Abstract

Recent studies of the $AdS_4/CFT_3$ correspondence involve the construction of a peculiar supersymmetric gauge theory on the worldvolume of multiple M2s branes as a boundary field theory. Under suitable conditions the quantum theory becomes a noncommutative supersymmetric YM-CS gauge theory which call for an study of its renormalized perturbative corrections. As a preliminary step to more general consideration, the modification of the $\mathcal{N} = 3, 2, 1$ supersymmetric YM-CS gauge theory due to noncommutativity of spatial coordinates is proposed. We carry out the one-loop renormalization and a noncommutative correction for the Chern-Simons coefficient is obtained. Finally it is found that this new correction depends of the noncommutative parameter in an analytic form.

1 Introduction

In recent years, supersymmetric Chern-Simons (CS) gauge theories have attracted a great deal of attention due to the correspondence AdS$_4$/CFT$_3$ between CS matter field theories (CSM) and M-theory on AdS$_4 \times S^7$ (the ABJM model [1]). It is expected that a superconformal CSM theory with a large number of supersymmetries be useful to describe, at low energies, the worldvolume theory on multiple membranes (M2-branes) in M-theory. However in Ref. [2], it was argued that these theories have not the required supersymmetries. Moreover from the construction of a model with $\mathcal{N} = 8$ supersymmetry [3] (the BL model) a lot of work has been developed in different directions (for instance see [4] and references therein). On the other hand, it has been constructed a large class of $\mathcal{N} = 4$ CSM theories by a method that enhances $\mathcal{N} = 1$ supersymmetry to $\mathcal{N} = 4$ [5], and has been proved that with some suitable conditions these theories are equivalent to the model building in [3]. By using group representation theory, from $\mathcal{N} = 1$ to $\mathcal{N} = 8$ CSM theories were constructed systematically [6], and the equivalence of these models has been described for $\mathcal{N} = 5$ in [7].

In Ref. [8] it is studied the quantum properties of the theory of Bagger and Lambert (BL) where it is analyzed the perturbative shift in the CS coupling constant. They use a Yang-Mills action as regulator in the spirit of [9], and find that there are a one-loop correction in the coupling $\kappa \rightarrow \kappa + 2\text{sgn}(\kappa)$. They conjecture that, although the BL theory and the model proposed in [1] for $\mathcal{N} = 6$ are equivalent classically, they may not be equivalent at the quantum level. Another study in the context of quantum properties of CSM models for $\mathcal{N} = 2$ is performed in [10]. So the quantum properties of CS theories with supersymmetry are interesting.

Perturbative studies of Chern-Simons theories have many motivations. Historically they arise from the quest of new topological invariants order by order in perturbation theory [11]. From a seminal paper [12], it is a known fact that the requirement of invariance of the Chern-Simons Lagrangian under finite gauge transformation leads to the quantization of the coupling constant. This quantization is also valid in the noncommutative version as it was shown in [13, 14, 15]. Nevertheless if one couples Yang-Mills theory in three dimensions with the Chern-Simons theory it was recognized that a shift of the
coupling constant is found due to quantum corrections, $\kappa \to \kappa + c_v$, where $c_v$ is the Casimir of the underlying group. This shift is found through the analysis of the renormalization of the coupled theory [11, 16].

Supersymmetric YM-CS theories arise also from some configurations of $D3$-branes and $(p,q)$-fivebranes in Type IIB superstring theory. These theories has been described in [17] for which is placed a $D3$-brane between NS5-branes and $D5$ branes. In [18, 19] it was constructed the brane configuration which describe supersymmetric YM-CS and the conditions under which is breaking the supersymmetry. There were reproduced the results obtained by Witten by computing the index [20].

For $\mathcal{N} = 3, 2, 1$ supersymmetric theories the quantum corrections for YMCS theory are nice computed in by Kao, Lee and Lee in Ref. [9]. They found a shift in the coupling constant only for $\mathcal{N} = 1$. In the present paper we construct a noncommutative version of Kao, Lee and Lee model. We find some no-trivial correction to the Chern-Simons coefficient in terms of the non-commutative parameter $\Theta$, which is an analytical function of this parameter. This would be relevant in order to find a noncommutative version of the the $AdS_4/CFT_3$. The field theory version would involves a noncommutative YM-CS theory of the form considered in this paper or in general grounds a noncommutative version of the BL model or the ABJM model. Some recent proposals in this direction are found in [21]. To construct the noncommutative theory we will consider only spatial noncommutativity to avoid causality problems [22]. The noncommutativity is introduced as usual, by through the Moyal star product (for a review, see [23, 24]). As it is known the noncommutativity changes the algebra of the gauge group to the universal enveloping algebra of the group. As we will shown this change can be summarize in a new $\Theta$ dependent functions of structure.

In the context of noncommutative supersymmetric Chern-Simons theories, recently there have been some studies shown the consistency an finiteness of this kind of theories by using superfields formulation [25, 26, 27, 28, 29].

The paper is organized as follows. I Section II we review the supersymmetric YM-CS theory and build the noncommutative version. Section III is devoted to study the Ward-Slanov-Taylor identities. In section IV we analyze the one-loop renormalization
of our model. In section V we compute the noncommutative shift to the Chern-Simons coefficient. In section VI the final comments are presented.

2 Noncommutative Supersymmetric Yang-Mills-Chern-Simons

We start from the $\mathcal{N} = 3$ supersymmetric YM Lagrangian with gauge group $G$ [9] with a explicit symmetry $O(3)$. In this Lagrangian we have the gauge multiplet, consisting of a massive vector $A_\mu$, three Majorana Fermions $\lambda_a$, three neutral scalar bosons $C_a$ and one Majorana fermion of opposite helicity $\chi$. This Lagrangian can be obtained from the dimensional reduction for a pure supersymmetric $\mathcal{N} = 2$ YM theory in four dimensions [30]. The Lagrangian is given by

$$
\mathcal{L}_{YM} = \frac{1}{g^2} \text{Tr} \left\{ -\frac{1}{2} F_{\mu\nu} F^{\mu\nu} + D_\mu C_a D^\mu C_a + (D_a)^2 + i \bar{\lambda}_a \partial_\mu \lambda_a + \bar{\chi} \partial_\mu \chi \\
+ i \varepsilon_{abc} \bar{\lambda}_a [\lambda_b, C_c] - 2i \bar{\lambda}_a [\chi, C_a] - \frac{1}{2} [C_a, C_b][C_b, C_a] \right\},
$$

where $D_\mu = \partial_\mu - i[A_\mu, \cdot]$, $a, b, c = 1, 2, 3$ y $D_a$ are auxiliary fields. The auxiliary fields are absent when we consider the Lagrangian on-shell. The generators of the gauge group satisfy $[T^m, T^n] = i f^{lmn} T^l$ and $\text{Tr} T^m T^n = \delta^{mn}/2$ with $f^{lmn}$ being the structure constants of $G$. The fields belong to the adjoint representation and $A_\mu = A^m_\mu T^m$. The quadratic Casimir $c_f$ of the gauge group $G$ in the adjoint representation is given by $f^{kmn} f^{lmn} = c_f \delta^{kl}$.

The metric is written as $(1, -1, -1)$ and $\varepsilon^{012} = \varepsilon_{012} = 1$. The gamma matrices are purely imaginary and satisfy the relation: $\gamma^\mu \gamma^\nu = \eta^{\mu\nu} - i \varepsilon^{\mu\nu\rho} \gamma^\rho$.

Now the $\mathcal{N} = 3$ supersymmetric Chern-Simons Lagrangian which is obtained and given in [30]

$$
\mathcal{L}_{CS} = \kappa \text{Tr} \left\{ \varepsilon^{\mu\nu\rho} \left( A_\mu \partial_\nu A_\rho - \frac{2}{3} i A_\mu A_\nu A_\rho \right) - \bar{\lambda}_a \lambda_a + \bar{\chi} \chi + 2C_a D_a + \frac{i}{3} \varepsilon_{abc} C_a [C_b, C_c] \right\},
$$

where $\kappa$ is the coupling constant also termed the Chern-Simons coefficient.

The system to be considered in this paper comes from the addition of both Lagrangians

$$
\mathcal{L} = \mathcal{L}_{YM} + \mathcal{L}_{CS}.
$$
The $\mathcal{N} = 3$ supersymmetric transformations are given by

$$
\begin{align*}
\delta A_\mu &= -i \bar{\alpha}_a \gamma_\mu \lambda_a, \\
\delta \lambda_a &= i B \alpha_a - \varepsilon_{abc} (D_b \alpha_c - i \bar{D} C_b \alpha_c) + i [C_a, C_b] \alpha_b, \\
\delta \chi &= -i \bar{D} C_a \alpha_a - D_a \alpha_a + \frac{i}{2} \varepsilon_{abc} [C_b, C_c] \alpha_a, \\
\delta C_a &= -\varepsilon_{abc} \bar{\alpha}_b \lambda_c + \bar{\alpha}_a \chi, \\
\delta D_a &= \varepsilon_{abc} \bar{\alpha}_b \bar{D} \lambda_c + i \bar{\alpha}_a \bar{D} \chi + i [\bar{\alpha}_b \lambda_a, C_b] \\
&\quad - i [\bar{\alpha}_b \lambda_b, C_a] + i [\bar{\alpha}_a \lambda_b, C_b] - i \varepsilon_{abc} \bar{\alpha}_b [\chi, C_c],
\end{align*}
$$

where $B^\mu = \varepsilon^{\mu \nu \rho} \partial_\nu A_\rho$.

Using field equations for the auxiliary field $D_a + \kappa g^2 C_a = 0$, derived from $\mathcal{L}$ we can eliminate the auxiliary fields $D_a$ to obtain in this way, the total on-shell Lagrangian reads

$$
\mathcal{L} = \frac{1}{g^2} \text{Tr} \left\{ -\frac{1}{2} F_{\mu \nu} F^{\mu \nu} + (D_\mu C_a)^2 + i \bar{\lambda}_a \gamma_\mu D_\mu \lambda_a + i \bar{\chi} \gamma_\mu D_\mu \chi \\
+ \varepsilon_{abc} \bar{\lambda}_b \lambda_c - 2 i \bar{\lambda}_a [\chi, C_a] - \frac{1}{2} [C_a, C_b] [C_b, C_c] \right\} \\
+ \kappa \text{Tr} \left\{ \varepsilon^{\mu \nu \rho} \left( A_\mu \partial_\nu A_\rho - \frac{2}{3} i A_\mu A_\nu A_\rho \right) - \kappa g^2 C_a^2 - \bar{\lambda}_a \lambda_a + \bar{\chi} \chi \\
- \frac{i}{3} \varepsilon_{abc} C_a [C_b, C_c] \right\}.
$$

If we scale the gauge field by $A_\mu^m \rightarrow g A_\mu^m$, we can see that the expansion parameter is $g^2$, which has mass dimension.

We must add the fixing gauge term and the Faddeev-Popov one for the ghost fields

$$
\mathcal{L}_{gf} = -\frac{1}{2\xi} (\partial_\mu A_\mu^m)^2, \quad (6)
$$

$$
\mathcal{L}_{FP} = -2 \text{Tr} [\bar{\eta} (\partial_\mu D_\mu)^m \eta]. \quad (7)
$$

These terms complete the commutative theory.

We are interested in analyzing the one-loop corrections of the noncommutative theory.

The spatial noncommutativity of space is introduced by changing the usual product of smooth functions by the Moyal star product. After defining $m = kg^2$ and adding all
Lagrangians we have

\[ \mathcal{L} = \text{Tr} \frac{1}{g^2} \left\{ \frac{1}{2} \left( \partial_\mu A_\nu - \partial_\nu A_\mu - i[A_\mu, A_\nu]_\ast \right) \left( \partial^\mu A^\nu - \partial^\nu A^\mu - i[A^\mu, A^\nu]_\ast \right) \right. \\
+ \left( \partial_\mu C_a - i[A_\mu, C_a]_\ast \right) \left( \partial^\mu C^a - i[A^\mu, C^a]_\ast \right) \\
+ i\bar{\lambda}_a \gamma^\mu \partial_\mu \lambda_a + \bar{\lambda}_a \gamma^\mu [A_\mu, \lambda_a]_\ast + i\bar{\chi} \gamma^\mu \partial_\mu \chi + \bar{\chi} \gamma^\mu [A_\mu, \chi]_\ast \\
+ i\varepsilon_{abc} \bar{\lambda}_a [C_b, C_c]_\ast - 2i\bar{\lambda}_a [C_a, C_a]_\ast - \frac{1}{2} [C_a, C_b]_\ast [C_b, C_a]_\ast \\
+ m \varepsilon^{\mu\nu\rho} \left( A_\mu \partial_\nu A_\rho - \frac{i}{3} A_\mu [A_\nu, A_\rho]_\ast \right) - m^2 C_a^2 - m \bar{\lambda}_a \lambda_a + m \bar{\chi} \chi \\
\left. - \frac{i}{3} \varepsilon_{abc} C_a [C_b, C_c]_\ast \right\} - \frac{1}{g^2} \xi \partial^\mu A^\mu \partial^\nu A^\nu - \bar{\eta}^m \partial^\mu \partial^\nu \eta^m - i \partial^\mu \bar{\eta}^m [A_\mu, \eta]^m, \tag{8} \right. \\
\right. \\
\]
and we can rewrite (10) as
\[
[A_\mu, A_\nu] = iA_\mu^m \cos \left( \frac{\Theta_{\alpha}^{\alpha} \Theta_{\beta}^{\beta}}{2} \right) A_\mu^n f_{lmn} T^l + iA_\mu^m \sin \left( \frac{\Theta_{\alpha}^{\alpha} \Theta_{\beta}^{\beta}}{2} \right) A_\nu^n d_{lmn} T^l. \tag{12}
\]

In the momentum space the last expression takes the form
\[
[A_\mu, A_\nu] = \int_{p,q} iA_\mu^m(p) \left[ \cos \left( -\frac{p \wedge q}{2} \right) f_{lmn} T^l + \sin \left( -\frac{p \wedge q}{2} \right) d_{lmn} T^l \right] A_\nu^n(q) e^{i(p+q)x}, \tag{13}
\]
where \( p \wedge q \equiv p_\alpha \Theta^{\alpha \beta} q_\beta \). Thus we can define a new structure functions as follows
\[
F_{lmn}(q \wedge p) = f_{lmn} \cos \left( \frac{q \wedge p}{2} \right) + d_{lmn} \sin \left( \frac{q \wedge p}{2} \right). \tag{14}
\]

Then we can write the commutator in a simplified form by
\[
[A_\mu, A_\nu]^m = \int_{p,q} A_\mu^k(p) A_\nu^l(q) iF_{klm}(q \wedge p) e^{-i(p+q)x}, \tag{15}
\]
where as we mentioned earlier, we are working with the universal enveloping algebra of the gauge group \([40, 41, 42, 43, 44, 45, 46]\). The new structure function have the following property
\[
F_{lmn}(p \wedge q) = -F_{mnl}(q \wedge p). \tag{16}
\]

Consequently the free Lagrangian is given by
\[
\mathcal{L}_0 = \frac{1}{2g^2} A^{\mu\nu} \left\{ (\partial^2 \eta_{\mu\nu} - \partial_\mu \partial_\nu) - m \varepsilon_{\mu\nu\rho} \partial^\rho + \frac{1}{\xi} \partial_\mu \partial_\nu \right\} A_{\mu\nu} \\
+ \frac{1}{2g^2} C_a (-\partial^2 - m^2) C_a + \frac{1}{2g^2} \bar{\lambda}_a (i\gamma \partial - m) \lambda_a + \frac{1}{2g^2} \bar{\chi} (i\gamma \partial + m) \chi \\
+ \bar{\eta}^m (-\partial^2) \eta^m, \tag{17}
\]
while the interacting Lagrangian is written as

\[
L_I = \frac{1}{g^2} \int_k \left\{ ik_{\mu} A^{\mu}_{\nu}(k_1) A^{\nu}(k_2) A^{\nu}(k_3) F_{nrm}(k_2 \wedge k_3) e^{-i(k_2 + k_3)x} \\
- \frac{1}{4} A^{\mu}_{\nu}(k_1) A^{\nu}(k_2) A^{\mu}(k_3) F_{nrm}(k_1 \wedge k_2) F_{stnm}(k_3 \wedge k_4) e^{-i(k_1 + k_3 + k_4)x} \\
+ \frac{m}{6} \epsilon_{\mu \nu \rho} A^{\mu}_{\nu}(k_1) A^{\nu}(k_2) A^{\mu}(k_3) F_{nrm}(k_2 \wedge k_3) e^{-i(k_1 + k_3)x} \\
- i k_{\mu} C^{\mu}_{\nu}(k_1) A^{\nu}(k_2) C^{\nu}(k_3) F_{nrm}(k_2 \wedge k_3) e^{-i(k_1 + k_3)x} \\
+ \frac{i}{2} \lambda^{\mu}_{\nu}(k_1) \gamma^{\mu}_{\nu}(k_2) \lambda^{\nu}(k_3) F_{nrm}(k_2 \wedge k_3) e^{-i(k_2 + k_3 - k_1)x} \\
+ \frac{i}{2} \lambda^{\nu}(k_1) \gamma^{\mu}_{\nu}(k_2) \chi^{\nu}(k_3) F_{nrm}(k_2 \wedge k_3) e^{-i(k_2 + k_3 - k_1)x} \\
- \frac{1}{2} \epsilon_{\alpha \beta \gamma} \lambda^{\alpha}_{\gamma}(k_1) \lambda^{\beta}_{\gamma}(k_2) C^{\gamma}(k_3) F_{nrm}(k_2 \wedge k_3) e^{-i(k_2 + k_3 - k_1)x} \\
+ \lambda^{\mu}_{\nu}(k_1) \chi^{\nu}(k_2) C^{\nu}(k_3) F_{nrm}(k_2 \wedge k_3) e^{-i(k_2 + k_3 - k_1)x} \\
+ \frac{1}{4} C^{\mu}_{\nu}(k_1) C^{\nu}_{\rho}(k_2) C^{\rho}_{\gamma}(k_3) F_{nrm}(k_1 \wedge k_2) F_{stnm}(k_3 \wedge k_4) e^{-i(k_1 + k_2 + k_3 + k_4)x} \\
+ \frac{1}{6} m \epsilon_{\alpha \beta \gamma} C^{\alpha}_{\gamma}(k_1) C^{\beta}_{\gamma}(k_2) C^{\gamma}(k_3) F_{nrm}(k_2 \wedge k_3) e^{-i(k_1 + k_2 + k_3)x} \right\} \\
+ \int_k ik^{\nu}_{\mu} \eta^{\nu}(k_1) A^{\nu}(k_2) \eta^{\nu}(k_3) F_{nrm}(k_2 \wedge k_3) e^{-i(k_2 + k_3 - k_1)x}. \tag{18}
\]

Now we are in position to calculate the Feynman rules for the theory (see Appendix A). Let us write here only the propagator for the gauge field by

\[
\Delta_{\mu \nu}(k) = \frac{g^2}{k^2(k^2 - m^2)}(k_\mu k_\nu - k^2 \eta_{\mu \nu} - i m \epsilon_{\mu \nu \rho} k^\rho) + g^2 \xi \frac{k_\mu k_\nu}{k^4}. \tag{19}
\]

In order to avoid infrared divergences we will take the Landau gauge i.e. \( \xi = 0 \).

### 3 The Ward-Slanov-Taylor identities

In the ordinary gauge field theory the Ward-Slanov-Taylor identities play a very important role in the renormalizability of the perturbative theory. For renormalizable gauge theories these identities essentially represent the manifestation of the gauge invariance with the regularized or renormalized action with counterterms included. Conversely, by verifying the Ward-Slanov-Taylor identities we can check the renormalizability and the gauge invariance of the renormalized theory. The same is valid for the noncommutative
theories \[14\]. In this section we comment on the conditions that Ward identities must be fulfilled in order to verify the gauge invariance.

Due to the symmetry of the system, we can factorize the self-energy as

\[
\Pi_{\mu\nu}(p) = \frac{1}{m}(\delta_{\mu\nu}p^2 - p_\mu p_\nu)\Pi_e - i\varepsilon_{\mu\nu\rho}p^\rho\Pi_0. \tag{20}
\]

Contracting \(\Pi_{\mu\nu}\) with \(\delta_{\mu\nu}\) and \(\varepsilon_{\mu\nu\rho}p^\rho\) we obtain \(\Pi_e\) and \(\Pi_0\) respectively. The kinetic term in the effective action for the gauge boson leads to

\[
\Delta_{\mu\nu}^{-1}(p) = \Delta_{0\mu\nu}^{-1}(p) + \Pi_{\mu\nu}(p), \tag{21}
\]

where \(\Pi_{\mu\nu}\) is the self-energy of the gauge boson, and the subindex \(0\) stands for the bare propagator. In the same way, the ghost propagator is corrected in the next form

\[
\tilde{\Delta}(p) = \frac{1}{\tilde{Z}(p)p^2}, \tag{22}
\]

where

\[
\tilde{Z}(p) = 1 + \Pi(p). \tag{23}
\]

The part of the action that is similar to the classical Lagrangian can be written in terms of the renormalized fields and their respective parameters according to the standard normalization \[47, 48\]. Thus we obtain the relation between the renormalized fields and bare fields, for instance

\[
A^m_\mu = \sqrt{Z_3}A^m_{\text{ren},\mu}, \tag{24}
\]

\[
\eta^m = \sqrt{\tilde{Z}}\eta^m_{\text{ren}}. \tag{25}
\]

Consequently the interaction between the ghost fields and the gauge field must be the identity after the renormalization by the Ward identities, then we have

\[
Z_3 = \tilde{Z}^{-2}. \tag{26}
\]

Let us define now \(Z_\kappa \equiv 1 - \Pi_o(p)/\kappa \[9\], and the renormalized Chern-Simons coefficient is

\[
\kappa_{\text{ren}} = \kappa Z_\kappa Z_3 = Z_\kappa \tilde{Z}^{-2} = \kappa \left(1 - \frac{1}{\kappa}\Pi_o(p) + 2\Pi(p)\right). \tag{27}
\]
4 One-loop renormalization

In here we calculate the one-loop self-energy of the gauge field, for which there are seven diagrams, but according to decomposition did in (20), we have that for the odd part \( \Pi_o \) of the self-energy only contribute three diagrams, which are those that have a term with a factor \( \varepsilon_{\mu
u\rho} \). For the even part of the self-energy \( \Pi_e \) it is necessary to take into account all diagrams.

As we seen in the previous section, to calculate the correction to the Chern-Simons coefficient only is necessary to find the odd part of the self-energy of the gluon and the self-energy of the ghost field. Let us first calculate the self-energy of the ghost field.

4.1 Self-energy of the Ghost Field

Using the Feynman rules shown in Appendix A, the term that result after contracting the indices and taking the trace of the structure functions is given by

\[
\tilde{\Pi}(p) = \frac{im}{\kappa p^2} \frac{1}{2} (c_f + c_d) \int \frac{d^3 k}{(2\pi)^3} \frac{p^2 k^2 - (p \cdot k)^2}{k^2 (k^2 - m^2) (p + k)^2}
\]

\[
+ \frac{im}{\kappa p^2} \frac{1}{2} (c_f - c_d) \int \frac{d^3 k}{(2\pi)^3} \frac{\cos(\tilde{p} k) (p^2 k^2 - (p \cdot k)^2)}{k^2 (k^2 - m^2) (p + k)^2},
\]

(28)

where \( \tilde{p} k = p_\mu \Theta^{\mu\nu} k_\nu \) and \( c_f, c_d \) are the quadratic Casimirs of the structure constants antisymmetric and symmetric respectively. To obtain this factorization, in the process of using the Feynman rules we must take into account the properties of the algebra in the new \( \Theta \)-dependent structure function as is shown as follows

\[
\text{Tr}[F_{tsr}(p \wedge k) F_{usr}(p \wedge k)] = \text{Tr} \left\{ \left[ f_{tsr} \cos \left( \frac{\tilde{p} k}{2} \right) + d_{tsr} \sin \left( \frac{\tilde{p} k}{2} \right) \right] \left[ f_{usr} \cos \left( \frac{\tilde{p} k}{2} \right) + d_{usr} \sin \left( \frac{\tilde{p} k}{2} \right) \right] \right\}
\]

\[
= \text{Tr} \left[ f_{tsr} f_{usr} \cos^2 \left( \frac{\tilde{p} k}{2} \right) + d_{tsr} d_{usr} \sin^2 \left( \frac{\tilde{p} k}{2} \right) + (f_{tsr} d_{usr} + f_{usr} d_{tsr}) \cos \left( \frac{\tilde{p} k}{2} \right) \sin \left( \frac{\tilde{p} k}{2} \right) \right],
\]

(29)

which can be simplified by using the Jacobi identity \([T^k, \{T^l, T^m\}] \) + cyclic permutations = 0. Thus we obtain

\[
f_{klo} d_{mno} + f_{nlo} d_{ako} + f_{mlo} d_{kno} = 0.
\]

(30)
For our particular case we have
\[ f_{tsr} d_{usr} + f_{usr} d_{str} + f_{ssr} d_{tur} = 0, \]
\[ f_{tsr} d_{usr} + f_{usr} d_{str} = 0. \] \quad (31)

After substitution of Eq. (31) in (29) obtain finally that
\[ \text{Tr}[F_{tsr}(p \wedge k)F_{usr}(p \wedge k)] = \text{Tr}[f_{tsr} F_{usr} \cos \left( \frac{\tilde{p}k}{2} \right)] + \text{Tr}[d_{tsr} d_{usr} \sin \left( \frac{\tilde{p}k}{2} \right)], \] \quad (32)
where it is defined the quadratic Casimir as
\[ \text{Tr}[f_{tsr} f_{usr}] = c_f \quad \text{Tr}[d_{tsr} d_{usr}] = c_d. \] \quad (33)

Using some trigonometric properties we obtain the desired form (28).

In Eq. (28) we can see that the planar and non-planar contributions for this diagram are separated. For computing the integrals we use the Feynman parametrization
\[ \frac{1}{abc} = \Gamma(3) \int_0^1 dx \int_0^{1-x} dy \int \frac{1}{[a(1 - x - y) + bx + cy]^3}, \] \quad (34)
in which if we take \( a = k^2, \) \( b = (k + p)^2 \) and \( c = k^2 - m^2 \) we get
\[ \frac{1}{k^2(k^2 - m^2)(k + p)^2} = 2 \int_0^1 dx \int_0^{1-x} dy \left[ \frac{1}{[(k + xp)^2 + x(1 - x)p^2 - ym^2]^3}. \right. \] \quad (35)

Making the change of variable
\[ k' = k + xp \quad M^2 = ym^2 - x(1 - x)p^2, \] \quad (36)
we can rewrite Eq. (28) as the planar and non-planar contributions
\[ \Pi(p) = \Pi_p(p) + \Pi_{np}(p) \] \quad (37)
where
\[ \Pi_p(p) = \frac{im}{k^2 p^2} (c_f + c_d) \int_0^1 dx \int_0^{1-x} dy \int \frac{d^3k'}{2\pi^3} \frac{p^2 k'^2 - (p \cdot k')^2}{[k'^2 - M^2]^3} \] \quad (38)
and
\[ \Pi_{np}(p) = \frac{im}{k^2 p^2} (c_f - c_d) \int_0^1 dx \int_0^{1-x} dy \int \frac{d^3k'}{2\pi^3} \frac{\cos(\tilde{p}k')(p^2 k'^2 - (p \cdot k')^2)}{[k'^2 - M^2]^3}. \] \quad (39)
It is convenient to reduce this integral into a simpler form, for which we use the property
\[ \int d^D k k^\mu k^\nu f(k^2) = \int d^D k k^2 f(k^2) (\frac{2}{k^2})^{\mu\nu} \] and make a Wick’s rotation by taking \( k_0 = ik_{E0} \), then \( k_E^2 = -k^2 \) and \( d^D k = id^D k_E \). Therefore we write the planar part as \(^3\)
\[ \tilde{\Pi}_p(p) = -\frac{m}{\kappa^2} \frac{2}{3} (c_f + c_d) \int_0^1 dx \int_0^{1-x} dy \int \frac{d^3k}{(2\pi)^3} \frac{k^2}{[k^2 + M^2]^3}. \] (40)

It is convenient to use spherical coordinates such that \( d^3k = d\Omega k^2 dk \). Integration over the angles and using the definition of the beta function and its properties we find
\[ \tilde{\Pi}_p(p) = -\frac{m}{\kappa^2} \frac{1}{32\pi} (c_f + c_d) \int_0^1 dx \int_0^{1-x} dy \int \frac{1}{[m^2y - x(1-x)p^2]^\frac{3}{2}}. \] (41)

The non-planar part \(^3\) after Wick’s rotation is expressed as
\[ \tilde{\Pi}_{np}(p) = -\frac{m}{\kappa^2} \frac{2}{3} (c_f - c_d) \int_0^1 dx \int_0^{1-x} dy \int \frac{d^3k}{(2\pi)^3} \frac{k^2 \cos(\tilde{p}k)}{[k^2 + M^2]^3}. \] (42)

Defining a new variable \( \sqrt{\rho^2 k_\mu} = z_\mu \) one can rewrite Eq. (42) as
\[ \tilde{\Pi}_{np}(p) = -\frac{m}{\kappa^2} \frac{2}{3} (2\pi)^3 (c_f - c_d) \int_0^1 dx \int_0^{1-x} dy \int d^3z \frac{z^2 \cos(z \cdot \hat{p})}{[z^2 + a^2]^3}, \] (43)

where we defined \( a^2 = M^2 \rho^2 \) and \( \rho = \sqrt{\rho^2} \). The last integral in the previous expression can be rewritten as
\[ I(a) = \frac{1}{8a^2} \left[ \frac{d^2}{da^2} - \frac{1}{a} \frac{d}{da} \right] \int d^3z \frac{z^2 \cos(z \cdot \hat{p})}{z^2 + a^2}, \] (44)

where \( \hat{p} \) is the unit vector along \( \vec{p} \). The integral arising in Eq. (44) can be done by choosing, without loss of generality, \( z_2 \) in the direction of \( \hat{p} \). For the integration we use the functional form of the modified Bessel function \[50\]. Thus one finally gets for \( I(a) \) the following form
\[ I(a) = -\frac{2\pi^2}{8a^2} (a^2 - 3a) e^{-a}. \] (45)

Finally the non-planar correction of the ghost fields is
\[ \tilde{\Pi}_{np}(p) = \frac{m}{\kappa^2} \frac{2}{3} (2\pi)^3 (c_f - c_d) \int_0^1 dx \int_0^{1-x} dy \frac{2\pi^2}{8a^2} (a^2 - 3a) e^{-a}, \] (46)

or in terms of \( M \) we have
\[ \tilde{\Pi}_{np}(p) = \frac{m}{\kappa^2} \frac{1}{24} (2\pi)^3 (c_f - c_d) \int_0^1 dx \int_0^{1-x} dy \left( 1 - \frac{3}{\rho M} \right) e^{-\rho M}. \] (47)

\(^3\)From now on we will omit the apostrophe in \( k \) except that it does not cause confusion.
4.2 Self-energy of the gauge field

As was mentioned above, we are interested in noncommutative corrections to the renormalization of the Chern-Simons coefficient, for this reason in what follows we consider only the odd part of the self-energy of the gluon.

There are seven one-loop diagrams that contribute to the gauge field self-energy, but for the odd part $\Pi_o$, only the diagrams that have a gluon loop and two of them that have a fermion loop do contribute (see Appendix B). Due to supersymmetry the self-energy for the gauge field have not UV divergencies and do not be necessary to regularize. Moreover, in [25, 26, 27, 28, 29] it was shown that the noncommutative supersymmetric Chern-Simons is indeed finite. The contribution to the term $\Pi_o$ will be divided into a bosonic part $\Pi^B_o(p)$ for which only the ghost loop diagram contribute, and a fermionic part $\Pi^F_o(p)$ where everything else contribute. In both parts there are planar and non-planar contributions. Thus we have for the bosonic part

$$\Pi^B_o(p) = \Pi^B_{op}(p) + \Pi^B_{onp}(p),$$

where

$$\Pi^B_{op}(p) = \frac{im}{p^2} \frac{1}{2} (c_f + c_d) \int \frac{d^3k}{(2\pi)^3} \frac{k^2 p^2 - (k \cdot p)^2}{k^2(k^2 - m^2)(k + p)^2[(k + p)^2 - m^2]},$$

and

$$\Pi^B_{onp}(p) = \frac{im}{p^2} \frac{1}{2} (c_f - c_d) \int \frac{d^3k}{(2\pi)^3} \frac{k^2 p^2 - (k \cdot p)^2}{k^2(k^2 - m^2)(k + p)^2[(k + p)^2 - m^2]}.$$  (50)

The fermionic contribution is given by

$$\Pi^F_o(p) = \Pi^F_{op}(p) + \Pi^F_{onp}(p),$$

where

$$\Pi^F_{op}(p) = -\frac{im}{p^2} \frac{1}{2} (c_f + c_d) \int \frac{d^3k}{(2\pi)^3} \frac{2p^2}{[(k + p)^2 - m^2](k^2 - m^2)},$$

and

$$\Pi^F_{onp}(p) = -\frac{im}{p^2} \frac{1}{2} (c_f - c_d) \int \frac{d^3k}{(2\pi)^3} \frac{\cos(\tilde{p}k)2p^2}{[(k + p)^2 - m^2][k^2 - m^2]}.$$  (53)

For simplicity we first calculate the planar part (52). Using the Feynman parametrization $\frac{1}{ab} = \int_0^1 \frac{dx}{ax + b(1-x)}$ and making $k' = k - xp$ and $M^2_1 = m^2 - x(1-x)p^2$, (52) is simplified

$$\Pi^F_{op}(p) = -im(c_f + c_d) \int_0^1 dx \int \frac{d^3k'}{(2\pi)^3} \frac{1}{[k'^2 - M^2_1]^2}. $$  (54)
Making a Wick’s rotation and integrating in spherical coordinates this integral becomes
\[
\Pi_{op}^F(p) = \frac{m}{4} \frac{1}{2\pi} \frac{1}{8} (c_f + c_d) \int_0^1 \frac{dx}{[m^2 - x(1 - x)p^2]^{1/2}}. \tag{55}
\]

The non-planar part, after Feynman parametrization and Wick’s rotation, is written as
\[
\Pi_{onp}^F(p) = m(c_f - c_d) \int_0^1 \frac{dx}{[m^2 - x(1 - x)p^2]^{1/2}} \int \frac{d^3k'}{(2\pi)^3} \frac{\cos(\vec{p}k')}{[k'^2 + M^2]^{1/2}} \tag{56}
\]
where we have defined \(\sqrt{\vec{p}^2} = z_\mu\) and \(a^2 = M^2\rho^2\), like in the previous section, we have
\[
\Pi_{onp}^F(p) = m \frac{\rho}{(2\pi)^3} (c_f - c_d) \int_0^1 \frac{dx}{[m^2 - x(1 - x)p^2]^{1/2}} \int \frac{d^3z}{[z^2 + a^2]^{1/2}} \tag{57}
\]
The second integral in this equation reads
\[
I_1(a) = -\frac{1}{2a} \frac{d}{da} \int \frac{d^3z}{z^2 + a^2} \cos(\hat{p} \cdot z). \tag{58}
\]
Following a similar procedure in the computation of the integral in the non-planar case for the ghost field (43) we obtain
\[
I_1(a) = \frac{\pi^2 e^{-a}}{a}. \tag{59}
\]
Finally the non-planar contribution is given by
\[
\Pi_{onp}^F(p) = m \frac{\rho}{4} (c_f - c_d) \int_0^1 \frac{dx}{[m^2 - x(1 - x)p^2]^{1/2}} e^{-\rho M_1}. \tag{60}
\]
For the bosonic part the procedure is completely analogous though a bit more involved. Using the Feynman parametrization
\[
\frac{1}{abcd} = 3! \int_0^1 dw \int_0^{1-x} dx \int_0^{1-w-x} dy \int \frac{1}{[ay + bx + cw + d(1 - w - x - y)]^4}, \tag{61}
\]
the planar part (49) reads
\[
\Pi_{op}^B(p) = 3! \frac{2im}{3p^2} \frac{1}{2} (c_f + c_d) \int_0^1 \frac{dw}{\frac{[k'^2p^2[5k'^2 + p^2(5u^2 - 5u) + 2m^2]}{(2\pi)^3}[k'^2 - M^2]^4]}, \tag{62}
\]
where \(k' = k - up\), \(M_2^2 = (w + y)m^2 - u(1 - u)p^2\) and \(u = x + y\).

Making the Wick’s rotation as in the previous cases and integrating out in spherical coordinates we obtain
\[
\Pi_{op}^B(p) = -\frac{2m}{3} \frac{1}{2} (c_f + c_d) \int_0^1 \frac{dw}{\frac{[5]}{162\pi [(w + y)m^2 - u(1 - u)p^2]^{3/2}}}
\]
\[
\quad \bullet \frac{3}{162\pi} \frac{1}{[(w + y)m^2 - u(1 - u)p^2]^{3/2}} \tag{63}
\]

The non-planar part after parametrization and Wick’s rotation is given by
\[
\Pi_{\text{onp}}^B(p) = -3!2m \frac{1}{3} (c_f - c_d) \int_0^1 dw \, dx \, dy \left\{ \int \frac{d^3 k}{(2\pi)^3} \frac{5k^4 \cos(\tilde{p} k)}{[k^2 + M_2^2]^4} \right. \\
\left. - [p^2(5u^2 - 5u) - 2m^2] \int \frac{d^3 k}{(2\pi)^3} \cos(\tilde{p} k) k^2 \right\}. \quad (64)
\]

We make the same change of variables that in the previous cases and we get
\[
\Pi_{\text{onp}}^B(p) = -3!2m \frac{5\rho}{3} \frac{1}{2} (c_f - c_d) \int_0^1 dw \, dx \, dy \left\{ \int d^3 z \frac{z^4 \cos(\tilde{p} \cdot z)}{[z^2 + a^2]^4} \right. \\
\left. - \rho^2 [p^2(5u^2 - 5u) - 2m^2] \int d^3 z \frac{\cos(\tilde{p} \cdot z) z^2}{[z^2 + a^2]^4} \right\}. \quad (65)
\]

The last integrals in each term can be written as
\[
I_2(a) = -\frac{1}{48a^3} \left[ \frac{d^3}{da^3} - 3 \frac{d^2}{a^2 da} + 3 \frac{d}{a^2 da} \right] \int d^3 z \frac{z^4 \cos(\tilde{p} \cdot z)}{z^2 + a^2}, \quad (66)
\]
\[
I_3(a) = -\frac{1}{48a^3} \left[ \frac{d^3}{da^3} - 3 \frac{d^2}{a^2 da} + 3 \frac{d}{a^2 da} \right] \int d^3 z \frac{\cos(\tilde{p} \cdot z) z^2}{z^2 + a^2}. \quad (67)
\]

Similarly than the previous situations we can compute these integrals and this yields
\[
I_2(a) = \frac{2\pi^2}{48a^3} (a^4 + 15a^3 + 15a^2) e^{-a}, \quad (68)
\]
\[
I_3(a) = \frac{2\pi^2}{48a^3} (a^2 - 3a - 3) e^{-a}. \quad (69)
\]

Finally we obtain that the correction is given by
\[
\Pi_{\text{onp}}^B(p) = -\frac{5m \rho}{48} \frac{1}{2\pi} (c_f - c_d) \int_0^1 dw \, dx \, dy \left\{ \left( \rho M_2 + 15 + \frac{15}{\rho M_2} \right) e^{-\rho M_2} \right. \\
\left. - [p^2(5u^2 - 5u) - 2m^2] \left( \frac{1}{\rho M_2} - \frac{3}{(\rho M_2)^2} - \frac{3}{(\rho M_2)^3} \right) e^{-\rho M_2} \right\}. \quad (70)
\]

5 **Shift of \( \kappa \)**

In order to calculate the shift of the \( \kappa \) coefficient we will expand the contributions to the self-energy of gluon, and the contribution of the ghost fields and integrate over Feynman parameters obtaining in this way that
\[
\bar{\Pi}(p) \approx -\frac{c_f}{6\pi|\kappa|} + \frac{m \rho (c_f - c_d)}{24\pi}, \quad (71)
\]
\[
\Pi_F^G(p) \approx \frac{c_f}{4\pi|\kappa|} - \frac{m \rho (c_f - c_d)}{8\pi}, \quad (72)
\]
\[
\Pi_B^G(p) \approx -\frac{7c_f}{12\pi|\kappa|}. \quad (73)
\]
We can see that for the bosonic part of the self-energy that comes from the gluon there is not correction due to noncommutativity. The value obtained is the same that the obtained for the commutative case with \( p = 0 \). The terms that have not as common factor \( \rho \) in the fermionic and ghost contributions are precisely those that correspond to the commutative usual case. The other terms are due to the non-commutativity.

Finally applying the equation

\[
\kappa_{\text{ren}} = \kappa \left( 1 - \frac{1}{k} \Pi_o(p) + 2 \Pi(p) \right),
\]

we obtain the result

\[
\kappa_{\text{ren}} = \kappa \left( 1 + \frac{5}{24 \pi} g^2 \Theta (c_f - c_d) p \right).
\]

For finding the shifts for the \( \mathcal{N} = 2 \) theory it is necessary to consider that \( C_1 = C_2 = \lambda_3 = \chi = 0 \), but as in the fermionic contribution to the ghost self-energy, the contribution of \( \lambda_a \) is canceled by the contribution of \( \chi \). Then we have that for the \( \mathcal{N} = 2 \) theory the shift is the same. Nevertheless for the \( \mathcal{N} = 1 \) theory we can obtain the contributions from the \( \mathcal{N} = 2 \) theory by considering that \( C_3 = 0 \) and \( \lambda_2 = 0 \) so the contribution to the fermionic part of the self-energy is one-half of the result presented here. In this way we find that for the \( \mathcal{N} = 1 \) theory we have

\[
\kappa_{\text{ren}} = \kappa \left( 1 + \frac{c_f}{8 \pi |\kappa|} + \frac{5}{48 \pi} g^2 \Theta (c_f - c_d) p \right).
\]

6 Final Comments

In the present paper a noncommutative version of the supersymmetric YM-CS theory is studied. This theory constitutes a Moyal deformation of the theory considered in [9]. For this noncommutative deformation we calculated the shifting to the Chern-Simons coefficient due to noncommutativity in the limit of small moments. This calculation was done in the context of perturbative \( \mathcal{N} = 1, 2, 3 \) supersymmetric YM-CS gauge theory in three dimensions with compact gauge group \( U(N) \). It was found that this shift have a dependence of noncommutative parameter \( \Theta \) and the momenta \( p \) (see Eqs. (75) and (76)). This correction, nevertheless vanishes in the limit \( \Theta \to 0 \) which is expected.
Although we explore noncommutative gauge theories in the perturbative context it is known that the analyticity properties of the observables of the theory with respect to the noncommutative parameter has information about non-perturbative properties of the system \[51\] and there were computed different nonperturbative quantities as the Witten index \[20\]. It is known that that Witten’s index is compatible with a one-loop quantum correction to the Chern-Simons coupling \(\kappa\) in the Yang-Mills-Chern-Simons gauge theory. Given our result from Eqs. (75) and (76) it would be very interesting to explore if there will be a modification introduced by the noncommutative theory and make a comparison with the result in \[51\]. We are currently exploring these issues and intend to report some progress elsewhere.

A Feynman rules

The propagator for the gauge bosons $A_\mu$ is

$$\Delta_{\mu\nu}(k) = \frac{g^2}{k^2(k^2 - m^2)}(k_\mu k_\nu - k^2 \eta_{\mu\nu} - im\varepsilon_{\mu\nu\rho}k^\rho) + g^2\xi \frac{k_\mu k_\nu}{k^4}, \quad (77)$$

the propagator for each $\lambda_a$ is given by

$$D^{mn}(k) = \frac{\delta^{mn}g^2}{k' - m}, \quad (78)$$

the propagator for the fermion $\chi$ is

$$D^{mn}(k) = \frac{\delta^{mn}g^2}{k' + m}, \quad (79)$$

the propagator for the bosons $C_a$ is

$$\delta(k) = -\frac{g^2}{k^2 + m^2}, \quad (80)$$

the propagator for the ghost fields is $\eta$ son

$$\Delta_{ab}(k) = -\frac{\delta_{ab}g^2}{k^2}. \quad (81)$$

The Feynman rules for the vertex are:

$$= \frac{i}{g^2} [(p - r)^\nu \eta^{\rho\mu} + (r - q)^\mu \eta^{\rho\nu} + (q - p)^\rho \eta^{\mu\nu} - im\varepsilon^{\mu\nu\rho\delta}] F_{kln}(q \wedge p), \quad (82)$$

$$\frac{1}{g^2} \left[ F_{nmc}(r \wedge s) F_{lkc}(p \wedge q)(\eta^{\mu\rho} \eta^{\nu\delta} - \eta^{\mu\delta} \eta^{\nu\rho}) + F_{nlc}(q \wedge s) F_{mkc}(p \wedge r)(\eta^{\mu\nu} \eta^{\rho\delta} - \eta^{\mu\delta} \eta^{\rho\nu}) + F_{nkc}(p \wedge s) F_{mlc}(q \wedge r)(\eta^{\mu\nu} \eta^{\rho\delta} - \eta^{\mu\delta} \eta^{\rho\nu}) \right], \quad (83)$$

18
\[ k, \mu \ \overset{p}{\sim} \ q = \frac{-i}{2g^2} \gamma^\mu F_{klm}(q \wedge p) \delta_{ab}, \] (84)

\[ k, \mu \ \overset{p}{\sim} \ q = \frac{-i}{2g^2} \gamma^\mu F_{klm}(q \wedge p), \] (85)

\[ k, \mu \ \overset{p}{\sim} \ q = -ir^\mu F_{klm}(q \wedge p), \] (86)

\[ k, \mu \ \overset{p}{\sim} \ q \quad l, a \quad m, b \quad = \frac{1}{g^2} ir^\mu F_{klm}(q \wedge p) \delta_{ab}, \] (87)

\[ k, \mu \ \overset{p}{\sim} \ q \quad l, a \quad m, b \quad s, n, b \quad = \frac{1}{g^2} \delta^{\mu\nu} \delta_{ab} [F_{int}(s \wedge q) F_{kmt}(r \wedge p) + F_{knt}(s \wedge p) F_{lmt}(r \wedge q)], \] (88)

\[ k, a \ \overset{r}{\sim} \ q \quad p, \ l, b \quad m, c \quad = \frac{1}{2g^2} \epsilon_{cba} F_{klm}(q \wedge p), \] (89)

\[ k, a \ \overset{r}{\sim} \ q \quad p, \ l \quad m, b \quad = \frac{1}{g^2} F_{klm}(q \wedge p) \delta_{ab}, \] (90)
where the indexes $a, b, c, d$ run from 1 to 3 and refer to $C_a \gamma_{\lambda a}$ and $k, l, m, n$ refer to the group algebra indexes.
