Abstract

We consider a class of \((N, M)\)-elementary step functions on the \(p\)-adic Vilenkin group. We prove that \((N, M)\)-elementary step function generates a MRA on \(p\)-adic Vilenkin group iff it is generated by a special \(N\)-valid rooted tree on the set of vertices \(\{0, 1, \ldots, p - 1\}\) with the vector \((0, \ldots, 0) \in \mathbb{Z}^N\) as a root. Bibliography: 15 titles.

keywords: zero-dimensional group, Vilenkin group, multiresolution analysis, wavelet bases, tree.

1 Introduction

In articles [1]-[4] first examples of orthogonal wavelets on the dyadic Cantor group \((p = 2)\) are constructed and their properties are studied. Yu.Farkov [5]-[7] found necessary and sufficient conditions for a refinable function to generate an orthogonal MRA in the \(L_2(G)\)-spaces on the \(p\)-adic Vilenkin group \(G\). These conditions use the Strang-Fix and the modified Cohen properties.

In [7] this construction is given in a concrete fashion for \(p = 3\). In [8], some algorithms for constructing orthogonal and biorthogonal compactly supported wavelets on Vilenkin groups are proposed. In [5]-[8] two types of orthogonal wavelet examples are constructed: step functions and sums of Vilenkin series.

Khrennikov, Shelkovich, and Skopina [10],[11] introduced the concept of a \(p\)-adic MRA with orthogonal refinable function, and described a general pattern for their construction. This method was developed for an orthogonal refinable function \(\varphi\) with condition \(\text{supp} \widehat{\varphi} \subset B_0(0)\), where \(B_0(0) = \{x : |x|_p \leq 1\}\) is the unit ball in the field \(\mathbb{Q}_p\). Similar results were obtained for an arbitrary zero-dimensional group [13]. The condition \(\text{supp} \widehat{\varphi} \subset B_0(0)\) is very important. S. Albeverio, S. Evdokimov, M. Skopina

\[\text{This research was carried out with the financial support of the Russian Foundation for Basic Research (grant no. 13-01-00102).}\]
proved that if a refinable step function $\varphi$ generates an orthogonal $p$-adic MRA, then $\text{supp} \hat{\varphi}(\chi) \subset B_0(0)$.

On the other hand on Vilenkin groups Yu.A.Farkov constructs examples of step refinable functions $\varphi$, which generate an orthogonal MRA with $\text{supp} \hat{\varphi} \subset G_1^+$. In the author’s work [14] a necessary condition for a support of orthogonal refinable step function are found: if step refinable $(1, M)$-elementary function $\varphi$ generates an orthogonal MRA on $p$-adic Vilenkin group, then $\text{supp} \hat{\varphi} \subset G_{p-2}^\perp$. In [15] some trees was used to construct refinable function.

In this work we consider more general situation and study a structure of the set $\text{supp} \hat{\varphi}$. We define a concept of $N$-valid tree and prove that $(N, M)$-elementary function $\varphi$ generates an orthogonal MRA on $p$-adic Vilenkin group iff the function $\varphi$ is generated by means of some $N$-valid tree. For any $N$-valid tree we give an algorithm for constructing corresponding refinable function and orthogonal wavelets.

The paper is organized as follows. We consider $p$-adic Vilenkin group $\mathfrak{G}$ as a zero-dimensional group $(G, +)$ with condition $p^n g = 0$. Therefore, in section 2, we recall some concepts and facts from the theory of zero-dimensional group. We will systematically use the notation and the results from [13], [14].

In section 3 and the following sections we consider MRA on $p$-adic Vilenkin group $\mathfrak{G}$. In section 3 we study refinable step-functions which generate the orthogonal MRA. We define a class of $(N, M)$-elementary set and prove that the shifts system $\varphi(x - h)_{h \in H_0}$ is orthonormal if $\text{supp} \hat{\varphi}$ is $(N, M)$-elementary set.

In section 4 we introduce such concepts as ”a set generated by a tree” and ”a refinable step function generated by a tree” and prove, that any rooted $N$-valid tree generates a refinable step function that generates an orthogonal MRA on Vilenkin group.

In section 5 we give an algorithm for constructing orthogonal wavelets according to the tree.

2 Preliminaries

We will consider the Vilenkin group as a locally compact zero-dimensional Abelian group with additional condition $p_n g_n = 0$. Therefore we start with some basic notions and facts related to analysis on zero-dimensional groups. One may find more information on the topic in [12]–[14].
Let \((G, +)\) be a locally compact zero-dimensional Abelian group with the topology generated by a countable system of open subgroups
\[
\cdots \supset G_n \supset \cdots \supset G_0 \supset G_1 \supset \cdots \supset G_n \supset \cdots
\]
where
\[
\bigcup_{n=\infty}^{+\infty} G_n = G, \quad \bigcap_{n=\infty}^{+\infty} G_n = \{0\},
\]
p\(_n\) is an order of quotient group \(G_n / G_{n+1}\). We will always assume that all \(p_n\) are prime numbers. We will name such chain as basic chain. In this case, a base of the topology is formed by all possible cosets \(G_n + g, g \in G\).

We further define the numbers \((m_n)_{n=\infty}^{+\infty}\) as follows:
\[
m_0 = 1, \quad m_{n+1} = m_n \cdot p_n.
\]

Let \(\mu\) be a Haar measure on \(G\), we know that \(\mu G_n = \frac{1}{m_n}\). Further, let \(\int_G f(x) d\mu(x)\) be the absolutely convergent integral of the measure \(\mu\).

Given \(n \in \mathbb{Z}\), consider an element \(g_n \in G_n \setminus G_{n+1}\) and fix it. Then any \(x \in G\) has a unique representation in the form
\[
x = \sum_{n=\infty}^{+\infty} a_n g_n, \quad a_n = 0, p_n - 1.
\]
(2.1)

The sum (2.1) contain finite number of terms with negative subscripts, that is,
\[
x = \sum_{n=\infty}^{+\infty} a_n g_n, \quad a_n = 0, p_n - 1, \quad a_m \neq 0.
\]
(2.2)

We will name system \((g_n)_{n \in \mathbb{Z}}\) as a basic system.

Classical examples of zero-dimensional groups are Vilenkin groups and groups of \(p\)-adic numbers (see [12, Ch. 1, § 2]). A direct sum of cyclic groups \(\mathbb{Z}(p_k)\) of order \(p_k, k \in \mathbb{Z}\), is called a Vilenkin group. This means that the elements of a Vilenkin group are infinite sequences \(x = (x_k)_{k=\infty}^{+\infty}\) such that:

1) \(x_k = 0, p_k - 1\);

2) only a finite number of \(x_k\) with negative subscripts are different from zero;
3) the group operation \( \dot{+} \) is the coordinate-wise addition modulo \( p_k \), that is,
\[
x + y = (x_k + y_k), \quad x_k \dot{+} y_k = (x_k + y_k) \mod p_k.
\]
A topology on such group is generated by the chain of subgroups
\[
G_n = \{ x \in G : x = (\ldots, 0, 0, \ldots, 0, x_n, x_{n+1}, \ldots), \ x_\nu = 0, p_\nu - 1, \ \nu \geq n \}.
\]
The elements \( g_n = (\ldots, 0, 0, 1, 0, 0, \ldots) \) form a basic system. From definition of the operation \( \dot{+} \) we have \( p_n g_n = 0 \). Therefore we will name a zero-dimensional group \( (G, \dot{+}) \) with the condition \( p_n g_n = 0 \) as Vilenkin group.

By \( X \) we denote the collection of the characters of a group \( (G, \dot{+}) \); it is a group with respect to multiplication, too. Also let \( G_n^\perp = \{ \chi \in X : \forall x \in G_n, \chi(x) = 1 \} \) be the annihilator of the group \( G_n \). Each annihilator \( G_n^\perp \) is a group with respect to multiplication, and the subgroups \( G_n^\perp \) form an increasing sequence
\[
\cdots \subset G_{-n}^\perp \subset \cdots \subset G_0^\perp \subset G_1^\perp \subset \cdots \subset G_n^\perp \subset \cdots \tag{2.3}
\]
with
\[
\bigcup_{n=-\infty}^{+\infty} G_n^\perp = X \quad \text{and} \quad \bigcap_{n=-\infty}^{+\infty} G_n^\perp = \{1\},
\]
the quotient group \( G_{n+1}^\perp / G_n^\perp \) having order \( p_n \). The group of characters \( X \) is a zero-dimensional group with a basic chain (2.3). The group may be supplied with the topology using the chain of subgroups (2.3), the family of the cosets \( G_n^\perp \cdot \chi, \chi \in X \), being taken as a base of the topology. The collection of such cosets, along with the empty set, forms the semiring \( \mathcal{X} \).

Given a coset \( G_n^\perp \cdot \chi \), we define a measure \( \nu \) on it by \( \nu(G_n^\perp \cdot \chi) = \nu(G_n^\perp) = m_n \) (so that always \( \mu(G_n) \nu(G_n^\perp) = 1 \)). The measure \( \nu \) can be extended onto the \( \sigma \)-algebra of measurable sets in the standard way. One then forms the absolutely convergent integral \( \int_X F(\chi) \, d\nu(\chi) \) using this measure.

The value \( \chi(g) \) of the character \( \chi \) at an element \( g \in G \) will be denoted by \( (\chi, g) \). The Fourier transform \( \hat{f} \) of an \( f \in L_2(G) \) is defined as follows
\[
\hat{f}(\chi) = \int_G f(x) \overline{\chi(x)} \, d\mu(x) = \lim_{n \to +\infty} \int_{G_{-n}} f(x) \overline{\chi(x)} \, d\mu(x),
\]
with the limit being in the norm of $L_2(X)$. For any $f \in L_2(G)$, the inversion formula is valid
\[
f(x) = \int_X \hat{f}(\chi)(\chi, x) \, d\nu(\chi) = \lim_{n \to +\infty} \int_{G_n} \hat{f}(\chi)(\chi, x) \, d\nu(\chi);
\]
here the limit also signifies the convergence in the norm of $L_2(G)$. If $f, g \in L_2(G)$ then the Plancherel formula is valid
\[
\int_G f(x)g(x) \, d\mu(x) = \int_X \hat{f}(\chi)\hat{g}(\chi) \, d\nu(\chi).
\]
Provided with this topology, the group of characters $X$ is a zero-dimensional locally compact group; there is, however, a dual situation: every element $x \in G$ is a character of the group $X$, and $G_n$ is the annihilator of the group $G_n^\perp$. The union of disjoint sets $E_j$ we will denote by $\bigcup E_j$.

For any $n \in \mathbb{Z}$ we choose a character $r_n \in G_{n+1}^\perp \setminus G_n^\perp$ and fixed it. $(r_n)_{n \in \mathbb{Z}}$ is called a Rademacher system. Let us denote
\[
H_0 = \{ h \in G : h = a_{-1}g_{-1} + a_{-2}g_{-2} + \ldots + a_{-s}g_{-s}, s \in \mathbb{N}, a_j = \overline{0, p - 1} \},
\]
\[
H_n = \{ h \in G : h = a_{-1}g_{-1} + a_{-2}g_{-2} + \ldots + a_{-s}g_{-s}, a_j = 0, p - 1, s \in \mathbb{N} \}.
\]
The set $H_0$ is an analog of the set $N_0 = \mathbb{N} \cup \{0\}$.

If in the zero-dimensional group $G$ $p_n = p$ for any $n \in \mathbb{Z}$ then we can define the mapping $\mathcal{A} : G \to G$ by $\mathcal{A}x := \sum_{n=-\infty}^{+\infty} a_n g_n^{-1}$, where $x = \sum_{n=-\infty}^{+\infty} a_n g_n \in G$. The mapping $\mathcal{A}$ is called a dilation operator if $\mathcal{A}(x+y) = \mathcal{A}x + \mathcal{A}y$ for all $x, y \in G$. By definition, put $(\chi, \mathcal{A}) = (\chi, \mathcal{A}x)$.

**Lemma 2.1** ([14]) For any zero-dimensional group
1) $\int_{G_0} (\chi, x) \, d\nu(\chi) = 1_{G_0}(x)$, 2) $\int_{G_0} (\chi, x) \, d\mu(x) = 1_{G_0^\perp}(\chi)$.

**Lemma 2.2** ([14]) If $p_n = p$ for any $n \in \mathbb{Z}$ and the mapping $\mathcal{A}$ is additive then
1) $\int_{G_n} (\chi, x) \, d\nu(\chi) = p^n 1_{G_n}(x)$,
2) $\int_{G_n^\perp} (\chi, x) \, d\mu(x) = \frac{1}{p^n} 1_{G_n^\perp}(\chi)$.

**Lemma 2.3** ([14]) Let $\chi_{n,s} = r_n^{\alpha_n} r_{n+1}^{\alpha_{n+1}} \ldots r_{n+s}^{\alpha_{n+s}}$ be a character which does not belong to $G_n^\perp$. Then
\[
\int_{G_n} (\chi, x) \, d\nu(\chi) = p^n (\chi_{n,s}, x) 1_{G_n}(x).
\]
Lemma 2.4 ([14]) Let \( h_{n,s} = a_{n-1}g_{n-1} + a_{n-2}g_{n-2} + \ldots + a_{n-s}g_{n-s} \notin G_n \). Then
\[
\int_{G_n \dagger h_{n,s}} (\chi, x) \, d\mu(x) = \frac{1}{p^n} \langle \chi, h_{n,s} \rangle \mathbf{1}_{G_n^\perp}(\chi).
\]

Definition 2.1 ([14]) Let \( M, N \in \mathbb{N} \). We denote by \( \mathfrak{D}_M(G \setminus N) \) the set of step-functions \( f \in L_2(G) \) such that 1) \( \text{supp} \ f \subseteq G \setminus N \), and 2) \( f \) is constant on cosets \( G_M \dagger g \). \( \mathfrak{D}_N(G_M^\perp) \) is defined similarly.

Lemma 2.5 ([14]) Let \( M, N \in \mathbb{N} \). \( f \in \mathfrak{D}_M(G \setminus N) \) if and only if \( \hat{f} \in \mathfrak{D}_N(G_M^\perp) \).

3 MRA and refinable function on Vilenkin groups

In what follows we will consider groups \( G \) for which \( p_n = p \) and \( pg_n = 0 \) for any \( n \in \mathbb{Z} \). We know that it is a Vilenkin group. We will denote a Vilenkin group as \( \mathfrak{G} \).

In this group we can choose Rademacher functions in various ways. We define Rademacher functions with the equation
\[
\left( r_n, \sum_{k \in \mathbb{Z}} a_k g_k \right) = \exp\left( \frac{2\pi i}{p} a_n \right).
\]
In this case
\[
( r_n, g_k ) = \exp\left( \frac{2\pi i}{p} \delta_{nk} \right).
\]

Our main objective is to find a simple algorithm to get a refinable step-function that generates an orthogonal MRA on Vilenkin group.

Definition 3.1 A family of closed subspaces \( V_n, n \in \mathbb{Z} \), is said to be a multiresolution analysis of \( L_2(\mathfrak{G}) \) if the following axioms are satisfied:

A1) \( V_n \subseteq V_{n+1} \);

A2) \( \overline{\bigcup_{n \in \mathbb{Z}} V_n} = L_2(\mathfrak{G}) \) and \( \bigcap_{n \in \mathbb{Z}} V_n = \{0\} \); 

A3) \( f(x) \in V_n \iff f(Ax) \in V_{n+1} \) (\( A \) is a dilation operator);

A4) \( f(x) \in V_0 \iff f(x^{\dagger}h) \in V_0 \) for all \( h \in H_0 \); (\( H_0 \) is analog of \( \mathbb{Z} \)).

A5) there exists a function \( \varphi \in L_2(\mathfrak{G}) \) such that the system \( (\varphi(x^{\dagger}h))_{h \in H_0} \) is an orthonormal basis for \( V_0 \).
A function \( \varphi \) occurring in axiom A5 is called a scaling function.

Next we will follow the conventional approach. Let \( \varphi(x) \in L_2(\mathcal{G}) \), and assume that \((\varphi(x - h))_{h \in H_0}\) is an orthonormal system in \( L_2(\mathcal{G}) \). With the function \( \varphi \) and the dilation operator \( \mathcal{A} \), we define the linear subspaces \( L_n = (\varphi(A^nx - h))_{h \in H_0} \) and closed subspaces \( V_n = \overline{L_n} \). It is evident that the functions \( p_\mathcal{A}^n \varphi(A^nx - h)_{h \in H_0} \) form an orthonormal basis for \( V_n \), \( n \in \mathbb{Z} \). If subspaces \( V_n \) form a MRA, then the function \( \varphi \) is said to generate an MRA in \( L_2(\mathcal{G}) \). If a function \( \varphi \) generates an MRA, then we obtain from the axiom A1

\[
\varphi(x) = \sum_{h \in H_0} \beta_h \varphi(A^nx - h) \quad \left( \sum |\beta_h|^2 < +\infty \right). \tag{3.1}
\]

Therefore we will look up a function \( \varphi \in L_2(\mathcal{G}) \), which generates an MRA in \( L_2(\mathcal{G}) \), as a solution of the refinement equation \( (3.1) \), A solution of refinement equation \( (3.1) \) is called a refinable function.

**Lemma 3.1** ([14]) Let \( \varphi \in D_M(\mathcal{G}_-N) \) be a solution of \( (3.1) \). Then

\[
\varphi(x) = \sum_{h \in H_0^{N+1}} \beta_h \varphi(A^nx - h) \tag{3.2}
\]

The refinement equation \( (3.2) \) may be written in the form

\[
\hat{\varphi}(\chi) = m_0(\chi) \hat{\varphi} (\chi A^{-1}), \tag{3.3}
\]

where

\[
m_0(\chi) = \frac{1}{p} \sum_{h \in H_0^{N+1}} \beta_h (\chi A^{-1}, h) \tag{3.4}
\]

is a mask of the equation \( (3.3) \).

**Lemma 3.2** ([14]) Let \( \varphi \in D_M(\mathcal{G}_-N) \). Then the mask \( m_0(\chi) \) is constant on cosets \( \mathcal{G}_-N \zeta \). If \( \hat{\varphi}(\mathcal{G}_-N) \neq 0 \) then \( m_0(\mathcal{G}_-N) = 1 \).

**Lemma 3.3** ([14]) The mask \( m_0(\chi) \) is a periodic function with any period \( r_1^{\alpha_1} r_2^{\alpha_2} \ldots r_s^{\alpha_s} \) \( (s \in \mathbb{N}, \alpha_j = 0, p-1, j = 1, s) \).

So, if \( m_0(\chi) \) is a mask of \( (3.3) \) then

T1) \( m_0(\chi) \) is constant on cosets \( \mathcal{G}_-N \zeta \),
T2) \( m_0(\chi) \) is periodic with any period \( r_1^{\alpha_1} r_2^{\alpha_2} \ldots r_s^{\alpha_s} \), \( \alpha_j = 0, p-1 \),
T3) \( m_0(\mathcal{G}_-N) = 1 \).

Therefore we will assume that \( m_0 \) satisfies these conditions.
Theorem 3.1 ([14]) $m_0(\chi)$ is a mask of equation (3.3) on the class $D_{-N}(G_M^\perp)$ if and only if
\[ m_0(\chi)m_0(\chi A^{-1})\ldots m_0(\chi A^{-M-N}) = 0 \] (3.5)
on $G_M^\perp \setminus G_{M+1}^\perp$. If, in addition, the system $\varphi(x\cdot h)_{h\in H_0}$ is orthonormal, then $\varphi(x)$ generate an orthogonal MRA.

So, to find a refinable function that generates orthogonal MRA, we need to take a function $m_0(\chi)$ that satisfies conditions T1, T2, T3, (3.5), construct the function
\[ \hat{\varphi}(\chi) = \prod_{k=0}^{\infty} m_0(\chi A^{-k}) \in D_{-N}(G_M^\perp) \]
and check that the system $\varphi(x\cdot h)_{h\in H_0}$ is orthonormal.

For any zero-dimensional group $G$ the shifts system $(\varphi(x\cdot h))_{h\in H_0}$ is orthonormal if the condition $|\hat{\varphi}(\chi)| = 1_{G_M^\perp}(\chi)$ is valid [14]. For Vilenkin group $G$ we can give another condition.

Definition 3.2 Let $N, M \in \mathbb{N}$. A set $E \subset X$ is called $(N, M)$-elementary if $E$ is disjoint union of $p^N$ cosets
\[ G_M^\perp \hat{\xi}_j = G_M^\perp \rho^{-N}_{\alpha} \cdot \rho^{-N+1}_{\alpha} \cdot \ldots \cdot \rho^{N-1}_{1} \cdot \rho^{N}_{0} \cdot \ldots \cdot \rho^{M-1}_{M} = G_M^\perp \hat{\xi}_j \eta_j, \]
j = 0, 1, \ldots, p^N - 1, j = \alpha_N + \alpha_{N+1}p + \ldots + \alpha_1p^{N-1} (\alpha_\nu = 0, p - 1) such that
1) $\bigcup_{j=0}^{p^N-1} G_M^\perp \hat{\xi}_j = G_M^\perp, G_M^\perp \xi_0 = G_M^\perp$,
2) for any $l = 0, M + N - 1$ the intersection $(G_M^\perp \hat{\xi}_{N+l+1} \setminus G_M^\perp \hat{\xi}_{N+l}) \cap E \neq \emptyset$.

Lemma 3.4 The set $H_0 \subset G$ is an orthonormal system on any $(N, M)$-elementary set $E \subset X$.

Proof. Using the definition of $(N, M)$-elementary set we have
\[ \int_E (\chi, h)(\chi, g) d\nu(x) = \sum_{j=0}^{p^N-1} \int_{G_M^\perp \hat{\xi}_j} (\chi, h)(\chi, g) d\nu(x) = \]
\[ = \sum_{j=0}^{p^N-1} \int_X 1_{G_M^\perp \hat{\xi}_j}(\chi)(\chi, h)(\chi, g) d\nu(x) = \]
\[ = \sum_{j=0}^{p^N-1} \int_X 1_{\mathfrak{g}^\perp_{-N_\xi_j}}(\chi x)(\chi x, h)(\chi x, g) \, d\nu(x) = \]
\[ = \sum_{j=0}^{p^N-1} \int_X 1_{\mathfrak{g}^\perp_{-N_\xi_j}}(\chi x)(\chi x, h)(\chi x, g) \, d\nu(x). \]

Since
\[
(\eta_j, h) = (r_0^0 r_1^{a_0} \ldots r_{M-1}^{a_{M-1}}, a_{-1} g_{-1}^+ a_{-2} g_{-2}^+ \ldots a_{-s} g_{-s}^+ 1) = 1,
\]
\[
(\eta_j, g) = (r_0^0 r_1^{b_0} \ldots r_{M-1}^{b_{M-1}}, b_{-1} g_{-1}^+ b_{-2} g_{-2}^+ \ldots b_{-s} g_{-s}^+ 1) = 1,
\]
then
\[
\int_E (\chi, h)(\chi, g) \, d\nu(x) = \sum_{j=0}^{p^N-1} \int \mathfrak{g}^\perp_{-N_\xi_j} (\chi, h)(\chi, g) \, d\nu(x) = \int \mathfrak{g}^\perp_{-N_\xi_j} (\chi, h)(\chi, g) \, d\nu(x) = \]
\[ = \delta_{h,g}. \]

**Theorem 3.2** Let \((\mathfrak{g}, \dot{+})\) be a \(p\)-adic Vilenkin group, \(E \subset \mathfrak{g}^\perp_M\) an \((N, M)\)-elementary set. If \(|\hat{\phi}(\chi)| = 1_E(\chi)\) on \(X\) then the system of shifts \((\varphi(x-h))_{h \in H}\) is an orthonormal system on \(\mathfrak{g}\).

**Proof.** Let \(\tilde{H} \subset H\) be a finite set. Using the Plancherel equation we have
\[
\int_{\mathfrak{g}} \varphi(x-g) \overline{\varphi(x-g)} \, d\mu(x) = \int_X |\hat{\phi}(\chi)|^2(\chi, g)(\chi, h) \, d\nu(\chi) = \int_E (\chi, h)(\chi, g) \, d\nu(\chi) = \]
\[ = \sum_{j=0}^{p^N-1} \int \mathfrak{g}^\perp_{-N_\xi_j} (\chi, h)(\chi, g) \, d\nu(\chi). \]

Transform the inner integral
\[
\int \mathfrak{g}^\perp_{-N_\xi_j} (\chi, h)(\chi, g) \, d\nu(\chi) = \int_X 1_{\mathfrak{g}^\perp_{-N_\xi_j}}(\chi, h)(\chi, g) \, d\nu(\chi) = \]
\[ = \int_X 1_{\mathfrak{g}^\perp_{-N_\xi_j}}(\chi x)(\chi x, h-g) \, d\nu(\chi) = \int_X 1_{\mathfrak{g}^\perp_{-N_\xi_j}}(\chi x)(\chi x, h-g) \, d\nu(\chi) = \]
9
\[
\int_{\mathcal{G}} \sum_{j=1}^{N} \chi_{\eta_j} \cdot h \cdot d\nu(\chi).
\]

Repeating the arguments of lemma 3.4 we obtain
\[
\int_{\mathcal{G}} \varphi(x) \overline{\varphi(x)} \, d\mu(x) = \delta_{h,g}. \tag{3.6}
\]

**Theorem 3.3** ([14]) Let \( \varphi(x) \in \mathcal{D}_M(\mathfrak{G}_N) \). A shifts system \( \varphi(x) \) will be orthonormal if and only if for any \( \alpha_N, \alpha_{N+1}, \ldots, \alpha_{-1} = (0, p - 1) \)
\[
\sum_{a_0,a_1,\ldots,a_{M-1}=0}^{p-1} |\hat{\varphi}(\mathfrak{G}_N^{-1} r_0^{\alpha_0} \ldots r_0^{\alpha_{M-1}})|^2 = 1. \tag{3.6}
\]

**Lemma 3.5** ([14]) Let \( \hat{\varphi} \in \mathcal{D}_\mathcal{M}(\mathfrak{G}_N) \) be a solution of the refinement equation
\[
\hat{\varphi}(\chi) = m_0(\chi) \hat{\varphi}(\chi A^{-1})
\]
and \( \varphi(x) \) be an orthonormal system. Then for any \( \alpha_N, \alpha_{N+1}, \ldots, \alpha_{-1} = 0, p - 1 \)
\[
\sum_{a_0=0}^{p-1} |m_0(\mathfrak{G}_N^{-1} r_0^{\alpha_0} \ldots r_0^{\alpha_{M-1}})|^2 = 1. \tag{3.7}
\]

## 4 Trees and refinable functions

In this section we reduce the problem of construction of step refinable function to construction of some tree.

We will consider some special class of refinable functions \( \varphi(\chi) \) for which \( |\hat{\varphi}(\chi)| \) is a characteristic function of a set. Define this class.

**Definition 4.1** A mask \( m_0(\chi) \) is called \( N \)-elementary \( (N \in \mathbb{N}_0) \) if \( m_0(\chi) \) is constant on cosets \( \mathfrak{G}_N^{-1} \chi \), its absolute value \( |m_0(\chi)| \) has two values only: 0 and 1, and \( m_0(\mathfrak{G}_N^{-1}) = 1 \). The refinable function \( \varphi(x) \) with Fourier transform
\[
\hat{\varphi}(\chi) = \prod_{n=0}^{\infty} m_0(\chi A^{-n})
\]
is called \( N \)-elementary too. \( N \)-elementary function \( \varphi \) is called \( (N,M) \)-elementary if \( \hat{\varphi}(\chi) \in \mathcal{D}_N(\mathfrak{G}_M) \). In this case we will call the Fourier transform \( \hat{\varphi}(\chi) \) \( (N,M) \)-elementary, also.
Definition 4.2 Let $\tilde{E} = \bigcup_{\alpha_{-N}, \ldots, \alpha_{N}} \mathcal{G}_{\alpha_N}^{\perp} \alpha_{N}^{r_{-N}} \ldots \alpha_{1}^{r_{1}} \alpha_{0}^{r_{0}} \subset \mathcal{G}_{1}^{\perp}$ be an $(N, 1)$-elementary set. We say that the set $\tilde{E}_X$ is a periodic extension of $\tilde{E}$ if

$$\tilde{E}_X = \bigcup_{s=1}^{\infty} \bigcup_{\alpha_1, \ldots, \alpha_s=0}^{p-1} \tilde{E}^{\alpha_1 \alpha_2 \ldots \alpha_s}_{12 \ldots s}.$$  

We say that $\tilde{E}$ generates an $(N, M)$ elementary set $E$, if $\bigcap_{n=0}^{\infty} \tilde{E}_X A^n = E$.

Since $\tilde{E}_X \supset \mathcal{G}_{-N}^{\perp}$ then $\bigcap_{n=0}^{M+1} \tilde{E}_X A^n = E$ and $\left( \bigcap_{n=0}^{M+1} \tilde{E}_X A^n \right) \cap \left( \mathcal{G}_{M+1}^{\perp} \setminus \mathcal{G}_{M}^{\perp} \right) = \emptyset$. The converse is also true. Since

$$\left( \bigcap_{n=0}^{M+1} \tilde{E}_X A^n \right) \cap \left( \mathcal{G}_{M+1}^{\perp} \setminus \mathcal{G}_{M}^{\perp} \right) = \emptyset.$$

Then we have

$$\left( \bigcap_{n=0}^{M+2} \tilde{E}_X A^n \right) \cap \left( \mathcal{G}_{M+2}^{\perp} \setminus \mathcal{G}_{M+1}^{\perp} \right) = \tilde{E}_X \cap \left( \bigcap_{n=0}^{M+1} \tilde{E}_X A^n \cap \left( \mathcal{G}_{M+1}^{\perp} \setminus \mathcal{G}_{M}^{\perp} \right) \right) A =$$

$$= \tilde{E}_X \cap \emptyset = \emptyset.$$

Let $N$ be a natural number. Denote $V = \{0, 1, \ldots, p-1\}$ and construct a tree $T(V)$ in the following way:

1) The root of this tree and its vertices of level 1, 2, \ldots, $N-1$ are equal to zero.

2) Any path $(\alpha_k \rightarrow \alpha_{k+1} \rightarrow \cdots \rightarrow \alpha_{k+N-1})$ of length $N$ is present in the tree $T(V)$ exactly 1 time.

Such tree we will call $N$-valid.

For example for $p = 3, N = 2$ we can construct the tree

```
0   0
 2  0 1
 2 1
```

Figure 1

This tree contains any edge

$(0, 0), (0, 1), (0, 1), (1, 0), (1, 1), (1, 2), (2, 0), (2, 1), (2, 2)$
For any a path

\[(\alpha_s \rightarrow \alpha_{s-1} \rightarrow \cdots \rightarrow \alpha_{s-N+1} \rightarrow \alpha_{s-N} \rightarrow \alpha_{s-N-1} \rightarrow \cdots \rightarrow \alpha_{-N+1} \rightarrow \alpha_{-N})\]

in which \(\alpha_s = \alpha_{s-1} = \cdots = \alpha_{s-N+1} = 0\).

We construct cosets

\[
G_{-N}^\perp r_0^\alpha \cdots r_0^\alpha \cdots r_0^\alpha \cdots r_0^\alpha, \quad G_{-N}^\perp r_0^\alpha \cdots r_0^\alpha \cdots r_0^\alpha \cdots r_0^\alpha,
\]

(4.1)

\[
G_{-N}^\perp r_0^\alpha \cdots r_0^\alpha \cdots r_0^\alpha \cdots r_0^\alpha.
\]

(4.2)

The union of all such cosets we denote as \(\tilde{E}\). It is clear that \(\tilde{E} \subset G_1^\perp\).

**Definition 4.3** Let \(\tilde{E}_X\) be a periodic extension of \(\tilde{E}\). We say that the tree \(T(V)\) generates a set \(E\), if \(E = \bigcap_{n=0}^{\infty} \tilde{E}_X A^n\).

**Lemma 4.1** Let \(T(V)\) be a \(N\)-valid tree. Let \(E \subset X\) be a set generated by the tree \(T(V)\), \(H - \text{height of } T(V)\). Then \(E\) is an \((N, H - 2N)\)-elementary set.

**Proof.** Let us denote

\[
m(\chi) = 1_{\tilde{E}_X}(\chi), \quad M(\chi) = \prod_{n=0}^{\infty} m(\chi A^{-n}).
\]

First we note that \(M(\chi) = 1_E(\chi)\). Indeed

\[
1_E(\chi) = 1 \iff \chi \in E \iff \forall n, \chi A^{-n} \in \tilde{E}_X \iff \forall n, 1_{\tilde{E}_X}(\chi A^{-n}) = 1 \iff \forall n, m(\chi A^{-n}) = 1 \iff \prod_{n=0}^{\infty} m(\chi A^{-n}) = 1 \iff M(\chi) = 1.
\]

It means that \(M(\chi) = 1_E(\chi)\).

Now we will prove, that \(1_E(\chi) = 0\) for \(\chi \in \mathcal{G}_{H-2N+1}^\perp \mathcal{G}_{H-2N}^\perp \). Since \(\tilde{E}_X \supset \mathcal{G}_{-N}^\perp \) it follows that \(1_{\tilde{E}_X}(\mathcal{G}_{H-2N}^\perp A^{-H+N}) = 1_{\tilde{E}_X}(\mathcal{G}_{-N}^\perp) = 1\). Consequently

\[
\prod_{n=0}^{\infty} 1_{\tilde{E}_X}(\chi A^{-n}) = \prod_{n=0}^{H-N-1} 1_{\tilde{E}_X}(\chi A^{-n})
\]
if $\chi \in \mathcal{G}_{H-2N+1}^{\perp} \setminus \mathcal{G}_{H-2N}^{\perp}$. Let us denote

$$m(\mathcal{G}_{-N}^{\perp} r_{-N}^{\alpha} r_{-N+1}^{\alpha} \cdots r_{0}^{\alpha}) = \lambda_{\alpha_{-N}, \alpha_{-N+1}, \ldots, \alpha_{0}}.$$ 

By the definition of cosets (4.1), (4.2) $m(\mathcal{G}_{-N}^{\perp} r_{-N}^{\alpha} r_{-N+1}^{\alpha} \cdots r_{0}^{\alpha}) \neq 0 \Leftrightarrow$ the vector $(\alpha_{0}, \alpha_{1}, \ldots, \alpha_{-N+1}, \alpha_{-N})$ is a path $(\alpha_{0} \rightarrow \alpha_{1} \rightarrow \cdots \rightarrow \alpha_{-N+1} \rightarrow \alpha_{-N})$ of the tree $T(V)$.

We need to prove that

$$\mathbf{1}_{E}(\mathcal{G}_{-N}^{\perp} r_{-N}^{\alpha} r_{-N+1}^{\alpha} \cdots r_{H-2N}^{\alpha}) = 0$$

for $\alpha_{H-2N} \neq 0$. Since $\tilde{E}_{X}$ is a periodic extension of $E$ it follows that the function $m(\chi) = \mathbf{1}_{E_{X}}(\chi)$ is periodic with any period $r_{1}^{\alpha_{1}} r_{2}^{\alpha_{2}} \cdots r_{s}^{\alpha_{s}}$, $s \in \mathbb{N}$, i.e. $m(\chi_{1}) r_{s}^{\alpha_{s}} \cdots r_{s}^{\alpha_{s}} = m(\chi)$ when $\chi \in \mathcal{G}_{1}^{\perp}$. Using this fact we can write $M(\chi)$ for $\chi \in \mathcal{G}_{H-2N+1}^{\perp} \setminus \mathcal{G}_{H-2N}^{\perp}$ in the form

$$M(\mathcal{G}_{-N}^{\perp} \zeta) = m(\mathcal{G}_{-N}^{\perp} r_{-N}^{\alpha} r_{-N+1}^{\alpha} \cdots r_{H-2N}^{\alpha}) =$$

$$= m(\mathcal{G}_{-N}^{\perp} r_{-N}^{\alpha} r_{-N+1}^{\alpha} \cdots r_{0}^{\alpha}) m(\mathcal{G}_{-N}^{\perp} r_{-N}^{\alpha} r_{-N+1}^{\alpha} \cdots r_{0}^{\alpha}) \cdots$$

$$m(\mathcal{G}_{-N}^{\perp} r_{-N}^{\alpha} r_{-N+1}^{\alpha} \cdots r_{-1}^{\alpha} r_{0}^{\alpha})$$

(4.3)

Assume that $M(\mathcal{G}_{-N}^{\perp} \zeta) \neq 0$. Then all factors in (4.3) are nonzero. So we have the path

$$0 \rightarrow \cdots \rightarrow 0 \rightarrow \alpha_{H-2N} \neq 0 \rightarrow \alpha_{H-2N-1} \rightarrow \cdots \rightarrow \alpha_{0} \rightarrow \cdots \rightarrow \alpha_{-N+1} \rightarrow \alpha_{-N},$$

where there are $N$ zeroes at the beginning of the path. The length of such path is $H+1$, which contradicts the condition $\text{height}(T) = H$.

Now we prove that $E$ is $(1, H-2N)$ elementary set. Since the tree $T(V)$ is $N$-valid, it has all possible combinations of $N$ numbers $\alpha_{i} = \overline{0, p-1}$ as its paths, and we have the first property of elementary sets satisfied. Also, since $\text{height}(T) = H$, there exists a path

$$\alpha_{1} = 0 \rightarrow \cdots \rightarrow \alpha_{N} = 0 \rightarrow \alpha_{N+1} \neq 0 \rightarrow \alpha_{N+2} \rightarrow \cdots \rightarrow \alpha_{H}$$

of length $H$. Such path generates the set $\mathcal{G}_{-N}^{\perp} r_{-N}^{\alpha_{N+1}} \subset \mathcal{G}_{-N+1} \setminus \mathcal{G}_{-N}$, since $\alpha_{N+1} \neq 0$. Also, the same path generates the set $\mathcal{G}_{-N}^{\perp} r_{-N}^{\alpha_{N+2}} r_{-N+1}^{\alpha_{N+1}} \subset \mathcal{G}_{-N+2} \setminus \mathcal{G}_{-N+1}$. Continuing this process we will obtain all sets

$$\forall l = 0, H-N-1; \mathcal{G}_{-N}^{\perp} \prod_{n=0}^{l} r_{-N+n}^{\alpha_{N+n}} \subset \mathcal{G}_{-N+l+1} \setminus \mathcal{G}_{-N+l},$$

13
which means the second property of elementary sets is also satisfied. Thus we can conclude that $E$ is $(1, H - 2N)$-elementary set and the lemma is proved. □.

**Theorem 4.1** Let $M, p \in \mathbb{N}, p \geq 3$. Let $E \subset \mathfrak{G}_M^\perp$ be an $(N, M)$-elementary set, $\hat{\varphi} \in \mathfrak{D}_N(\mathfrak{G}_M^\perp)$, $|\hat{\varphi}(\chi)| = 1_E(\chi)$, $\hat{\varphi}(\chi)$ the solution of the equation

$$\hat{\varphi}(\chi) = m_0(\chi)\hat{\varphi}(\chi A^{-1}), \quad (4.4)$$

where $m_0(\chi)$ is an $N$-elementary mask. Then there exists a rooted tree $T(V)$ with $\text{height}(T) = M + 2N$ that generates the set $E$.

**Prof.** Since the set $E$ is $(N, M)$-elementary set and $|\hat{\varphi}(\chi)| = 1_E(\chi)$, it follows from theorem 3.2 that the system $((\varphi(x-h))_{h \in H_0})$ is an orthonormal system in $L_2(\mathfrak{G})$. Using the theorem 3.3 we obtain that $\forall \alpha_{-N}, \ldots, \alpha_{-1} = 0, p-1$

$$\sum_{\alpha_0, \alpha_1, \ldots , \alpha_{M-1} = 0}^{p-1} |\hat{\varphi}(\mathfrak{G}_N^\perp r_{-N}^{\alpha_{-N}} \ldots r_{-1}^{\alpha_{-1}} r_0^{\alpha_0} \ldots r_{M-1}^{\alpha_{M-1}})|^2 = 1.$$

Since $\hat{\varphi}$ is a solution of refinement equation (4.4) it follows from lemma 3.5 that $\forall \alpha_{-N}, \ldots, \alpha_{-1} = 0, p-1$

$$\sum_{\alpha_0 = 0}^{p-1} |m_0(\mathfrak{G}_N^\perp r_{-N}^{\alpha_{-N}} r_{-1}^{\alpha_{-1}} r_0^{\alpha_0})|^2 = 1. \quad (4.5)$$

Let as denote $\lambda_{\alpha_{-N}, \ldots, \alpha_{-1}, \alpha_0} := m_0(\mathfrak{G}_N^\perp r_{-N}^{\alpha_{-N}} \ldots r_{-1}^{\alpha_{-1}} r_0^{\alpha_0})$. Then we write (4.5) in the form

$$\sum_{\alpha_0 = 0}^{p-1} |\lambda_{\alpha_{-N}, \ldots, \alpha_{-1}, \alpha_0}|^2 = 1. \quad (4.6)$$

Since the mask $m_0(\chi)$ is $N$-elementary it follows that $|\lambda_{\alpha_{-N}, \ldots, \alpha_{-1}, \alpha_0}|$ takes one of two values only: 0 or 1.

Now we will construct the tree $T$. We will begin with the path of $N$ zeros

$$0_1 \rightarrow 0_2 \rightarrow \cdots \rightarrow 0_N,$$

where $0_1$ is the root of the tree.

Let $\mathfrak{U}$ be a family of cosets $\mathfrak{G}_N^\perp \zeta \subset \mathfrak{G}_M^\perp$ such that $\hat{\varphi}(\mathfrak{G}_N^\perp \zeta) \neq 0$ and $\mathfrak{G}_N^\perp \zeta \notin \mathfrak{U}$. We can write a coset $\mathfrak{G}_N^\perp \zeta \in \mathfrak{U}$ in the form

$$\mathfrak{G}_N^\perp \zeta = \mathfrak{G}_N^\perp r_{-N}^{\alpha_{-N}} \ldots r_{-1}^{\alpha_{-1}} r_0^{\alpha_0} \ldots r_{s}^{\alpha_{s}}, \alpha_{s} \neq 0. \quad (4.7)$$
Here $s \leq M - 1$ since each coset in $\mathcal{U}$ is a subset of $\mathcal{G}_M^\perp$, and there exists at least one coset with $s = M - 1$ since function is $(N,M)$-elementary. If $s = M - 1$ and $\alpha_{s+1} + \cdots + \alpha_{s+l} \neq 0$ then coset

$$\mathcal{G}_N^\perp r_0^\alpha_0 \cdots r_1^\alpha_1 \cdots r_s^\alpha_s r_{s+1}^\alpha_{s+1} \cdots r_{s+l}^\alpha_{s+l} \notin \mathcal{U}$$

0) Initially, we take a coset

$$\mathcal{G}_N^\perp \zeta_1 = \mathcal{G}_N^\perp r_0^\alpha_0 \cdots r_1^\alpha_1 \cdots r_s^\alpha_s \in \mathcal{U}, \alpha_s \neq 0$$

and connect the path

$$p^{(1)} = \alpha_s \rightarrow \cdots \rightarrow \alpha_0 \rightarrow \alpha_{-1} \rightarrow \cdots \rightarrow \alpha_{-N}$$

to the $0_N$ vertex. We obtain the tree $T^{(0)}$ that contains unique branch

$$T^{(0)} = (0_1 \rightarrow 0_2 \rightarrow \cdots \rightarrow 0_N \rightarrow \alpha_s \rightarrow \cdots \rightarrow 0_0 \rightarrow \alpha_{-1} \rightarrow \cdots \rightarrow \alpha_{-N}).$$

1) On the first step, take another coset

$$\mathcal{G}_N^\perp \zeta_2 = \mathcal{G}_N^\perp r_0^\alpha_0 \cdots r_1^\alpha_1 \cdots r_{s_2}^\alpha_{s_2} \in \mathcal{U} \setminus \mathcal{G}_N^\perp \zeta_1, \alpha_{s_2} \neq 0$$

which generates the path

$$p^{(2)} = (\alpha_{s_2}^{(2)} \rightarrow \cdots \rightarrow \alpha_0^{(2)} \rightarrow \alpha_{-1}^{(2)} \rightarrow \cdots \rightarrow \alpha_{-N}^{(2)}).$$

Let us add the path $0_1 \rightarrow 0_2 \rightarrow \cdots \rightarrow 0_N$ to the beginning of the path $p^{(2)}$ and denote it as $\tilde{p}^{(2)}$, i.e.

$$\tilde{p}^{(2)} = (0_1 \rightarrow 0_2 \rightarrow \cdots \rightarrow 0_N \rightarrow \alpha_{s_2}^{(2)} \rightarrow \cdots \rightarrow 0_0^{(2)} \rightarrow \alpha_{-1}^{(2)} \rightarrow \cdots \rightarrow \alpha_{-N}^{(2)}).$$

Now we will include this path into our tree $T^{(0)}$. To include it we will compare the path $\tilde{p}^{(2)}$ with the tree $T^{(0)}$.

There are 3 possible cases:

1) The path $\tilde{p}^{(0)}$ is shorter than $p^{(1)}$ and

$$\alpha_{s_0}^{(0)} = \alpha_{s_1}^{(1)}, \alpha_{s_0-1}^{(0)} = \alpha_{s_1-1}^{(1)}, \ldots, \alpha_{-N}^{(0)} = \alpha_{s_1-(s_0+N)}^{(1)}.$$

In this case we connect the tail

$$\alpha_{s_1-(s_0+N+1)}^{(1)} \rightarrow \alpha_{s_1-(s_0+N+2)}^{(1)} \rightarrow \cdots \rightarrow \alpha_{-N}^{(1)}$$
of the path $p^{(1)}$ to the vertex $\alpha^{(0)}_{-N}$.

2) The path $p^{(0)}$ is longer than $p^{(1)}$ and

$$
\alpha^{(0)}_{s_0} = \alpha^{(1)}_{s_1}, \alpha^{(0)}_{s_0-1} = \alpha^{(1)}_{s_1-1}, \ldots, \alpha^{(0)}_{s_0-(s_1+N)} = \alpha^{(1)}_{-N}.
$$

In this case the path $\tilde{p}^{(1)}$ is already a path of the tree $T^{(0)}$ and we leave the tree $T^{(0)}$ unchanged.

3) There exists an integer $l$ such that $\alpha^{(1)}_{s_1-l} \neq \alpha^{(0)}_{s_0-l}$ and $\forall k < l$, $\alpha^{(1)}_{s_1-k} = \alpha^{(0)}_{s_0-k}$. If $l = -1$ then we get $\alpha^{(1)}_{s_1-l} = 0_N$. When $l$ is calculated we connect the path

$$
\alpha^{(1)}_{s_1-l} \rightarrow \alpha^{(1)}_{s_1-l-1} \rightarrow \cdots \rightarrow \alpha^{(1)}_{-N}
$$
to the vertex $\alpha^{(0)}_{s_1-l+1}$ and obtain the tree

$$
\begin{array}{c}
\alpha^{(1)}_{s_1-l} \rightarrow \cdots \rightarrow \alpha^{(1)}_{-1} \rightarrow \cdots \rightarrow \alpha^{(1)}_{-N} \\
0_1 \rightarrow \cdots \rightarrow 0_N \rightarrow \alpha^{(0)}_{s_0} \rightarrow \alpha^{(0)}_{s_0-l+1} \rightarrow \alpha^{(0)}_{s_0-l} \rightarrow \alpha^{(0)}_{s_0-l-1} \rightarrow \cdots \rightarrow \alpha^{(0)}_{-N}.
\end{array}
$$

This is the end of first step.

Consider $n$ steps fulfilled, i.e. paths $p^{(0)}, p^{(1)}, \ldots, p^{(n)}$ are chosen and the correspondent tree $T^{(n)}$ is constructed. Now we will perform the $(n+1)$-th step. Let us take a coset

$$
\mathcal{G}^{\perp}_{-N} \zeta_{n+1} = \mathcal{G}^{\perp}_{-N} r^{(n)}_{s_0} \cdots r^{(n)}_0 = \mathcal{U} \bigcup_{k=1}^{n} \mathcal{G}^{\perp}_{-N} \zeta_k, \alpha^{(n+1)}_{s_{n+1}} \neq 0,
$$

which generates a path

$$
p^{(n+1)} = (\alpha^{(n+1)}_{s_{n+1}} \rightarrow \cdots \rightarrow \alpha^{(n+1)}_0 \rightarrow \alpha^{(n+1)}_{-1} \rightarrow \cdots \rightarrow \alpha^{(n+1)}_{-N}).
$$

and denote

$$
\tilde{p}^{(n+1)} = (0_1 \rightarrow \cdots \rightarrow 0_N \rightarrow \alpha^{(n+1)}_{s_{n+1}} \rightarrow \cdots \rightarrow \alpha^{(n+1)}_0 \rightarrow \alpha^{(n+1)}_{-1} \rightarrow \cdots \rightarrow \alpha^{(n+1)}_{-N}).
$$

Now we will include the path $\tilde{p}^{(n+1)}$ into the tree $T^{(n)}$. To do it, we will be looking for a path in the tree $T^{(n)}$ such that it has the longest starting sequence matching with the beginning of $\tilde{p}^{(n+1)}$.

**Step** $n+1.1$. If $\alpha^{(n+1)}_{s_{n+1}}$ is not equal to any vertex of level $N+1$ of the tree $T^{(n)}$ then we connect the path $p^{(n+1)}$ to the vertex $0_N$, obtain the new tree $T^{(n)}$ and finish the step.
Step $n + 1$. Otherwise there exists such (always unique) vertex of the level $N + 1$, which we will denote by $\alpha_{(N+1),i}$, equal to $\alpha_{s_n+1}^{(n+1)}$ we consider all vertices of level $N + 2$ connected to it. If there are no vertices connected or there are no such vertices matching $\alpha_{s_n+1-1}^{(n+1)}$ then we connect the tail of $p^{(n+1)}$ starting from the element $\alpha_{s_n+1-1}^{(n+1)}$ to the vertex $\alpha_{(N+1),i}$, obtain new tree and finish the step. Otherwise, if there exists vertex of level $N + 2$ $\alpha_{(N+2),i}$ equal to $\alpha_{s_n+1-1}^{(n+1)}$, we continue the process of including the path $p^{(n+1)}$ into the tree until either there are no more elements in the path $p^{(n+1)}$ or at some level there are no vertices equal to corresponding element of the path $p^{(n+1)}$. In the first case the tree is left unchanged at this step. In the second case the tail of $p^{(n+1)}$ is added to the tree somewhere. Obviously, since the path $p^{(n+1)}$ has finite number of elements the process will also be finite.

The description of the $(n + 1)$-th step is finished and there are only few final remarks left.

1) The resulting graph is a tree, since we produce no cycles at each step.

2) The process of constructing such tree is finite, i.e. contains finite number of steps since during each step we use different coset of $\mathcal{U}$ and there is a finite number of such cosets.

So, at this point we have obtained a tree. Let us prove that this tree $T$ is $N$-valid. To prove it, we must show, that each path of $N$ elements is unique in our tree. Firstly, let us prove that the path of $N$ zeros appears only once in our tree – and it is the path starting from its root. Indeed, let us assume that the path exists somewhere else in the tree $T$ and that it is a part of some path

$$0_1 \to \cdots \to 0_N \to \alpha_s \to \cdots \to \alpha_k \to 0_1 \to \cdots \to 0_N \to \cdots \to \alpha_{-N}$$

from root to leaf. Since $\alpha_s \neq 0$ there exists at least one nonzero element between two instances of the path $0_1 \to \cdots \to 0_N$. Without the loss of generality we can consider $\alpha_k \neq 0$.

Using the same technique as in (4.3), we can conclude, that

$$|\hat{\varphi}(\mathfrak{G}_{-N}^{\perp} \mathfrak{A}_N \cdot r_{k-2N-1}^{0_{N}} \cdots r_{k-N-1}^{0_{N}} \cdots r_{k-N}^{0_{N}} r_{k-N}^{0_{N}} \cdots r_{\alpha_k}^{0_{N}})| =$$

$$= |\lambda_{\alpha_0,0,0} | \cdots |\lambda_{0,0,0}| \cdots |\lambda_{\alpha_0,0,0}| = 1,$$

which in particular means that $|\lambda_{0,0,0}| = 1$. Also, by the properties of the mask $\lambda_{0,0,0} = 1$. These equalities contradict (4.6).
Now, let us assume that the arbitrary path $\gamma_1 \rightarrow \cdots \rightarrow \gamma_N$ appears twice. Thus, it is a subpath of 2 different paths from root to leaf

$$0_1 \rightarrow \ldots 0_N \rightarrow \alpha_s \rightarrow \cdots \rightarrow \alpha_k \rightarrow \gamma_1 \rightarrow \cdots \rightarrow \gamma_N \rightarrow \cdots \rightarrow \alpha_N, \ k < s,$$

$$0_1 \rightarrow \ldots 0_N \rightarrow \beta_{s'} \rightarrow \cdots \rightarrow \beta_{k'} \rightarrow \gamma_1 \rightarrow \cdots \rightarrow \gamma_N \rightarrow \cdots \rightarrow \beta_N, \ k' < s'.$$

Let us denote $0_i = \alpha_{s+N-i+1} = \beta_{s'+N-i+1}$. Now, let us prove, that $\exists j \geq 0 : \alpha_{k+j} \neq \beta_{k'+j}$.

We assume that the length of $\alpha$ subpath is less than the length of $\beta$ subpath, i.e. $s - k < s' - k'$. Firstly, let us check if $\alpha_k \neq \beta_{k'}$. If they are equal, let’s check if $\alpha_{k+1} \neq \beta_{k'+1}$. If we haven’t encountered nonequal pair before $0_N = \alpha_{s+1}$ and $\beta_{k'-k+s+1}$, we check if they are nonequal. If not (i.e they are equal), we check all the remaining pairs. If next $N - 1$ elements of $\beta$ subpath are equal to elements $0_i$ of the $\alpha$ subpath, it contradicts the fact that there is only one subpath of $N$ zeros in our tree. Thus in this case $\exists j \geq 0 : \alpha_{k+j} \neq \beta_{k'+j}$.

Now, let us assume, that both subpaths are of the same length. If $\forall j \geq 0 : \alpha_{k+j} = \beta_{k'+j}$ then, by construction of the tree $T$ these two paths actually correspond to the same vertices from $0_1$ to $\gamma_N$, which means subpath $\gamma$ does not appear twice in our tree. It contradicts the initial assumption that it does appear twice. Thus in this case $\exists j \geq 0 : \alpha_{k+j} \neq \beta_{k'+j}$, too.

Let us assume, without loss of generality, that $\alpha_k \neq \beta_{k'}$. Using the same technique as in (4.3), we can conclude, that

$$|\hat{\phi}(G^\bot_{-N} r_{-N}^{\alpha-N} \cdots r_{k-2N-1}^{\gamma-N} \cdots r_{k-N-1}^{\gamma-1} r_{k-N}^{\alpha_k} \cdots r_{s'}^{\alpha_s})| =$$

$$= |\lambda_{\alpha_{-N}, \ldots, \alpha_{-1}, 0} | \cdots |\lambda_{\gamma_{-N}, \ldots, \gamma_{-1}, \alpha_k} | \cdots |\lambda_{\alpha_s, 0, \ldots, 0} | = 1,$$

$$|\hat{\phi}(G^\bot_{-N} r_{-N}^{\beta-N} \cdots r_{k'-2N-1}^{\gamma-N} \cdots r_{k'-N-1}^{\gamma-1} r_{k'-N}^{\beta_{k'}} \cdots r_{s'}^{\beta_{s'}})| =$$

$$= |\lambda_{\beta_{-N}, \ldots, \beta_{-1}, 0} | \cdots |\lambda_{\gamma_{-N}, \ldots, \gamma_{-1}, \beta_{k'}} | \cdots |\lambda_{\beta_{s'}, 0, \ldots, 0} | = 1.$$

That means, in particular, that $|\lambda_{\gamma_{-N}, \ldots, \gamma_{-1}, \beta_{k'}}| = |\lambda_{\gamma_{-N}, \ldots, \gamma_{-1}, \alpha_k}| = 1$, which contradicts (4.6). Thus our tree is $N$-valid.

It is evident that this tree generates refinable function $\hat{\phi}$ with a mask $m_0$. Let’s show that height($T$) = $M + 2N$. Indeed, since $\hat{\phi} \in D_{-N}(G^\bot_M)$ it follows that there exists a coset $G^\bot_{-N} r_{-N}^{\alpha-N} \cdots r_{-1}^{\alpha-1} r_0^{\alpha_0} \cdots r_{M-1}^{\alpha_{M-1}}$, $\alpha_{M-1} \neq 0$ for which $|\hat{\phi}(G^\bot_{-N} r_{-N}^{\alpha-N} \cdots r_{-1}^{\alpha-1} r_0^{\alpha_0} \cdots r_{M-1}^{\alpha_{M-1}})| = 1$. This coset generates a path

$$0_1 \rightarrow \cdots \rightarrow 0_N \rightarrow \alpha_{M-1} \rightarrow \cdots \rightarrow \alpha_0 \rightarrow \alpha_{-1} \rightarrow \cdots \rightarrow \alpha_{-N}$$

of $T$. This path contain $M + 2N$ vertices. It means that height($T$) $\geq M + 2N$. On the other hand there is no coset $G^\bot_{-N} \zeta \subset G^\bot_{M+1} \setminus G^\bot_M$,
consequently there is no path with $L > M + 2N$. So height($T$) = $M + 2N$. The theorem is proved. □

**Definition 4.4** Let $T(V)$ be an $N$-valid tree, $H = \text{height}(T)$. Using cosets (4.1) we define the mask $m_0(\chi)$ in the subgroup $\mathfrak{G}_1^\perp$ as follows: $m_0(\mathfrak{G}_1^-) = 1$, $m_0(\mathfrak{G}_1^\perp r_0^\alpha N \cdots r_1^\alpha N) = \lambda_{\alpha_{-N},\ldots,\alpha_{-1},\alpha_0}$, $|\lambda_{\alpha_{-N},\ldots,\alpha_{-1},\alpha_0}| = 1$ when $\mathfrak{G}_1^- r_0^\alpha N \cdots r_1^\alpha N \subseteq \tilde{E}$, $m_0(\mathfrak{G}_1^\perp r_0^\alpha N \cdots r_1^\alpha N) = \lambda_{\alpha_{-N},\ldots,\alpha_{-1},\alpha_0} = 0$ when $\mathfrak{G}_1^- r_0^\alpha N \cdots r_1^\alpha N \subseteq \mathfrak{G}_1^\perp \setminus \tilde{E}$. Let us extend the mask $m_0(\chi)$ on the $X \setminus \mathfrak{G}_1^\perp$ periodically, i.e. $m_0(\chi r_1^\alpha N r_2^\alpha \cdots r_s^\alpha) = m_0(\chi)$. Then we say that the tree $T(V)$ generates the mask $m_0(\chi)$. Set $\hat{\varphi}(\chi) = \bigoplus_{n=0}^{\infty} m_0(\chi A^{-n})$.

It follows from lemma 4.1 that
1) $\text{supp} \hat{\varphi}(\chi) \subset \mathfrak{G}_{H-2N}^\perp$,
2) $\hat{\varphi}(\chi)$ is $(N, H - 2N)$ elementary function,
3) $(\varphi(x-h))_{h \in H_0}$ is an orthonormal system.

In this case we say that the tree $T(V)$ generates the refinable function $\varphi(x)$.

**Theorem 4.2** Let $p \geq 3$ be a prime number, $T(V)$ an $N$-valid tree. Let $H$ be are height of $T(V)$. By $\varphi(x)$ denote the function generated by the $T(V)$. Then $\varphi(x)$ generates an orthogonal MRA on $p$-adic Vilenkin group.

**Proof.** Since $T(V)$ generates the function $\varphi$ then 1) $\hat{\varphi} \in \mathfrak{D}_N(\mathfrak{G}_M^\perp)$, 2) $\hat{\varphi}(\chi)$ is $(N, H - 2N)$- elementary function, 3) $\hat{\varphi}(\chi)$ is a solution of refinable equation (3.3), 4) $(\varphi(x-h))_{h \in H_0}$ is an orthonormal system. From the theorem 3.1 it follows that $\varphi(x)$ generates an orthogonal MRA. □

5 Construction of wavelet bases

In [6] and [7] Yu.A.Farkov reduces the problem of $p$-wavelet decomposition into a problem of matrix extension. We will use another method [13].

As usual, $W_n$ stands for the orthogonal complement of $V_n$ in $V_{n+1}$; that is $V_{n+1} = V_n \oplus W_n$ and $V_n \perp W_n$ ($n \in \mathbb{Z}$, and $\oplus$ denotes the direct sum). It is readily seen that
1) $f \in W_n \iff f(\mathbb{A}x) \in W_{n+1}$,
2) $W_n \perp W_k$ for $k \neq n$,
3) $\oplus W_n = L^2(\mathfrak{G}), n \in \mathbb{Z}$.

From theorems 4.1, 4.2 we derive an algorithm for constructing wavelet bases.

**Step 1.** Choose an arbitrary tree $T - N$-valid. Let $H$ be a height of the
tree $T$.

**Step 2.** Choose a finite sequence $(\lambda_{a_{-N}, \ldots, a_0})_{p-1}^{p-1}$ such that $\lambda_{0, \ldots, 0} = 1$, $|\lambda_{a_{-N}, \ldots, a_0}| = 1$ if there exists subpath $\alpha_{-N} \to \cdots \to \alpha_0$ in the tree $T$, $|\lambda_{a_{-N}, \ldots, a_0}| = 0$ otherwise.

**Step 3.** Construct the mask $m_0(\chi)$ and Fourier transform $\hat{\varphi}(\chi)$ using definition 4.4. It is clear that $E = \text{supp}(\hat{\varphi}(\chi))$ is $(N, H - 2N)$-elementary set.

**Step 4.** Find coefficients $\beta_h$ for which

$$m_0(\chi) = \frac{1}{p} \sum_{h \in H_0^{(N+1)}} \beta_h(\chi, A^{-1}h). \quad (5.1)$$

To find coefficients $\beta_h$, we write this equation in the form

$$m_0(\chi_k) = \frac{1}{p} \sum_{j=0}^{p^{N+1} - 1} \beta_j(\chi_k, A^{-1}h_j) \quad (5.2)$$

where

$$h_j = a_{-1} + a_{-2} + \cdots + a_{-N} - 1, \quad \chi_k \in \mathcal{G}_{-N} \mathcal{r}^{-1}_{-N} \cdots r^{-1}_{-1} r_0^{a_0},$$

$$j = a_{-1} + a_{-2} + \cdots + a_{-N} p^N, \quad k = a_{-N} + \cdots + a_{-1} + a_0 p^{N-1} + \alpha_0 p^N,$$

$$a_{-1}, a_{-2}, \ldots, a_{-N} = 0, p - 1, \quad \alpha_{-N}, \ldots, \alpha_{-1}, a_0 = 0, p - 1.$$

Since the matrix $\frac{1}{p}(\chi_k, A^{-1}h_j)$ of this system is unitary it follows that the system $\text{(5.2)}$ has a unique solution.

**Step 5.** We set $m_l(\chi) = m_0(\chi r_0^{-l})$, $l = 1, p - 1$, $X_0 = \{ \chi : |m_0(\chi)| = 1 \}$. Clearly, $m_l(\chi)$ may be written as

$$m_l(\chi) = \frac{1}{p} \sum_{h \in H_0^{(N+1)}} \beta_h(\chi r_0^{-l}, A^{-1}h) = \frac{1}{p} \sum_{h \in H_0^{(N+1)}} \beta_h^{(l)}(\chi, A^{-1}h)$$

where $\beta_h^{(l)} = \beta_h(r_0^l, A^{-1}h)$. By the construction of $m_l(\chi)$ we have $|m_l(X_0 r_0^l)| = 1$. From the necessary condition $\text{(3.7)}$ it follows that $|m_l(X_0 r_0^\nu)| = 0$ for $\nu \neq l$, $m_l(\chi)m_k(\chi) = 0$ when $k \neq l$.

**Step 6.** Define the functions

$$\psi_l(x) = \sum_{h \in H_0^{(N+1)}} \beta_h^{(l)} \varphi(A x \cdot \cdot h).$$

**Theorem 5.1** The functions $\psi_l(x \cdot \cdot h)$, where $l = 1, p - 1$, $h \in H_0$, form an orthonormal basis for $W_0$. 

---

20
**Proof.** a) We claim that $(\varphi(\cdot \cdot g^{(1)}), \psi_l(\cdot \cdot g^{(2)})) = 0$ for any $g^{(1)}, g^{(2)} \in H_0$.

Since

$$\hat{\varphi}(\cdot h)(\chi) = (\chi, h) \hat{\varphi}(\chi), \quad \hat{\varphi}_A(\cdot g)(\chi) = \frac{1}{p} (\chi, A^{-1} g) \hat{\varphi}(\chi A^{-1}),$$

it follows that

$$(\varphi(\cdot \cdot g^{(1)}), \psi_l(\cdot \cdot g^{(2)})) = \int_X \hat{\varphi}(\chi) \overline{\hat{\varphi}(\chi A^{-1})} (\chi, g^{(1)}) (\chi, g^{(2)}) m_l(\chi) d\nu(\chi) = 0$$

because $\text{supp } \hat{\varphi}(\chi) = E$ and $m_l(E) = 0$, $l = 1, p - 1$.

b) By analogy

$$(\psi_k(\cdot \cdot g^{(1)}), \psi_l(\cdot \cdot g^{(2)})) = \int_X |\hat{\varphi}(\chi A^{-1})|^2 (\chi, g^{(2)} \cdot g^{(1)}) m_k(\chi) m_l(\chi) d\nu(\chi) = 0$$

when $k \neq l$.

c) We verify that $(\psi_l(\cdot \cdot g^{(1)}), \psi_l(\cdot \cdot g^{(2)})) = 0$, provided that $g^{(1)}, g^{(2)} \in H_0$ and $g^{(1)} \neq g^{(2)}$. Write this scalar product in the form

$$(\psi_l(\cdot \cdot g^{(1)}), \psi_l(\cdot \cdot g^{(2)})) = \int_X |\hat{\varphi}(\chi A^{-1})|^2 (\chi, g^{(2)} \cdot g^{(1)}) m_l(\chi)^2 d\nu(\chi) =$$

$$= \int_{E A \cap X_0 r_0^l} (\chi, g^{(2)} \cdot g^{(1)}) d\nu(\chi).$$

Show that $E A \cap X_0 r_0^l$ is an $(N, H - 2N)$-elementary set. By the definition

$$E = \bigsqcup_{\alpha \in T(V)} \mathcal{E}_{-N}^\perp r_{-N}^{\alpha_N} \ldots r_{0}^{\alpha_0} \ldots r_{s}^{0} \ldots r_{s+N}^{0} (s \leq H - 2N - 1) \quad (5.3)$$

where the union is taken over all paths

$$\overline{\alpha} = (0, \ldots, 0, \alpha_s, \alpha_{s-1}, \ldots, \alpha_0, \alpha_{-1}, \ldots, \alpha_{-N})$$

of the tree $T$. It means that for any vector $(\alpha_{-1}, \ldots, \alpha_{-N})$, $\alpha_j = 0, p - 1$ the union (5.3) contains unique coset $\mathcal{E}_{-N}^\perp r_{-N}^{\alpha_N} \ldots r_{-1}^{\alpha_{-1}} r_{0}^{\alpha_0} \ldots r_{s}^{0} \ldots r_{s+N}^{0}.$

Consequently $E A = \bigsqcup_{\alpha \in T(V)} \mathcal{E}_{-N+1}^\perp r_{-N+1}^{\alpha_N} \ldots r_{0}^{\alpha_0} \ldots r_{s}^{0} \ldots r_{s+N}^{0}$.
\[ \bigcup_{\alpha_{-N-1}=0}^{p-1} \bigcup_{\pi \in T(V)} \mathcal{G}^\perp_{-N} r_{-N}^{\alpha_{-N-1}} \cdots r_{-N+1}^{\alpha_0} \cdots r_{s+1}^{\alpha_s} r_s^0 \cdots r_{s+N+1}^0. \]

On the other hand

\[ X_0 r_0^l = \bigcup_{j \in \mathbb{N}} \bigcup_{(\gamma_{-N}, \ldots, \gamma_{-1}, \gamma_0) \in T(V)} \mathcal{G}^\perp_{-N} r_{-N}^{\gamma_{-N}} \cdots r_{-1}^{\gamma_0 + l} r_1^{b_1} \cdots r_j^{b_j}. \]

Therefore \( EA \cap X_0 r_0^l \) consists of all cosets

\[ \mathcal{G}^\perp_{-N} r_{-N}^{\gamma_{-N}} \cdots r_{-1}^{\gamma_0 + l} r_1^{b_1} \cdots r_j^{b_j} \]

where

\[ (0, \ldots, 0, \alpha_s, \alpha_{s-1}, \ldots, \alpha_{-1} = \gamma_0 + l, \gamma_{-1}, \ldots, \gamma_{-N}) \in T \]

Since the tree \( T \) is \( N \)-valid it follows that \( EA \cap X_0 r_0^l \) is \((N, H - 2N + 1)\)-elementary set. By lemma 3.4 it follows that

\[ \int_{EA \cap X_0 r_0^l} (\chi, g^2 - g^1) d\nu(\chi) = 0. \]

d) We claim that any function \( f \in W_0 \) can be expanded uniquely in a series in terms of \( (\psi_l(x - g))_{l=1, p-1, g \in H_0} \). The proof of this fact may be found in [13], theorem 5.1. \( \square \)

**Step 7.** Since the subspaces \( (V_j)_{j \in \mathbb{Z}} \) form an MRA in \( L_2(\mathcal{G}) \), it follows that the functions

\[ (\psi_l(A^n x - h)) \quad l = \frac{1}{\overline{p-1}}, n \in \mathbb{Z}, h \in H_0 \]

form a complete orthogonal system in \( L_2(\mathcal{G}) \).
