The 100 most influential publications in paracetamol poisoning treatment: a bibliometric analysis of human studies

Sa’ed H. Zyoud1,2,3*, W. Stephen Waring4, Samah W. Al-Jabi2, Waleed M. Sweileh5 and Rahmat Awang3

Abstract
Background: Analysis of the most influential publications within paracetamol poisoning treatment can be helpful in recognizing main and novel treatment issues within the field of toxicology. The current study was performed to recognize and describe the most highly cited articles related to paracetamol poisoning treatment.

Methods: The 100 most highly cited articles in paracetamol poisoning treatment were identified from the Scopus database in November 2015. All eligible articles were read for basic information, including total number of citations, average citations per year, authors’ names, journal name, impact factors, document types and countries of authors of publications.

Results: The median number of citations was 75 (interquartile range 56–137). These publications were published between 1974 and 2013. The average number of years since publication was 17.6 years, and 45 of the publications were from the 2000s. A significant, modest positive correlation was found between years since publication and the number of citations among the top 100 cited articles ($r = 0.316; \ p = 0.001$). A total of 55 journals published these 100 most cited articles. Nine documents were published in Clinical Toxicology, whereas eight documents were published in Annals of Emergency Medicine. Citations per year since publication for the top 100 most-cited articles ranged from 1.5 to 42.6 and had a mean of 8.5 citations per year and a median of 5.9 with an interquartile range of 3.75–10.35. In relation to the origin of the research publications, they were from 8 countries. The USA had the largest number of articles, 47, followed by the UK and Australia with 38 and nine articles respectively.

Conclusions: This study is the first bibliometric assessment of the top 100 cited articles in toxicology literature. Interest in paracetamol poisoning as a serious clinical problem continues to grow. Research published in high-impact journals and from high income countries is most likely to be cited in published paracetamol research.

Keywords: Paracetamol, Acetaminophen, N-acetylcysteine, Bibliometric, Citations, Scopus, Poisoning

Background
$\text{N}$-acetylcysteine (NAC) is a well-established antidote for a paracetamol (acetaminophen) overdose and is highly effective in minimising liver injury if administered promptly. However, NAC is associated with a number of adverse effects, including nausea, vomiting and non-immunoglobulin E anaphylactic (anaphylactoid) reactions (Zyoud et al. 2010c). A number of methods have been applied in clinical practice for risk stratification, such that NAC is administered to patients thought to be at significant risk of paracetamol-induced liver injury. Most prominently, the extent of paracetamol exposure may be estimated from a measured serum concentration at a known interval after ingestion. However, there are difficulties in relying on patient reporting, and errors may occur concerning the reported drug name, dose and timing of ingestion (Zyoud et al. 2012; Hewett et al. 2013; Rutter et al. 2013). A history of acute or chronic alcohol ingestion and biochemical tests of malnutrition have

been explored as means of detecting an increased susceptibility to paracetamol liver toxicity; however, none of these are sufficiently reliable for routine clinical application (Waring et al. 2008a, b; Zyoud et al. 2011).

The original NAC infusion regimen described by Prescott in the late 1970s gives rise to very high initial blood concentrations, which are associated with the development of adverse effects; a number of alternative regimens have been described, which incorporate a slower initial rate of infusion (Prescott et al. 1977; Zyoud et al. 2010a, b; Waring 2012). Novel NAC infusion regimens are associated with a lower rate of occurrence of adverse effects, but too few data are currently available for a comparison of efficacy in preventing paracetamol-induced liver injury (Chiew et al. 2016). Nonetheless, the regulatory authorities in the UK made substantial changes to the NAC Marketing Authorisation in September 2012, incorporating a slower delivery of the initial loading dose of 150 mg per kg, extended from 15 to 60 min. At the same time, amendments were made to the criteria for NAC so that treatment should be considered for any patient that ingests more paracetamol than 75 mg per kg of body weight or has a measured paracetamol concentration higher than the 100-line nomogram that was formerly used for “high risk” patients only. Other countries have followed suit and incorporated these amendments into local policy. At present, few data exist concerning the impact on rates of occurrence of liver injury or adverse acetylcysteine effects. Early reports from the UK indicate that, since September 2012, there have been increased numbers of patients receiving acetylcysteine, increased hospitalisation and a substantial financial burden (Thompson et al. 2013; Bateman et al. 2014a).

Other novel therapeutic approaches have been examined in patients receiving an intravenous NAC antidote after paracetamol poisoning. For example, co-administration of cimetidine has been found to have no significant effect on patient outcome (Ebrahimi et al. 2015). Co-administration of ondansetron is highly effective in reducing the adverse effects associated with NAC administration, and this might be considered for routine administration in patients at high risk of anaphylactoid reactions, for example those with a history of asthma or previous adverse effects after NAC (Bateman et al. 2014b).

While numerous bibliometric reports have been performed to investigate factors related to research output in the toxicology field (Zyoud et al. 2010b, 2014a, 2015a, b, c, d), to our knowledge, no study has attempted to evaluate the most influential publications within a particular subspecialty in toxicology. The main aim of our study was to identify the 100 most frequently cited articles related to paracetamol poisoning treatment. Therefore, a bibliometric evaluation of scientific literature in a particular field may be used to recognize the impact of influential scholarly work, authors, subjects, countries, etc. The total number of citations that a published article has achieved indicates the importance that published article has on that area of practice. Analysis of the most influential publications within paracetamol poisoning treatment can be helpful in recognizing main and novel treatment issues within the field of toxicology.

**Methods**

**Data acquisition**

In November 2015, we used the Scopus database to retrieve the most frequently cited articles on paracetamol poisoning treatment. Scopus is the largest electronic scientific database. It is larger than either MEDLINE or Web of Science and is more accurate than Google Scholar. Furthermore, Scopus is accessible and allows researchers to obtain information and do analysis that might not be readily achievable in MEDLINE or Google Scholar.

The search terms used to retrieve articles related to paracetamol poisoning treatment were elected from previous bibliometric studies related to paracetamol (Robert et al. 2009; Zyoud et al. 2015a, d). The articles entitled with the terms “acetaminophen” or “paracetamol” or “acetamidophenol” or “hydroxyacetonilide” or “tylenol” or “n-acetyl-p-aminophenol” or “panadol” or “APAP” or “acephen” were included in the research. Then, the following keywords were entered as terms in the article title or abstract: “poison*” or “overdose*” or “toxic*”. All the previous terms were followed by “treat*” or “antidot*” or “detoxification” or “intervention” or “manag*”. To include all possible publications related to paracetamol treatment, we included the following strategy in addition to the previous one. The following keywords, “NAC” or “acetylcysteine” or “N-acetyl-l-cysteine” were entered as terms in the article title or abstract and followed by the following terms: “acetaminophen” or “paracetamol” or “acetamidophenol” or “hydroxyacetonilide” or “tylenol” or “n-acetyl-p-aminophenol” or “panadol” or “APAP” or “acephen”. The Scopus search was conducted by applying the previous strategies of search for all previous years. No limits were placed on the time period for this search. Furthermore, all documents related to paracetamol, with no language restriction, were searched in Scopus database. Wildcard characters were used to include variations of a word by using an asterisk (*) to make our search strategy simpler. For example, in the Scopus search engine, when we entered “toxic*”, it offered a wildcard character capability, and we got results for toxic, toxicity, toxicant, toxicities, intoxication—briefly, any possible word that might include the five letters (i.e. toxic).
Data analysis
We sorted the extracted results from the largest number of citations to the lowest. The results were then evaluated by two independent researchers to extract only the top 100 cited articles related to paracetamol poisoning treatment in human research subjects. Total numbers of citations, average citations per year, authors’ names, journal name, impact factors (IF), document types, countries of publication, and number of authors for only the top 100 cited articles were noted. The impact factor was obtained from 2014 Journal Citation Reports® (Thomson Reuters, New York, NY, USA) (Thomson Reuters 2015) for all journals that published the top 100 cited articles. This is useful in clarifying the significance of absolute citation frequencies. This search used the electronic version of this database by ranking the top 100 cited publications using the standard competition ranking (SCR). It is possible that some articles were cited more frequently than others because of the long time elapsed since their publication. Therefore, a citation index was calculated for each article to avoid the bias created by the time elapsed since publication. Citation index is calculated as the average number of citations divided by number of years elapsed since the article was initially published. A Pearson’s correlation coefficient test was applied to assess the correlation between the impact factor of the journal or years since publication or citation index and the number of citations for the top 100 cited articles included in the study. This was carried out using Statistical Package for Social Sciences (SPSS) Version 15.0. Descriptive statistics were presented as frequencies, medians and interquartile ranges or averages. p values <0.05 were considered statistically significant for all the comparisons.

Results
Citation count and publication year
The number of citations for the top 100 cited articles in paracetamol poisoning treatment ranged from 44 to 553 (Mitchell et al. 1974; Gazzard et al. 1975; Prescott et al. 1976, 1977, 1979, 1989; Rumack and Peterton 1978; Prescott 1981, 1983; Rumack et al. 1981; Forrest et al. 1982; Prescott and Critchley 1983; Black 1984; Mant et al. 1984; Rumack 1984, 1986; Seeff et al. 1986; Slattery et al. 1987; Lauterburg and Velez 1988; Smilkstein et al. 1988; Ziment 1988; Burgunder et al. 1989; Dawson et al. 1989; Riggs et al. 1989; Harrison et al. 1990; Murphy et al. 1990; Underhill et al. 1990; Flanagan and Meredith 1991; Harrison et al. 1991; Holdiness 1991; Keays et al. 1991; O’Grady et al. 1991; Penna and Buchanan 1991; Smilkstein et al. 1991; Bray et al. 1992; Jones and Vale 1993; Thomas 1993; Mutimer et al. 1994; Makin et al. 1995; Eguia and Materson 1997; Makin and Williams 1997; Bernal et al. 1998; Jones 1998; Kelly 1998; Mitchell et al. 1998; Perry and Shannon 1998; Anderson et al. 1999; Buckley et al. 1999a, b; Detry et al. 1999; McClain et al. 1999; Prescott 2000; Prince et al. 2000; Whyte et al. 2000; Woo et al. 2000; Ferner et al. 2001; Schmidt and Dalhoff 2001; Ward et al. 2001; Appelboam et al. 2002; Gynamlani and Parikh 2002; Rumack 2002; Schiodt et al. 2002; Schmidt et al. 2002; Wallace et al. 2002; James et al. 2003; Kao et al. 2003; Kozer et al. 2003; Daly et al. 2004; Lee 2004; Lynch and Robertson 2004; Benson et al. 2005; Kerr et al. 2005; Marzullo 2005; Prescott 2005; Sivilotti et al. 2005; Aitio 2006; Dart et al. 2006; Kanter 2006; Mahadevan et al. 2006; Nourjah et al. 2006; Atkuri et al. 2007; Larson 2007; Daly et al. 2008; Dodd et al. 2008; Fontana 2008; Heard 2008; Kortsalioudaki et al. 2008; Mazer and Perrone 2008; Pakravan et al. 2008; Waring et al. 2008c; Chun et al. 2009; James et al. 2009; Lee et al. 2009; Millea 2009; Sandilands and Bateman 2009; Yarema et al. 2009; Winnike et al. 2010; Ferner et al. 2011; Khandelwal et al. 2011; Antoine et al. 2013; Samuni et al. 2013) (see Table 1 for the top 100 cited publications in paracetamol poisoning treatment ranked in descending order of the number of citations). The median number of citations was 75 (interquartile range 56–137). These publications were published between 1974 and 2013. The average number of years since publication was 17.6 years, and 45 of the publications were from the 2000s. A significant, modest positive correlation was found between years since publication and the number of citations among the top 100 cited articles (r = 0.316; p = 0.001). The earliest article was written by Mitchell et al. (1974) almost 41 years ago in Clinical Pharmacology and Therapeutics, and the most recent were published about 2 years ago (2013) by Samuni et al. (2013) and Antoine et al. (2013) in Biochimica et Biophysica Acta—General Subjects and Hepatology respectively.

Average number of citations per year
Average number of citations per year for the top 100 cited articles ranged from 1.5 to 42.6 with a mean of 8.5 citations per year and a median of 5.9 (interquartile range 3.75–10.35). Table 2 ranks the top 10 publications based on the highest average number of citations per year. Nine of the articles in the list were published after year 2000. The top three articles based on average number of citations per year were the followings: “Acetaminophen-induced hepatotoxicity” with 42.6 average number of citations per year, “Mechanistic biomarkers provide early and sensitive detection of acetaminophen-induced acute liver injury at first presentation to hospital” with 42.0 average number of citations per year and “The chemistry and biological activities of N-acetylcycteine” with 38.6 average number of citations per year. Interestingly, the total number of citations was significantly correlated with citation index (r = 0.485, p < 0.001).

SCR standard competition ranking
* The impact factor was reported according to the Institute for Scientific Information (ISI) journal citation reports (JCR) 2014
Authorship
The total number of authors for the top 100 cited articles was 419, for an average of 4.15 authors per paper. Authors per paper ranged from 1 to 23, and 20 articles were written by one author. Table 3 ranks the top 10 most prolific authors, who have published at least four publications among the 100 most cited publications.

Journals
A total of 55 journals published these top 100 cited articles. Nine documents were published in Clinical Toxicology, whereas eight documents were published in Annals of Emergency Medicine and five documents each were published in British Journal of Clinical Pharmacology, Hepatology and British Medical Journal. The impact factor for journals containing the top 100 cited paracetamol poisoning treatment articles ranged from 0.703 to 55.873. Twenty-eight documents were published in the ten journals with an IF >10. Only three journals for the top 100 cited articles were without IF. A significant, modest positive correlation was found between the journal impact factor and the number of citations among the top 100 cited articles ($r = 0.426; p < 0.001$).

Origins and publication type
In relation to the origin of the research publications for the highly cited articles, they were from eight countries. The USA had the largest number of articles with 47 articles. The UK and Australia published 38 and nine articles respectively, whereas Denmark, Switzerland, Canada, New Zealand and Israel published four, four, three, two and two articles respectively. In the terms of “collaboration with other countries”, we found that eight articles were published and co-authored by researchers from multiple countries. Sixty-six articles were original articles, 32 articles were review articles and three were other types of publications, including conference papers, editorials and notes.

Discussion
The present study was designed to rank and characterize the top 100 cited publications in the field of paracetamol poisoning treatment. The most obvious finding to emerge from this study is that results of this study may explain how developments in this area of clinical toxicology have progressed over time. It becomes obvious which key publications and authors have made exceptional contributions that have played an integral role in shaping the guidelines related to the treatment of paracetamol. Furthermore, the results of this study enhance our understanding about the leading publications that have contributed to the development of this field of toxicology.

Common treatment guidelines for paracetamol poisoning that are currently in use include Australian and New Zealand guideline by Daly et al. (2008), USA guideline by Dart et al. (2006) and UK guideline by Wallace et al. (2002). These guidelines ranked 33rd, 55th and 77th respectively. Furthermore, these common guidelines were based on several articles in the top 100 cited publications such as Smilkstein et al. (1988), Prescott et al. (1979), Keays et al. (1991), Prescott et al. (1977), Rumack (2002), and Smilkstein et al. (1991).

The top 100 cited studies in our study were published from 1974 to 2013 with a citation range of 44–553 times since publication. Compared to citations in other medical

Table 3 The top 10 ranking of prolific authors who published most frequently cited publications, with their affiliations

| SCR | Author | No. of publications | Affiliation |
|-----|--------|---------------------|-------------|
| 1st | Prescott, L. | 10 | University of Edinburgh, Edinburgh, Scotland, UK |
| 1st | Williams, R. | 10 | Foundation for Liver Research, Institute of Hepatology, London, UK |
| 3rd | Rumack, B. H. | 9 | Department of Emergency Medicine, University of Colorado School of Medicine, Aurora, CO, USA |
| 4th | Wendon, J. | 6 | Institute of Liver Studies at King’s College School of Medicine at King’s College Hospital, London, UK |
| 5th | Bateman, D. N. | 5 | University of Edinburgh, Edinburgh, UK |
| 5th | Buckley, N. | 5 | Department of Pharmacology, School of Medical Sciences, University of Sydney, Sydney, New South Wales, Australia |
| 5th | Davson, A. | 5 | NSW Poisons Information Center, Westmead Children’s Hospital Sydney, Australia |
| 5th | Lee, W. M. | 5 | Division of Digestive and Liver Diseases, University of Texas Southwestern Medical Center at Dallas, 5959 Harry Hines Boulevard, Suite 420, Dallas, TX 75390-8887, USA |
| 9th | Alexander, G.J.M. | 4 | Institute of Liver Studies, King’s College School of Medicine and Dentistry, London, UK |
| 9th | Harrison, P.M. | 4 | Institute of Liver Studies, King’s College Hospital, Denmark Hill, London, UK |
| 9th | Whyte, I.M. | 4 | Calvary Mater Newcastle, Newcastle, NSW, Australia |

SCR standard competition ranking
fields, this occupies a very narrow field with a very small readership and number of researchers, it should not be surprising for toxicology topics or toxicology journals to have a small numbers of citations (Bird 2008; Zyoud et al. 2014a, b, 2015a, b, d). Furthermore, since the toxicology field is considered as a very narrow field with a very small readership and number of researchers, it should not be surprising for toxicology topics or toxicology journals to have a small numbers of citations (Bird 2008; Zyoud et al. 2014b). Our results confirm that there was a modest relationship between the number of years elapsed since the time of publication and the number of citations. These results support previous findings which reported that older articles attained more citations because their citable period was longer (Loonen et al. 2008; Lefaivre et al. 2011; Aminian et al. 2014; Joyce et al. 2014; Lee et al. 2015). The annual total number of citations for any article fluctuates with time and for some articles the total annual number of citations might decrease with time while for other articles, the total annual number of citations might increase or remain steady with time. In our study, the low correlation between the total citations and citation index seems to be related to papers that have many citations when they are first published but then drop off in later years because researchers might be tended to preferentially cite the most recent studies (Azer and Azer 2016). Our study showed that the average number of citations per year for articles published after year 2000 was higher than those published before 2000. This finding may be due to the tendency of authors to cite recent papers which is a common practice among authors (Van Noorden et al. 2014).

The most influential article in paracetamol poisoning treatment was conducted by Smilkstein and experts from the USA (Smilkstein et al. 1988) and was published in 1988 in New England Journal of Medicine. This article described the final outcomes of 2540 patients with paracetamol overdose treated with a loading dose of 140 mg per kg of oral NAC followed by 70 mg per kg given every 4 h for an additional 17 doses. It was concluded that NAC treatment should be started within 8 h of an paracetamol overdose (Smilkstein et al. 1988). In contrast to earlier findings, recently, in the last decade, described novel NAC infusion regimens offer different rates of intravenous NAC administration in both the loading and maintenance doses, and this is associated with a lower rate of the occurrence of adverse effects (Pakravan et al. 2008; Waring et al. 2008c). These studies were in the list of influential papers in the top 100 cited articles.

The first paper for paracetamol poisoning treatment was cited only 25 times and was published by Maclean et al. (1968) in 1968 in The Lancet. This article recommended immediate gastric lavage, intravenous hydrocortisone, forced diuresis and antihistamine for paracetamol poisoning treatment. This article achieved a low rate of citation to be listed in the top 100 cited publications in the field of paracetamol poisoning treatment because it was based on treatment regimens, which limited recommendations for the treatment of such cases. The two pioneering publications in the field of general paracetamol poisoning were conducted by Mitchell et al. (1973a, b). They explained the mechanism of paracetamol hepatotoxicity, were published in Journal of Pharmacology and Experimental Therapeutics and are considered as remarkable papers in paracetamol poisoning (Rumack and Bateman 2012). These two publications achieved higher citations in the field of general paracetamol poisoning than in the field of paracetamol poisoning treatment, 1052 and 904 citations each respectively (data not shown), but did not appear in our list because they involved animal research. What is surprising is that this group was in our list and got an advanced position (i.e. the seventh most frequently cited paper) by providing a rationale for therapy in humans by indicating that cysteamine could prevent hepatotoxicity (Mitchell et al. 1974). Prescott et al. (1974) reported the successful treatment of patients with severe paracetamol overdose with cysteamine, but this article was not among the top 100 cited articles. This might be due to the adverse effects in patients making it a less than ideal antidote and of low interest to researchers. Surprisingly, Prescott et al. (1979) were found to be in the list of the top 100 cited articles for a different article, which achieved the third position in the list. They reported that intravenous NAC was more effective in the treatment of paracetamol poisoning than cysteamine and methionine and was markedly free from adverse effects (Prescott et al. 1979). Furthermore, it is somewhat surprising that Prescott and his colleagues in Edinburgh published a series of influential papers in the top 100 cited articles (Prescott et al. 1976, 1977, 1989; Prescott 1983, 2000, 2005; Prescott and Critchley 1983).

One of the pioneering article in the field of general paracetamol poisoning was written by Rumack and Matthew (1975). This article is considered as one of the highly cited articles in the field of general paracetamol poisoning, rather than in the field of paracetamol poisoning treatment. It achieved 303 citations (data not shown) but did not appear in our list. Contrary to expectations, several studies (Schiodt et al. 1997; Larson et al. 2005) were dropped from the list of the top 100 cited articles in the field of paracetamol poisoning treatment because these studies did not mention paracetamol poisoning related treatment terms in their titles or abstract. The most
obvious finding to emerge from our study is that Rumack published a series of influential papers in the top 100 cited articles (Rumack and Peterson 1978; Rumack et al. 1981; Rumack 1984, 1986, 2002).

In the present study, 28 documents were published in the ten journals with an IF >10, including New England Journal of Medicine, The Lancet, Annual Review of Pharmacology and Toxicology, Annals of Internal Medicine, British Medical Journal, Archives of Internal Medicine, Gastroenterology, Gut, Annual Review of Medicine and Hepatology. Our results confirm the modes relationship between the journal impact factor and the number of citations among the top 100 cited articles. These results seem to be consistent with other research, which found that the most cited articles in the field of tuberculosis are often published in journals that top the impact factor list (Chen et al. 2015). The results of our study show that more than half of the publications originated from the USA, followed by the UK. These results match those observed in earlier studies (Loonen et al. 2008; Joyce et al. 2014; Oh and Galis 2014; Chen et al. 2015; Dolan et al. 2015). Research activity in these countries is most likely due to their economic strength (Li et al. 2013; Yun et al. 2015), or numerous large poison centers (Forrester 2016), or the number of researchers or general research activity in this scientific field (Zyoud et al. 2015a, b, c, d), or number of poisoning incidents in these countries (Bateman 2014; Mowry et al. 2015).

There are several limitations of this study. First, our analysis to choose publications with a primary focus on paracetamol poisoning treatment research likely excluded articles that had otherwise notably influenced thinking in the field, including some of the highly cited articles that refer to investigations of paracetamol poisoning in animals or in vitro. Second, it was based on the Scopus database alone; Scopus does not index all journals, and we may have missed journals that figure in other databases such as Google Scholar. Third, articles published in recent years had less of a chance to be among the top 100 cited articles because less time has elapsed since the date of publication to allow citation. Another limitation is that some publications did not mention paracetamol poisoning related treatment terms in their titles or abstract, so it is possible that not all publications about paracetamol were considered. The present study design means that we are unable to include some clinicians that have influenced the treatment of paracetamol poisoning through other means, including unpublished research work, presentations at scientific meetings, and pioneering clinical practice. For example, many influential toxicologists, such as Matthew H., Jæschke H., Piperno E. and Khairallah E.A. (Rumack 2002; Proudfoot and Prescott 2009; Rumack and Bateman 2012), were not identified in our study.

In conclusion, we carried out a bibliometric analysis of the most cited publications focused on paracetamol poisoning research, revealing a number of characteristics related to these influential publications, including the country of origin, type of study, journal and authorship. This study is the first bibliometric assessment of the top 100 cited articles in toxicology literature. The most influential report in paracetamol poisoning treatment research appears to be conducted by Smilkstein et al. from the USA and was published by in 1988 in New England Journal of Medicine. Interest in paracetamol poisoning as a serious clinical problem continues to grow. Research published in high-impact journals and from high income countries is most likely to be cited in published paracetamol research.

Authors’ contributions
SZ led the study design, data collection, statistical analysis, and drafting of the manuscript, SA, WS and RA participated in the study design, and revised the article for important intellectual content, and WW wrote part of the article and revised the article for important intellectual content. All authors read and approved the final manuscript.

Competing interests
The author declares that they have no competing interests.

Ethics approval and consent to participate
As a bibliometric study, as there were no patients involved in this type of analysis, there was no need for Institutional Review Board approval and it was exempted based upon the design of this study.
