July 18, 2009

Abstract
Nicolas Conjecture is disproved. The Robin Conjecture follows.

To V. I. Arnold, the greatest mathematician of all times.

I believe this to be false. There is no evidence whatever for it (unless one counts that it is always nice when any function has only real roots). One should not believe things for which there is no evidence. In the spirit of this anthology I should also record my feelings that there is no imaginable reason why it should be true.

J. E. Littlewood on Riemann’s Conjecture

... We are all in our own eyes a failure: after all, we haven’t proved Fermat’s Last Theorem, nor Riemann’s Conjecture.

Mary L. Cartwright

1 Introduction

The Nicolas Conjecture [Nic 1983] states that

\[ \frac{\mathcal{N}_k}{\varphi(\mathcal{N}_k)} > e^\gamma \log \log \mathcal{N}_k, \quad k \geq 1, \]  

(0)

where:

\[ \mathcal{N}_k = \prod_{i=1}^{k} p_i, \]

\( p_i \) is the prime number \( \#i \), \( \varphi \) is the Euler phi-function, and \( \gamma = 0.57... \) is the Euler constant. For more details, see the beautiful paper [CLM 2006], where it was proven that

\[ \prod_{i=1}^{k} (p_i + 1)/p_i < e^\gamma \log \log \mathcal{N}_k^2, \quad k > 4, \]
in contrast to (1):

$$\prod_{i=1}^{k} \frac{p_i}{p_i - 1} > e^\gamma \log \log N_k, \ k \geq 1.$$  

Crucially, Nicolas proved that if his Conjecture is not true then the inequality (1) is both true and untrue infinitely often. Thus, it’s enough to establish it for $k >> 1$, i.e. for $k$ large enough.

The Robin’s inequality, equivalent to Nicolas one, is:

$$\frac{\sigma(n)}{n} < e^\gamma \log \log n, \ n \geq 5041,$$  \hfill (1)

where $\sigma(n) = \sigma_1(n) = \sum_{d|n} d$ is the sum of divisors of $n$. [Rob 1984].

As is clear from the table of exceptions $\leq 5040$ in [CLM 2006], (1) can be replaced by:

$$\frac{\sigma(n)}{n} < e^\gamma \log \log n, \ \omega(n) > 4,$$  \hfill (2)

where $\omega(n)$ is the number of distinct prime divisors of $n$.

CLMS also mention that it’s enough to consider only those $n$ which are in Hardy-Ramanujan form: if $\omega(n) = m$,

$$n = p_1^{e_1} \ldots p_m^{e_m},$$  \hfill (3)

then

$$e_1 \geq e_2 \geq \ldots \geq e_m.$$  

Still, the inequality (1) has arbitrary many parameters: the $e_i$’s. This is not conducive to a proof. The Nicolas conjecture offers better chances.

## 2 The Method

Thus, in handling the Nicolas inequality, we need

$$\log \text{LHS} > \log \text{RHS},$$

where

$$\log \text{LHS} = \sum_{i=1}^{m} \log \left(1 + \frac{1}{p_i - 1}\right),$$  \hfill (4)

$$\log \text{RHS} = \gamma + \log \log \theta(p_m).$$  \hfill (5)

Now,

$$\theta(p_m) \leq p_m \left(1 + \frac{\eta_s}{\log^s p_m}\right), \ s = 1, 2, 3 \ \Rightarrow$$

$$\log \theta(p_m) \leq \log p_m + \frac{\eta_s}{\log^s p_m} = \log p_m \left(1 + \frac{\eta_s}{\log^{s+1} p_m}\right) \Rightarrow$$

$$\log \log \theta(p_m) \leq \log \log p_m + \frac{\eta_s}{\log^{s+1} p_m},$$  \hfill (6)
and we are going to look, beyond first 2 terms, \(\gamma + \log \log p_m\), at the series in \(\frac{1}{\log p_m}\). Thus,

\[
\log \text{RHS} = \log \log p_m + \gamma + \frac{\eta_3}{\log^4 p_m} + \ldots
\]  

(7)

For the LHS, we have:

\[
\sum_{i=1}^{m} \log \left(1 + \frac{1}{p_i - 1}\right) = \sum_{i=1}^{m} \left\{ \left[ \log \left(1 + \frac{1}{p_i - 1}\right) - \frac{1}{p_i} \right] + \frac{1}{p_i} \right\} = \sum_{i=1}^{m} \left[ \log \left(1 + \frac{1}{p_i - 1}\right) - \frac{1}{p_i} \right] + \sum_{i=1}^{m} \frac{1}{p_i} = \sum_{i=1}^{m} \frac{1}{p_i} + \sum_{i=1}^{\infty} \log \left(1 + \frac{1}{p_i - 1}\right) - \frac{1}{p_i} - \sum_{m+1}^{\infty} \left[ \log \left(1 + \frac{1}{p_i - 1}\right) - \frac{1}{p_i} \right]
\]

(8)

where ([Fin 2003], p. 95)

\[
\sum_{i=1}^{m} \frac{1}{p_i} = \log \log p_m + M + 0(1),
\]

(9)

\[
M = 0.261497\ldots
\]

(10)

Let’s dispose now of \(\sum_{m+1}^{\infty}\) - term. We have:

\[
\log \left(1 + \frac{1}{p_i - 1}\right) - \frac{1}{p} \sim \frac{1}{p - 1} - \frac{1}{p} \sim \frac{1}{i^2 \log^2 i}
\]

and

\[
\int_{m+1}^{\infty} \frac{dx}{x^2 \log^2 x} \sim \frac{1}{x \log^2 x} \bigg|_{m+1}^{\infty} \sim \frac{1}{m \log^2 m},
\]

and we are going to count only \(m\)-free terms in comparing the log LHS with the log RHS.

Thus, the first two leading terms: \(\log \log p_m\) and \(\gamma\) - being equal on both sides, we are comparing

\[
\sum_{i=1}^{m} \frac{1}{p_i} - \log \log p_m - M\text{ and }0,
\]

(11)

at least modulo

\[
\frac{1}{\log^4 m}.
\]

(12)

We need the first nonzero term in the log LHS, in (11), being \(> 0\) (or \(< 0\), as the case may be).
3 The Proof

We calculate modulo $1/m^2$ and modulo $1/m \log^4 m$. Our coefficients are polynomial functions in $w = \log \log m$.

Lemma 13.

$$\log(m + 1) = \log m + \frac{1}{m}.$$ (14)

Proof.

$$\log(m + 1) = \log[m \left(1 + \frac{1}{m}\right)] = \log m + \log \left(1 + \frac{1}{m}\right) \equiv \log m + \frac{1}{m} \quad \blacksquare$$

Lemma 15.

$$\log \log(m + 1) = \log \log m + \frac{1}{m \log m}.$$ (16)

Proof.

$$\log \log(m + 1) = \log \left[\log m\left(1 + \frac{1}{m \log m}\right)\right] =$$

$$= \log \log m + \frac{1}{m \log m} \quad \blacksquare$$ (1)

Let $C = C(w), w = \log \log m$. Call it $C_m$.

Lemma 17.

$$\frac{C_m}{\log^k m} - \frac{C_{m+1}}{\log^k (m+1)} = \frac{kC - C'}{m \log^{k+1} m}.$$ (18)

Proof. We have:

$$LHS = \frac{C}{\log^k m} - \frac{C + C' \frac{1}{m \log m}}{\left(\log m + \frac{1}{m}\right)^k} = \frac{1}{\log^k m \left(\log^k m + \frac{k}{m \log^{k-1} m}\right)}$$ times:

$$C \left(\log^k m + \frac{k}{m \log^{k-1} m}\right) - \left(C + C' \frac{1}{m \log m}\right) \log^k m =$$

$$= \frac{\log^{k-1} m}{m} (kC - C').$$

Altogether,

$$LHS = \frac{1}{m \log^{k+1} m} (kC - C'). \quad \blacksquare$$

Lemma 19.

$$\frac{1}{p_{m+1}} = \frac{1}{p_m}. \quad (20)$$

Proof. Set

$$p_m = mf(m), \quad (21)$$
where
\[ f(m) = \log m + (\log \log m - 1) + \frac{\log \log m - 2}{\log n} + \ldots = \]
\[ = \log m + \sum_{i \geq 0} \frac{P_i}{\log^i m}. \]  
(22)

Denote \( P(m + 1) = \tilde{P}. \) Then
\[ \frac{1}{p_m} - \frac{1}{p_{m+1}} = \frac{1}{p_mp_{m+1}} (p_{m+1} - p_m) \sim \frac{1}{m^2 \log^2 m} (p_{m+1} - p_m), \]  
(23)

and
\[ p_{m+1} - p_m = (m + 1)f(m + 1) - mf(m) = \]
\[ = m[f(m + 1) - f(m)] + f(m + 1) \equiv m[f(m + 1) - f(m)], \]
and
\[ f(m + 1) - f(m) = \log(m + 1) - \log m + \sum_{i \geq 1} \left( \frac{\tilde{P}_i}{\log^i (m + 1)} - \frac{P_i}{\log^i m} \right). \]

But
\[ \log(m + 1) - \log m = \frac{1}{m}, \]
and by (18),
\[ \frac{\tilde{P}_i}{\log^i (m + 1)} - \frac{P_i}{\log^i m} = \frac{P_i' - iP_i}{m \log^{i+1} m}. \]

Together with (23), this proves (20). ■

We are interested in \( C = C_1, D = C_2, \) such that
\[ \sum_{i=1}^{m} \frac{1}{p_i} = \log \log p_m + M + \frac{C}{\log m} + \frac{D}{\log^2 m} + \ldots \]

We use induction on \( m \) to find \( C \) and \( D. \) We have:
\[ \sum_{i=1}^{m} \frac{1}{p_i} + \frac{1}{p_{m+1}} = \frac{1}{p_{m+1}} + \log \log p_m + M + \frac{C}{\log m} + \frac{D}{\log^2 m} = \]
\[ = \log \log p_{m+1} + M + \frac{\tilde{C}}{\log(m + 1)} + \frac{\tilde{D}}{\log^2(m + 1)}, \]  
(24)

or
\[ \left( \frac{C}{\log m} - \frac{\tilde{C}}{\log (m + 1)} \right) + \left( \frac{D}{\log^2 m} - \frac{\tilde{D}}{\log^2 (m + 1)} \right) = \left( \log \log p_{m+1} - \log \log p_m \right) - \frac{1}{p_m}, \]  
(25)

5
By (18), this is:

\[
\frac{C - C'}{m \log^2 m} + \frac{2D - D'}{m \log^4 m} = (\log \log p_{m+1} - \log \log p_m) - \frac{1}{p_m}. \tag{26}
\]

Let’s start with the $1/p_m$ term. We have:

\[
- \frac{1}{p_m} = - \frac{1}{m \log m} \left( 1 + \frac{P_0}{\log m} + \frac{P_1}{\log^2 m} + \ldots \right) = - \frac{1}{m \log m} \left( 1 - \frac{P_0}{\log m} - \frac{P_1}{\log^2 m} + \ldots \right). \tag{27}
\]

Lemma 28.

\[
\log p_{m+1} - \log p_m \sim \frac{1}{m} \left( 1 + \frac{1}{\log m} \right) - \frac{P_0' - P_0}{m \log^2 m}. \tag{29}
\]

Proof. We have:

\[
LHS = \log \frac{p_{m+1}}{p_m} = \log \left[ \frac{m + 1}{m} \frac{f(m+1)}{f(m)} \right] = \frac{1}{m} \log \frac{f(m+1)}{f(m)} = \frac{1}{m} + \log \left( \frac{\log(m+1)}{\log m} \left[ 1 + \frac{P_0}{\log m} + \frac{P_1}{\log^2 m} + \ldots \right] \right) = \frac{1}{m} + \frac{1}{m \log m} \left( 1 - \log \log \frac{m+1}{m} \right) = \frac{1}{m} \left( 1 + \frac{1}{\log m} \right) + \frac{P_0}{\log m} - \frac{P_0}{\log m} \left[ \text{by (18)} \right] = \frac{1}{m} \left( 1 + \frac{1}{\log m} \right) - \frac{P_0' - P_0}{m \log^2 m}. \tag{30}
\]

Lemma 30.

\[
\frac{1}{\log p_m} = \frac{1}{\log m} \left( 1 - \frac{\log \log m}{\log m} \right) + O \left( \frac{1}{\log^3 m} \right). \tag{31}
\]

Proof. We have:

\[
\frac{1}{\log p_m} = \frac{1}{\log m + \log f(m)} = \frac{1}{\log m} \left[ 1 + \frac{1}{\log m} \log f(m) \right] = \frac{1}{\log m} \left( 1 - \frac{\log \log m}{\log m} \right). \tag{32}
\]

Lemma 32.

\[
\log \log p_{m+1} - \log \log p_m = \frac{1}{m \log m} \left( 1 + \frac{1}{\log m} \right) + \frac{P_0' - P_0}{m \log^2 m} \log \log m \left( 1 + \frac{1}{\log m} \right). \tag{33}
\]
Proof. We have:

\[ LHS = \log \frac{\log p_{m+1}}{\log p_m} = \log \left( 1 + \frac{\log p_{m+1} - \log p_m}{\log p_m} \right) = \]

\[ = \frac{\log p_{m+1} - \log p_m}{\log p_m} \text{[by (29), (31)]} = \]

\[ = \frac{1}{\log m} \left( 1 - \frac{\log \log m}{\log m} \right) \left( 1 + \frac{1}{m} \right) - \frac{P'_0 - P_0}{m \log^2 m} = \]

\[ = \frac{1}{m \log m} \left( 1 + \frac{1}{\log m} \right) - \frac{P'_0 - P_0}{m \log^3 m} - \frac{\log \log m}{m \log^2 m} \left( 1 + \frac{1}{\log m} \right). \]

Collecting all lemmas, we rewrite (25) as

\[ \frac{C - C'}{m \log^2 m} + \frac{2D - D'}{m \log^3 m} = \]

\[ = \frac{1}{m \log m} \left( 1 - \frac{P_0}{\log m} + \frac{P^2_0 - P_1}{\log^2 m} \right) + \]

\[ + \frac{1}{m \log m} \left( 1 + \frac{1}{\log m} \right) - \frac{P'_0 - P_0}{m \log^3 m} - \frac{\log \log m}{m \log^2 m} \left( 1 + \frac{1}{\log m} \right). \quad (34) \]

Thus,

\[ \frac{1}{m \log m} - \text{coefficient is 0}; \]

\[ \frac{1}{m \log^2 m} - \text{coefficient is :} \]

\[ P_0 + 1 - \log \log m = 0 \text{ because } P_0 = \log \log m - 1; \]

\[ \frac{1}{\log^3 m} - \text{coefficient is :} \]

\[ -P^2_0 + P_1 - P'_0 + P_0 - \log \log m < 0 \text{ for } m >> 0. \text{ Thus,} \]

\[ LHS < RHS. \quad (35) \]

The Nicolas Conjecture is thus disproved, but the strengthened Robin Inequality, is established:

\[ \prod_{i=1}^{m} \frac{p_i}{\varphi(p_i)} < e^\gamma \log \log N_m. \]

Notice that Nicolas Inequality is disproved in a way that contradicts the Nicolas result, that if his inequality is wrong, then it’s wrong and right infinitely often. Note that the equation

\[ kF - F' = p(w), \]

where \( p \) is a polynomial, has trivially a unique polynomial solution in \( w = \log \log m \).
4 Acknowledgment 1

Although not apparent, the paper is a result of hundreds of computer experiments, and it has an invisible hero: the PARI-GP program, a free to the mathematical community wonderful tool for computer experiments. My deep gratitude to the developers of PARI.

Nicholas Lynn was instrumental in discovering widespread order among the primes, by running many numerical experiments for me on Mathematica. Later Tony Saad had replaced him. Joshua Kupershmidt set me up with PARI, and helped both with its quirks and the actual programming.

I thank Remi Engels for technical assistance with Robin’s article, and Keith Briggs for sending me his inspiring paper.

Last but not least, over the years of struggles with the problem, with me often concluding that it’s unsolvable, K. C. Reddy held unshakably to the firm believe that I’ll conquer it. Why he was so certain, is a mystery to me.

5 Acknowledgment 2

It would be churlish of me not to mention the wonderfully well written and remarkably exciting and stimulating paper [CLMS 2006].

6 Acknowledgment 3

I’m grateful to Pieter Moore for the careful reading of the first version of this paper and constructing a counterexample.

I’m also deeply indebted to Patrick Solé for his encouragement after reading the fatally flawed 1st version of the Manuscript.
