $k, n$ are even and $k \geq 2$, then $X^k_{m,n}$ is $C$-trivial.
5. If $k$ is even and $n$ is odd, then $X^k_{m,n}$ is not $C$-trivial.

The paper is organized as follows. In Section 2 we prove some general facts about $C$-triviality. In Section 3 we determine which suspensions of stunted complex and quaternionic projective spaces are $C$-trivial and prove the main theorems.

**Conventions.** By a space we mean a finite connected $CW$-complex. Given a map $\alpha : X \rightarrow Y$ between spaces the induced homomorphism in $K$-theory and singular cohomology will again be denoted by $\alpha$. 
2. Generalities

In this section we prove some general facts about $C$-triviality. We give sufficient conditions under which $W$-triviality implies $C$-triviality and $C$-triviality implies $W$-triviality.

To begin, note that a finite $CW$-complex $X$ is $C$-trivial if the reduced complex $\tilde{K}$-group $\tilde{K}(X) = 0$.

**Lemma 2.1.** For any space $X$, we have the following.

1. If $H^{2s}(X; \mathbb{Z}) = 0$ for all $s > 0$, then $X$ is $C$-trivial.
2. If $X$ has cells only in odd dimensions, then $X$ is $C$-trivial.
3. If $X$ is $C$-trivial, then $H^2(X; \mathbb{Z}) = 0$.
4. If $X$ is $W$-trivial and the mod-2 reduction homomorphism $\rho_2 : H^{2i}(X; \mathbb{Z}) \to H^{2i}(X; \mathbb{Z}_2)$ is monomorphic for all $i > 0$, then $X$ is $C$-trivial.

**Proof.** We omit the easy proofs of (1)-(3). The claim (4) follows from the fact that for a complex bundle $\xi$ we have $\rho_2(c_i(\xi)) = w_{2i}(\xi_{\mathbb{R}})$. Here $\xi_{\mathbb{R}}$ denotes the underlying real bundle of $\xi$. $\square$

Thus the real and complex projective spaces $\mathbb{R}P^n$ ($n > 1$) and $\mathbb{C}P^n$ are not $C$-trivial as their second integral cohomology group is non-zero.

The following observations are straightforward and we omit their easy proofs.

**Lemma 2.2.** Let $f : X \to Y$ be a map between spaces.

1. If $f : \tilde{K}(Y) \to \tilde{K}(X)$ is onto and $Y$ is $C$-trivial, then $X$ is $C$-trivial.
2. Suppose $f : H^{2i}(Y; \mathbb{Z}) \to H^{2i}(X; \mathbb{Z})$ is a monomorphism for all $i > 0$. Then if $X$ is $C$-trivial so is $Y$. $\square$

We shall use the above observations in the sequel sometimes without an explicit reference. We have already noted that the even dimensional spheres $S^{2d}$ with $d > 4$ are examples of spaces that are $W$-trivial but not $C$-trivial and also that $S^1$ is $C$-trivial but not $W$-trivial. We give some more examples below.

**Example 2.3.** Let $X = \Sigma \mathbb{R}P^2$ be the suspension of the real projective space $\mathbb{R}P^2$. Then $X$ has non-zero integral cohomology only in degree 3 and hence $X$ must be $C$-trivial. It is known that $X$ is not $W$-trivial ([6], Theorem 1.4).

**Example 2.4.** Let $X = M(\mathbb{Z}_3, 1)$ be the Moore space of type $(\mathbb{Z}_3, 1)$. This is a 2-dimensional $CW$-complex. Since the second (integral) cohomology of $X$ is non-zero, $X$ is not $C$-trivial. However, as $H^i(X; \mathbb{Z}_2) = 0$ for $i > 0$, $X$ is $W$-trivial.
We now state a necessary condition for a space to be $C$-trivial.

**Lemma 2.5.** Let $X$ be a $C$-trivial space. Then for any real bundle $\xi$ over $X$ we have $w_i^2(\xi) = 0$ for all $i > 0$.

**Proof.** Let $\eta$ denote the underlying real bundle of the complexification $\xi \otimes \mathbb{C}$ of $\xi$. Then the total Stiefel-Whitney class of $\eta$ is given by

$$w(\eta) = 1 + w_1^2 + w_2^2 + \cdots$$

where $w_i = w_i(\xi)$. If $w(\eta) \neq 1$, then clearly $c(\xi \otimes \mathbb{C}) \neq 1$. This completes the proof. \(\square\)

In particular, if there exists a real bundle $\xi$ over $X$ with $w_i^2(\xi) \neq 0$ for some $i > 0$, then $X$ cannot be $C$-trivial. The above lemma, in particular, implies that the quaternionic projective space $\mathbb{H}P^n$ is not $C$-trivial for $n > 1$. This is because for the canonical line bundle $\xi$ over $\mathbb{H}P^n$ we have $w_4^2(\xi) \neq 0$. That $\mathbb{H}P^1 = S^4$ is not $C$-trivial is clear. The (even dimensional) spheres show that the converse of the above lemma is not true.

For a space $X$, we have the realification homomorphism $r: \tilde{K}(X) \longrightarrow \tilde{KO}(X)$. The following lemma gives a sufficient condition for a $C$-trivial space to be $W$-trivial.

**Lemma 2.6.** Suppose that $r: \tilde{K}(X) \longrightarrow \tilde{KO}(X)$ is onto. If $X$ is $C$-trivial, then $X$ is $W$-trivial.

**Proof.** The surjectivity of $r$ implies that every real vector bundle $\xi$ over $X$ is stably equivalent to the underlying real bundle $\eta_R$ of a complex vector bundle $\eta$ over $X$. Now $w(\xi) = w(\eta_R) = 1$. This completes the proof. \(\square\)

We mention that the converse to the above lemma is not true. Indeed, if $X = S^6$, then as $\tilde{KO}(S^6) = 0$, $X$ is $W$-trivial but $X$ is not $C$-trivial.

Some of our proofs depend upon the following important observation which gives a sufficient condition for a $W$-trivial space to be $C$-trivial.

**Proposition 2.7.** Let $X$ be a space. Assume that $H_*(X; \mathbb{Z})$ is concentrated in odd degrees and is direct sum of copies of $\mathbb{Z}_2$. If $X$ is $W$-trivial, then $X$ is $C$-trivial.

**Proof.** Given the assumptions on the integral homology of $X$ it follows from the universal coefficients theorem that the integral cohomology of $X$ is concentrated in even degrees and is a direct sum of copies of $\mathbb{Z}_2$. Again, by the universal coefficients theorem, it follows that $H^{2i}(X; \mathbb{Z})$ is a direct sum of copies of $\mathbb{Z}_2$ with the same number of $\mathbb{Z}_2$ summands as in the integral cohomology. As $X$ has no integral cohomology in odd degrees, the mod-2 reduction map

$$\rho_2: H^{2i}(X; \mathbb{Z}) \longrightarrow H^{2i}(X; \mathbb{Z}_2)$$
is surjective and hence an isomorphism as both the groups are a direct sum of equal number of copies of $\mathbb{Z}_2$. The proposition now follows from Lemma 2.1 (4). This completes the proof.

**Remark 2.8.** We remark that the converse of the above proposition is not true. For consider the space $X^6_2 = \Sigma^6 \mathbb{R}P^2$. Then $X^6_2$ satisfies the conditions of the above proposition. By Theorem 1.1, $X^6_2$ is $C$-trivial. However $X^6_2$ is not $W$-trivial, by Theorem 1.4 (3) of [6].

We end this section by noting that second suspension of a $C$-trivial space is $C$-trivial. The idea of the proof is same as that of Theorem 1 in [1] and Theorem 1.1 of [6].

**Theorem 2.9.** Let $X$ be a $C$-trivial space. Then the second suspension $\Sigma^2 X$ of $X$ is $C$-trivial.

**Proof.** Let $\pi_1, \pi_2$ denote the projection maps of $S^2 \times X$ to the first and second factor respectively and $p : S^2 \times X \to \Sigma^2 X$ the quotient map. Let $\nu$ denote the Hopf bundle over $S^2$. Given a bundle $\xi$ over $\Sigma^2 X$ there exists, by Bott periodicity, a bundle $\theta$ of rank $n$ (say) over $X$ such that $p^* \xi$ is stably isomorphic to the tensor product

$$(\pi_1^* \nu - 1) \otimes (\pi_2^* \theta - n).$$

Thus

$$c(p^* \xi) = c(\pi_1^* \nu \otimes \pi_2^* \theta)c(\pi_1^* \nu)^{-n}c(\pi_2^* \theta)^{-2}.$$ 

Since $X$ is $C$-trivial we have $c(\pi_2^* \theta) = 1$. It is clear that $c(\pi_1^* \nu) = 1 + t \times 1$ where $t \in H^2(S^2; \mathbb{Z})$ is a generator. Finally, one checks that

$$c(\pi_1^* \nu \otimes \pi_2^* \theta) = (1 + t \times 1)^n$$

so that

$$c(p^* \xi) = 1.$$

But as $f : H^*(\Sigma^2 X; \mathbb{Z}) \to H^*(S^2 \times X; \mathbb{Z})$ is a monomorphism it follows that $c(\xi) = 1$. This completes the proof. \qed

### 3. Proof of Theorems 1.1 and 1.2

In this section we prove the main theorems and derive some consequences. We first state the Bott integrality theorem which we shall use in the sequel.

**Theorem 3.1.** (Bott integrality theorem) ([3], Chapter 20, Corollary 9.8) Let $a \in H^{2n}(S^{2n}; \mathbb{Z})$ be a generator. For any complex vector bundle $\xi$ over $S^{2n}$, the Chern class $c_n(\xi)$ is divisible by $(n - 1)!a$. For each $m$ divisible by $(n - 1)!$, there exists a unique $\xi \in \tilde{K}(S^{2n})$ with $c_n(\xi) = ma$. \qed
The Bott integrality theorem implies that if $\xi$ is a complex vector bundle over the even dimensional sphere $S^{2n}$ with $n \geq 3$, then $c_n(\xi) \in H^{2n}(S^{2n}; \mathbb{Z})$ is an even multiple of a generator.

The following observation is now immediate from the Bott integrality theorem.

**Proposition 3.2.** Let $X$ be a finite CW-complex. Assume that there is a map $\alpha : X \rightarrow S^d$ such that the homomorphism $\alpha : H^d(S^d; \mathbb{Z}) \rightarrow H^d(X; \mathbb{Z})$ is injective. Then $\Sigma^k X$ is not $C$-trivial whenever $k + d$ is even.

**Proof.** The map $\Sigma^k f$ induces a monomorphism in cohomology in degree $(k + d)$ for all $k$. If $(k + d)$ is even, then as there exists a vector bundle $\xi$ over $S^{k+d}$ with $c(\xi) \neq 1$ we must have $c(f^*\xi) \neq 1$. □

If $X$ is a connected closed orientable manifold we have a degree one map $f : X \rightarrow S^{\dim(X)}$. This induces an isomorphism in top integral cohomology. Thus we have the following.

**Corollary 3.3.** Suppose $X$ is a connected closed orientable manifold. Then $\Sigma^k X$ is not $C$-trivial whenever $\dim(X) + k$ is even. □

If $k$ is odd then the suspensions $\Sigma^k(\mathbb{C}P^m/\mathbb{C}P^n)$ and $\Sigma^k(\mathbb{H}P^m/\mathbb{H}P^n)$ have cells only in odd dimensions and hence are $C$-trivial. The following observation is now immediate from the above noted facts.

**Corollary 3.4.** Let $\mathbb{F} = \mathbb{C}$ or $\mathbb{H}$. Let $0 \leq n < m$. Then $\Sigma^k(\mathbb{F}P^m/\mathbb{F}P^n)$ is $C$-trivial if and only if $k$ is odd. □

**Corollary 3.5.** The product of two connected closed orientable manifolds is not $C$-trivial.

**Proof.** In the case the product $M \times N$ is even dimensional, the claim follows from Corollary 3.3. In the case that $M \times N$ is odd dimensional, assume that $M$ is even dimensional. Then $M$ is not $C$-trivial and since the composition

$$M \xrightarrow{i} M \times N \xrightarrow{\pi_1} M$$

where $i(x) = (x, y)$ for a fixed $y \in N$ and $\pi_1$ the projection to the first factor, is identity it follows that $M \times N$ is not $C$-trivial. This completes the proof. □

In particular, a product of spheres is not $C$-trivial. We make some more observations before proving the main theorems.

**Lemma 3.6.** Suppose $k$ is even.

1. If $X^n_k$ is $W$-trivial, then $X^n_k$ is $C$-trivial.
If $n$ is even and $X_{m,n}^k$ is $W$-trivial, then $X_{m,n}^k$ is $C$-trivial.

**Proof.** We prove (1), the proof of (2) is similar. As $k$ is even, the integral cohomology is zero in odd degrees except in degree $n$ when $n$ is odd in which case it is infinite cyclic. The integral cohomology in even degrees is cyclic of order two. The mod-2 reduction map in even degrees is readily seen to be an isomorphism. By Lemma 2.1 (4), the proof is complete. \qed

**Lemma 3.7.** Let $k, m, n$ be even. If $X_{m+1,n}^k$ is not $C$-trivial, then $X_{m,n}^k$ is not $C$-trivial.

**Proof.** The lemma follows from the fact that the obvious map

$$j : X_{m,n} \longrightarrow X_{m+1,n}$$

induces isomorphism in integral cohomology in even degrees. Hence so does the map $\Sigma^k j$. \qed

**Proof of Theorem 1.1.** If both $k$ and $n$ are odd, then as $\mathbb{RP}^n$ is orientable, it follows from Corollary 3.3 that $X_{n}^k$ is not $C$-trivial. Next assume that $k$ is odd and $n$ is even. Then as $H^i(X_{n}^k; \mathbb{Z}) = 0$ if $i > 0$ is even it follows that $X_{n}^k$ is $C$-trivial in this case. This proves the theorem when $k$ is odd.

Next we assume that $k$ is even. We first show that $X_{n}^4$ is not $C$-trivial if and only if $n \geq 4$. We know that $X_{n}^4$ for $n \leq 3$ is $W$-trivial ([6], Theorem 1.4). Hence it follows from Lemma 3.6 that $X_{n}^4$ is $C$-trivial for $n \leq 3$. So assume that $n \geq 4$. Let $\xi$ be a complex 2-plane bundle over $S^4$ with $c_2(\xi)$ a generator and let $\eta$ be a complex line bundle over $\mathbb{RP}^n$ with $c_1(\eta) = t \in H^2(\mathbb{RP}^n; \mathbb{Z}) \cong \mathbb{Z}_2$ the non-zero element. The cofiber sequence

$$S^4 \vee \mathbb{RP}^n \xrightarrow{j} S^4 \times \mathbb{RP}^n \xrightarrow{\alpha} \Sigma^4 \mathbb{RP}^n$$

gives rise to an exact sequence

$$0 \longrightarrow K(\Sigma^4 \mathbb{RP}^n) \xrightarrow{\alpha} K(S^4 \times \mathbb{RP}^n) \xrightarrow{j} K(S^4 \vee \mathbb{RP}^n) \longrightarrow 0.$$

We compute (see, for example, Lemma 2.1, [6])

$$c((\pi_1^* \xi - 2) \otimes (\pi_2^* \eta - 1)) = 1 + c_2(\xi) \times ((1 + t)^{-2} - 1) = 1 + c_2(\xi) \times (-2t + 3t^2 - 4t^3 + \cdots) \neq 1$$

as $c_2(\xi) \neq 0$ is a generator and $3t^2 \neq 0$. Now as $j((\pi_1^* \xi - 2) \otimes (\pi_2^* \eta - 1)) = 0$, there exists a bundle $\theta \in K(\Sigma^k \mathbb{RP}^n)$ with

$$\alpha(\theta) = (\pi_1^* \xi - 2) \otimes (\pi_2^* \eta - 1).$$
Clearly, \( c(\theta) \neq 1 \). This completes the proof that \( X^4_n \) is not \( C \)-trivial if and only if \( n \geq 4 \).

We now look at the case \( k = 2 \). Note that \( X^2_1 = S^3 \) is \( C \)-trivial. We now check that \( X^2_n \) is not \( C \)-trivial if \( n \geq 2 \). Let \( \xi \) be a complex bundle over \( S^2 \) with \( c(\xi) \neq 1 \) and \( c_1(\xi) \) a generator. Let \( \eta \) denote the non-trivial complex line bundle over \( \mathbb{R}P^n \). Let \( \pi_1, \pi_2 \) be the two projections of \( S^2 \times \mathbb{R}P^n \) onto the first and the second factor respectively. Then,

\[
c((\pi_1^*\xi - 1) \otimes (\pi_2^*\eta - 1)) = 1 + c_1(\xi) \times ((1 + t)^{-1} - 1) = 1 + c_1(\xi) \times (-t + t^2 - t^3 + \ldots)
\]

\[
\neq 1
\]

as \( c_1(\xi) \) is a generator. Here \( t \in H^2(\mathbb{R}P^n; \mathbb{Z}) = \mathbb{Z}_2 \) is the unique non-zero element.

Then, arguing as in the above case, it follows that there must exist a bundle \( \theta \in \tilde{K}(\Sigma^k \mathbb{R}P^n) \) with \( c(\theta) \neq 1 \). Thus \( X^2_n \) is not \( C \)-trivial if and only if \( n \geq 2 \).

To complete the proof of the theorem we finally show that \( X^6_n \) is \( C \)-trivial for all \( n > 0 \). This will imply, by Theorem 2.9, that \( X^k_n \) is \( C \)-trivial for all \( k \geq 6 \) and \( k \) even. First note that \( X^6_1 = S^7 \) is \( C \)-trivial. That \( X^6_2 \) is \( C \)-trivial follows from the fact that \( X^4_2 \) is \( C \)-trivial and by Theorem 2.9. By Theorem 1.4 of [6], \( X^6_n \) is \( W \)-trivial whenever \( n > 3 \). Hence by Lemma 3.6, \( X^6_n \) is \( C \)-trivial when \( n > 3 \). Finally, we look at \( X^6_3 \). The long exact sequence of the pair \(( \mathbb{R}P^3, \mathbb{R}P^2) \) shows that the inclusion map \( i : \mathbb{R}P^2 \rightarrow \mathbb{R}P^3 \) induces an isomorphism \( i : H^2(\mathbb{R}P^3; \mathbb{Z}) \rightarrow H^2(\mathbb{R}P^2; \mathbb{Z}) \). Hence the map \( \Sigma i : \Sigma^6 \mathbb{R}P^2 \rightarrow \Sigma^6 \mathbb{R}P^3 \) induces isomorphism in integral cohomology in degree 8. Since the only non-zero cohomology in even degree (for both \( X^6_2 \) and \( X^6_3 \)) is in degree 8 and \( X^6_2 \) is \( C \)-trivial, it follows by Lemma 2.2 (2) that \( X^6_3 \) is \( C \)-trivial. This completes the proof that \( X^6_n \) is \( C \)-trivial.

This takes care of all the cases and completes the proof of the theorem.

We now come to the proof of Theorem 1.2. First note that if \( m \) is odd then the stunted real projective space \( X_{m,m-2} \) admits a splitting

\[
X_{m,m-2} = S^m \vee S^{m-1}
\]

and if \( m \) is even then

\[
X_{m,m-2} = \Sigma^{m-2} \mathbb{R}P^2.
\]

We now prove Theorem 1.2.

**Proof of Theorem 1.2.** We first prove (1). If \( k \) is odd and \( m \) is even, then the integral cohomology of \( X^k_{m,n} \) is trivial in even degrees and hence \( X^k_{m,n} \) is \( C \)-trivial in this case proving (1).
Next, if \( k, m \) are both odd there exists a map \( \alpha : X_{m,n}^k \to S^{k+m} \) inducing isomorphism in top integral cohomology. By Corollary 3.3 \( X_{m,n}^k \) is not \( C \)-trivial. This proves (2).

Next we prove (3). By Theorem 7.3 [2], the projection \( j : \mathbb{R}P^m \to X_{m,n} \) maps \( \tilde{K}(X_{m,n}) \) isomorphically into the subgroup of \( \tilde{K}(\mathbb{R}P^m) \) generated by class of \( 2^t\nu \), where \( \nu = \xi \otimes \mathbb{C} \) is the complexification of the canonical line bundle \( \xi \) over \( \mathbb{R}P^m \).

Let \( \alpha \in \tilde{K}(X_{m,n}) \) be the generator such that \( j^*(\alpha) = 2^t\nu \). If \( z \in H^2(\mathbb{R}P^m;\mathbb{Z}) \) is the unique non-zero element, then the total Chern class
\[
\tilde{c}(2^t\nu) = (1 + z)^{2^t} = (1 + z^{2^t}).
\]

Since \( j^* : H^k(X_{m,n};\mathbb{Z}) \to H^k(\mathbb{R}P^m;\mathbb{Z}) \) is injective for \( 0 \leq k \leq m \), we have \( c(\alpha) = 1 \) if and only if \( m < 2^{t+1} \). As \( \alpha \) is a generator, we conclude that \( X_{m,n} \) is \( C \)-trivial if and only of \( m < 2^{t+1} \).

We now prove (4). We shall only prove the \( C \)-triviality for the case \( k = 2 \). Then in view of Theorem 2.9 \( X_{m,n}^k \) will be \( C \)-trivial for all \( k \geq 4 \) and \( k \) is even. By Theorem 1.3 of [4], \( X_{m,n}^2 \) is \( W \)-trivial if \( m \neq 6, 7 \). By Lemma 3.6 we see that for \( n \) even, \( X_{m,n}^2 \) is \( C \)-trivial if \( m \neq 6, 7 \). We are now left to prove \( C \)-triviality of the following cases: \( X_{6,n}^2 \) and \( X_{7,n}^2 \) for \( n \) even. We prove these as follows.

We first prove that \( X_{6,n}^2 \) is \( C \)-trivial for \( n \) even. As \( X_{6,4}^2 = \Sigma^6\mathbb{R}P^2 \), it follows from Theorem 1.1 that \( X_{6,4}^2 \) is \( C \)-trivial. We next look at the case \( X_{6,2}^2 \) and let \( \xi \) be a complex vector bundle over \( X_{6,2}^2 \). We shall show that \( c_3(\xi) = 0 = c_4(\xi) \). We first claim that \( c_3(\xi) = 0 \). For if \( c_3(\xi) \neq 0 \), then \( w_0(\xi_{\mathbb{R}}) \neq 0 \) as the mod-2 reduction homomorphism is an isomorphism. Now observe that \( w_3(\xi_{\mathbb{R}}) = 0 \) for \( 1 \leq i \leq 5 \). This contradicts the well-known fact that for a real bundle the first non-zero Stiefel-Whitney class appears in degree a power of two. Thus \( c_3(\xi) = 0 \). Assume now that \( c_4(\xi) \neq 0 \). Consider the exact sequence
\[
\cdots \to \tilde{K}^{-2}(X_{8,6}) \xrightarrow{\alpha} \tilde{K}^{-2}(X_{8,2}) \xrightarrow{i} \tilde{K}^{-2}(X_{6,2}) \to \tilde{K}^{-1}(X_{8,6}) \to \cdots.
\]

Using the Atiyah-Hirzebruch spectral sequence in complex \( K \)-theory it is easy to see that if \( m \) is even, then
\[
\tilde{K}^{-1}(X_{m,n}) = 0.
\]

Thus the homomorphism \( j \) is epimorphic. Hence, \( X_{6,2}^2 \) is \( C \)-trivial as \( X_{8,2}^2 \) is \( C \)-trivial.

Next we prove that \( X_{7,n}^2 \) is \( C \)-trivial for \( n \) even. Clearly, \( X_{7,6}^2 = S^9 \) is \( C \)-trivial. That \( X_{7,2}^2 \) and \( X_{7,4}^2 \) is \( C \)-trivial follows from \( C \)-triviality of \( X_{6,2}^2 \) and \( X_{6,4}^2 \) and by Lemma 3.7. This completes the proof of (4).
We now prove (5). Here $k$ is even and $n$ is odd. First we assume $m$ is even. We look at the cofiber sequence
\[ X_{n+1,n} \xrightarrow{j} X_{m,n} \xrightarrow{\alpha} X_{m,n+1} \]
and the associated exact sequence
\[ \cdots \rightarrow \tilde{K}^{-k}(X_{m,n+1}) \xrightarrow{\alpha} \tilde{K}^{-k}(X_{m,n}) \xrightarrow{j} \tilde{K}^{-k}(X_{n+1,n}) \rightarrow \tilde{K}^{-k+1}(X_{m,n+1}) \rightarrow \cdots . \]
As noted above, since the last group in the above exact sequence is zero the homomorphism $j$ is epimorphic. Since $\Sigma^k X_{n+1,n}$ is an even dimensional sphere, and therefore not $C$-trivial, we conclude that $X_{m,n}$ is not $C$-trivial. Note that, in particular, there exists a complex vector bundle $\xi$ over $X_{m,n}$ with
\[ c_{k+\frac{n+1}{2}}(\xi) \neq 0. \]
Next we assume $m$ is odd. Consider the obvious map
\[ j : X_{m,n} \longrightarrow X_{m+1,n}. \]
The homomorphism $j$ in integral cohomology is an isomorphism in degree $(n+1)$. The homomorphism $\Sigma^k j$ is an isomorphism in integral cohomology in degree $(k+n+1)$. Now if $\xi$ is a complex vector bundle over $X_{m+1,n}$ with
\[ c_{k+\frac{n+1}{2}}(\xi) \neq 0, \]
we have that
\[ c_{k+\frac{n+1}{2}}(j^*\xi) \neq 0. \]
Thus $X_{m,n}$ is not $C$-trivial when $k$ is even and $m, n$ are odd. This completes the proof of (5) and the theorem. \qed

We remark that the fact that $\tilde{K}^{-k}(X_{m,n}) = 0$ whenever $k$ is odd and $m$ is even also gives another proof of Theorem 1.2 (1).
