Measurement of the splitting function in pp and PbPb collisions at $\sqrt{s_{NN}} = 5.02$ TeV

The CMS Collaboration

Abstract

Data from heavy ion collisions suggest that the evolution of a parton shower is modified by interactions with the color charges in the dense partonic medium created in these collisions, but it is not known where in the shower evolution the modifications occur. The momentum ratio of the two leading partons, resolved as subjets, provides information about the parton shower evolution. This substructure observable, known as the splitting function, reflects the process of a parton splitting into two other partons and has been measured for jets with transverse momentum between 140 and 500 GeV, in pp and PbPb collisions at a center-of-mass energy of 5.02 TeV per nucleon pair. In central PbPb collisions, the splitting function indicates a more unbalanced momentum ratio, compared to peripheral PbPb and pp collisions. The measurements are compared to various predictions from event generators and analytical calculations.

Published in Physical Review Letters as doi:10.1103/PhysRevLett.120.142302.
Scattering processes with large momentum transfer $Q$ between the partonic constituents of colliding nucleons occur early in heavy ion collisions. Further interactions of the outgoing partons with the produced (colored) hot and dense quantum chromodynamics (QCD) medium (the quark-gluon plasma, QGP) may modify the angular and momentum distributions of final-state hadronic jet fragments relative to those in proton-proton collisions. This process, known as jet quenching, can be used to probe the properties of the QGP \[1, 2\]. Jet quenching was first observed at RHIC \[3–9\] and then at the LHC \[10–25\]. This Letter reports an attempt to isolate parton splittings to two well separated partons with high transverse momentum ($p_T$), probing medium induced effects during the parton shower evolution in the QGP. Information about these leading partons of a hard splitting can be obtained by removing the softer wide-angle radiation contributions, done through the use of jet grooming algorithms that attempt to split (“decluster”) a single jet into two subjets \[26–30\]. For a parton shower in vacuum, these subjets provide access to the properties of the first splitting in the parton evolution \[31, 32\]. Interactions of the two outgoing partons with the QGP potentially modify the properties of subsequent splittings resulting in different subjet properties. This Letter reports a study of hard parton splittings in pp and PbPb collisions.

An observable characterizing the parton splitting, denoted by $z_g$, is defined as the ratio between the $p_T$ of the less energetic subjet, $p_{T,2}$, and the $p_T$ sum of the two subjets \[32\], $z_g = p_{T,2} / (p_{T,1} + p_{T,2})$. A measurement of the $z_g$ distribution in pp collisions, using CMS open data, was recently reported \[33, 34\]. In PbPb collisions, this measurement reflects how the two color-charged partons produced in the first splitting propagate through the QGP, probing the role of color coherence of the jet in the medium \[35\]. If the partons act as a single coherent emitter, the two subjets will be equally modified, leaving $z_g$ unaffected \[36\]. If, instead, the partons in the medium act as decoherent emitters, the two subjets should be modified differently, thereby altering $z_g$. In addition, $z_g$ is sensitive to semi-hard medium-induced gluon radiation \[37\], modifications of the initial parton splitting \[38\], and the medium response \[39\].

The analysis uses data collected by the CMS experiment in 2015. The PbPb and pp data samples, both at a nucleon-nucleon center-of-mass energy of 5.02 TeV, correspond to integrated luminosities of 404 $\mu$b$^{-1}$ and 27.4 pb$^{-1}$, respectively. The central feature of the CMS apparatus is a superconducting solenoid of 6 m internal diameter, providing a magnetic field of 3.8 T. Within the solenoid volume are a silicon pixel and strip tracker, a lead tungstate crystal electromagnetic calorimeter, and a brass and scintillator hadron calorimeter, each composed of a barrel and two endcap sections. Forward calorimeters extend the pseudorapidity, $\eta$, coverage provided by the barrel and endcap detectors. A more detailed description of the CMS detector, together with a definition of the coordinate system used and the relevant kinematic variables, can be found in Ref. \[40\].

The particle-flow (PF) algorithm reconstructs and identifies each individual particle with an optimized combination of information from the various elements of the CMS detector \[41\]. The PF candidates identified as a photon or a neutral hadron are treated as massless, while for charged hadrons the pion mass is assumed. The electron and muon PF candidates are assigned the corresponding lepton masses. Jets are reconstructed from the PF candidates using the anti-$k_T$ jet algorithm \[42, 44\] with a distance parameter $R = 0.4$. The kinematics of the jet are determined using the vectorial sum of all particle momenta in the jet. For this analysis, jets are required to have $p_{T,jet} > 140$ GeV and $|\eta| < 1.3$.

The online event selection trigger also uses the anti-$k_T$ algorithm with $R = 0.4$ but applies a lower threshold on $p_{T,jet}$: all events with a PF jet with $p_{T,jet} > 80$ GeV were recorded in the pp case, while in PbPb collisions the triggers (based on jets reconstructed from calorimeter deposits
including a subtraction for the uncorrelated underlying event) use a 100 GeV threshold. Non-collision events, such as beam-gas interactions or cosmic-ray muons, are rejected offline [19]. The events are required to have a primary vertex reconstructed within 15 cm (0.15 cm) of the nominal interaction point along the beam direction (in the transverse plane). The average number of additional collisions per bunch crossing is less than 0.9 in both data sets, having a negligible effect on the measurement. The PbPb event sample is divided into centrality intervals, reflecting the impact parameter of the colliding nuclei, using the percentage of the total inelastic hadronic cross section, which is evaluated using the sum of the total energy deposited in both forward hadron calorimeters, covering the $3 < |\eta| < 5$ range [45].

The PYTHIA 6.423 [46] event generator (tune Z2* [47, 48]) is used to calculate Monte Carlo (MC) corrections. For PbPb simulations, the PYTHIA 6 events are embedded into an underlying event produced with HYDJET 1.9 [49]. All generated events undergo a full GEANT4 [50] simulation of the CMS detector response. Additional cross check samples are produced with PYTHIA 8.212 [51] (tune CUETP8M1 [48]) and HERWIG++ [52] (tune EE5C [53]).

In PbPb collisions, the constituents of the jet are corrected for the underlying event contribution using the “Constituent Subtraction” method [54], a particle-by-particle approach that removes or corrects jet constituents based on the average underlying event density. The subtraction corrects both the four-momentum of the jet and its substructure. Underlying event densities are determined by calculating the median $p_T$ per unit area, $\rho$, and a density term related to the jet mass, $\rho_m$, using a procedure in which all of the particles in the event are clustered into jets using the $k_T$ algorithm with $R = 0.4$ [42, 43, 55]. To match the jets used in this analysis, only $k_T$ jets with $|\eta| < 1.3$ are included in the density determination. The influence of true hard jet fragments on the background estimation is reduced by excluding the two leading $k_T$ jets. The constituent-subtracted jets are corrected for the detector response with jet energy corrections derived from independent pp and PbPb simulations. Additional corrections for the mismodeling of the detector response are also applied [56].

Jet grooming algorithms aim to isolate the hard prongs of a jet and remove soft wide-angle radiation. The “soft drop” declustering procedure, used in this analysis, is an extension of the modified mass drop tagger [29]. The procedure starts by selecting an anti-$k_T$ jet that has already been constituent-subtracted and reclustered with the Cambridge/Aachen algorithm [57] to form a pairwise clustering tree with an angular-ordered structure. A pairwise declustering is performed on this tree. In each step of the declustering, a branching into two subjets is accepted if they pass the soft drop condition [30],

$$\min(p_{T,i}, p_{T,j}) > z_{\text{cut}} \left( \frac{\Delta R_{ij}}{R_0} \right)^\beta,$$

where the subscripts “$i$” and “$j$” indicate the subjets at that step of the declustering, $\Delta R_{ij}$ is the distance between the two subjets in the $\eta$-$\phi$ plane, $R_0$ is the cone size of the anti-$k_T$ jet, and $z_{\text{cut}}$ is an adjustable parameter. If the soft drop condition is not satisfied, the softer subjet is dropped. For this study, $z_{\text{cut}}$ is set to 0.1 [30]. The parameter $\beta$ is set to 0, which satisfies an extended version of infrared and collinear safety by absorbing the collinear divergences into a generalized fragmentation function recovering the QCD splitting function [32]. Once the soft drop condition is satisfied, the two subjets at that position in the tree are used in the analysis. If the soft drop condition is never satisfied, the jet is not used. This is the case for 1.5% of the jets measured at $p_{T,jet} = 140$ GeV, increasing to 3.0% at $p_{T,jet} = 300$ GeV, independent of collision centrality.

Groomed jets with a small distance between the two subjets frequently result from the ambigu-
ous case where the two subjects cannot be distinctly resolved, leading to a significant misassignment of particle constituents to subjets. An additional selection of $\Delta R_{12} > 0.1$ is applied, removing 40% (60%) of the jets measured at low (high) $p_{T,\text{jet}}$, to avoid an unphysical modification of $z_g$. This selection rejects an additional 15% (5%) of the jets at low (high) $p_{T,\text{jet}}$ in the 10% most central PbPb collisions, in comparison to the non-central collisions, an effect well reproduced by the simulation. The systematic uncertainty on the $z_g$ variable is evaluated by varying the $\Delta R_{12}$ minimum distance requirement by its one standard deviation MC resolution of 10%; this variation results in a 2% uncertainty, independent of centrality.

The transverse momentum of the jet after grooming, $p_{T,g}$, is identical to or smaller than the original $p_{T,\text{jet}}$. The groomed $p_T$ fraction, $p_{T,g}/p_{T,\text{jet}}$, is compared to simulations in Fig. 1 for jets with $160 < p_{T,\text{jet}} < 180$ GeV, in pp and central PbPb collisions. The measured and simulated distributions are in agreement.

The potential bias due to the online jet trigger is evaluated by using events collected with a lower threshold and also minimum bias events. For the 10% most central PbPb collisions, a bias is found in the lowest $p_{T,\text{jet}}$ range, $140 < p_{T,\text{jet}} < 160$ GeV, changing the yield by values linearly decreasing from +6% at $z_g = 0.1$ to −15% at $z_g = 0.5$. In the 10–30% centrality class, the bias is half as large, and it vanishes for more peripheral events. The full bias is corrected for and the magnitude of the correction is treated as a $z_g$ systematic uncertainty. The trigger has no effect on the measurements at higher $p_{T,\text{jet}}$.

The systematic uncertainty in the jet energy scale, on the measured and simulated distributions, is obtained by propagating the uncertainties in the jet response correction [56, 58]. A maximum deviation in yield of 4% is found in central PbPb collisions, decreasing to 2% in pp and peripheral PbPb collisions. This effect tends to increase (decrease) the $p_T$ of the leading (subleading) subject. The systematic uncertainty in the normalization of the $z_g$ distributions is estimated to be 5% (3%) in central (peripheral) collisions. The relative uncertainty in the jet energy resolution is 10%, leading to an uncertainty smaller than 0.5% on the $z_g$ distribution.

Figure 2 shows the $z_g$ distribution measured in pp collisions, together with results obtained with PYTHIA 6, PYTHIA 8, and HERWIG++, including a full simulation of detector effects. Both PYTHIA simulations have a slightly steeper $z_g$ distribution than the data, while HERWIG++...
shows an opposite trend.

To compare the $z_g$ distribution in pp and PbPb collisions, in given $p_{T,jet}$ and centrality ranges, the measurements in pp collisions are adjusted to match the subjet resolution in PbPb data. The resolution correction is derived, for each $p_{T,jet}$ and collision centrality range, from full detector simulation studies of the ratio of the $z_g$ distributions between PYTHIA and PYTHIA embedded into HYDJET. The ratio between simulated PbPb and pp $z_g$ distributions shows a relative decrease in the number of PbPb events at high $z_g$, reaching $\sim40\%$ in central collisions and negligible in peripheral collisions. The uncertainty in the correlation between the response of the two subjets is estimated by varying the individual subjet resolution by 10%, the relative correlation by 15%, and the subjet energy scale by 5%, corresponding to one standard deviation in resolution. This results in an uncertainty of 8–10% in $z_g$. The mismodeling of the $z_g$ distribution in PYTHIA, evaluated by reweighting to the $z_g$ measurement in pp collisions, adds an uncertainty of 4–5%. These uncertainties are assigned to the “smeared” pp data points. The resolution correction is validated with a parametric resolution model that uses the jet resolution and a sampled $z_g$ in each $p_{T,jet}$ range, and recreates the correction function for each centrality selection by sampling the individual subjet resolutions.

Figure 3 shows the $z_g$ distributions measured in PbPb collisions, for several centrality intervals, in comparison to the smeared pp reference data. The systematic uncertainties on the $z_g$ distributions are fully correlated from point-to-point, resulting in an anti-correlated uncertainty on the self-normalized distributions, and are uncorrelated between the pp and PbPb data sets. The $z_g$ distribution in peripheral PbPb collisions agrees with the pp reference, while the more central collisions exhibit a steeper $z_g$ distribution. Differences between the $z_g$ of quark- and gluon-initiated jets are found to be a few percent \cite{32}, so that the observed modification cannot be attributed to the flavor composition within a fixed $p_{T,jet}$ interval. The observation indicates that the splitting into two branches becomes increasingly more unbalanced as the PbPb collisions become more central.

The modification of the $z_g$ distribution in central PbPb collisions is shown in Fig. 4 over a wide kinematic range in $p_{T,jet}$. The measurement is compared to a prediction of the JEWEL event generator (shown with statistical and theoretical uncertainties originating from the treat-
Figure 3: The $z_g$ distributions in PbPb collisions for $160 < p_{T,\text{jet}} < 180$ GeV, in several centrality ranges, compared to pp data smeared to account for the differences in resolution. The error bars (shaded area) represent the statistical (systematic) uncertainty.

ment of the medium response), which incorporates medium-induced interactions while the partons propagate through the QGP [39, 60, 61]. The measurement is also compared with a soft-collinear effective theory (SCET) with Glauber gluon interactions [38] for two different quenching strengths, with a calculation incorporating multiple medium-induced gluon bremsstrahlung (BDMPS) [2, 62, 63] assuming that the two hard partons radiate gluons as a coherent emitter [37], and with a higher twist (HT) approach employing both coherent and incoherent energy loss [59]. Each of the three models is presented for two settings of the parameters reflecting their medium properties, as indicated in the legends, where $L$ is the medium length, $\hat{q}$ and $\hat{q}_0$ denote medium transport coefficients, and $g$ is the coupling strength between the jet and the medium. The BDMPS medium effect is too weak to describe the observed $p_{T,\text{jet}}$ dependence, while the other models reproduce the data at low and high $p_{T,\text{jet}}$, using medium properties previously tuned to match measurements of the nuclear modification factors of charged hadrons and jets. For the HT calculation, the presence or absence of color coherence makes a significant difference. Since the detector resolution effects have a negligible impact on the theoretical calculations, given that they largely cancel in the PbPb to (smeared) pp ratio, the theoretical curves are shown without detector smearing.

In summary, the first measurement of the splitting function in pp and PbPb collisions at a center-of-mass energy of 5.02 TeV per nucleon pair has been presented. This represents the first application of a grooming technique to PbPb data, removing soft wide-angle radiation from the jet and thereby isolating the two leading subjets. The momentum sharing between these subjets is used to obtain information about hard parton splitting processes during the shower evolution. The PYTHIA and HERWIG++ event generators reproduce the measured splitting
Figure 4: Ratios of $z_g$ distributions in PbPb and smeared pp collisions in the 10% most central events, for several $p_T^\text{jet}$ ranges, compared to various jet quenching theoretical calculations [37–39, 59]. function in pp and peripheral PbPb collisions, at the level of 15%. In central PbPb collisions, a steeper $z_g$ distribution is observed, indicating that the parton splitting process is modified by the hot medium created in heavy ion collisions. These results provide new insight into the role of color coherence and other attributes of the interactions of partons in the quark-gluon plasma.

University of Rochester, Rochester, USA
A. Bodek, P. de Barbaro, R. Demina, Y.t. Duh, T. Ferbel, M. Galanti, A. Garcia-Bellido, J. Han, O. Hindrichs, A. Khukhunaishvili, K.H. Lo, P. Tan, M. Verzetti

The Rockefeller University, New York, USA
R. Ciesielski, K. Goulianos, C. Mesropian

Rutgers, The State University of New Jersey, Piscataway, USA
A. Agapitos, J.P. Chou, Y. Gershtein, T.A. Gómez Espinosa, E. Halkiadakis, M. Heindl, E. Hughes, S. Kaplan, R. Kunnawalkam Elayavalli, S. Kyriacou, A. Lath, R. Montalvo, K. Nash, M. Osherson, H. Saka, S. Salur, S. Schnetzer, D. Sheffield, S. Somalwar, R. Stone, S. Thomas, P. Thomassen, M. Walker

University of Tennessee, Knoxville, USA
A.G. Delannoy, M. Foerster, J. Heideman, G. Riley, K. Rose, S. Spanier, K. Thapa

Texas A&M University, College Station, USA
O. Bouhali69, A. Castaneda Hernandez69, A. Celik, M. Dalchenko, M. De Mattia, A. Delgado, S. Dildick, R. Eusebi, J. Gilmore, T. Huang, T. Kamon70, R. Mueller, Y. Pakhotin, R. Patel, A. Perloff, L. Pernì, D. Rathjens, A. Safonov, A. Tatarinov, K.A. Ulmer

Texas Tech University, Lubbock, USA
N. Akchurin, J. Damgov, F. De Guio, P.R. Dudero, J. Faulkner, E. Gurpinar, S. Kunori, K. Lamichhane, S.W. Lee, T. Libeiro, T. Mengke, S. Muthumuni, T. Peltola, S. Undleeb, I. Volobouev, Z. Wang

Vanderbilt University, Nashville, USA
S. Greene, A. Gurrola, R. Janjam, W. Johns, C. Maguire, A. Melo, H. Ni, K. Padeken, P. Sheldon, S. Tuo, J. Velkovska, Q. Xu

University of Virginia, Charlottesville, USA
M.W. Arenton, P. Barria, B. Cox, R. Hirosky, M. Joyce, A. Ledovskoy, H. Li, C. Neu, T. Sinthuprasith, Y. Wang, E. Wolfe, F. Xia
Wayne State University, Detroit, USA
R. Harr, P.E. Karchin, N. Poudyal, J. Sturdy, P. Thapa, S. Zaleski

University of Wisconsin - Madison, Madison, WI, USA
M. Brodski, J. Buchanan, C. Caillol, S. Dasu, L. Dodd, S. Duric, B. Gomber, M. Grothe, M. Herndon, A. Hervé, U. Hussain, P. Klabbers, A. Lanaro, A. Levine, K. Long, R. Loveless, G. Polese, T. Ruggles, A. Savin, N. Smith, W.H. Smith, D. Taylor, N. Woods

†: Deceased
1: Also at Vienna University of Technology, Vienna, Austria
2: Also at State Key Laboratory of Nuclear Physics and Technology, Peking University, Beijing, China
3: Also at IRFU, CEA, Université Paris-Saclay, Gif-sur-Yvette, France
4: Also at Universidade Estadual de Campinas, Campinas, Brazil
5: Also at Universidade Federal de Pelotas, Pelotas, Brazil
6: Also at Université Libre de Bruxelles, Bruxelles, Belgium
7: Also at Institute for Theoretical and Experimental Physics, Moscow, Russia
8: Also at Joint Institute for Nuclear Research, Dubna, Russia
9: Also at Helwan University, Cairo, Egypt
10: Now at Zewail City of Science and Technology, Zewail, Egypt
11: Now at Fayoum University, El-Fayoum, Egypt
12: Also at British University in Egypt, Cairo, Egypt
13: Now at Ain Shams University, Cairo, Egypt
14: Also at Université de Haute Alsace, Mulhouse, France
15: Also at Skobeltsyn Institute of Nuclear Physics, Lomonosov Moscow State University, Moscow, Russia
16: Also at CERN, European Organization for Nuclear Research, Geneva, Switzerland
17: Also at RWTH Aachen University, III. Physikalisches Institut A, Aachen, Germany
18: Also at University of Hamburg, Hamburg, Germany
19: Also at Brandenburg University of Technology, Cottbus, Germany
20: Also at MTA-ELTE Lendület CMS Particle and Nuclear Physics Group, Eötvös Loránd University, Budapest, Hungary
21: Also at Institute of Nuclear Research ATOMKI, Debrecen, Hungary
22: Also at Institute of Physics, University of Debrecen, Debrecen, Hungary
23: Also at Indian Institute of Technology Bhubaneswar, Bhubaneswar, India
24: Also at Institute of Physics, Bhubaneswar, India
25: Also at University of Visva-Bharati, Santiniketan, India
26: Also at University of Ruhuna, Matara, Sri Lanka
27: Also at Isfahan University of Technology, Isfahan, Iran
28: Also at Yazd University, Yazd, Iran
29: Also at Plasma Physics Research Center, Science and Research Branch, Islamic Azad University, Tehran, Iran
30: Also at Università degli Studi di Siena, Siena, Italy
31: Also at INFN Sezione di Milano-Bicocca; Università di Milano-Bicocca, Milano, Italy
32: Also at Purdue University, West Lafayette, USA
33: Also at International Islamic University of Malaysia, Kuala Lumpur, Malaysia
34: Also at Malaysian Nuclear Agency, MOSTI, Kajang, Malaysia
35: Also at Consejo Nacional de Ciencia y Tecnología, Mexico city, Mexico
36: Also at Warsaw University of Technology, Institute of Electronic Systems, Warsaw, Poland
37: Also at Institute for Nuclear Research, Moscow, Russia
38: Now at National Research Nuclear University ‘Moscow Engineering Physics Institute’ (MEPhI), Moscow, Russia
39: Also at St. Petersburg State Polytechnical University, St. Petersburg, Russia
40: Also at University of Florida, Gainesville, USA
41: Also at P.N. Lebedev Physical Institute, Moscow, Russia
42: Also at Budker Institute of Nuclear Physics, Novosibirsk, Russia
43: Also at Faculty of Physics, University of Belgrade, Belgrade, Serbia
44: Also at University of Belgrade, Faculty of Physics and Vinca Institute of Nuclear Sciences, Belgrade, Serbia
45: Also at Scuola Normale e Sezione dell’INFN, Pisa, Italy
46: Also at National and Kapodistrian University of Athens, Athens, Greece
47: Also at Riga Technical University, Riga, Latvia
48: Also at Universität Zürich, Zurich, Switzerland
49: Also at Stefan Meyer Institute for Subatomic Physics (SMI), Vienna, Austria
50: Also at Adiyaman University, Adiyaman, Turkey
51: Also at Istanbul Aydin University, Istanbul, Turkey
52: Also at Mersin University, Mersin, Turkey
53: Also at Cag University, Mersin, Turkey
54: Also at Piri Reis University, Istanbul, Turkey
55: Also at Izmir Institute of Technology, Izmir, Turkey
56: Also at Necmettin Erbakan University, Konya, Turkey
57: Also at Marmara University, Istanbul, Turkey
58: Also at Kafkas University, Kars, Turkey
59: Also at Istanbul Bilgi University, Istanbul, Turkey
60: Also at Rutherford Appleton Laboratory, Didcot, United Kingdom
61: Also at School of Physics and Astronomy, University of Southampton, Southampton, United Kingdom
62: Also at Instituto de Astrofísica de Canarias, La Laguna, Spain
63: Also at Utah Valley University, Orem, USA
64: Also at Beykent University, Istanbul, Turkey
65: Also at Bingol University, Bingol, Turkey
66: Also at Erzincan University, Erzincan, Turkey
67: Also at Sinop University, Sinop, Turkey
68: Also at Mimar Sinan University, Istanbul, Istanbul, Turkey
69: Also at Texas A&M University at Qatar, Doha, Qatar
70: Also at Kyungpook National University, Daegu, Korea
